COMMERCE, DEPARTMENT OF, one of the executive departments of the U. S. Government. It succeeded the earlier Department of Commerce and Labor, by an Act of Congress, approved March 4 1913, which also created a separate and independent Department of Labor (see LABOR, DEPARTMENT OF). The Secretary of Commerce is a member of the president's Cabinet but is not in line of succession to the presidency. It is his duty to promote the commerce, domestic and foreign, of the United States. There is also an assistant secretary and a solicitor, the latter acting as legal adviser to the Secretary and to the heads of the various bureaus of the department.

As originally organized there were 9 bureaus, as follows: (1) The bureau of the census, charged with the collection of data concerning population, agriculture, manufactures, mining, etc.; (2) the bureau of foreign and domestic commerce, for the collection and diffusion of information of use to the manufacturer and exporter; (3) the coast

and geodetic survey, for charting coast waters and surveying rivers to the head of tidewater or ship navigation, and for making deep-sea soundings, magnetic observations, etc.; (4) the bureau of fisheries, for regulating and conserving fisheries; (5) the lighthouse service, in charge of the aids to navigation on all U.S. territory, except Panama and the Philippines; (6) the bureau of navigation, having general superintendence of the commercial marine and merchant seamen, and the enforcement of navigation laws; (7) the steamship inspection service, which inspects steam vessels for the purpose of insuring safety at sea, and issues licences to masters, mates, pilots, and engineers of the merchant marine; (8) the bureau of standards, for determining all American measurements; and (9) the bureau of corporations. The last-mentioned bureau, on March 16 1915, was transferred to, and merged with, the Federal Trade Commission (see FEDERAL TRADE COMMISSION).

Because of the importance of manufactures there had long been agitation among various commercial organizations of the United States for the creation of a governmental department for promoting commercial interests; but it was not until 1903 that a bill establishing the Department of Commerce and Labor was passed by Congress; it was approved by President Roosevelt Feb. 14. For the next ten years the joint interests of labor and capital were entrusted to this department. The arrangement proved unsatisfactory because of the frequent conflict of these interests, and in 1913 an independent Department of Labor was created, the name of the Department of Commerce and Labor being changed to Department of Commerce.

COMMUNISM (see 6.791).—The term "communism" is used loosely to cover all forms and theories of social ownership of wealth, but has a more specific current meaning to denote the type of revolutionary socialism first expounded in *The Communist Manifesto* of Marx and Engels (1847) and to-day held by the various communist parties that exist in most countries and are united in the Communist International. Communism is thus both an old term and an old theory; but the practice of the Bolshevik revolution in Russia (see BOLSHEVISM) and the subsequent propaganda of the Communist International have given it a significance that is in many ways new.

It is important to distinguish at the outset the various senses in which "communism" is often used, in order to avoid the confusions that beset the term. The English writer, Sidney Webb, has distinguished five senses of communism:—(1) the communism of free use, or "all things in common," as exemplified on a limited scale in public roads and bridges, and as aimed at on a general scale in religious or utopian "communities" of all ages; (2) communism by rationing, or the equal distribution of some particular thing or things among the whole population; (3) communism in treatment, or the supply of some particular service, not equally, but according to need, as in the public provision of medical care or education; (4) communism in the sense of nationalization or municipalization; (5) the communism of *The Communist Manifesto*. To these should possibly be added the anarchistic communism of Kropotkin and his school, to which the name of "anarchism" was formerly given (see 1.914).

It is only the last of the five senses given above (the communism of *The Communist Manifesto*) which will be treated here, since the other senses either do not cover a specific political theory or else are coterminous with Socialism in general. It alone has a continuous history and a present significance.

Historical Development.—The conditions which gave rise to communism began with the industrial revolution. The social transformation produced by that event, the emergence of a new middle class and its rise to power, and the creation of a growing town population of wage-earners in large industry, led to numerous movements of unrest in the early 19th century and to all kinds of social theories and questionings. At this time the term socialism became applied to various types of theories of a benevolent or coöperative economic order. These theories, however, formulated mainly by individual thinkers in England and France, had no direct relation to the movement of the masses. The new feature introduced by communism was its direct correlation of social theory with the struggle of the working class. The necessity for this was making itself felt in various quarters; but its first clear expression was given to the world in what is still the classic statement of communism, *The Communist Manifesto* of Marx and Engels, written in Nov. 1847. The year 1847 thus marks the starting-point of communism as a conscious force.

The Communist Manifesto.—*The Communist Manifesto* opens with the statement that the history of all hitherto existing human society has been the history of successive class struggles, which have on each occasion either resulted in the revolutionary transformation of society or in its collapse. From the slave systems of ancient civilization to the feudal system of mediæval society, and from that in turn to the rule of capitalism or the bourgeoisie, there has been on each occasion a new class rising to power out of the conditions of the old society after a violent and revolutionary struggle with the preceding class. The rise to power of the bourgeoisie is described in rapid outline, its origin from the bosom of feudal society, its breaking of the bonds of feudalism and monarchy, its revolutionizing of the methods of industry, agriculture and communication, its establishment of modern industry with its accelerated and concentrated production, extended franchise, the national state and the international trade, and finally its subjugation of the whole world to its mode of production. "It has achieved greater miracles than the construction of Egyptian pyramids, Roman aqueducts or Gothic cathedrals; it has carried out greater movements than the migration of peoples or the crusades. . . . Although it is scarcely a century since it became the dominating class, the bourgeoisie has created more powerful and more gigantic forces of production than all past generations put together."

Yet to-day the bourgeoisie finds itself threatened in its turn by the new class of the proletariat or wage-earners which its own method of production has created. Like the systems which preceded it, capitalism has created the forces which, in the communist view, will lead to its overthrow: the proletariat, ever growing in numbers and in the insistence of its demands, and an anarchical system of production leading to periodical crises, unemployment, gluts and overproduction in the midst of famine and misery, and (a modern communist would add) in its last phase the fierce struggles of imperialism and the havoc of world war. It is contended that these contradictions of capitalism¹ reveal that the forces of production have outstripped the existing conditions of social organization, and are producing goods faster than society can control the use of them under the existing laws of property. Social production has been established, but individual appropriation of the results still remain. The contradiction receives expression in the class struggle of the workers against the capitalists. The proletariat, being without property and living in a régime of increasing social production, can no longer fight for individual ownership, but only for the socially conducted utilization of the means of production belonging to the community and of the goods produced. Thus capitalism has created in the

¹ To explain the "contradictions" of capitalism would demand an examination of Marxian economic theory for which there is here no room. It must suffice to say that Marx saw in the wage system a system by which monopoly in the means of production is used to compel those outside the monopoly (the proletariat) to sell their labour in return for subsistence and forego all rights to the actual value produced. The resulting surplus provides new capital for yet more production on the same system, but always with the need of finding new markets, since the workers themselves, only receiving in wages a portion of the value produced, can only buy back a portion of the value produced; with the result that, while the early stages of capitalism show rapid expansion and development, opening up the whole world and forcing every nation and race into the circle of its operations, the later stages show increasing crises of overproduction and rivalry in markets, tremendous concentration of financial power, and, in the last phase, the continually intensifying struggles of imperialism culminating in world war and world economic disorganization. In this progress capitalism by its own development has completely destroyed the basis of private property from which it began. Originating in private property and competition, it has eaten up the independent small proprietor and replaced him by tremendous combines, replaced competition by monopoly, reduced the masses of the population to the position of a proletariat which in a régime of private property is without private property, and finally reached a stage of production whose forces it is no longer able to control, any more than it can control the proletarian masses who now begin to rise against its domination. Thus all is ready for its dissolution and for the replacement of its worn-out basis of private property by the new basis of social ownership in accordance with the new mode of production and through the agency of the new class, the proletariat, which has no knowledge of private property. (For a different view of the capitalistic system, see CAPITALISM.)

proletariat a social class which can only have as its object the abolition of the capitalist system of ownership and its replacement by the proletarian system of common ownership.

But there is this new feature in the struggle and future victory of the proletariat, that, whereas all previous class struggles have resulted simply in the rule of a new minority—the rise to power of a new separate stratum of society—the victory of the proletariat carries with it the emancipation of the whole of humanity, because there is no remaining class below them to be freed. The struggle of the working class is thus the struggle of the humanity of the future, and this is the secret of the class basis of all communist thinking.

It is with this struggle that the communists identify themselves, not as any special party, but simply as the champions of the interests of the working class. They believe that just as each succeeding class has won to power only after violent and revolutionary struggle with the preceding class, so the working class can never realize its aims save by the violent overthrow of the capitalist class and its whole system of power. "The communists disdain to reveal their aims and intentions. They declare openly that their ends can only be attained by the forcible overthrow of every obtaining order of society. Let the ruling classes tremble before a communist revolution; the workers have nothing to lose by it but their chains. They have the world to win. Workers of every land, unite!"

The Later Period of Marxism.—In *The Communist Manifesto* may thus be traced all the characteristic conceptions of Marx: the materialist conception of history (not to be confused with either materialism or economic determinism), the doctrine of the class struggle, and the theory of the revolutionary transference of power to the proletariat. At the same time the analysis of the rôle of capitalism, which was to be worked out later with a wealth of detail in the pages of *Capital* (1867), is already briefly indicated, and in a rapid forward glance the prospect is presented of a transition through the revolutionary rule of the proletariat to a classless society. It remained in his later work to give elaboration and precision to these original conceptions in the light of the experience of European history and the working-class struggle for the next generation. These writings have particular reference to two dominant events, the revolution of 1848 which led in Paris to the first distinct attempt of the working class to seize power in "the days of June," with the consequent coalition of all the bourgeois forces into a single "Party of Order," and the Commune of Paris in 1871 when for the first time the working class held power for six weeks. The later developments in Marx's historical and other writings are of especial interest for the new light they throw on the practical questions of the communist attitude to the State and the conception of the dictatorship of the proletariat (a phrase which did not take shape till after the writing of *The Communist Manifesto*, its first appearance in Marx's writings coming in 1850).

The modern State has already been described in *The Communist Manifesto* as the "executive committee for administering the affairs of the capitalist class as a whole." The experience of the 19th-century revolutions appears to have convinced Marx that it was idle to expect any fundamental change so long as the apparatus of the existing State was left unaffected. Alike in writing of 1848 and of 1871 he stresses the necessity for destroying and shattering the existing machinery of the State. The one and only amendment of substance to *The Communist Manifesto* that he makes in his last preface to it before his death, written in 1872, is to declare that "One thing especially was proved by the commune, namely, that the working class cannot simply lay hold of the ready-made State machinery and wield it for its own purposes." But he demands not merely the destruction of the existing State, but its replacement by a new type of State, a Workers' State or the dictatorship of the proletariat as the transitional organ to carry through the change to communist society:—

"Between capitalist society and communist society there lies a period of revolutionary transformation from the former to the latter. A stage of political transition corresponds to this period, and

the State during this period can be no other than the revolutionary dictatorship of the proletariat." (Critique of the Gotha Programme, 1875.)

This new State will be based on the workers' organizations:—

"Against this new official Government," Marx wrote, in describing the tactics for communists during a revolution in its first stages, "they must set up a revolutionary workers' government, either in the form of local committees, communal councils, or workers' clubs or committees, so that the democratic middle class government not only immediately loses its support among the working class, but from the commencement finds itself supervised and threatened by a jurisdiction behind which stands the entire mass of the working class." (Address to the League of Communists, 1850.)

On the other hand the proletarian State is in its nature temporary, because, in proportion as it carries out its task of suppressing class distinctions it destroys its own class basis, and the State as a special organ of class power and coercion gives way to the machinery of a homogeneous communist society. It is only in this second phase of communism that freedom becomes realizable.

The First and Second Internationals.—While the main body of communist doctrine was thus receiving its completed form, the first attempts were being made at giving expression to communism in working-class organization. The First International (1864-73) was not a Marxian body; it was a coming together of various types of working-class organization and theory; but from the first Marx played a leading part in it, he drafted its principal declarations, and his ideas became more and more dominant within its ranks, until the controversy with the anarchist Bakunin led to its break-up. The First International was the battle-ground in which Marxism established its supremacy as the social philosophy of the working class. By the time of its demise in 1873 the seed of Marxian socialism had been sown in the working-class movements of Europe.

When the movement towards international working-class organization was resumed with the formation of the Second International in 1889, Marxian socialism was now assumed as the natural basis. Henceforward the class struggle and the transference of power to the proletariat were the statutory objects of international working-class organization. But meanwhile, beneath this apparently rapid victory of Marxism, a deep change in conditions had taken place. The movements that came together in the Second International were no longer the scattered sections of a handful of pioneers in working-class organization. They were powerful national organizations of the workers, numbering their adherents in millions. Thus the second stage had been reached of winning the masses to organization; but the work of training in the principles of the revolutionary struggle still remained. This was the task begun, but never fully achieved, by the Second International, as the war revealed. The peaceful conditions of the period led to hopes of peaceful progress and a gradual transition to socialism without the disastrous necessities of catastrophic change. It was not until the World War, with the collapse that it brought to the ideals of peaceful progress, that communism appeared once more in its full force and with all the revolutionary implications with which Marx had left it.

The War and Bolshevism.—The World War, then, is the starting-point of modern communism. The war forced to the forefront in an acute form the issues and divisions that had been latent in the socialist movement. It was no longer possible for the great national movements to maintain their dual allegiance, at once to the existing national State which they hoped some day to control, and to the international class war which they had still continued to proclaim in their resolutions. So there came the division of forces, the division of majority and minority which manifested itself in every belligerent country. The bulk of the official parties supported the war, and in consequence found themselves involved in closer and closer alliance with the Governments. Sections in each country, and in some cases (notably Italy and Russia) the majority, were in opposition.

This division, which began as a difference over the issue of war and peace, soon developed into a deeper opposition. It was not possible for one side to support the war without entering into closer and closer relations with the whole administration of the

existing Governments; it was not possible for the other side to oppose the war without implying a denial of the whole conception of the existing national State. As the division developed, its revolutionary implication became more and more manifest; the Zimmerwaldian organization of anti-war socialists, which had been founded as a temporary substitute for the collapsed International at a conference at Zimmerwald in Switzerland in 1915, gradually evolved from an organ of international peace and working-class solidarity into an organ of international revolution and working-class struggle.

It was the Russian revolution that finally brought this new division to a head. The Russian revolution forced into the realm of actual decision the old controversies of class war or class peace, working-class government or democracy. The party which proclaimed its stand on the Marxian principles of class struggle and working-class government was the Russian Social Democratic party (Majority) or Bolsheviki. (From this title of Bolsheviki, meaning "Majority," derived from their holding the majority at the Brussels-London Conference of the Russian Social Democratic party in 1903, has been formed the word "Bolshevism" as a current popular expression for communism and a loose journalistic term for all forms of extremism and violence.) Against the other socialist sections who maintained a coalition with the bourgeoisie, the Bolsheviki carried through the second revolution of Nov. 1917, and established a new form of government based on the Soviets or workers' councils. With this government they proclaimed the inauguration of the dictatorship of the proletariat, and maintained their power against a series of attacks from without and within. From thenceforward they became the natural leaders of the revolutionary working-class movement of the world. As the revolution spread to other countries, the division in the socialist world became more and more complete, and in 1919 the Third or Communist International was founded on the basis of the revolutionary working-class struggle. The old Marxian term communism was thus revived against the social democracy which Marx and Engels had always declared an unsuitable description for a movement which stood for the suppression both of the State and of democracy, and which the communists regarded as having been a cover for the betrayal of the socialist cause. At the Second Congress in 1920 a detailed statement of communist aims, policy and tactics was drawn up; and communism finally came into existence as a fully organized world force.

The Modern Communist Outlook.—The First Manifesto of the new Communist International describes the modern communist outlook. It sees in the ruin of the World War and the peace that succeeded it the fulfilment of the Marxian prediction of the catastrophic destiny of capitalism. Capitalism, it declares, torn by its own contradictions, has plunged into the agony of world war; but war has brought no solution to its problems, just as peace has brought no relief. Hardly has the last war ended before the next war is being prepared; imperialist rivalry continues with more intensity than ever; economic disorganization spreads apace. There is no way out save the complete ending of the system of imperial capitalism that compels these results, and its replacement by the world organization of production on the basis of the workers. "This is the epoch of the decomposition and break-up of the world capitalist system, which will mean the break-up of European culture in general if capitalism with its irreconcilable antagonism is not destroyed." The war has brought the populations of the world face to face with the realities of capitalism: what was before the theory and speculation of a few has become the bitter experience of millions. "The contradictions of the capitalist system were converted by the war into degrading torments of hunger and cold, disease and savagery for all mankind." They have seen the vanity of the hopes of peaceful progress in face of the iron onward sweep to destruction of the existing system. "The catastrophe of imperialist war has with one swoop swept away all the gains of experts and of Parliamentary struggles." Not only the populations of Europe, but the colonial populations of Asia and Africa, have been dragged into the vortex, and are now finding their only chance of libera-

tion in the international communist revolution. In the midst of this world upheaval there is need of a strong revolutionary power that can alone form the coherent force to carry through the necessary change and establish the new system. Reaction solves nothing, and half-measures are fatal. "Only the proletarian dictatorship, which recognizes neither inherited privilege nor rights of property, can shorten the period of the present crisis, and for this purpose will mobilize all materials and forces, introduce the universal duty to labour, establish the régime of industrial discipline, and in this way heal in the course of a few years the open wounds caused by the war and raise humanity to undreamt-of heights." It is the conditions of society that are producing chaos and revolution; it is the object of the communists to end those conditions by giving conscious direction to the instinctive forces of revolt, instead of vainly seeking to stem them. No error, in fact, could be greater than to suppose that the communists are out to "make" a revolution in order to impose their system upon mankind. "The Communist parties, far from conjuring up civil war artificially, rather seek to shorten its duration." In the communist conception the alternative to proletarian dictatorship is not peace. It is war and blockade, famine and disease, blind revolts and the break-up of civilization.

Communism and Democracy.—It is from this point of view that the controversy of communism and democracy should be approached if the communist position is to be understood. The communists do not reject the current conceptions of democracy because they believe in the superiority of the few, but because they believe that the phrases of democracy bear no relation to present realities. The divorce between the realities of power and the theory in modern democratic states has been noted by observers of all schools; it is the special point of the communist to insist that this divorce is not due to accidental and remediable causes, but is inherent in the nature of capitalist democracy. Democracy, in fact, is held to be unrealizable in capitalist society because of the fundamental helplessness of the propertyless man; the parliamentary forms only serve to veil the reality of the "bourgeois dictatorship" by an appearance of popular consent which is rendered unreal by the capitalist control of the social structure; and even this veil is cast aside in moments of any stress by the open assumption of emergency dictatorial powers. The plea that this situation may be remedied by education and propaganda is met by the reply that all the large-scale organs of education and propaganda are under capitalist control.

On the other hand communism, while rejecting current democracy, differs from syndicalism and other revolutionary philosophies which proclaim the right of the "militant minority" to endeavour to change society. The glorification of the minority and of the *coup d'état* really belongs to the Blanquist school, which was always vigorously opposed by Marxism. Marxism taught that the liberation of the workers could only be the act of the workers themselves, and that all the communists could do was to endeavour to guide the struggle of the workers into its realization in the dictatorship of the proletariat. In this way the Bolsheviki did not carry through their revolution of Nov. 1917 until they had gained the majority in the Soviets and the trade unions. Where the communists differ from other believers in the ultimate victory of the working class is that they do not believe that victory will be achieved until after a very much more severe struggle than is ordinarily contemplated. They believe that the ruling class will use every means, political, economic and military, to defend its privileges, and that the final decision will not be reached without open civil war. In support of this they quote evidence to show the readiness of the ruling class in many countries to fling constitutional considerations to the winds when their privileges are in danger. To mistake dislike of this prospect for evidence of its improbability they regard as a fatal policy, and they believe it necessary, therefore, to make preparations for the event, considering the best guarantee against the chaos of prolonged social disorder (otherwise inevitable in the period of capitalist dissolution) to be the existence of a powerful revolutionary party. It is this aspect of communism which has led to the current distinction between communism and other forms

of socialism as a difference of method: but it will be seen that this difference of method arises from a far more fundamental divergence in outlook and philosophy. The methods of the communists are not comprehensible save in relation to the whole philosophy of *The Communist Manifesto*.

Communist Organization.—From the above considerations certain conclusions follow as to the rôle and character of the communist party in any country. The fully organized communist party, it is stated, is to be the "advance guard" of the working class, never regarding itself as separate from the working class, always working in and through existing working-class organizations on the plane of the struggle of the moment, but always coördinating and giving conscious direction to the different aspects of the working-class struggle with a view to the larger ultimate issue. For this purpose it must be based on the strictest internal discipline, and on severe conditions of membership; but this internal strictness of theory and discipline must be accompanied by an external policy of revolutionary opportunism which is in contrast with the usual "purism" of the revolutionary sect. This is the explanation of the alternate charges of "doctrinairism" and "opportunism" which are levelled by other socialists against the communist party. This discipline is ultimately international in character, because the struggle is regarded as international. To the communist the International is more than a coming-together of sympathetic parties in a common struggle: it is the union of different divisions in a single army, each with its own tactical problems, but all with a single ultimate directing centre. For this reason an absolute ultimate authority is vested in the International Executive, subject to the World Congress. This authority of the International is regarded as of particular importance, not only for the immediate struggle, but as the nucleus of future international authority in the World Soviet Republic.

Bibliography.—The classic statements of communism are contained in the writings of Marx and Engels: in particular, *The Communist Manifesto* by Marx and Engels (1848); *The 18th Brumaire* (1852); *Capital* (1867); *The Civil War in France* (1871) and the *Critique of the Gotha Programme* (1875) by Marx; and *The Origin of the Family, Private Property and the State* (1884) by Engels. *The Life and Teaching of Karl Marx* by Max Beer (1918, English translation 1921), gives a valuable short summary of his theories. The controversial literature of Marxism is very extensive, and would need a special bibliography. The most important documents of modern communism are the writings of Lenin, especially *The State and Revolution* (1917) and *Left Communism, an Infantile Disorder* (1920); the writings of Trotsky, including *The Russian Revolution to Brest Litovsk* (1918); Bukharin's *Programme of the World Revolution* (1920), and other writings of the Russian leaders; and the publications of the Communist International, including the *Congress Manifestoes* (1919 and 1920), the *Theses and Statutes of the Communist International* (1920) and the monthly organ *The Communist International*. Presentations by English workers of communist theories may be found in R. W. Postgate, *The Bolshevik Theory* (1920) and E. and C. Paul, *Creative Revolution* (1920). For criticisms of communist theories see Karl Kautsky, *The Dictatorship of the Proletariat* (1919); J. R. Macdonald, *Parliament and Revolution* (1919), and Bertrand Russell, *The Practice and Theory of Bolshevism* (1920). (R. P. D.)

COMPASS (see 6.804). In view of the large extension of the field covered by the term "compass" due to the introduction of the "Gyro Compass" and its adoption for navigational purposes, it is essential to define exactly what is meant by a word which is being very loosely applied to instruments of no practical navigational value.

The compass is an instrument designed to seek a certain definite direction in azimuth and to hold this direction permanently. For use in navigation, a compass must satisfy the following practical requirements:—

Magnetic.—When disturbed should return to within 1° of the above direction within 2 minutes of time.

Gyroscopic.—When disturbed or started should return to within 1° of the above direction within 3 hours.

Magnetic Compass.—The description given in the earlier article may be taken as generally applicable to the magnetic compass of the present day; a very great extension, however, in the use of the "liquid" type for nautical purposes has since taken place, while for aeronautical use the liquid compass is essential. The

British Admiralty compass department now occupies the "Compass Observatory" at Langley, Bucks., and deals with compasses of all types both for the Admiralty and Air Ministry. A comprehensive museum is now attached to the observatory.

Gyro Compass.—The gyro compass is an instrument in which use is made of the rotation of the earth and the properties of a rapidly spinning body to indicate some fixed direction relatively to the earth. Up to the present the only successful models have been definitely North-seeking, and all such compasses consist essentially of:—

1. A wheel mounted so as to be capable of spinning rapidly without vibration about its axis and also free to point that axis in any direction.

2. A gravity control of some description which restricts the tilting freedom of the axis of the wheel.

Modern gyro compasses differ somewhat in the mechanical devices by which the degrees of freedom of the axis are obtained and in the methods adopted to provide the gravity control; but they are all the practical outcome of experiments made in 1852 by Foucault to demonstrate the rotation of the earth by means of a gyroscope. Edward Sang, of Edinburgh, had described in 1836 how this could be done, but he did not actually carry out the experiment. Much later, in 1884, Lord Kelvin exhibited a model gyro compass before the British Association. Early in the present century the development of submarines called for a non-magnetic type of compass, and fortunately the advance in electrical and mechanical science made it possible for Dr. Anschütz to utilize this pioneer work and evolve the first practical gyro compass. In this instrument a single gyro was used and both the tilting and the azimuthal freedoms were obtained by attaching to the gyro case a float supported in a bath of mercury. A full account of this compass and the elementary mathematical theory of it is to be found in Crabtree's *Spinning Tops and Gyroscopic Motion*. The chief objection to this compass was its failure to function correctly if the ship was rolling, especially when on a quadrantal course. This intercardinal rolling error was, for some time, a stumbling-block to further progress, but in modern gyro compasses it is almost non-existent.

Anschütz in 1912 brought out a very different instrument which was adopted by the German navy. In this model three gyros are used in place of the single one of the earlier model, the two extra gyros having been introduced to overcome the rolling error.

About the same time, the Sperry Co. of New York put on the market their gyro compass. The first model was found, on trial, to be subject to rolling error and this necessitated an alteration in design, a small gyro-pendulum, called the *floating ballistic*, being introduced. This compass, in its modified form, was very largely used by the British and Allied navies during the war.

More recent types are the Brown, Carrie and Twin Sperry. The first is an entirely British-made compass and has many novel features; in particular, the device used to obtain the azimuthal freedom and the gravity control. It is small and light, the whole as fitted in the binnacle weighing about 15 pounds.

Certain very important modifications of the Sperry compass were developed by the Admiralty compass department as a result of war experience, especially the mercury control attachment invented by Commander G. B. Harrison, O.B.E., and Mr. A. L. Rawlings; this simplifies the construction of the compass, reduces its cost and makes it more efficient, particularly in bad weather (fig. 4).

The most important constants of the Anschütz, Brown and Sperry wheels are as follows:—

	Mass in lb.	Radius of Gyration in inches.	Rate of Spin in r. p. m.
Anschütz	6	1.85	20,000
Brown	4½	1.57	15,000
Sperry	50	4.62	8,600

Precession.—So far as gyro-compass work is concerned the phenomenon of precession may be described in the following manner. If a torque is applied to a free gyro in any plane passing through the gyro-axis then the axis will precess in a plane perpendicular to the plane of the torque and also to the plane of the

spin; and the sense of the precession is such that it causes the plane of the spin to move towards the plane of the torque as if to secure agreement of sense after one quarter-turn.

The Sperry Compass.—The Sperry type being the most universally known is used in the following discussion as a convenient example to illustrate the principles of gyro compasses. It consists essentially of a gyro mounted so as to be free to spin, free to tilt about a horizontal axis and free to turn in azimuth round a vertical axis. The tilting freedom is modified by the addition of a gravity control in the form of a *bail weight*, fastened to the case by a roller connexion at one point only.

For the present it will be assumed that this roller connexion is in the vertical plane through the gyro-axis, so that whenever the gyro-axis is tilted the gravity control only produces a torque on the gyro in the vertical plane. On account of the earth's rotation the N.

end of the gyro-axis will, whenever it is $\begin{cases} \text{East} \\ \text{West} \end{cases}$ of the meridian be tilting $\begin{cases} \text{upwards} \\ \text{downwards} \end{cases}$; and as a result of the gravity control, whenever

the N. end of the axis is tilted $\begin{cases} \text{above} \\ \text{below} \end{cases}$ the horizontal plane it must

be precessing $\begin{cases} \text{East} \\ \text{West} \end{cases}$. This precession, however, is relative to space and not relative to the earth.

It follows that such a gyro compass will have, at the equator, a resting-position in which the gyro-axis is horizontal and in the meridian. At a place in N. lat. the gyro-axis, in its resting-position, will be in the meridian with the N. end tilted up slightly, so that the gravity control may provide a torque in the vertical plane sufficient to cause the gyro-axis to precess in azimuth at a rate equal to that at which the meridian is turning round the vertical.

With the Sperry constants the tilt required is about 8' of arc in lat. 53°. for this tilt produces a torque of $\frac{8}{60} \times \frac{\pi}{180} \times \frac{320}{2}$ ft.-pound-

als and so a rate precession equal to $\frac{8 \times 160 \times 3600}{60 \times 7 \times 900}$ degrees per hour or about 12° per hour. (Mass of bail = 10 lb.; depth of O. G. below tilt axis = 6 in.)

Further, if the gyro-axis is disturbed from its resting-position it will oscillate about that position but will not settle again unless there is sufficient friction to damp out the oscillations. Such friction must always be reduced to a minimum as it involves a degree of uncertainty in the resting-position.

In order to damp out any oscillations of the gyro-axis the roller connexion between the bail weight and the case is placed slightly to the E. of the vertical plane through the gyro-axis. This roller connexion will, in what follows, be referred to as the "eccentric pivot." With this arrangement whenever the N. end of the gyro-axis is tilted above the horizontal plane there are two torques acting on the gyro, both proportional to the tilt:

- (a) one in a vertical plane as before,
- (b) the other in a horizontal plane.

The second torque is the damping torque and always acts in the sense opposing the precession in azimuth due to the first torque. Its effect on the gyro is always to reduce the tilt whether above or below the horizontal plane. By reducing the tilt it lessens the torque producing the azimuth precession and so diminishes the amplitude of the azimuth movement and consequently damps out the oscillations.

The angle between the two planes through the gyro-axis which pass through the slope diameter and the eccentric pivot respectively is called the *eccentricity of the pivot*, and is usually about 1°. By increasing this eccentricity the damping can be made heavier, the value 7° being enough to give to the Sperry compass a dead-beat movement in all latitudes.

The damping torque causes the compass to settle, in N. latitudes, with the N. end of the gyro-axis tilted up and E. of the meridian. This damping error, or latitude error as it is sometimes called, varies as the eccentricity of the pivot and the tangent of the latitude. In the resting-position the damping torque maintains the slight precession of the gyro-axis in the vertical plane necessary to keep the tilt constant although the axis is not in the meridian.

The resting-position in any latitude can be adjusted to be horizontal and in the meridian by putting out the horizontal balance of the case. Imagine a weight put on the N. side of the case sufficient to produce the torque in a vertical plane required to keep the gyro-axis precessing at the same rate as the meridian is turning round the vertical. Then in the resting-position there would be no tilt and so no pressure at the eccentric pivot, no damping torque and no damping error. That is, the gyro would settle with its axis horizontal and in the meridian. This gives a clue to the effect of a change in the horizontal balance on the resting-position—making this balance N. heavy reduces the upward tilt of the N. end and causes it to settle to the W. of its normal resting-position.

In a similar way can be seen the effect of a twist in the suspension. This merely introduces an extra torque in a horizontal plane and so either increases or decreases the damping torque and therefore the

damping error. Hence the only effect on the resting-position is to introduce a change in azimuth in the sense of the twist.

The preceding remarks refer to a compass in a binnacle fixed relative to the earth. When the binnacle is mounted in a ship further complications arise. That part of the earth's rotation which is essential to the working of a gyro compass is the tilting movement of the horizontal plane about a N.-S. line. This tilting movement in combination with the gravity control causes the gyro compass to be N.-seeking. If the ship, in which the compass is mounted, is steaming due N., the curvature of the earth's surface causes a tilting movement, sense S.-Z.-N., of the horizontal plane about an E.-W. axis; the gyro compass detects this tilting movement and on account of this alone would point its N. end west. The final result is that the gyro-axis points in the direction of the axis of the resultant angular movement. Since the angular velocity of the horizontal plane due to the ship's speed is only a small fraction of that due to the earth's rotation, this direction will be only slightly W. of N. Hence for northerly speeds the compass has a resting-position which is W. of its normal one. This error is called *speed error* and its value in radians is given approximately by the expression

$$\frac{\text{Northerly speed of ship}}{\text{Easterly speed of the latitude circle}}$$

For British latitudes it is roughly 1° per 10 knots. The error for southerly courses is E. and for east or west courses it is zero. Thus it is clear that every alteration of course will involve a change in the resting-position of the compass. Take the case of a ship which, when steaming N. at 20 knots, alters course to S. The gyro compass, supposed settled when the ship was on the northerly course, would be pointing some 2° W. of its normal resting-position; at the end of the turn the new resting-position will be 2° E. of the normal one and so 4° E. of that for the northerly course. But during the turn there has been a southerly acceleration, and consequently a tendency for the bail weight, acting as a pendulum in the N.-S. plane, to lag behind to the north. Hence it exerts a pressure (due to the acceleration) on the case at the eccentric pivot, and so produces two torques on the gyro:

- (1) in a vertical plane sense N.-Z.-S;
- (2) in a horizontal plane sense W.-S.-E.

The former of these causes the N. end to precess E., that is toward the new resting-position for the southerly speed. The angular displacement of the gyro-axis thus obtained is called the *ballistic deflexion*. If the constants of the compass are so arranged that this deflexion is equal to the difference of the two speed errors, then during the turn the gyro-axis will have moved in azimuth exactly to its new resting-position. But the ballistic deflexion is independent of the latitude, whilst the change of speed error varies with the latitude. Hence this adjustment can only be made correctly in one particular latitude called the *standard latitude*. To obtain this effect the constants of the compass must be adjusted so that its undamped period is 85 minutes in the standard latitude. This is the reason why all gyro compasses of this type have periods approximating to 1½ hours.

The torque in the horizontal plane produces no such beneficial results. It causes an upward precession of the N. end during the turn and so increases the tilt. Since the resting-position for the S. speed requires the same tilt of the N. end as that for the N. speed, the gyro-axis will begin to wander, after the turn is completed towards the west. This wander, called the *ballistic tilt effect*, is always opposed in sense to the ballistic deflexion. It also occurs in the Anschütz and Brown compasses because the acceleration causes a transference of the oil in the damping mechanism. In order to reduce this ballistic tilt effect the eccentricity of the pivot is kept small in the Sperry compass.

The mercury-box attachment to the Sperry compass provides a means of making the ballistic deflexion approximately correct in all latitudes, and is noteworthy as being the only practical device which so far has overcome this difficulty. The gravity control consists of two cast-iron boxes containing mercury and joined together by a long U tube which enters each box at the bottom. This is essentially a top-heavy form of gravity control and the magnitude of the torque exerted by it depends on the area of the free surfaces of mercury in the boxes. Each box is divided by vertical partitions into three compartments whose areas are as 1:2:3. A valve at the bottom of the box, actuated by turning a knob at one bottom corner, enables the area of the free surface—and so the magnitude of the bail weight—to be varied in the ratios 3:4:5:6. By means of this device the bail weight can be so adjusted that the ballistic deflexion is equal to the change of speed error within ½° in any navigable latitude.

Further complications arise due to the rolling and pitching of the vessel. A swinging ring oscillates stably in its own plane but unstably in a perpendicular plane. This is because the moments of inertia of the ring, about a diameter and about a line through the centre at right angles to the plane of the ring, are not equal. This inequality existed in the original Sperry compass but was removed by the attachment of the compensator weights and frame to the vertical ring. In addition, with the ship on an intercardinal course, say N.E., and rolling, the compass in the binnacle is subject to an alternating acceleration in the N.W.-S.E. vertical plane. The E.-W. component of this causes the compass as a whole to swing in the gimbals in the plane of the case, and so the eccentric pivot swings E. and W.

obtained from the Sperry Gyroscope Co., Ltd., 15, Victoria Street, S. W. 1., by whose permission their copyright diagrams of the Sperry compass are produced in this article. Messrs. S. G. Brown, Ltd., of Victoria Road, North Acton, have also published a small pamphlet on their compass. Several types of gyro compasses can be seen in operation at the Admiralty Compass Observatory, Langley, on application to the Director. (F.C.-O.)

COMPAYRE, JULES GABRIEL (1843-1913), French educationalist (see 6.809), died March 23 1913.

COMPTON, EDWARD (1854-1918), English actor, was born in London Jan. 14 1854. He was the son of the actor Henry Compton (Charles Mackenzie) and was educated at Kensington. He married Miss Virginia Bateman, an actress and a member of a well-known theatrical family. He first appeared at Bristol in 1873 and in London in 1877. In 1881 he organized the Compton Comedy company, which for over 30 years played Shakespearean and old English comedies throughout the country and formed a valuable school of training for young actors and actresses. He died in London July 16 1918. Among his children were Mr. Compton Mackenzie (b. 1883), the well-known novelist, and Miss Fay Compton, the actress.

CONNAUGHT, ARTHUR WILLIAM PATRICK ALBERT, DUKE OF (1850-), 3rd son of Queen Victoria (see 6.950), went in 1910 to S. Af. to open the Union Parliament on behalf of King George V. He was appointed in 1911 to succeed Earl Grey as governor-general of Canada, retiring from this office in 1916. In Dec. 1920 he went to India as the representative of King George in order to inaugurate the provincial legislative councils of Madras, Bengal, and Bombay, arriving at Madras Jan. 10 1921. In various speeches he sounded a note of conciliation with Indian progressive feelings, and it was agreed on his return to England that valuable help had been given by his utterances to the work of self-government in India under the new régime.

The Duchess of Connaught died in London March 14 1917. The Duke's only son, Prince Arthur of Connaught (b. 1883), married in 1913 Princess Alexandra, Duchess of Fife, daughter of the Princess Royal, who had succeeded in 1912 to her father's dukedom by special remainder. Prince Arthur was in 1920 appointed governor-general of the Union of S. Africa. The Duke of Connaught's elder daughter, Princess Margaret (1882), was married in 1905 to the Crown Prince of Sweden, and died at Stockholm May 1 1920. The younger daughter, Princess Patricia (b. 1886), married in 1919 the Hon. Alexander Robert Maule Ramsay, third son of the 13th Earl of Dalhousie. Princess Patricia of Connaught resigned her royal title on her marriage, and elected to be known as Lady Patricia Ramsay.

CONNECTICUT (see 6.951) had in 1920 a pop. of 1,380,631, as compared with 1,114,756 in 1910. The increase for the decade was 23.0%, as compared with 14.9% for the whole United States, and was the highest percentage of increase for Connecticut of any decade up to that time. In 1900 the pop. per sq. m. was 181.9; in 1910, 231.3; in 1920, 286.4.

The populations and percentages of increase of the important cities during the years 1910-20 are as follows:—

	1920.	1910.	Increase Percent.
Bridgeport	143,538	102,054	40.6
Bristol	20,620	9,572	116.4
Hartford	138,036	98,915	39.6
Meriden	29,842	27,265	9.5
New Britain	59,316	43,916	35.1
New Haven	162,519	133,605	21.6
New London	25,688	19,693	30.7
Norwalk	27,700	6,954	299.0
Norwich	22,304	20,367	9.5
Stamford	35,086	25,138	39.6
Torrington	20,623	15,483	33.2
Waterbury	91,410	73,141	25.0

Agriculture.—In 1900 40.1% of the population was classed as rural by the census; in 1910 34.4% and 1920 32.2%. The farming population was actually somewhat smaller than even these figures would signify. In 1900 the farms of the state numbered 26,948, in 1910 26,815 and in 1920 22,655, a loss of 4,160 in the latter decade. During the decade 1900-10, the state lost 126,295 ac. held in farms, or 5.5% of the total area of the state. Moreover, 76,273 ac. of improved land, 7.2% of the total, were allowed to go back to forest.

In spite of this decline, the total value of farm property increased by 40.7% during the decade. In 1910 the average value of land per ac. was \$33.03; in 1920 it was \$53.28. The most important crops of the state are hay, corn and tobacco. The rapid growth of the cities has stimulated dairying, market gardening and egg raising. During the World War a Farm Bureau was introduced into each of the counties of Connecticut. It is one of the most important factors in the state, making for better farming and the solution of the local agricultural problems.

Manufactures.—Connecticut is one of the preëminent manufacturing states. From 1909 to 1914 the increase in the total of its manufactured products was 11.3%. In 1914 this value was \$545,471,517. Connecticut, although the 46th state in size, was in 1914 12th in the value of its manufactured goods. The *per capita* value was \$454 as compared with \$245 for the United States. In 1914 the state contained 4,104 manufacturing establishments employing an average number of 226,264 wage-earners, and was the 8th among the states in number of wage-earners. The five most important branches of manufacturing were the following:—

Products Manufactured.	No. Establish- ments.	Value of Products.
Brass, Bronze and copper goods	67	\$69,353,103
Foundry and machine-shop products	388	67,009,127
Cotton goods	50	30,808,918
Silk goods	44	30,591,825
Firearms and ammunition	13	25,657,797

The outbreak of the World War speedily brought profound changes to Connecticut manufacturing. Inevitably, large war orders of the belligerent nations were placed in Connecticut. Not only did munitions plants grow, but many other factories benefited by making accessory parts such as springs for shells, bases for machine-guns, etc. A rough measure of the effect of the new stimulus is to be found in the building projects of the state. During the years 1913 and 1914, 254 manufacturers constructed 386 buildings at a cost of \$6,288,230. In 1915 and 1916, 294 manufacturers built 627 buildings at a cost of \$18,277,825, nearly three times the amount of the preceding two years. The expansion continued during 1917 and 1918, when 386 manufacturers engaged in 738 building operations at a cost of \$13,837,802, but in the summer of 1920 it came practically to an end as a result of the post-war depression setting in at that time. In May 1918 Gov. Holcomb stated that 80% of Connecticut manufacturing was "directly or indirectly engaged in producing munitions, rifles, machine-guns, clothing and other articles used by the army; and we have at least five plants within our borders where ships and power-boats are being constructed." With the signing of the Armistice and the cancelling of war orders, Connecticut factories began to reorganize. The readjustment to a peace footing was made easier by the great demand for manufactured goods that characterized the year 1919, and had been practically completed throughout the state when the depression of 1920-1 brought a considerable slowing up of productive effort. The growth of manufacturing, coupled with the increase in the cost of living that followed the outbreak of the World War, brought labour troubles to Connecticut. Before the war the wage-earners of the state were not well organized, labour organizations totalling in 1912 59,895 members. The bulk of these organizations were among the skilled trades and the transportation workers. Factory employees were in general not unionized. In 1911 and 1912 the state suffered only 48 strikes and in the next two years 45. In 1915 and 1916, the years of the great expansion, there were 422 strikes, involving approximately 68,000 employees. In the next two years there were 183 strikes involving 33,391 employees. From that time until 1921 strikes diminished in number until the depression of 1920-1, when because of wide-spread unemployment they practically ceased. The rapid changes in the manufacturing situation from 1918 to 1921 and the constant shifting of the wage-earning population made it difficult to collect statistics of value regarding the labour organizations. In 1918, however, there were 327 labour organizations in the state, mostly among the skilled trades and transportation workers. The most important result of the war-time labour disturbances was a general increase in wages. The attempt to increase the number, size and power of unions met with but indifferent success.

Government.—In 1911-2, the 34th and 35th, and in 1915-6 the 36th, amendments to the Connecticut constitution were adopted. The first stated the conditions under which the lieutenant-governor was to take the place of the governor; the second provided that the General Assembly should adjourn not later than the first Wednesday after the first Monday of June; the third allowed the passage by the General Assembly of a law to cover payment of mileage to the legislators. In 1914 a workmen's compensation law was passed, which applies to all industries in which five or more persons are employed. Compensation for total disability is one-half the employee's weekly wages, compensation to be not less than \$5.00 nor more than \$14.00 per week, and in no case to run for more than 520 weeks; compensation for partial temporary disability not more than half the weekly wages, compensation not to run more than 112 weeks; permanent partial disability, at same rates; in case of death, graded benefits. The law is enforced by Compensation Commissioners.

appeals from whose findings may be made to the superior court of the county. In the physical examinations for the draft during the World War, 20.79% of those examined were disqualified for physical disability, Connecticut being the seventh highest state in this percentage. On investigation it was found that many of the disabling disorders were due to preventable conditions in childhood. The result was the appointment of a commission to report a programme for child welfare. The commission reported in 1921. It was found at the same time that 37.21% of all Connecticut registrants under the draft law were aliens. Only one state had a higher percentage. The result of this situation was a vigorous movement for the Americanization of aliens.

Education.—Beginning July 15, 1909, the organization of public education changed from the district type to that of town management. There were in 1921 less than ten townships in the state that had not availed themselves of the law. Under township management all schools of the township are under the direction of the town school committee. Appropriations for the support of the schools are made at a town meeting. The plan has resulted in better and more uniform advantages for school children. Compulsion was made more rigid by the enactment providing that after Sept. 1, 1911, no employment certificate of any description could be accepted by any employer except such as were issued by the State Board of Education. On July 1, 1917, a law went into effect providing that all new public-school teachers pay annually 5% of their salary into a pension fund. At the end of 35 years (changed to 30 in 1919), the last 15 of which must be within the state, or on reaching the age of 60, the teacher might retire and receive the annuity which his or her contributions and accrued interest would warrant. To this the state would add as a pension a sum equal to the annuity. Special provisions were made to apply to public-school teachers already in service at the time of passage. In 1911 a charter was granted for a woman's college at New London, and in 1914 it was opened as the Connecticut Woman's College, with Dr. F. H. Sykes as president.

In 1920 the corporation of Yale University announced the establishment of a Department of Education in the graduate school, designed among other things to train "superintendents, supervisors, principals, directors of special activities, research specialists, normal and college instructors in education and class-room teachings." For further information regarding YALE UNIVERSITY, see that heading.

History.—In 1913 it became known to the public that the financial condition of the New York, New Haven, and Hartford railway was unsound. The dependence of the people of the state on the road was made clear by a statement of the road's president, Mr. Howard Elliott, that in 1913 the road controlled 942 of the 1,000 m. of steam railroad in the state, and in addition was interested in separately operated trolley lines aggregating 605 m. out of a total of 911 miles. This dependence was augmented by the fact that (to quote Gov. Holcomb) "the securities of this corporation are quite largely owned and held by women and children, in trust funds, and by our insurance companies who purchased them as a safe, conservative investment." The change in the financial affairs of the railway brought its stock rapidly from far above par to much below. The suffering caused was general and very considerable. Public opinion forced a change of management.

When the United States was finally compelled to sever diplomatic relations with the Imperial German Government (Feb. 3, 1917), Gov. Holcomb requested the Legislature (Feb. 6, 1917) to provide for a census of men of military age, the object being to determine not only the number of such men but their occupations, previous military training, nationality and whether or not they were citizens. It was the pioneer military census within the United States and served as a model for those of other states. The Home Guard of Connecticut, formed March 9, 1917, rose to 10,000 men. During the summer of 1917 the 26th Division was organized from the New England National Guard. Of the units in that organization the following came from Connecticut: the 1st and 2nd Conn. Infantry became part of the 102nd Infantry; two batteries of Conn. Field Artillery became part of the 103rd Field Artillery; the Conn. Cavalry became part of the 101st Machine-Gun Battalion; and the 1st Conn. Field Hospital and 1st New Haven Field Hospital became part of the 101st Sanitary Train. The division established its headquarters in France at Neufchâteau, Oct. 31, 1917. It participated, among other actions, in the Aisne-Marne, the St. Mihiel and the Meuse-Argonne offensives. During the formation of the 26th Division, preparations were being made for the National Army. The 1st Provisional Training Regiment was organized at Plattsburg,

N. Y., May 15, 1917. To this regiment Connecticut sent her officer candidates to train for commissions. On Aug. 25, 1917 the 76th Division was organized at Camp Devens, Ayer, Mass., its officers below the rank of lieutenant-colonel being drawn almost entirely from the 1st Provisional Training Regiment. The bulk of the drafted men from Connecticut went originally to this division. In July 1918 the division established headquarters in St. Amand-Mont-Rond, France, and became the 3rd Depot Division. The number of Connecticut men drafted under the Selective Service Act was 34,574; this figure does not include the numerous volunteers in the armies of the United States or of the Allies. The number who died were 1,305. The amount subscribed by Connecticut in the five War Loans was \$437,476,103, an amount \$137,557,803 above the state's quota.

Connecticut failed to ratify either the 18th (Prohibition) Amendment or the 19th (Woman Suffrage) Amendment to the Constitution of the United States. The governors of Connecticut in the years following 1909 were: Frank B. Weeks, 1909-11; Simon E. Baldwin, 1911-5; Marcus H. Holcomb, 1915-21; Everett J. Lake, 1921-.

Bibliography.—For recent works on Connecticut see H. W. Waldradt, *The Financial History of Connecticut from 1789 to 1861*, Connecticut Academy of Arts and Sciences, March 1912; P. W. Bidwell, *Rural Economy in New England at the Beginning of the Nineteenth Century*, *ibid.* April 1916; C. M. Douglas, *The Government of the State of Connecticut*, revised and rewritten by Lewis S. Mills, agent of the Conn. State Board of Education (1917); R. J. Purcell, *Connecticut in Transition* (1918); C. M. Andrews, *The Fathers of New England and Colonial Folkways in The Chronicles of America* (1919); M. Newcomer, *Separation of State and Local Revenues in the United States* (a comparative study of eight states, including Connecticut) (1917); H. Elliott, *Connecticut and the New Haven Road* (1913). (R. H. G.)

CONRAD, JOSEPH (1856-), English novelist (see 6.968). Later work includes a study of the revolutionary temperament, *Under Western Eyes* (1911); an autobiographical set of *Reminiscences* (1912); three volumes of short stories, *Twixt Land and Sea* (1912), *Within the Tides* (1915) and *The Shadow Line* (1917); as well as 4 novels, *Chance* (1914), *Victory* (1915), *The Arrow of Gold* (1919) and *The Rescue* (1920). A dramatized version of *Victory* was played at the Globe theatre, London, in 1920.

CONRAD VON HÖTZENDORF, COUNT (1852-), Austrian field-marshal, was born at Vienna, and after graduating at the military academy of Wiener Neustadt entered the army as lieutenant in a Jäger regiment. He was appointed to the general staff, and distinguished himself during the fighting in Bosnia and Herzegovina in 1878 and 1881. He continued to be employed mainly on the general staff, especially as lecturer on tactics in the Kriegsschule (the highest military academy), and he gained the reputation of an authoritative writer on military subjects. Among the many people in whom he inspired confidence was the heir to the throne, the Archduke Francis Ferdinand, by whose influence he was appointed in 1906 to succeed Count Beck as chief of the general staff. He displayed extraordinary activity, concerning himself not only with the work of his own office, but with matters of internal, and still more of foreign, policy. This brought him into increasingly sharp discord with the Foreign Minister, Count Aehrenthal. Conrad was filled more particularly with the deepest distrust of Italy, and, convinced as he was that it would be impossible to avoid a struggle for the very existence of the Habsburg Monarchy, he wished to precipitate this struggle while the chances were not unfavourable. The latent opposition between the two men led to Conrad's temporary retirement in 1911. At the end of 1912 he was recalled to his post and in 1914 agreed to the military measures against Serbia which led to the World War. For more than two years of the war he was the real leader of the Austro-Hungarian armies. Though he was not always successful in the unequal struggle, the essential credit of the great success at Gorlice (1915) must be ascribed to him. To him also are due a series of successful operations, although a decisive victory was denied him. In 1917 he assumed the command of the forces operating in Tirol, and took part in every engagement until the battle of the Piave in the summer of 1918. After this he retired from

active service, was raised to the rank of count, created a field-marshal, decorated with numerous orders, and appointed commander of the Imperial Guard. Conrad was one of the most predominant personalities of the fallen monarchy, whose fate he was unable to avert. In his active military operations his most distinguished colleague was Gen. Metzger (b. 1870), who, after Conrad's retirement, took over a high command, distinguishing himself on the Italian front and finally in France in coöperation with the German armies. (A.—K.)

CONS, EMMA (1838–1912), English philanthropist, was born in London March 4 1838. As a young woman she studied art, but, owing to an acquaintance with Miss Octavia Hill, became interested in social work, and in particular in questions of housing. She became best known, however, for her work in connexion with Morley College and the Royal Victoria Hall, Waterloo Road, generally known as the "Old Vic." At one time a well-known theatre, it had degenerated into a disreputable haunt where nothing but the lowest melodramas were played. Miss Cons, whose social work in Lambeth had made her well acquainted with the difficulties of providing decent amusement at a cheap rate for the people of the neighbourhood, obtained an interest in the building about 1880. It was enlarged and improved, the sale of drink was forbidden, and miscellaneous programmes of music, drama, and lectures were embarked upon. In 1882 the wealthy manufacturer and philanthropist Samuel Morley began to take an interest in the affairs of the Hall, and in 1884 he joined the executive committee. He contributed a large amount of money to the scheme, and his unflinching sympathy and practical business advice were of the greatest value. His death in 1886 was a great blow to the work, but his name has been perpetuated in the foundation of the Morley College for working men and women, which developed from the lectures given at the "Old Vic." Its first vice-principal was Miss Caroline Martineau, a friend and co-worker of Miss Cons, and the institution now has over a thousand members. Miss Cons's work bore fruit after some years in the excellence of the entertainment provided and the high repute which the "Old Vic" attained. In 1889 concert performances of grand opera were started, and in 1896 a chorus was formed, thus making it possible adequately to present the operas. In 1905 symphony concerts were embarked on, and continued for several seasons. Miss Cons was elected to the first London County Council (1888), and was chosen an alderman, but retired owing to difficulties raised as to the right of women to sit. She died at Hever, Kent, July 24 1912.

Her sister, **ELLEN CONS** (1840–1920), was also closely associated with many philanthropic schemes, and was one of the governors of the "Old Vic." She died in London June 25 1920.

CONSERVATION POLICY.—The name "Conservation" has been given in the United States to the movement for using and safeguarding the natural resources of the country (or indeed any country) for the greatest good of the greatest number of the inhabitants for the longest time. It is a fundamental misconception to suppose that Conservation means nothing but the husbanding of resources. The first principle of Conservation is use, but it refuses to recognize needless waste and destruction as normal processes in the proper development and enjoyment of natural wealth. This conception of Conservation as a principle to be followed by the American Government was first brought into prominence by the Chief Forester of the United States during the Roosevelt administration, and was first applied to forest protection.

As with all nations that are both rich and young, a general indifference to the protection and preservation of its natural resources had marked the history of the United States. The rapid and reckless destruction of the forests was the first cause of a change in the attitude of the American people toward natural wealth. Effective action toward the protection and preservation of natural resources was not taken until long after the early warnings, which were heard nearly a century before the Conservation movement was born. In 1810, more than three score years before forestry had secured a foothold in America, a French naturalist, André François Michaux, in his work *The*

North America Sylva, spoke thus of the destruction of forests in America:—

"... neither the Federal Government nor the several states have reserved forests. An alarming destruction of the trees proper for building has been the consequence—an evil which is increasing and which will continue to increase with the increase of population. The effect is already very sensibly felt in the large cities, where the complaint is every year becoming more serious, not only of excessive dearth of fuel, but of the scarcity of timber. Even now inferior wood is frequently substituted for the White Oak; and the Live Oak, so highly esteemed in ship-building, will soon become extinct upon the islands of Georgia."

Conservation, as an American problem, received its first recognition in the work of the Inland Waterways Commission. On Oct. 3 1907 this commission suggested to President Roosevelt, who had created it, the calling of a conference of governors to consider the condition of the natural resources of the United States. The conference assembled May 13 1908 in the White House at Washington. Among those in attendance were the President, the Vice-President, 7 of the 9 members of the Cabinet, the 9 justices of the Supreme Court, the governors of practically all the states and territories (including Alaska, Hawaii, and Porto Rico), numerous members of the Senate and the House of Representatives, representatives of 68 national societies, more than 50 citizens selected for their special attainments, and the members of the Inland Waterways Commission. This was the first time the governors of the states met in conference, and the gathering was unique in American history. The conference, after deliberating for some days, adopted a declaration containing the following passage:—

"We agree that further action is advisable to ascertain the present condition of our natural resources, and to promote the conservation of the same: and to that end we recommend the appointment by each State of a commission on the natural resources to co-operate with each other and with similar commissions of the Federal Government."

In accordance with this recommendation, the governors of 42 states promptly appointed state conservation commissions, and less than a month after the conference had closed President Roosevelt appointed a National Conservation Commission, divided into four sections dealing respectively with waters, forests, lands and minerals. The commission was directed by the President to investigate and report to him regarding the condition of the natural resources, and to recommend to him measures for conserving them. As the commission had no funds at its disposal, the President directed the heads of departments at Washington to place their officers and facilities at the service of the commission. Thereupon the commission undertook, for the first time in the history of any nation, to prepare an inventory of the natural resources of the country.

The report of the commission was presented to the President in Jan. 1909, and was by him transmitted to Congress with a special message concurring in its statements and conclusions, and recommending it to the consideration of Congress and of the people generally. After making its report the commission continued its efforts in coöperation with governmental and extra-governmental agencies for the conservation of natural resources, in order both to extend its inventory and to determine what specific laws were needed for the wise and orderly development of the country's natural wealth. Unfortunately, this constructive work was stopped by the abolition of the commission through a law enacted by Congress later in the same year. Meantime President Roosevelt had invited the governor-general of Canada, the governor of Newfoundland and the President of Mexico to appoint commissioners to discuss, with commissioners representing the United States, the principles of conservation in their application to the continent of N. America. As a result of this movement, the first N. American Conservation Congress was held in Washington in 1909. President Roosevelt in Feb. 1909, after consulting the Queen of the Netherlands, invited the powers of the world to meet at The Hague for the purpose of considering the conservation of natural resources everywhere. Although a majority of the nations accepted this invitation, the project, after President Roosevelt's retirement from the presidency,

was allowed to die. During the administration of President Taft the struggle for conservation centred in the so-called Ballinger-Pinchot controversy, the cause of which was an effort on the part of Richard Achilles Ballinger, then Secretary of the Interior, to transfer to private ownership certain valuable coal lands in Alaska, and to throw open to private acquisition highly valuable water-power sites upon the public lands which had been set aside by President Roosevelt. The controversy resulted in the resignation of Mr. Ballinger, and had much to do with the defeat of President Taft in the election of 1912. The coal lands and water-power sites which formed the subject matter of the dispute remained in the public hands.

In the effort to secure the use of the natural resources so as to promote the greatest good to the greatest number for the longest time, President Roosevelt, in support of legislation by Congress to that end, withdrew from private entry 148,000,000 ac. of forest land, 80,000,000 ac. of coal land, 4,700,000 ac. of phosphate land, and 1,500,000 ac. containing water-power sites on the public lands. Thus during the Roosevelt administration more than 234,000,000 ac. of land were preserved, most of which will probably be permanent property of the nation.

Because of the abolition of the National Conservation Commission, the movement threatened to be seriously hampered by the lack of a central body in which could be conjoined for united and effective action the many persons and agencies devoted to the movement. Accordingly, the National Conservation Association, whose purpose was to inform and give effect to public sentiment, was established in 1909. In its successful efforts to prevent the passage of bad laws and to secure the enactment of good laws, this association became an effective factor in the passage by Congress of measures that carry out the Roosevelt policies of Conservation. The more important of these measures are: the Weeks law, to purchase lands for national forests in the White Mountains and the Appalachian Mountains where there was no public land; the Coal and Oil Leasing bills (for the continental United States, including Alaska) which are securing conservation by wise use, without waste and without monopoly, of valuable resources still in the public hands; and the Federal Water-Power Act, to provide for the development by private enterprise, under Federal ownership and control, of water-power in the public domain and navigable streams. Here again public property worth thousands of millions of dollars has been saved for the benefit of all the people of the United States. The association has been especially influential in defeating legislation that sought to destroy the national forests and to permit the diversion to private ownership of natural resources.

The Conservation movement is probably, among the many constructive policies inaugurated by President Roosevelt, that which will be most influential for good, and for which he will be longest remembered. (G. P.)

CONSTANS, JEAN ANTOINE ERNEST (1883-1913), French statesman (see 6.986), resigned from the embassy at Constantinople in May 1909. His success as a diplomat was less marked than as a minister. Presenting himself for the Senate (for Aveyron) in 1912 he was defeated. He died April 7 1913.

CONSTANTINE, King of the Hellenes (1868-), eldest son of George I. of Greece, was born Aug. 2 1868, and succeeded to the throne March 18 1913, on the assassination of his father. As the first prince of a Greek reigning dynasty born in modern times on Greek soil, and reared in the Greek Orthodox faith, he became from his birth to the Greek people the embodiment of their national aspirations, and was given the name of the last Emperor of Constantinople, in the superstitious hope that he would fulfil the old prophecy that the Empire of Byzantium would be restored to the Greek nation, when a king named Constantine and a queen named Sophia should reign on the Greek throne. This strange legend strengthened Constantine's popularity amongst the Greeks, and when in 1889 he married Sophia Dorothea of Hohenzollern, daughter of the Emperor Frederick of Germany, the coincidence of the name enhanced immensely the superstitious belief of the Greeks. He received his early education under private tutors at Athens. At the age

of 18 he was sent to Berlin for a military education, and served in one of the Imperial Guard regiments, attending also a few desultory courses at the university of Leipzig. It was during his stay in Berlin that he made the acquaintance of his future wife, and (very much against his father's wishes) formed the attachment that was destined to exert such an important influence on his career.

After returning to Greece he was given various military commands. In 1897 he was sent to Larissa to take command of the Greek army in Thessaly, just before the outbreak of the disastrous war with Turkey. At the close of the war the Crown Prince was probably the best-hated man in Greece. The popular voice attributed the disasters to him and to his father. He still retained, however, his nominal post of commander-in-chief.

It was only in Aug. 1909, when the garrison of Athens suddenly revolted and demanded sweeping reforms, including the reorganization of the army and navy and the removal of the princes from all military commands, that Constantine and his brothers, George, Nicholas and Andrew, hastened to resign their commissions and to go abroad to escape the open hostility of public opinion. From this practical exile the Crown Prince first, and his brothers Nicholas and Andrew afterwards, were recalled and reinstated in their commands by Venizelos, when the latter became the all-powerful head of the Greek Government. His bill for the reappointment of Crown Prince Constantine as commander-in-chief of the army was bitterly opposed in the Greek Chamber by Theotokis, Gounaris, Rallis and other politicians, who a few years later were to become King Constantine's chief supporters. The army officers, too, with few exceptions, were much opposed to the bill. By a curious irony, it was only Venizelos' determined attitude that saved it from rejection. The Greek successes in the Balkan wars subsequently enhanced the Crown Prince's credit, and it was in an atmosphere of renewed popularity (Venizelos himself helping to exploit it) that he succeeded unexpectedly to the throne on his father's assassination.

King Constantine at once showed his monarchical spirit. He took to copying the modes of speech and action of his brother-in-law, the German Emperor. He began to speak, in his official utterances, of "My army" and "My navy"; to attend in person the swearing-in of the annual recruits and to impress upon them the extreme sanctity of their oath of allegiance to him. Officers were made to feel that their only hope of advancement lay in their devotion to the War-lord. And when his youngest daughter was born in 1913, he proclaimed "his" army and navy godfathers to the little princess. Such incidents attracted little serious attention at the time. But the subsequent course of events showed that the King was intent on converting the democratic, ultra-constitutional monarchy, which that of Greece had been, into one of a more absolute type on the Prussian model. Constantine and his defenders have indeed vehemently denied the existence of any secret understanding between himself and the Kaiser, either before or after the outbreak of the World War. Apart, however, from the indirect evidence furnished by the private telegrams exchanged between the royal couple of Greece and the Kaiser in 1916-7, which came to light after Constantine's dethronement, the existence of a definite understanding between William II. and Constantine to secure Greek neutrality in an impending European war has been expressly attested by Gen. Ludendorff himself in his war memoirs. During the first six months of the war Constantine gave no sign, even when Venizelos, before the first battle of the Marne, offered the alliance and aid of Greece to the Entente Powers. But when in Jan. 1915 the Entente promised Greece extensive territory in Asia Minor if she would join in the Dardanelles operations, and Venizelos proposed to coöperate, Constantine refused to give his sanction. Venizelos at once resigned, and at the ensuing parliamentary election a large Venizelist majority was returned (June 1915). The King was seriously ill at the time, and the Queen and the Government flatly refused to allow the appointment of a regent. Thus it was a full three months after the election before Venizelos

returned to power; during that interval every effort was vainly made by Court and Cabinet to seduce the Venizelist deputies into joining the "King's party," as it was now openly termed. When Venizelos finally was reinstated in office Bulgaria was preparing to fall upon Serbia in the flank, and Venizelos hastened to inform Bulgaria that any attack by her upon Serbia would cause the intervention of the Greek army. But Constantine, sending for the Bulgarian minister behind Venizelos' back, authorized him to inform his Government confidentially that Bulgaria need not fear any intervention on Greece's part. He gave the same assurance through the channel of the German Government. Thus Bulgaria proceeded unhesitatingly to order a general mobilization (Sept. 1915). To this step Venizelos at once replied by ordering a general mobilization of the Greek army. The King offered no objection to signing the decree, but when the next day Venizelos announced in the Greek Chamber that Greece would declare war against Bulgaria if she attacked Serbia, Constantine immediately sent for him and asked for his resignation, informing him that he would never consent to attack one of Germany's allies. To Venizelos' remonstrance that after the recent popular verdict the Crown was bound to follow the responsible Government's policy, Constantine replied that in questions of foreign policy he did not hold himself bound to follow the popular will, as he considered himself "personally responsible to God alone." Thus, after Venizelos' fresh resignation and the formation of a Zaimis Cabinet, the Greco-Serbian treaty was repudiated and Serbia was abandoned to her fate. As the Venizelist parliamentary majority refused to support the new Government a fresh dissolution was decreed, and in the new election (Dec. 1915), owing to the Venizelist party abstaining as a protest against the repeated unconstitutional proceedings of the Crown, a new Chamber was elected, composed entirely of Constantine's supporters. At Venizelos' invitation just before his resignation an Anglo-French force of over 100,000 men had been landed at Salonika, too late indeed to save Serbia but strong enough to entrench itself at Salonika.

Constantine and his party did not yet dare to commit themselves to a policy of open hostility to the Entente, although the Greek army, mobilized by Venizelos to defend Serbia, remained under arms in Macedonia until July 1916 to "defend Greek neutrality." But the Allied army in Macedonia was subjected to every sort of petty annoyance and even to espionage on the part of the Greek authorities; thus a Greek lieutenant, who was accused of tapping the Allied military telephone wires, was ostentatiously decorated by the King within the week. On May 26 1916, by direct order of Gen. Dousmanes, the King's chief-of-staff, over the head of the responsible Minister of War, Fort Rupel, which commanded the Struma Pass into east Macedonia, was surrendered to the Bulgarians by pre-arrangement between Constantine and the German general staff.

After Venizelos had seceded from Athens and established his "Provisional Government of National Defence" at Salonika, Constantine's movements became more and more openly hostile to the Entente. Regular communications with the Central Empires were kept up through north Epirus and Albania, and the German-Austrian submarines were suspected of receiving valuable assistance from royalist agents in Greece. Finally, Constantine's troops having become a standing menace to the Allied army in Macedonia, the Allies demanded the surrender of a quantity of arms and ammunition on the part of the Athens Government. The Lambrinos Ministry protested against this demand, but the King privately promised the French admiral, Dartige du Fournet, to surrender these arms if Athens were occupied by an Allied force to "save his face." When, however, on the following day (Dec. 1 1916) a body of 1,800 Allied blue-jackets landed at the Piræus and marched up to Athens, they were allowed to walk into positions carefully ambushed, and there were set upon by the royalist troops and thousands of reservists specially enrolled and armed for the purpose overnight. The Allied force drew off at nightfall with heavy losses. They would have been annihilated but for the presence at

Phaleron of a powerful Allied fleet, which late in the day hurled a few shells into the royal palace and caused Constantine to order a cessation of hostilities.

This act of treachery on Constantine's part was followed the next day by wild scenes of hunting down as rebels and enemies of the King the unarmed Venizelist citizens of Athens. But the Powers took no immediate steps either to protect their friends or to avenge the insult to their own flags. After a whole month of deliberation, on Dec. 31, they declared a blockade of Greece and demanded the removal of the entire Greek army to the Peloponnese. But no measures were taken against Constantine himself, since apparently there were still quarters within the Entente unwilling to believe the worst. It was only on the downfall of the Tsar (March 1917) that Great Britain and France finally arrived at a decision. On June 11 1917 a powerful Anglo-French fleet arrived at the Piræus, carrying a land force of 30,000 men; and M. Jonnart, in the name of the Allies, demanded the immediate abdication of Constantine and his eldest son and their departure from Greece. Constantine saw that resistance was hopeless and bowed to the inevitable. Constantine (or "Tino," as he was commonly called) withdrew to Switzerland; there, with the aid of the German propaganda, he organized intrigues in Greece among the disaffected. He went so far in 1918 as to send his chief aide-de-camp to Germany to select two officers of the Greek army corps of Kavalla, then interned at Görlitz, to proceed to Greece on board a German submarine, to spy upon the Allied army in Macedonia and to organize an armed uprising in their rear. And he openly proclaimed *urbi et orbi* that he had never renounced his rights to the Greek throne and was still the only legitimate sovereign, his son Alexander (who had been proclaimed the new king) being merely his temporary *locum tenens*. Thus it came about that upon Alexander's untimely death and Venizelos' defeat at the polls in Nov. 1920, Constantine returned in triumph to Athens, in defiance of the Allies' non-recognition of him. He was not recognized in 1921 by any of the Allied Powers. On June 11 1921 (still without any formal recognition from the Allies) he left for Smyrna to take command of the Greek army in Asia Minor in the renewal of war (England and France standing aloof) against Turkey.

CONVOY (see 7.67°).—The system of convoy adopted by the British and American navies in 1917, by which merchant vessels sailed in organized groups under naval escort, played an important part in the World War. In the following account it should be noted that the term is used in the British Admiralty sense to signify not only the system but also the merchant ships under escort; in the U.S. navy the warships are the escort, the merchant ships the "train," and the whole is the convoy.

At the beginning of the war the British system of commerce protection was based on cruiser squadrons stationed at the focal points of trade and in important areas to deal with enemy cruisers and raiders. Though it proved sufficient to accomplish the destruction of the "Kaiser Wilhelm der Grosse" and the "Cap Trafalgar," the principal cruiser raiders, escaped its clutches; for the "Emden" was sunk by the "Sydney" escorting a convoy at the time, the "Karlsruhe" was blown up by an internal explosion and the "Dresden" was sunk by a squadron detached for that purpose. From the first the system had been dislocated in every sea by demands for convoy, but by March 1915 the cruisers had been run to earth, and though raiders such as the "Moewe" and the "Wolf" reappeared, it was only occasionally and one at a time. The system of convoy was used in the case of the first large contingents of Australian and Canadian troops. The "Sydney" with the "Melbourne" and the Japanese cruiser "Ibuki," was escorting the Australian convoy across the Indian Ocean when she was detached to run the "Emden" down at Cocos I. on Nov. 9. The first Canadian contingent of 31,200 men which sailed from Quebec on Oct. 3 1914 in 31 transports was escorted by the cruisers "Charybdis," "Diana," "Eclipse" and "Talbot," reinforced, as they approached British shores, by the battle cruiser "Princess Royal" and the old battleship "Majestic." The system was

* These figures indicate the volume and page number of the previous article.

resumed in the Atlantic in 1916 when the "Moewe" was out, and in the course of that year some 15 convoys of two to three transports each sailed from Halifax. But these were special escorts intended to protect their convoys from surface craft. The adoption of a general convoy system was still outside the pale of contemporary naval thought. A considerable proportion of the troop service across Channel was escorted; but this was a local service arranged by the admirals at Dover (for Folkestone to Boulogne) or Portsmouth (for Southampton to Havre). There was a tendency to regard the loss of merchant ships with little concern during that period, and a number of large ships were even fitted out at great expense to act as dummy battleships to be torpedoed by the enemy instead of the vessels they tried to counterfeit. The idea of using destroyers to escort the ordinary trade would have received short shrift at the Admiralty and in the Grand Fleet, nor was it necessary at the time.

In March and April 1917, when the British losses in merchant shipping assumed alarming proportions, the idea of a convoy system came again to the front. Previous ocean convoys had been directed against the surface raider; it was the submarine that now formed the principal menace. The system was in use in the case of what was called the French coal trade, a cross-Channel traffic from Portsmouth and Falmouth performed by small ships, where it had worked very successfully, and it was now suggested to extend it to the ocean routes. The system of protection in vogue at the time may be called the patrolled route system. There were three main approach routes to the British Isles, one N. of Ireland for ships making the Clyde or Liverpool by the North Channel (Route C); one S. of Ireland for ships making the British Channel and Liverpool by St. George's Channel (Route B); one towards the Scillies for ships making the English Channel (Route A). These were called the Tory I., Fastnet (S.W. point of Ireland) and Scillies approaches, from the lights sighted by the ships as they made the coast. These approaches may be regarded as three great triangles gradually narrowing to three apexes at or near the points mentioned. They were patrolled with trawlers and a sprinkling of destroyers, and when any area was threatened by submarine activity the routes in it were changed.

In March 1917, the system was slightly modified. Half a dozen different routes were specified in each approach triangle, and it was proposed to switch the traffic from one route to the other every five days. As the routes in each triangle could lie some 150 m. apart in long. 15° W., there was considerable scope for dispersion, and the system was in effect a system of protection by means of dispersion and routing. The patrols were a mere pretence, for the routes were on an average some 240 m. long, and to patrol them in strength with two destroyers and 16 trawlers was impracticable. The scheme was in its essence an endeavour to circumvent the submarine by routing and it failed. Its advocates could not possibly maintain that it was as efficient as an escort system, for all important ships were actually escorted, and it must be regarded merely as an attempt to burke the significance of the fact that was beginning to assert itself, that every ship had to be escorted.

The idea of general convoy met with strong opposition from every side—at the Admiralty, in the Grand Fleet and amongst the masters and owners of ships. The Admiralty saw that it would involve the creation of a new organization; the Grand Fleet saw its destroyers being taken away; very few recognized the fact that the battlefleets were now becoming merely complementary factors in a *guerre de course*. The policy of the fleet being ready at any moment to rush out and join battle still held sway. It was a policy resting chiefly on the basis of intelligence supplied by wireless directionals, which made it possible to know when the German fleet was at sea. It meant that the fleet had to be ready at any moment to put to sea in battle array, and in these circumstances the commander-in-chief clung tenaciously to every one of his destroyers. These may be called the strategic objections to convoy, but other strong arguments could be urged against it. Ships would incur delay in assembling, instead of sailing direct; fast ships would incur further delay by having

to reduce their speed to that of the convoy. Convoy meant congestion of ports on departure and arrival, and congestion of labour due to the simultaneous arrival of a number of ships. These objections were as old as the days of Duguay Trouin and Jean Bart, but there were other objections of a more modern type. The masters would never be able to keep station, and were at first much in favour of independent sailings.

On the other hand strong arguments could be marshalled in favour of convoy. Why string out 15 armed trawlers 10 m. apart to supply feeble protection on a line 150 m. long, when four destroyers attached to a convoy could give it continual and efficient protection over double the distance? It might appear at first that a convoy gave the submarine a massed target, but the danger of approaching it was greater, and submarine commanders preferred to attack unescorted ships. The real obstacle in the way of a convoy system was the difficulty of finding the destroyers required for the escort. More than half the modern destroyers were absorbed by the Grand Fleet and the Harwich flotillas. In Feb. 1917 10 were detached from the Grand Fleet to Devonport to assist in escorting important ships, and the use of armed trawlers was extended, but the latter were too slow and too ill-armed to be of much value.

The weekly returns issued by the trade division at this time conveyed a misleading idea of the situation. They gave the number of arrivals and departure of all nationalities, with the number of British ships of over 1,600 tons lost. The first set of figures had little to do with the real issue, for a small Dutch coaster making three voyages a week to France would figure six times in the arrivals and departures, which ran into several thousands, whereas the number of big ships arriving and leaving daily was very much less. The situation was much worse than it appeared, and the idea of general convoy gained ground.

In April 1917 the British had 3,534 ships over 1,600 tons, of which 1,125 were required for naval and military purposes, leaving only 2,409 available for civil purposes. There were not more than 15 patrols in each area of approach, and in March and April 1917 the number of ships passing through them was about 300, of which 24 were sunk, at which rate, giving each ship a round voyage of two months, practically one-half would have been sunk by the end of the year. Again those who argued in favour of the patrolled route system were arguing in direct opposition to their own policy, for escorts were always provided for all valuable munition ships and ships of national importance carrying Government cargo (some three or four a day in 1917). The patrolled route system was thereby acknowledged to be an inferior sort of makeshift for ships that were not of national importance. But in April 1917 it began to be seen that every ship was of national importance, and that a loss of 373 ships a month meant that the navy would lose the war before the army could win it. The great advantage of the patrolled route system was that it gave much less trouble and required very few ships, but the same virtues were inherent in no system at all.

One other argument was marshalled against the system, namely, that it would be better to use destroyers directly against submarines. The reply was that no likelier spot could be chosen for seeking them than in the vicinity of a convoy, and from the date convoys commenced to run in May 1917 to the end of the war some 15% of submarines sunk were actually sunk in the vicinity of or when attacking convoys. The losses of April brought the question to an acute stage. The centralization of the control of shipping in the Ministry of Shipping facilitated the inauguration of a general system of convoy. On April 26 the director of the anti-submarine division urged its introduction, and on May 17 1917 a convoy committee was appointed to arrange the details of a specific scheme. The volume of trade in the Atlantic daily at that time amounted to about 400 vessels, of which 300 were British and 87 neutral. As the area of convoy only extended to about long. 20° W., only some 30 vessels had to be convoyed daily, and it was decided to start with a convoy from the United States and Canada every three days, from Gibraltar every four and from Dakar every five days. The initiation of the system fell largely to Comm. Reginald G.

Henderson, R.N., and its organization and business management to Paymaster-Capt. H. W. Manisty. The first homeward-bound Atlantic convoy started on May 24, and by June 1917 convoys were being regularly run.

The system may be considered under two heads: (1) the organization at the ports of assembly and at the Admiralty, (2) the system of command at sea and the tactical measures of the convoy and escort. At the ports of assembly, escorts had to be provided to conduct ships from the ports of loading and to the ports of discharge. The convoy had to be assembled, the masters mustered and given their instructions, and the convoy handed over to the commodore. This work was done by port convoy officers, who were appointed at home to Lamlash, Devonport, Falmouth and Milford Haven and abroad to Sydney (N.S.), New York, Halifax, Gibraltar and Dakar. At all ports of any size, there were shipping intelligence officers who were now merged in the system and issued route instructions to the masters. At the British Admiralty the two principal tasks were assembly and routing. The general management of the system lay with the organizing manager of convoys (Paymaster-Capt. H. W. Manisty), who worked in close coördination with the shipping controller. In the task of routing he was assisted by naval officers and by a large convoy chart which showed continuously the latest movements of submarines and convoys. This chart was of the greatest value, for it made it possible to alter at once the course of a convoy if a submarine was reported in its vicinity, a system much more elastic and more exact than altering the routes blindly every five days. The three principal ports of assembly were Lamlash or Buncrana (Lough Swilly) in the N., Queenstown, Milford Haven and Falmouth in the S. Escorts were provided by the admirals commanding these areas, and orders for convoy were passed to them. An escort generally consisted of six to eight destroyers for a convoy of about 25 ships. A large portion of the work at Queenstown was gradually taken over by the U.S. navy, who worked in the closest harmony with Vice-Adml. Sir Lewis Bailey, the local commander-in-chief. The whole question hinged on the provision of destroyers. In Feb. 1917 there were only 14 destroyers at Devonport and 12 sloops at Queenstown available for convoy, and it was estimated that 81 destroyers or sloops would be required to provide escort for homeward-bound convoys, and 44 additional destroyers or sloops for outward-bound convoys. It was here that the aftermath of Jutland was severely felt. For the Grand Fleet still had to be prepared to meet the German fleet again, and insisted on a minimum margin of destroyers to enable it to do so.

The destroyer position in 1917 is shown in the table (A=modern new destroyers and flotilla leaders; B=old destroyers).

small staff of signalmen. He took general charge of the convoy until it met the escort, when the commodore then took his instructions from the senior officer of the escorts. A considerable equipment had to be provided for each convoy, including fog buoys, masthead angle tables, station-keeping instruments, and signalling lanterns. A convoy usually consisted of 25 to 32 ships. They were organized in five or six columns with ships 500 yd. and columns 800 yd. apart. The proportion at a later date was eight destroyers to a convoy of 22 ships and six to a convoy of less than 16.

The convoy came across by itself and was met by the escort on approaching the submarine zone, some 300 m. out at sea, and brought in by it. In daylight or in suspected areas or on a submarine report the whole convoy zigzagged, an operation which consisted in an alteration of one or two points (11° to 22°) on each side of the navigator's course (course of advance) for some 10 minutes. These alterations of course were intended to make it more difficult for the enemy to estimate the exact course of the ship, a necessary factor in adjusting the sights for firing a torpedo. Another protective element was the system of camouflaging ships, which rendered it more difficult to distinguish the fore and aft line of a vessel, a necessary preliminary in estimating its course (see CAMOUFLAGE: *Naval*).

The first convoys in May 1917 were all homeward-bound to Great Britain, but by Aug. outward-bound convoys were running too. The main designation of convoys was into H. and O. (homeward and outward), with subsidiary letters indicating the port of departure and a series number for each convoy.

The principal convoys were as follows:—

Homeward (H.)		Outward (O.)
H.H.	Hampton Roads	O.B. Buncrana

By the end of Oct. 1917, 99 homeward convoys had come in comprising 1,507 steamers with a loss of 10 vessels sunk in convoy and 14 after dispersion, giving a total loss of 24 or 1.57 per cent. By the end of Nov., 77 outward convoys had gone out, with a loss of 0.57 per cent.

The time lost by fast ships remained a distinct disadvantage of the convoy system. In a voyage of 3,200 m. the time lost in waiting at ports of assembly (24 hours) and through slow travelling (133 hours) amounted to 157 hours or six and a half

Summary:—

Grand Fleet and Harwich	Jan.	June	Nov.
Dover, Nore, Portsmouth	172	142	151
Convoys	70	81	71
	29	113	139

It was not sufficiently appreciated that the adoption by the Germans of the strategy of the *guerre de course* would mean their abandonment of fleet operations on a large scale, and that the protection of Allied merchant shipping was now just as important as the defeat of the enemy's fleet. The command of the convoy at sea was vested in a "commodore of convoys," usually a captain or commander R.N. or R.N.R., who hoisted his broad pennant in the largest ship of the convoy and was attended by a

days, for a steamer of 5,000 tons. This was eventually diminished by the institution of fast and slow convoys, but on the other hand there were certain advantages which tended to compensate for the delay. Ships did not have to call anywhere for orders, and they were not affected by suspension of traffic, which often held up independent sailings.

The introduction of the convoy system had the effect of forcing the German submarines to attack nearer the shore. In

the early months of the year the crosses indicating ships sunk had been scattered all over the seas W. and S.W. of Ireland. They were now confined to coastal areas, which greatly facilitated the work of rescue and salvage. From Sept. to Dec. 1917, only six ships were lost over 50 m. from land, which meant a great reduction in casualties, with corresponding increase of confidence in convoyed ships. The homeward-bound convoys were also given what were called ocean escorts of armoured cruisers or armed merchantmen, who accompanied them the whole way. By Sept. 1917, Atlantic convoys were in regular operation with about 150 vessels coming in and the same number going out weekly. The destroyers which took the outward-bound convoy out, met the homeward-bound convoy and brought it in, though this procedure often led to delays and difficulties in bad weather, darkness and fog. The bulk of the Atlantic work in European waters was done by British craft, Great Britain providing 70% of the destroyers for convoy and the United States 27 per cent.

On the E. coast of Great Britain, matters followed a rather different course. A conference had been held at Longhope (Scapa Flow, Orkneys) on April 4 1917, under the vice-adml. of the Orkneys and Shetland (Sir Frederick Brock), and it had been decided to convoy Scandinavian ships, on whom Great Britain was dependent for much of its imported wood pulp. They came up from Hull to Lerwick, where an escort of two destroyers and four to six trawlers took them across. This route was much more exposed to attack by surface craft than the Atlantic route, for it was only some 350 m. from Horns Reef, a distance which could easily be covered by a fast cruiser in 15 hours of darkness. Such attacks were the natural counterstroke to a convoy system, and it was one of the principal functions of the fleet to screen convoys from them. The first attack of this sort took place on Oct. 17 1917, when the "Brummer" and "Bremse," two fast German cruisers, originally designed as minelayers for the Russian navy, attacked a Scandinavian convoy of 12 ships, and sank the two destroyer escorts, the "Mary Rose" and "Strongbow," and all but three of the convoy. A considerable force of light cruisers (comprising some 16 vessels) was in the vicinity, but as it was not close to the convoy, and the wireless installation of the escorts was destroyed by the first salvo, the enemy got away.

This was a severe blow to the E. coast convoy system and as a remedy it was proposed to provide a stronger covering force from the Grand Fleet. This entailed the reduction of convoys to three a week, the use of the Tyne instead of Humber as an assembly port, and the provision of nine modern destroyers. The commander-in-chief of the Grand Fleet demurred at the provision of destroyers, and at a conference on Dec. 10 1917 it was decided to use Methil, a small port on the Fifeshire coast of the Firth of Forth, as an assembly port. The decision had hardly been reached when two days later, on Dec. 12, the convoys were again attacked. The German attack was made on this occasion by two half torpedo flotillas (five boats each). The third half flotilla went N., and meeting heavy weather made Udaire on the Norwegian coast at 7 A.M. on the 13th. Steaming

down the coast, the flotilla sighted at 12:30 P.M. a convoy of six steamers from Lerwick to Norway, escorted by the destroyers "Pellaw" and "Partridge" and four armed trawlers. The "Partridge" received a shot in her main steam pipe, and after hitting a German destroyer, V100, with a torpedo which did not explode, was sunk. The "Pellaw" escaped. The convoy was sunk, and the half flotilla returned home round the Skaw. Two armoured cruisers, the "Shannon" and "Minotaur," were acting as a covering force, but were again too far off, and though they hurried to the spot on receipt of a wireless message arrived too late. Here can be seen a distinct divergence of opinion and method between the conduct of the Atlantic and Scandinavian convoys. An escort against surface craft should be at least within sight of a convoy, and a covering force against an attack in force is of little use if it is not within reinforcing distance. At the root of the insufficient protection accorded to the Scandinavian convoys was the policy prevailing both at Whitehall and at sea that the Grand Fleet must be ready at any moment to sail for the Bight and bring the enemy to action. This naturally led to convoy work being regarded as an entirely subsidiary task. In April 1918, the German admiral Scheer made a bold sortie in force against the convoy. The whole fleet put to sea on April 23 for the Norwegian coast. In front was Adml. von Hipper with the battle cruisers of the first scouting division, and Scheer followed with the battlefleet. The time was ill-chosen. One convoy of 34 ships was just entering the Forth and another of 47 ships leaving it, while the British 2nd Battle Cruiser Squadron and 7th Light Cruiser Squadron were at sea covering them. This was not the only misfortune for the Germans. The "Moltke" at 8 A.M., about 40 m. S.W. of Stavanger, met with a serious accident and had to be towed home, being torpedoed by E42 on her way back. This was the last sortie of the German fleet, and it is interesting to note that it was directed against the convoy system. It led on the British side to the convoy route being shifted to the northward, so as to remove it farther from the source of attack and increase the chance of striking a counter-blow.

The possibility of an attack by surface raiders in the Atlantic had not been lost sight of. The commander-in-chief of the Grand Fleet was kept informed of the approximate position of convoys so as to be in a position to appreciate the situation at once if a raider got out. In Dec. 1917 the two armoured cruisers H.M.S. "Leviathan" and "King Alfred" were attached to convoys, and in 1918 a U.S. pre-dreadnought battleship was added. The possibility of an attack by battle cruisers was met by a U.S. dreadnought force being stationed at Bere Haven in Sept. 1918 to be available to meet convoys coming in, and in Oct. 1918 it actually put to sea for this purpose. Convoy was gradually extended to other routes, and by the end of the war the grand total of ships convoyed reached 88,000, with a loss of 436 ships or approximately 0.5 per cent.

The Mediterranean had always been a difficult area, and the institution of convoys in that sea followed a somewhat different course. Operations in that sea were greatly influenced by the fact that the Mediterranean outside the Adriatic was under French naval control, and the French commander-in-chief, Vice-Adml. Gauchet, would have assumed command in the event of the Austrian fleet breaking out. However, with the consent of the French and Italian naval authorities, a British commander-in-chief, Vice-Adml. Sir Somerset Gough-Calthorpe, was appointed in Aug. 1917 with the special charge of arrangements for the protection of trade and anti-submarine operations. The divided control, and the different patrol areas under different nationalities, did not make for efficiency, but the general arrangements were settled by a conference of Allied officers at Malta (*Commission de Malte*), with delegates from France, Italy and Japan. In the Mediterranean, as at home, the question hinged on destroyers. The Italians preferred to retain their destroyer forces in the Adriatic and on their own coastal routes, just as the British commander-in-chief wanted to retain them with the Grand Fleet. Of the British destroyers available (about 36), some eight were required to watch the Dardanelles

and the Aegean, and operations on the Syrian coast engaged the services of a few more. The Japanese co-operated heartily; their 14 destroyers did yeoman service, and during 1918 the system was entirely dependent on them for the escort of troop transports. The general allocation of British escorting craft in that area in Oct. 1917 was as follows:—

	Destroyers	Sloops	Armed Trawlers	Yachts	Gunboat
Aegean	8	6	6	—	—
Malta	6	11	35	1	1
Egypt	—	11	28	1	—
Gibraltar	2	5	—	3	—

It will be seen that sloops played an important part in the convoy system in the Mediterranean, and as they could not make the voyage from Gibraltar to Port Said without refuelling, it was necessary to provide complete reliefs for the escorts of O.E. and H.E. convoys as they passed Malta. This involved a severe strain on the convoy system, though it was eased later by the addition of some patrol gunboats.

The control of the escorts was at first under a British admiral of patrols, with patrol commanders acting for him at the various ports, who arranged for the formation of convoys and issued route instructions and sailing orders. The principal convoys were the Bizerta-Alexandria (British), Bizerta to Malta (British), Marseilles to Bizerta (French), Marseilles to Algiers (French), Milo (Aegean) to Alexandria (Br. and Fr.), with fast through convoys between the United Kingdom and Port Said under British escort. The system of patrols was retained by the French for a time on the Algerian coast, and the losses there were heavy. The defects which had existed at British home ports exhibited themselves abroad. The staff work was defective; intelligence was not freely and quickly distributed, and action was not taken on it. This led on March 20 1918 to a convoy running right into an area N. of Alexandria where warning had been given of the presence of a submarine waiting for it, with the result that four ships of the convoy were lost.

The Mediterranean remained one of the worst areas for losses. For instance, in Nov. 1917 out of 41 British ships lost, 14 had gone down in the Channel and 11 in the Mediterranean. The losses in the Channel had been stopped by the Dover barrage and Rear-Adml. Roger Keyes; and the First Lord (Sir Eric Geddes) and the Director of Naval Intelligence now proceeded in person to the Mediterranean to consult with the commander-in-chief there and make arrangements for a complete reorganization of his staff. The admiral of patrols was abolished, and a director of shipping movements instituted. Wireless directional stations were established at suitable points, and the losses were reduced to a reasonable figure. In Nov. 1917, 381 sailed in convoy in the Mediterranean, with a loss of nine or 2.35 per cent. In Sept. 1918, 979 ships sailed in convoy with a loss of eight or 0.82 per cent.

Troop movements were one of the most important branches of the convoy system, and it is interesting in this connexion to note the total numbers moved by sea during the war, which amounted to 22,114,000 from Aug. 9 1914 to Sept. 28 1918, made up as follows:—

Troops moved by sea, Aug. 1914 to Oct. 1918.

Cross Channel to France	15,576,107
From U.K. to Medit., India, Persian Gulf, Russia	938,562
From North America	1,334,173
From Australia	391,043
In Mediterranean, less 560,000 included above	1,363,976
Between India and Egypt	1,500,204
Various	1,010,694
	22,114,759

In the English Channel most of the work in 1917 was being done by small fast packet-boats, of which there were 16 on the Southampton-Havre route and eight on the Folkestone to Boulogne. During 1915 the average daily number of transports from Southampton was three to four, and the daily average requiring escorts was five to six in 1918. Of loaded troop and

ambulance transports only two were sunk, the "Donegal" on April 17 1917, from Southampton to Havre, with 600 troops and 38 casualties, and the ambulance transport "Warilda" on Aug. 3 1918, from Havre to Southampton, with 125 casualties. The Folkestone to Boulogne route was controlled by the vice-admiral at Dover. Here the principal danger was mines. Vessels crossed only in daylight, and from two hours after to three hours before high-water. The average daily number of transports in the latter part of 1917 and 1918 was some half-dozen in each direction. In the last five months of the war the average daily troop traffic in the Channel was 11,254, viz. 5,500 at Southampton, 3,700 at Folkestone and 2,500 at Dover. The number of troops moved by fast steam-packet vessels in the Channel was enormous, and cannot have been much less than 12 millions, with casualties of less than 1,000. At Dover in the latter part of 1917 three to four destroyers and three to four P. boats were usually employed in cross-Channel escort work.

On the Atlantic route fast troop convoys came into use in April 1918, and during 1918 (up to Nov.) 1,037,000 men came over in them. Three large transports, the "Olympic" (23 knots), "Mauretania" (25 knots), and "Aquitania" (24 knots), also worked singly and independently, with escorts of three or four destroyers to bring them in and take them out. The "Olympic" was attacked on several occasions, but never successfully, and in May 1918 it rammed and sank a submarine (U103). Only three transports were lost on the Atlantic route, the "Tuscania" with 2,400 U.S. troops, torpedoed and sunk seven m. N. of Rathlin Is. on May 2 1918 with a loss of 211 troops, the armed merchant steamer "Moldavia," escorting H.C.1 and carrying troops, torpedoed and sunk in the English Channel on May 23 1918 with a loss of 64 troops, and the "Otranto," escort to H.X.50, wrecked on the coast of Islay after collision on Oct. 6 1918, with a loss of 368 troops. The total loss of troops was 537. The losses in the Mediterranean were much heavier, and three-fourths of the troopships sunk went down there though only 10% of troop movements took place in that sea. Submarines worked there under specially favourable circumstances, while the narrow waters gave little opportunity of altering the routes to any great extent. In 1915 some 330,000 troops were conveyed in 242 transports, all of which arrived safely except three—the "Royal Edward," torpedoed and sunk on 13/8/15 in the Aegean with a loss of 865 troops, the "Ramazan" in the Aegean on 19/9/15 with a loss of 11 troops, the "Marquette" approaching Salonika on 23/10/15 with a loss of 128 troops. In 1916, 220,000 troops were conveyed in 143 transports, all of which arrived safely.

During 1917 and 1918 the troop movements were principally to Salonika, Egypt and Syria, and 14 transports were lost as follows:—

Losses.

1917: "Ivernian," Marseilles to Egypt, 1/1/17, off C. Matapan	120
"Georgian," Alex. to Salonika, 8/3/17, off C. Sidoro	53
"Cameronian," Marseilles to Basra, 15/4/17, 150 m. E. of Malta	223
"Arcadian," Sal. to Egypt, 15/4/17, off Milo	279
"Transylvanian," Mars. to Egypt, 4/5/17, Gulf of Genoa	434
"Cameronian," (French service), 2/6/17, off Alexandria	63
"Aragon," Mars. to Egypt, 30/12/17, off Alexandria	426
"Osmanieh," Taranto to Alex., 31/12/17, off Alexandria	225
1918: "Kingstonian," Alex. to Mars., 11/4/18	9
"Omrah," 12/5/18, off C. Spartivento	1
"Leasowe Castle," 26/5/18, 104 m. from Alexandria	99
"Missir," 29/5/18, 80 m. from Alexandria	44
"Hyperia," 28/7/18, 84 m. from Port Said	52
"Anhui," 12/8/18, off Cyprus	4

There was thus a total loss in the Mediterranean of 17 transports and some 3,036 troops. It will be seen that the total loss of transports was about 20, with a loss of some 4,563 troops, or about one in 5,000, of which 60% occurred in the Mediterranean.

The number of vessels which sailed in British convoy from July 1917 to Oct. 1918 were:—

Outward	7,239
Homeward:	5,529
North Atlantic	1,705
Gibraltar	564
Dakar	405
Sierra Leone	307
Rio de Janeiro	321
Medit., through	10,464
Medit., local	10,487
Scandinavian	12,541
E. Coast	37,562
French coal trade	902
Dutch	88,026
(A. C. D.)	

CONWAY, SIR WILLIAM MARTIN (1856–), English traveller and man of letters (*see* 7.69), was elected Coalition Unionist M.P. for the minor (grouped) English universities in 1918. In 1917 he was made director-general of the projected Imperial War Museum, to the organization of which he devoted his energies, with the result of a large exhibition of the collections towards it being opened at the Crystal Palace in 1920. Amongst his later publications were *The Sport of Collecting* (1914), *The Crowd in Peace and War* (1915) and *Mountain Memories* (1920).

COOK, SIR EDWARD TYAS (1857–1919), English journalist and man of letters, was born at Brighton May 12 1857 and educated at Winchester and New College, Oxford. Whilst at Oxford he was president of the Union and of the Palmerston club and, on coming to London as secretary for the extension of university teaching, he became a contributor to the *Pall Mall Gazette*, then under the editorship of John Morley. He was later assistant editor under W. T. Stead and editor from 1890 till 1892, when the paper passed into the hands of Mr. W. W. (afterwards Lord) Astor and changed its politics. Cook then resigned, but a year later became first editor of the newly founded liberal evening paper, the *Westminster Gazette*. In 1896 he gave this up to take the editorship of the *Daily News*, which he held till 1901. During the World War, conjointly with Sir Frank Swettenham, he directed the official Press Bureau. He was knighted in 1912, and created K.B.E. in 1917 on the inauguration of the Order of the British Empire. He was a lover of art and of gardening. He published *Studies in Ruskin* (1891), edited the works of Ruskin (1903–7), and wrote the authoritative *Life of Ruskin* (1912); also producing handbooks to the National Gallery and the Tate Gallery, and to the Greek and Roman antiquities in the British Museum. His book on *The Rights and Wrongs of the Transvaal War* ran into several editions, and he wrote *Life of Florence Nightingale* (1913) and *Delane of the Times* (1915), as well as two volumes of *Literary Recollections* (1918 and 1919). He died at South Stoke, Goring, Sept. 30 1919.

COOK, SIR JOSEPH (1860–), Australian politician, was born at Silverdale, Staffs., and at the age of nine started life in a coal-mine. In 1885 he went to Australia and six years later entered the N.S.W. Legislature, holding office as Postmaster-General 1894–8 and Minister of Mines and Agriculture 1898–9. He was elected to the Commonwealth Parliament for Parramatta as a Free Trader in 1901 and became Minister for Defence under Mr. Deakin 1909–10. In 1913 he formed a Liberal Cabinet after the defeat of the Labour party; but just before the outbreak of the World War, the governor-general decided to appeal to the country and as a result of the elections Mr. Fisher assumed the premiership. Cook, before vacating office, had placed the Australian fleet units at the disposal of the British Admiralty. He did not take office again until 1917 when he was Minister for the Navy in Mr. Hughes's second Ministry. The following year he was created G.C.M.G., having in 1914 been sworn of the Privy Council.

COOLIDGE, CALVIN (1873–), American statesman, was born at Plymouth, Vt., July 4 1873. After graduating from Amherst in 1895 he studied law in an office at Northampton, Mass. Here he began to practise in 1897 and soon became prominent in local affairs. After serving as city clerk, city councillor, and

city solicitor successively, he was elected in 1907 a member of the General Court, or House of Representatives, of Mass. He was mayor of Northampton, 1910–11, and sat in the state Senate from 1912 to 1915, being its president during his last year. He became lieutenant-governor of Massachusetts in 1916 and was re-elected in 1917 and 1918. He was elected governor of Massachusetts in 1919 and in 1920 was re-elected under circumstances that attracted nation-wide attention. He had dealt summarily with the striking policemen in Boston Sept. 1919, refusing to reinstate them. In the following gubernatorial campaign this was made an issue by his Democratic opponent, who appealed to those in sympathy with the strikers. The results vindicated the governor's action; he obtained a majority of 114,000 votes (out of a total of 510,000). Already in April 1919, during a strike of telephone operators in Boston, he had proposed that the state take over the lines, but the trouble was soon settled. That he was not opposed to labour was shown by his earlier support of the bill limiting the scope of injunctions against striking employees. In June 1919 he vetoed the bill for increasing the pay of members of the Mass. House, arguing that their service was optional and not a means of livelihood; it was public service and should not be made a job. As governor he recommended that Massachusetts ratify the woman-suffrage amendment to the Federal Constitution. In 1920 he vetoed a bill calling for censorship of moving pictures and likewise a bill to permit the sale of "2.75 per cent" beer. The latter he declared would be "hypocritical legislation" because, with a Federal law on the statute book forbidding beer with an alcoholic content of over one-half of 1%, it would still not be possible to sell 2.75% beer in Massachusetts. At the Republican National Convention in 1920 he received a few votes on all ten ballots for president. When the voting for vice-president began his victory was at once apparent and he was nominated by acclamation. He was elected in Nov. on the ticket with Warren G. Harding by an overwhelming vote.

Some of his speeches were published under the title *Have Faith in Massachusetts* (1919).

COOPER, SIR RICHARD POWELL, 1ST BART. (1847–1913), English agriculturist, was born Sept. 21 1847. He became a member of the firm of Cooper & Nephews, chemical manufacturers and exporters of pedigree live stock, and achieved a great reputation as a breeder of shorthorn cattle and Shropshire sheep. He rendered great service to the Argentine Republic by supplying it with British live stock. He died at Berkhamstead July 30 1913, being succeeded as 2nd Bart. by his son Richard (b. 1874), M.P. for Walsall from 1910.

COÖPERATION (*see* 7.82).—The term "coöperation" covered in 1921 a large number of forms of economic organization which had little resemblance except that of name. In considering their development since about 1907, it is necessary to deal with each type separately. Coöperative organizations may be conveniently classified under four main heads:—consumers' coöperation, industrial producers' coöperation, coöperative credit and banking, agricultural coöperation.

Consumers' Coöperation.—The British coöperative movement, though it contains producers' societies, is in fact almost synonymous with consumers' coöperation. Of 1,459 societies affiliated to the Coöperative Union in 1919, 1,357 were consumers' societies and 95 producers' societies; the membership of the consumers' societies was 4,131,477 and their trade over £314,000,000, while in the producers' societies the membership was 39,331 and the trade £7,000,000.

The growth of the movement between 1906 and 1920 was very remarkable. The membership of retail societies rose from 2,250,000 to over 4,000,000, their capital from £33,000,000 to nearly £80,000,000, and their sales from £63,000,000 to £198,000,000. The significance of these figures is not merely that this vast industrial system has been built up and managed by the working classes of the United Kingdom, but also that in 1921 between one-third and one-fourth of the population of the United Kingdom consumed commodities manufactured or distributed under this coöperative industrial system, a system which eliminates profit-making and implies democratic control of industry

by the community of consumers. And it was now no longer true to say that the movement flourished mainly in the industrial districts of the North and Midlands; London, for instance, which for long had the reputation of being a "coöperative desert," had become an active centre of coöperation, and the London Coöperative Society, recently formed by an amalgamation of two important societies, was in 1921 the largest coöperative society in the kingdom and had a membership of nearly 100,000 and annual sales of nearly £3,500,000.

But if the expansion of the distributive side of the movement in the local societies had been great, the growth of production and manufacture by consumers' societies was even more remarkable. Nearly all the retail consumers' societies are federated in the English, Scottish, and Irish wholesale societies for the purposes of manufacture and wholesale supply. The value of the goods supplied by these three wholesale societies to their members amounted in 1919 to over £115,000,000. The outstanding feature in the history of 1910-20 was the way in which the wholesale societies, particularly the English C.W.S., proved that the system of consumers' coöperation can be adapted to control the various branches of industrial production. The English C.W.S. is one of the most important and varied industrial businesses in the world. Its employees number about 40,000; in 1919, apart from its activities as a wholesale supplier and distributor, it produced or manufactured for its members commodities valued at over £25,000,000. It was in 1921 the largest flour miller in the United Kingdom and probably the largest timber importer at the Manchester docks. Its factories are to be found in every large industrial centre in England. It produces boots and shoes, textiles and clothing, furniture, metals and hardware, soap and candles, tobacco and groceries.

The most significant feature in the development of the productive activities of the consumers' societies is the way in which circumstances have compelled the C.W.S. to obtain control over the raw materials necessary for the production of the commodities consumed by coöperators. The supply of a staple article like bread will afford a good example of this tendency. The baking of bread has from the earliest times been a successful coöperative industry and large numbers of societies have their own bakeries. Coöperators, however, soon found that baking was only the last link in a whole chain of industries which determined the price and quality of bread. In order that the community of consumers might really exercise control over that price and quality, the movement was driven backwards from the baking industry to enter the milling industry. Though the C.W.S. has become the biggest miller in the kingdom, and the value of the products of the corn-milling industry of the movement was nearly £13,000,000 in 1919, events at the beginning of the World War taught coöperators the weakness of their position unless they also had some control over the production and supply of grain which was ground into flour in their mills. In the early days of the World War the movement stood out against "profiteering" in bread and flour, and there were several instances of societies which succeeded in keeping down the price of bread in their areas by refusing to enter into agreements with the other bakers to raise it. But coöperators had no such power of influencing the price of wheat upon which depended the price of flour, because they depended themselves upon the private wheat-grower for their supplies. These considerations induced the C.W.S. to acquire 10,000 ac. of wheat-growing land in Canada.

There are other equally remarkable examples of the same tendencies. In 1914 the C.W.S. had hardly touched agriculture; in 1921 it owned nearly 35,000 ac. of land in the United Kingdom, and in a single quarter of 1920 it started a cattle market at Gisburn, a butter factory at Carlisle, and a fish-curing depot at Fleetwood. Again, it is only since the war that the English and Scottish wholesale societies have become really large owners of tea estates; during 1920 they purchased no less than 32,000 ac. of tea plantations in India and Ceylon. Lastly, the same process may be observed in the soap and candle industry, for in 1921 the C.W.S. at its depôts in West Africa purchased palm kernels direct from the natives, shipped them to its oil mills in Liverpool, which again supplied to its soap and candle factory at Irlam the materials of another industry.

Coöperative industry, based upon a democratic organization of consumers, spread in the decade 1910-20 from town to town and from industry to industry throughout the economic system of Great Britain, but perhaps one of its most interesting and important developments was in the sphere of international trade. In one sense the coöperative movement, as a large importer of food, raw materials, and manufactured goods, had always en-

gaged in foreign trade, but as an importer there was nothing to distinguish its activities from those of the ordinary private trader or joint-stock company. But the C.W.S. has shown since the war what great possibilities there are in the movement for conducting international exchange of goods on a non-profit-making, coöperative basis. Coöperative international trade implies, of course, that there should be a direct exchange of goods between the organized coöperative movements of the several countries and that profit-making should be eliminated by the payment of dividend upon purchase. The machinery for such trade already exists, for no fewer than 19 European countries possess coöperative wholesale societies, and these wholesale societies can organize international trade with one another on a strictly coöperative basis.

To some extent this kind of trade had existed for many years; before the war, for instance, the English C.W.S. supplied tea to the German wholesale society and imported cheese from the Swiss wholesale society, while the German wholesale, again, supplied goods to the Danish wholesale. But the economic situation at the end of the war gave a great impetus to international coöperative trade. The ordinary machinery of foreign trade had broken down as the result of war and blockade, and it would not right itself, partly because of the chaos in credit and the exchanges, and partly because a great deal of the machinery was under governmental control. In such circumstances the coöperative movements of the various countries, resting on the broad basis of the organized consumers both in regard to trade and credit, and with their machinery of production and distribution intact, were not under the same disadvantages as capitalist enterprises.

The English C.W.S. took the lead in organizing international exchange, and it did so in three different ways. It supplied goods direct to the coöperative organizations of France, Holland, Switzerland, Norway, Australia, Canada, Egypt, India, South Africa, Palestine, Brazil, and China. Secondly, it gave credits amounting to nearly £1,000,000 to the Rumanian, Polish, and Belgian coöperative movements, the greater part of these credits being taken in the form of food and manufactured goods. Thirdly, it tried the experiment of direct barter with the coöperators of South Russia, sending a cargo of clothing, etc., to the Russians and receiving in exchange a cargo of raw materials. This experiment in coöperative barter was not very successful, partly owing to political difficulties, but the other enterprises led to an international movement among coöperators to develop coöperative foreign trade. In 1919 and 1920 there were conferences of the wholesale societies of the various countries, and a scheme was agreed upon under which each wholesale society would organize an export department, there would be joint purchasing arrangements between the various societies, and there would be a central bureau of statistics for the collection of information regarding goods which each wholesale society either demands or can supply.

Two other developments of the coöperative movement deserve notice. The first is insurance. The Coöperative Insurance Society, which is a joint insurance department of the English and Scottish wholesale societies, now undertakes life, fire, accident, and employers' liability insurance. In all these departments there has been a rapid development in recent years. The most interesting feature is the collective life assurance business, under which a coöperative society collectively insures the lives of all its members: under this system there is a great saving in cost, for there is no collection of premiums from individuals, the premiums being paid in a lump sum by the society and recovered from the dividend payable to members. In 1919 there were 817 societies assured in this way, and the number of members in these societies was 2½ millions. This insurance business is conducted on strictly coöperative principles; thus out of the profits on fire insurance, after the usual rate of 5% on capital was paid, a dividend of 2s. in the £ to members and 1s. to non-members upon their fire insurance policies was declared in 1918. The progress of coöperative insurance may be seen in the fact that the income from life, fire, and accident premiums rose from £104,615 in 1909 to £924,066 in 1919, an increase of 783 per cent. The C.W.S. banking activities have made equal progress. The C.W.S. Bank has (1921) two branches, one in London and the other in Manchester. It accepts current accounts from coöperative societies, trade unions and friendly societies, clubs and other mutual organizations. In 1920 the number of current accounts with the bank was as follows: coöperative societies 1,016, trade unions and friendly societies 3,347, clubs, etc., 1,391. The deposits and withdrawals in the half year ending June 1920, amounted to £314,000,000, showing an increase of over 26% on the corresponding period of 1919. The C.W.S. banking is, again, conducted on a strictly non-profit-making, coöperative basis, the profits being returned to customers in the form of a dividend upon their balances.

The facts and figures given above show the tremendous growth of the coöperative movement. The increase in its membership and the great extension in the area of its operations have brought new problems and created new tendencies. Up to the end of the

19th century the movement was content to proceed on its way of steady development in a certain amount of obscurity. This is no longer the case: coöperators have begun to claim the place to which their numbers and operations entitle them in the economic life of their country. These claims can be stated shortly as follows: Consumers' coöperation is a system which ensures a democratic control of industry by the community organized as consumers. Every consumer can join a society and every member has one vote and can, if he cares to do so, exercise an equal power of control over the conduct of industry. The dividend on purchase ensures that commodities are supplied to consumers at cost price and that, therefore, profit is eliminated. Under coöperation production and the various spheres of industry from banking to insurance, from the production of raw materials to the distribution of manufactured articles across the counter of the shop or store, are all carried on for use and not for profit. This system has already shown that it can adapt itself to one economic sphere after another and there is no reason to suppose that the scope and range of coöperative industry are not capable of almost indefinite extension. The movement, with its 4 million members, already represents from 12 to 15 million consumers or more than one-quarter of the population, and consumers' coöperation is now, in fact, an alternative to the ordinary capitalist system of controlling industry.

These claims and ideals are being put forward and are undoubtedly having an effect upon the development of the movement. They are not held consciously by the vast mass of the 4 million members, but they are slowly penetrating the movement, largely owing to the educational work of the societies and the Coöperative Union and also of a very active and influential coöperative organization, the Women's Coöperative Guild, which has a membership of nearly 50,000 women members of coöperative societies.

The increase in coöperative activity and in the consciousness among coöperators of the importance and capacities of their movement are partly the effects of the war. It might have been expected that the dislocation in the economic life of the country and the difficulties of food supply would have had an adverse effect upon a working-class movement like the coöperative movement. The facts show that the reverse was the case. The membership of retail societies, for instance, rose from 3,054,000 in 1914 to 4,131,000 in 1919, an increase of 35%, while the increase from 1909 to 1914 was only 24%. This increased rate of growth was partly due to the rise in prices and the popular irritation against "profiteering," for the elimination of profit-making and the dividend on purchase tend to keep prices down in the coöperative store and make "profiteering" impossible.

Reference has also been made above to the way in which circumstances connected with the war led to an extension of the productive and distributive activities of the C.W.S. But the war had another effect upon British coöperators: rightly or wrongly there grew up in the movement a widespread conviction that it was being victimized in the interests of private traders. Definite complaints were made of unfair treatment of coöperative societies and their staffs by military service tribunals and of discrimination against coöperative organizations in the allocation of Government-controlled supplies. The decision of the British Government to tax coöperative societies by means of the Corporation Profits Tax brought the dissatisfaction of coöperators to a head. The argument was freely used that the movement, in order to protect itself against political action, must "enter politics." In 1917 the whole question was discussed at the Coöperative Congress, and a resolution was passed that the movement should enter politics and nominate candidates in constituencies as an independent unit, but that it might work with other organizations having similar aims and objects. Several coöperative candidates stood in the general election of 1918 and one was elected. The Coöperative party was still in its infancy in 1921 and any estimate of its future was impossible. One feature of the tendency which it represented must, however, be noted. There was a considerable body of feeling in the movement which held that the Coöperative party should unite with

the Labour party and trades union movement to form a "Labour and Coöperative Political Alliance." On the other hand a large number of coöperators were not prepared to accept this proposal. The whole scheme for such an alliance was in 1921 still under discussion in the movement.

Another problem which has assumed great importance in recent years for coöperators is their relations to their employees. In 1919 the consumers' societies employed about 175,000 persons, of whom about four-sevenths were employed in distribution and three-sevenths in production; the wages and salaries paid to these employees amounted to about £20,000,000 a year. The relations between the movement and its employees have been complicated until recent years by a misunderstanding as to the nature of consumers' coöperation. Coöperators themselves did not distinguish clearly between the control of industry by the community organized as consumers for use and not for profit (consumers' coöperation) and the control of industry by the workers or producers in self-governing workshops or factories in which the profits were divided among the workers (producers' coöperation). Hence arose a certain school within the consumers' movement which held that the employees of consumers' societies should share in the "profits," although the dividend on purchase eliminates "profits" in the sense in which a joint stock company or a self-governing workshop makes a profit. The illogicality of this position was, however, gradually realized, and in 1921 very few societies paid the bonus on wages by which the coöperative employee was given a "share in profits."

The coöperative employee was therefore recognized to be merely a wage-earning employee of the democracy of consumers. But the movement, as a large employer of labour, was brought face to face with many new problems. As an employer it stood in a peculiar position. It was composed mainly of the manual wage-earning class, and a very large number of its members were naturally trade unionists. It always professed to pay good wages and to give the best possible conditions of employment. But it was competing with the businesses and factories of the ordinary capitalist type, and competition was so severe that coöperative trade and industry would soon be killed out if wages and conditions of employment within the movement were such as to raise the cost of production substantially above that of its rivals. Most people agree that on the whole the conditions of the coöperative employee compared very favourably with those of employees of private firms and companies, although there were still societies in which wages, etc., were bad. The movement had, however, increasing difficulties with organized labour.

Up to 1920 large numbers of coöperative employees were organized in a special trade union, the Amalgamated Union of Coöperative Employees (membership in 1920, 90,000). This union was founded in 1891, and it throws some light upon its original relations with the coöperative employer that in the original rules there was no provision for strikes. But this happy situation could not and did not continue. The presence of large numbers of trade unionists within the movement means that any demand for increased wages will probably receive some support within a society. There is no doubt that organized labour to some extent took advantage of this fact: a demand for increased wages or shorter hours was often first made upon coöperative societies, with the intention that, when the coöperators had given way, labour could then go to non-coöperative employers and demand that they should pay the same wages or give the same conditions as coöperators.

These facts and conditions gradually led to strained relations between the movement and its organized employees. As a whole the movement stood as strongly for trade union recognition and for the payment of trade union rates of wages as the trade unions themselves, indeed several societies insisted that their employees should be members of their unions. There had also been for long in existence joint machinery of the movement and the unions for settling industrial disputes by conciliation and arbitration; but for various reasons this machinery did not work satisfactorily, and in 1911 the Amalgamated Union of Coöperative Employees began a more militant policy and made provision for a strike

fund. Since that time there have been several strikes against coöperative societies. The whole question of the relation between the coöperative democracy and its employees has been raised by these events, and in 1921 it remained unsettled. It was complicated by the demand among certain sections of labour for workers' control of industry. Many coöperators believed that the workers should be given some share in control, i.e. that they should share with the consumer in the determination of rates of wages and conditions of employment. On the other hand it is obvious that the whole principle of consumers' coöperation, control of industry by the community of consumers for the use of the community, is inconsistent with the complete control either of individual factories and workshops or of whole industries by the organized workers, the principle of producers' coöperation, syndicalism, and guild socialism.

Foreign Countries.—The consumers' movements outside England owe their origin directly to the British movement, and all of them were many years behind it in development. But the history of their progress has been almost precisely similar to that of the British movement. In 1921 there was hardly a single European country without consumers' societies. Nearly all of these foreign movements showed a considerable increase in membership and trade during 1910-20; the war, both in belligerent and neutral countries, had a marked effect in increasing the number of coöperators and in extending the development and scope of coöperative industry. The following figures show the growth of some of the Continental movements after 1914:—

Country.	Total Membership.		Total Turnover.	
	1914.	1919.	1914.	1919.
Denmark	244,000	317,000	Kr. 101,000,000	Kr. 150,000,000
France	880,000 ¹	1,300,000	Frs. 321,800,000 ¹	Frs. 1,000,000,000
Germany	1,717,519	2,308,107	Marks 492,080,519	Marks 1,075,581,269
Norway	31,000	80,000	Kr. 10,010,600	Kr. 21,215,200
Sweden	111,203	225,121	Kr. 39,466,473	Kr. 816,118,000
Switzerland	276,437	351,811	Frs. 141,650,071	Frs. 289,666,374

¹ Estimated.

Though the Continental movements were not so advanced, particularly on the productive side, as the British movement, there is evidence that most of them were firmly established in 1921 and were rapidly following the same path of successful development. The German movement, the largest and most successful on the Continent, had in fact reached the same stage as the British; its membership increased while the number of societies was stationary or decreased; it had a highly developed wholesale society, the *Gross-einkaufsgesellschaft Deutscher Konsumvereine*, whose productive activities included tobacco, soap, matches, textiles and clothing, and confectionery. The majority of the other Continental movements were still in that stage of structural consolidation which in England had been largely completed before 1900. Its most marked feature is federation or amalgamation of small, and often competing societies, so that an increase in the number of coöperators may be accompanied by a decrease in the number of societies. Examples may be found in the recent developments in Denmark and France. In Denmark, although agricultural coöperation had reached a very high state of development, consumers' coöperation in the towns only began about the beginning of this century. Its progress was slow until 1910. Then there was a rapid increase in the number of societies, members, and turnover; this was followed by a period of consolidation, in which there was extensive amalgamation among the Copenhagen societies while the membership and turnover continued to increase. This process, typical of the development of a consumers' movement, can be seen in the following statistics of Danish urban coöperative societies:—

Year.	Number of Societies.	Number of Members.	Turnover Kr.
1910	44	15,710	4,876,000
1914	92	39,698	14,378,000
1919	79	64,187	23,648,000

The same tendency is at work in France, where since 1914 has been seen the establishment of large district societies which absorbed the small local societies.

Another feature of foreign coöperation, which should be noted, is the development of wholesale societies. The development of a consumers' movement into a large industrial system depends upon the growth of a strong wholesale society which shall eventually be capable of undertaking a great variety of productive enterprises. It is significant that in 1919 no less than 19 European movements had wholesale societies. It is true that many of them were still in the stage of wholesale dealing for the supply of the local distributive societies, but the history of the British movement shows that this stage must precede any large development in manufacturing enterprise, and many foreign wholesale societies, e.g. the French, German, and Swiss, have greatly extended their productive activities.

Lastly, it should be remarked that in 1910-20 consumers' coöperation established itself in many countries outside Europe. For instance, up to very recent times consumers' coöperation could hardly be said to have existed in the United States, but latterly, partly owing to the educational work of the Coöperative League of America, a vigorous movement and some 2,000 societies had come into existence. Coöperation had also established itself and was making progress in Armenia, some of the British dominions, e.g. Canada, South Africa, and India.

Industrial Producers' Coöperation.—The typical example of producers' coöperation is the workers' society in which the workers own and manage the factory and divide the profits of the enterprise among themselves. But many distinct types of industrial organization are ordinarily included under the term producers' or workers' coöperation, types differing as widely from one another as the ordinary business or joint stock company which gives its employees a share in the profits, and the self-governing workshop. Here we shall deal only with producers' coöperation in the strict sense, i.e. societies or enterprises in which the instruments of production are owned and control exercised by the workers or producers.

There was little change in the position of producers' coöperation during 1910-20. There was no marked extension in the number of enterprises or in the sphere of their operations either in Great Britain or abroad. Thus the number of productive societies in the Coöperative Union actually declined from 108 in 1913 to 95 in 1919, while the number of members rose from 34,662 to 39,331. It is true that their annual sales during the period rose from £3,710,234 to £7,047,147, but the rise in prices would more than account for this increase. The history of the workers' society from 1907 to 1921 is, in fact, a repetition of its previous history. This form of industrial organization is liable to peculiar difficulties. A small self-governing workshop is easily started and a small workers' coöperative society easily formed. But the problem of internal organization and discipline is extremely difficult, if full democratic control is exercised by the workers. Hence in Britain, France and Italy workers' societies are continually coming into existence, but, with a few exceptions, their lives are short. And, since the larger and more highly organized the enterprise the more acute become the difficulties of organization, control, and discipline, the workers' society, where successful, has practically always remained a small and simple industrial unit. These facts account for the lack of development in producers' coöperation and its failure hitherto to adapt itself to the large-scale, complex organization of modern industry.

It should be noticed, however, that both syndicalism and guild socialism advocate forms of industrial organization which would in effect be developments of producers' coöperation. The workers' society takes the workshop or the factory as the unit of industrial organization and places the control of industry in the hands of the workers organized in factory or workshop; the syndicalist or guild socialist would make each industry, e.g. mining, railway transport or building, the unit of organization and would give control to the workers organized in these larger units. But, although experiments in guild socialism have already been made in England in the building trade, and although the Works Councils Act in Germany and legislation in Italy, following the seizure of factories by the workers in 1920, made some approach to a syndicalist control by workers, both syndicalism and guild socialism still remained in 1921 in the theoretical stage. They had, however, as theories and ideals of industrial organization, taken the place which previously workers' coöperation, in the strict sense, occupied with many people.

Coöperative Credit and Banking.—If the consumers' coöperative movements of the world owe their origin to the British movement, Germany can claim to be the pioneer of coöperative credit and banking. Two well-known types of credit societies are distinguished in Germany, the *Schulze-Delitzsch* and the *Raiffeisen*. Apart from their differences in constitution and structure, these two types are characteristic of a difference in function which runs through the whole of coöperative credit in every country. The Schulze-Delitzsch bank supplies credit or loans to the small industrialist in towns; the Raiffeisen bank supplies credit to farmers and agriculturists. This distinction of function is fundamental, and therefore it is not surprising that the history of the spread and development of urban and rural coöperative credit has not followed the same course.

It is obvious that neither large scale capitalist industry nor consumers, coöperation is favourable for the development of urban coöperative banks. The people whom Schulze-Delitzsch desired to help were townsmen, especially the small craftsmen working on their own account, the joiners, shoemakers and so forth; and his ideal was to do this by stimulating their thrift. The idea was to gather together into a society a number of persons, each individually weak economically, but whose combined capital, savings, and deposits would be sufficient to provide the credit upon which the bank might borrow money and lend it to its members. The membership of such an urban bank is always found to consist mainly of small craftsmen, shopkeepers, and small professional men. It follows that this kind of coöperative credit will only establish itself where the small independent hand worker still exists or where the small shopkeeper has an instinct for coöperation. But these conditions are not fulfilled in many European countries. Hence the success of urban coöperative credit has not been nearly so widespread as that of some other forms of coöperation. In Germany itself the movement was a great success during the first 50 years of its existence, but during 1910-21 it had not made much progress. Thus between 1859 and 1905 the number of Schulze-Delitzsch banks rose from 80 with a membership of just under 19,000 to about 1,000 with a membership of about 590,000; in 1921 the number of Schulze-Delitzsch credit societies organized in the general union remained about 1,000 with a membership of 600,000. Outside Germany the urban bank has established itself mainly in Italy, though it also exists on a small scale in France, Belgium and Switzerland. Its greatest success has been in Italy, where Signor Luzzatti was able to adapt the Schulze-Delitzsch model to the requirements of his own countrymen. As in Germany, so in Italy, the statistics of recent years pointed in 1921 to a very considerable slowing down in the growth of the movement. It should also be remarked that there is a tendency for the urban popular banks if they are financially successful, to lose their original object and function, i.e. they tend to neglect the small man for the big man, though there is probably some truth in the contention that this often results from the fact that the bank itself has helped its members to change from small men to big men.

The movement for rural coöperative credit associations has not been subject to the same limitations as the urban movement. In many Continental countries the peasant or small farmer exists in large numbers, and more often than not they are burdened by debt contracted with money lenders on usurious terms. In all these countries the scope for coöperative associations for providing credit to the small agriculturist is very great, and there has in fact been a considerable extension and development of this kind of coöperation. It has usually accompanied a development of other forms of agricultural coöperation, but one of the most curious characteristics of rural coöperative credit is that its development has been most erratic. Thus in Germany the whole of agricultural coöperation has developed from the Raiffeisen rural banks, and the credit associations remain the pivot of the whole movement. But at the other end of the scale are Denmark and Ireland. In no country in the world has agricultural coöperation been more successful than in Denmark, yet in 1921 rural credit societies or banks scarcely existed there. The growth of the Danish agricultural movement was singularly spontaneous, while Irish agricultural coöperation has been the result of intensive and prolonged propaganda. Yet the same fact with regard to coöperative credit is observable in Ireland: in some districts the rural credit societies have performed useful functions, but, taking the country as a whole, they have declined while agricultural coöperation has made great progress; this is shown by the fact that the number of agricultural credit societies declined from 267 in 1908 to 136 in 1920, while the number of agricultural societies and creameries rose from 458 in 1908 to 705 in 1918.

Between Germany at one end of the scale and Denmark and Sweden at the other, the different countries of Europe show great differences in the degree and manner in which they have accepted the rural credit movement. In Italy, Hungary, Finland and France, for instance, rural coöperative credit societies or banks have all proved successful, but as soon as the organization of the movement is investigated in the four countries, marked differences of development become apparent. One of the most important of these differences is the degree in which the movement does or does not rely upon State aid. Thus the Finnish banks are essentially voluntary associations which rely for their working capital mainly upon the Rural Banks' Central Credit Institute, while this central institute obtains its working capital very largely from Government loans. The Hungarian local credit societies in 1913 numbered 2,500 with a membership of between 600,000 and 700,000, and their capital voluntarily subscribed amounted to about £3,000,000, and deposits to about £8,000,000. For many years they relied in no way upon Government aid, but after the beginning of the century they received loans from a central credit organization financed almost entirely by the State. But it is in France that the reliance of agricultural credit upon the State is most marked. The French rural credit societies are grouped under a district bank to which a society wanting a loan applies; the district bank forwards the application through the Préfet to the Ministry of Agriculture, and the Ministry, if it approves, makes the loan to the district bank. The system is

therefore little more than a system of State aid to agriculture and has scarcely any of the characteristics of voluntary coöperation.

Agricultural Coöperation.—Voluntary association among farmers, peasants, or agriculturists can and does take place for many different objects. In addition to the rural coöperative bank or credit society, already dealt with, the chief forms of agricultural coöperative organization may be classified as follows: (1) societies or associations for coöperative supply of the instruments and means of production; (2) societies or associations for coöperative production, e.g. creameries, dairies; (3) societies or associations for coöperative marketing; (4) societies or associations having a variety of miscellaneous coöperative objects, e.g. coöperative insurance. It should be noted, however, that there is no rigid separation of function in the societies actually existing; a single society may and often does perform two distinct functions; it may for instance, as in the case of a dairy, perform both the function of production and that of marketing.

There was a great and widespread development of agricultural coöperation in Europe, and indeed throughout the world, during 1905-20. Unlike consumers' coöperation, however, there was very little uniformity in the development of agricultural coöperation in the various nations. As was pointed out above, in one country the whole of agricultural coöperation will centre in the organization of agricultural coöperative credit, while in another country, like Denmark, a no less highly developed system of agricultural coöperation will exist with little or no organization of coöperative credit. But this lack of uniformity is not confined to agricultural banking; it will be found that in one country agricultural coöperation has developed principally along the lines of coöperative supply, in another of coöperative production, and in another of coöperative marketing. It is not possible, therefore, to give a general account of the progress of agricultural coöperation which would be applicable to every country in which it has proved successful; all that is possible is to show the range of its development and to give one or two typical examples.

In 1907 a fully developed agricultural coöperative system existed already in Germany, Switzerland, Denmark, France, Italy, and Belgium, and a real beginning had been made in Ireland. Up to the outbreak of the World War the old established systems continued to maintain themselves, but such statistics as are available seem to indicate that agricultural coöperation was more adversely affected by the war than the consumers' movements. But the most notable feature of the decade 1910-20 was the spread of agricultural coöperation and its progress in countries where before it was non-existent or only feebly established. The best examples of this development are to be found in the United Kingdom, Norway, Sweden, Finland, and Siberia.

Agricultural coöperation in the United Kingdom nowhere developed spontaneously. Its greatest successes have been obtained in Ireland, where the whole movement was created by the Irish Agricultural Organization Society, founded in 1894. Thanks to the educational work of this organization a considerable number of societies for supply, production, and marketing were formed on the model of Danish societies. The most successful societies were supply societies, dairies or creameries, and egg and poultry societies. By 1908 there were 292 creameries and 166 supply societies. In the next decade there was continuous progress, and by 1920 there were 334 creameries and 371 supply societies. The membership of the creameries rose from 42,404 in 1908 to 50,052 in 1917, and the turnover from £1,700,000 in 1908 to £5,200,000 in 1917, while the membership and turnover of the supply societies rose from 12,999 and £87,000 in 1908 to 31,200 and £691,000 in 1917. These figures indicate the trend of development in Irish agricultural coöperation. It contains two main features. The creameries are productive societies mainly occupied in the coöperative manufacture of dairy products, principally butter and cheese. In the early years of the movement coöperative production was for the most part confined to butter, but the war adversely affected the butter trade, and from 1914 to 1918 there was a big fall in the quantity of butter and a big rise in the quantity of cheese manufactured. The creameries and the Irish Coöperative Agency Society, which is a federation of creameries, also perform the function of coöperative marketing for their members. In recent years the development of the productive side of the movement in the creameries has slackened, and after 1919 conditions in Ireland led to great destruction of property and heavy losses for the creameries. The second feature of Irish coöperation is the rapid development in recent years of the "Agricultural Societies," which are supply societies providing the farmer with every kind of requirement at wholesale prices. They have had

a marked effect upon Irish agriculture, for the supply of such things as fertilizers and feeding stuffs at reasonable prices has created demand for them. The supply associations also perform an important function in providing agricultural machinery which the individual farmer could not possibly afford.

The example and success of the Irish Agricultural Organization Society led to the creation of similar movements and kindred societies in England and Scotland. In 1918 there were in England 237 supply societies with a membership of nearly 40,000 and a turnover of £4,670,000, and 39 dairies with a membership of over 5,000 and a turnover of nearly £1,500,000. In 1918 the total number of all societies in Scotland was 170 and the membership over 8,000.

In Sweden, Norway, and Finland the development of agricultural coöperation has been very rapid. In Sweden organized coöperation dates from 1906 when the "National Union of Swedish Agriculturists" was formed. This union acts both as a supply and a marketing organization. By 1910 the union had 42,000 members and a turnover of over £1,000,000, while there were 19 provincial and 940 local associations for supply and marketing; there were also 477 coöperative dairies. The development in Norway has been as great and even greater, and in 1913 there were 660 coöperative dairies and 1,344 local supply societies. Norwegian agricultural coöperation is remarkable for the highly organized system of federation among both productive and supply societies. Norway and Sweden resemble Denmark in the fact that agricultural coöperation has developed and succeeded with little or no reliance upon coöperative credit. Finnish agricultural coöperation is remarkable for the way in which the various forms of coöperation, credit, supply, production, and marketing have developed. This can be seen from the increase in the turnover of the various types of societies from 1903-13:—

	1903 £.	1913 £.
Dairies	140,000	1,480,000
Banks	8,000	356,000
Supply	80,000	480,000

The success of agricultural coöperation in Siberia has also been extraordinarily rapid. Coöperative butter-making associations were first started about 1900, and in 1908 the Union of Siberian Creamery Associations was established with 12 affiliated societies for the purpose of both marketing and supply. By 1914 the union had over 1,000 affiliated societies and a turnover of about £1,000,000.

COPPER (see 7.102).—The industrial history of copper after 1910 was more important, both technically and economically, than for many decades previously. A very large part of the world's supply of the metal came after that date from deposits so low in grade that they could not be worked under the conditions of 1905. The major developments in this progress were the enlargement of the scale of operations in individual units of stupendous capacity; immense reductions in the cost of mining by the introduction of the caving system and steam shovelling; reduction in the cost of milling and increase in the extraction of mineral by the introduction of the flotation process; reduction in the cost of smelting by the application of coal-dust firing to reverberatory furnaces and the successful operation of basic-lined converters, and finally the development of processes for the hydrometallurgical treatment of certain ores and the direct production of refined electrolytic copper.

These developments were to a large extent both the inspiration toward the exploitation of the "porphyry" deposits, and the

consequences thereof. The porphyry deposits are more correctly described as fine disseminations of copper minerals through large masses of igneous rock. The economic characteristics of these deposits were mainly their large size and their occurrence at or near the surface in substantially horizontal positions. Fine disseminations of copper had been exploited for many years in the Lake Superior region, but there the copper occurred in its native form and the mineralization was in lodes dipping steeply. Previous to 1905 the occurrence of immense masses of rock, containing about 2% of copper in sulphide form, was known in Bingham Canyon, Utah, at Ely, Nev., and elsewhere, but it was not believed to be possible to exploit them profitably. The conception of profitable exploitation by taking advantage of improved methods in mining and the prosecution of operations on a previously unparalleled scale, was due especially to Daniel C. Jackling (b. 1869) of San Francisco. The provision of plant and equipment for carrying out that conception called for immense ventures of capital (\$10,000,000 for single enterprises), and this at a time when success was problematical. Production by this new group of mines began about 1907, but it was not until about 1910 that it assumed large proportions and the success of the new enterprises began to be clearly recognized. The idea at that time was to work sulphide ores containing about 2% of copper, but in the short space of the 10 years following it became possible to work ores containing but little more than 1% of copper. The brilliant success of the porphyry copper mines and their ability to produce the metal at a very low figure stimulated the operators of lode mines, most notably the Anaconda Copper Mining Co., at Butte, Mont., toward improvements in methods in order to permit them to meet the competition of the porphyries.

Mining Processes.—The following are the major advances made during 1910-20 in the arts of mining and metallurgy:

Steam Shovelling.—No detailed description is necessary, for the steam shovels and general methods are substantially the same as are used in any excavation work. In their application to the mining of copper-bearing ore, the latter is broken down in benches, a line of holes being churn-drilled back of the face, charged heavily with an explosive, and the ore blasted down in quantities of many thousands of tons. The steam shovel is moved along a track at the bottom of the bench and picks up the broken ore, transferring it to cars alongside. Excessively large boulders are broken up by block-holing and blasting, but the steam shovel can pick up very large pieces, its dipper being as much as 8 cub. yd. in capacity. The largest steam shovels weigh 325 tons and dig 300 cub. yd. (place measure) per hour. This method of mining is so cheap per ton of ore that it can be applied economically even when it is necessary to shovel away 100 or 200 ft. of worthless overburden in order to uncover 100 vertical ft. of ore. The process of removing the overburden, technically known as stripping, necessarily precedes the actual mining. The laying out of plans for the working of a mine in this way and the figuring of the various factors furnish complicated engineering problems.

Caving.—When the overburden is too thick, or is too thick with relation to the thickness of the ore deposit, mining by the caving system is adopted. In essence this system consists in opening permanent galleries under the ore body. Raises to the ore body are then made, and sub-galleries of relatively small size are driven into it, with the purpose of so undercutting the ore body that its support by rock pillars is reduced to the minimum. Finally the pillars are blasted out, causing the superincumbent ore to settle in a great crushed mass. The crushed ore is then drawn off through chutes, previously prepared, into cars in the main galleries. This operation proceeds through the ore body section by section, the natural surface over the mines settling as the ore is drawn off. There are many modifications of this system of mining, but its application to large flat-lying ore deposits is substantially as described. Modifications of the caving system of mining are also applicable in many lode mines, when the lodes are of large size. It is a very economical system of mining owing to its reduced requirements for labour, explosives, timber, etc.

The Flotation Process.—Copper ore as mined at the present time contains generally only a small percentage of copper mineral, which is obtained by crushing the ore to such fineness as to liberate the mineral particles and by separating these from the worthless gangue by mechanical processes, commonly performed by washing, in which advantage is taken of the difference in specific gravities. Although there had been great improvements in the processes of ore dressing, the losses of valuable mineral continued relatively high up to 10 years ago. In the flotation process advantage was taken of the discovery that when ore suspended in water was mixed with a small

quantity of certain oils or other agents (the addition of oil being perhaps only 2 lb. per ton of ore), and was then subjected to violent agitation, the copper minerals (if sulphides) would rise to the surface in the form of a froth, while the worthless gangue would settle to the bottom. Separation in this way was possible at relatively low cost and yielded a far higher percentage of the mineral than the older processes. The improvement might be generalized by indicating an extraction of 90%, compared with 65 to 75% previously.

Metallurgy.—Previous to 1910 the blast furnace and the reverberatory furnace were frequently competitive choices for the smelting of copper ore. At one time one would be in the lead and then improvements would cause preference to be given to the other. With the increasing fineness of the ore to be smelted, the leaning began to be definitely in favour of the reverberatory furnace, but with the advent of the Dwight-Lloyd sinterer, which enables fine ores to be agglomerated cheaply and efficiently, the blast furnace gained a new prestige. With the successful application of coal-dust firing, however, which was due especially to the work of David H. Browne at Copper Cliff, Ont., the reverberatory furnace obtained an unquestionable predominance, which it is likely to hold. The modern copper-smelting plant designed for the treatment of fine ore comprises roasting furnaces of the MacDugall type and reverberatory smelting furnaces of very large size. Previous to the introduction of coal-dust firing, a furnace at Anaconda, Mont., 19 x 112 ft., smelted 240 tons of charge with one ton of coal per 4½ tons of charge. By the new method a furnace 25 x 144 ft. smelted 650 tons, and one ton of coal smelted seven tons of charge. For the smelting of coarse ore, and especially of heavy sulphide, the blast furnace operated on the pyritic or the semi-pyritic principle still held its place in 1920. These furnaces also were constructed of very large size. The Anaconda Co. attained dimensions of 72 x 1,044 in. at the tuyeres, but this was exceptional, the blast furnaces at most American works being something like 72 x 280 inches.

The converting of copper matte in a basic-lined vessel, which had long been a hope of copper metallurgists, was carried to success by W. H. Pierce and E. A. Cappel-Smith at the works of the Baltimore Copper Smelting and Rolling Co., just previous to 1910, and early in 1910 the process was introduced in the works of the Garfield Smelting Co. in Utah. Subsequently it was found that the process was not limited to the Pierce-Smith horizontal converters, but could be applied to other forms of converters, both horizontal and upright. The main advantages of the basic over the acid converter are the decreased cost of lining (one basic lining for 2,500 tons of copper compared with one acid lining for 10 tons), greater air efficiency, ability to convert low-grade matte with a mixture of silicious ore, reduction of intermediate products, neatness and cleanliness of plant, and decrease in danger from accidents. The basic converters are lined with magnesite. Their use became general. They reduced the cost of converting copper matte to less than 50% of what it used to be with the converters lined with acid (silicious) material.

The existence of immense ore deposits of the porphyry type, but with the copper occurring as oxide or chloride, which rendered the ore unamenable to mechanical concentration, directed renewed attention to the hydrometallurgical extraction of the copper of such ore. At Chuquibambilla, Chile, lies the world's greatest known deposit of copper, its development being estimated at about 700,000,000 tons assaying about 2% copper. Exploitation of this was undertaken by the Chile Copper Co., an American corporation. The copper occurs in the ore as brochantite contaminated with chlorides. E. A. Cappel-Smith devised a process for the leaching of this ore with sulphuric acid, purification of the solution and deposition of the copper by electrolysis, using magnetite anodes, but in practice anodes of ferro-silicon have been substituted. The copper cathodes are melted and cast into bars of grade equivalent to standard

electrolytically refined copper. Production in 1920 was at the rate of 100,000,000 lb. per annum. At Ajo, Ariz., the New Cornelia Copper Co. also produced electrolytic copper directly from ore, from which the copper was first leached by sulphuric acid. Hydrometallurgical extraction of copper was also applied on a large scale for the treatment of tailings, e.g., by the Anaconda Copper Mining Co., and by the Calumet & Hecla Mining Co., the latter extracting the native copper by means of ammonia, and precipitating the copper as oxide by distillation, with recovery of the ammonia. A similar process was employed for ore treatment at the Kennecott mine, in Alaska.

General Economic Conditions.—A large part of the world's copper production was in 1920 derived from immense units. Thus in 1918 Anaconda produced 273,000,000 lb. of copper. This, however, was derived from a group of mines. The Utah Copper Co. produced 12,500,000 tons of ore in 1917, yielding 196,000,000 lb. of copper from a single mine. Previous to the World War about 15 cents per lb. was regarded as a market price reasonably to be expected on the average. The cost of production to the largest producers was about 10 cents per lb. The immense demand for copper for military purposes that began in 1915 temporarily outran the ability of the producers to meet it, and the price ran up to about 32 cents per lb. at the end of 1916; but the increased production began to show its effect in 1917 and the market declined materially during that year. In the latter part of 1917 the American Government fixed the price at 23½ cents. Mining, smelting and refining capacities were rapidly increased and in 1917 American electrolytic refiners attained a capacity for the production of 2,800,000,000 lb. of copper per annum. With the termination of the war it was found that all of the Allied and Associated Powers had overbought their requirements, and producers were unable to curtail their scale of operations quickly. This led to the greatest accumulation of unsold copper in the history of the metal, and combined with the greatly increased cost of operation, a bad economic situation developed in the industry which continued into 1921. At the end of 1920 the price for copper was about 12½ cents per lb. Statistics of the world's production of copper are given in the accompanying table.

Previous to the World War the world's production of copper had risen to an annual rate of about 1,000,000 metric tons. In 1916-8 there was an annual production of about 1,400,000 tons. In 1919 it was curtailed to slightly less than the pre-war rate. In April 1921 a general closing of copper mines became necessary on account of the economic situation, and the world's production was thus curtailed to about one-third of the pre-war rate. American interests control (1921) the major part of the copper production of Chile and Peru, and in fact control upward of 80% of the world's production. Outside of this control the production of Japan, Spain, Portugal, Australia and Africa is the most important, but of those countries Japan is the only one whose output has exceeded 100,000 tons per annum.

The best record of progress in the mining and metallurgy of copper, economic conditions, etc., is to be found in the file of the *Engineering and Mining Journal*, New York. Important technical

CORDONNIER, VICTOR LOUIS ÉMILIEN (1858–), French general, was born at Surgy (Nièvre) March 23 1858, and after passing through the military college of St. Cyr entered the infantry as sub-lieutenant in 1879. Eight years later he graduated from the École de Guerre, and thereafter staff and regimental service (including tours of duty in the Alps and in Algeria) alternated till in 1905 he was appointed an instructor at the École de Guerre. He had already served as commander of the cadet battalion and director of studies at St. Cyr, and from this time till 1910 his work was wholly instructional. In this period he wrote his work *Les Japonais en Mandchourie* (published 1911), a study which soon took rank as the most important critical work on the Russo-Japanese War and was translated into several languages (English translation, *The Japanese in Manchuria*, Part I. 1912, Part II. 1914). In 1910 on promotion to colonel he took command of an infantry regiment and in 1913 he was promoted general of brigade and appointed to command the new 87th Brigade, forming part of the reinforced *couverture* created by the Three Years' Service Act.

In command of this brigade, Cordonnier played a distinguished part in the successful action of Mangiennes on Aug. 10 1914, and in the heavy fighting of the IV. Army in the Ardennes. Before the battle of the Marne he had been advanced to the command of the 3rd Division, and he led this formation in that battle and in the advance to Ste. Menchould and the Argonne which followed. On Sept. 15 he was severely wounded, and though he resumed his command in October, he had again to be invalided. In December, having meantime become general of division and an officer of the Legion of Honour, he commanded his division in the bitter trench-warfare fighting in the Argonne, and in Jan. 1915 he was in charge of a group of divisions in Alsace. From May 1915 he commanded the VIII. Corps in the St. Mihiel sector. In July 1916, having been meantime awarded the grade of commander in the Legion of Honour, he was appointed to command the French contingent of the Salonika armies grouped under Sarrail, which became the "Armée française d'Orient."

In general charge of the Allied left wing in Sarrail's autumn offensive he fought the actions of Ostrovo, Florina, Armenohor and Kenali, but owing to acute differences with Sarrail, which are discussed elsewhere, he returned to France just before the battle at Monastir which his movements and combats had prepared. He was already gravely ill, and immediately on landing in France was sent into hospital, where he underwent an operation for cancer. A command on the French front had been promised to him but he was never fit to take it up, and soon after the end of the World War he was placed on the retired list. He then devoted himself to historical and critical work on the war. In 1921 he published an account of the operations of the 87th Brigade under the title *Une Brigade au feu; Potins de Guerre*.

CORNELL UNIVERSITY (see 7.169).—The total enrolment of regular students in 1920 was 5,765 (including 1,127 women), divided as follows: graduate school, 407; college of arts and sciences, 1,812; college of law, 178; medical college, 312 in New York city and 37 taking freshman work in the Ithaca division of the college; New York state veterinary college, 103; New York state college of agriculture, 1,283; college of architecture, 130; college of civil engineering, 403; Sibley College of mechanical engineering, 1,210; duplicate enrolment, 170. In addition 2,171 students were enrolled in the 1919 summer session (especially for teachers) and 306 in the short winter course in agriculture in 1920. The students came from nearly all the states, territories, and insular possessions of the United States and from 38 foreign countries—e.g. there were 50 students from China, 30 from Europe, 25 from South America, 16 from Cuba, 7 from South Africa, 6 from Japan, 3 from Australia, etc.

In 1919–20 new endowment was pledged to the amount of \$5,700,000 to increase teachers' salaries. The same year an anonymous gift was received of \$1,500,000 to build and equip a new laboratory of chemistry; \$500,000 from August Heckscher of New York for the endowment of research, and from other sources special gifts aggregating \$708,000. Under the will of Goldwin Smith, \$683,000 was received in 1911 for the promotion of liberal studies, and from Jacob H. Schiff, in 1912, \$100,000 for the promotion of studies in German culture; in 1918 at Mr. Schiff's request the purpose was changed to the promotion of studies in human civilization, and in the same year Baron Charnwood gave 15 lectures on this foundation.

During the decade 1911–20 the university's physical growth continued; the state added 10 large buildings to the equipment of the two state colleges and built a new armoury for the department of military science; gifts of \$350,000 from George F. Baker, a New York banker, and \$300,000 from Mrs. Russell Sage provided four residential halls for students; Mrs. Florence Rand Lang of Montclair, New Jersey, added Rand Hall (machine-shop and electrical laboratory) to Sibley College. In 1919 the university's invested funds amounted to \$14,076,500, yielding in the fiscal year 1919–20 an income of \$738,100; the income from state and nation was \$1,397,800, and from tuition fees \$975,000. The grounds, buildings, and equipment were valued at about \$7,637,400. The area of the campus was 350 ac. and that of the experimental farms (adjoining the campus) was about 1,100 acres. The appropriation made by the state to the College of Agriculture for the fiscal year 1920 was \$1,800,588; in 1910 it was \$412,000. The regular annual tuition fee in 1921 was \$200, but in medicine it was \$300; tuition in the two state colleges was free to residents of New York state. The university library in 1920 contained about 630,000 volumes. Among the important recent accessions were the Charles W. Wason collection of works relating to China and the Chinese, 9,399 volumes, presented in 1918; the James Verner Scaife collection of books relating to the American Civil War; and the engineering library of the late Emil Kuichling, 2,093 volumes, presented by Mrs. Kuichling in 1919. The Willard Fiske bequests have been described in three important bibliographies: *Catalogue of the Icelandic Collection* (1914), *Catalogue of Runic Literature* (1918), both compiled by H. Hermannsson, and *Catalogue of the Petrararch Collection* (1916), compiled by Mary Fowler. The results of the Cornell expedition to Asia Minor and the Assyro-Babylonian Orient were published in 1911. In 1920 appeared the fifth volume of the *Cornell Studies in English*, founded in 1916. Several volumes have also been added to the *Cornell Studies in Classical Philology*, the *Cornell Studies in History and Political Science*, and the *Cornell Studies in Philosophy*. The valuable law library numbered about 53,300 volumes. The law school publishes *The Cornell Law Quarterly* (established 1915). Since 1900 the governor of New York state has appointed five members of the university's board of 40 trustees; 15 are co-opted, and the alumni elect ten; others are *ex-officio* members. Since 1916 the faculty has sent three representatives to the board who sit as trustees, but without a vote. Andrew Dickson White (*q.v.*), who, at the request of Ezra Cornell, drew up the original plans for organizing the university and served as its first president, died at Ithaca Nov. 4 1918. Pres. Jacob Gould Schurman (*q.v.*) resigned in June 1920, and Prof. A. W. Smith, dean of Sibley College, was elected acting-president. Of the 21,445 degrees granted since the founding of the university, 18,992, or more than seven-eighths, were granted during President Schurman's 28 years of service. He was appointed U.S. minister to China by President Harding in 1921. Dr. Livingston Farrand (*q.v.*) was elected president in June 1921. Dr. Farrand, formerly a professor in Columbia University, was president of the university of Colorado from 1914 to 1919, and was then appointed chairman of the Central Committee of the American Red Cross. For two years he directed the work against tuberculosis in France under the auspices of the International Health Board of the Rockefeller Foundation.

During the World War the university, in coöperation with the

War Department, conducted at Ithaca a school of military aeronautics, a school of aerial photography, a school for military artisans, and a unit of the Students' Army Training Corps, and, at the medical college in New York, a school of röntgenology for officers of the U.S. Army Medical Corps. Many members of the faculty gave professional or technical service to the Government. About 7,000 students and former students of the university were in uniform; 1,500 of these were in officers' training organizations when hostilities ceased; of the others, 3,300, or 60%, were commissioned officers; 216 died in the service; 147 were decorated for distinguished services or gallantry in action. (W. P.)

CORONEL (German, *Santa Maria*), the name given to the naval battle fought on Nov. 1 1914 about 40 m. to the W. of Coronel (Chile), between a British cruiser squadron under Rear-Adml. Sir Christopher Cradock and the German East Asiatic Squadron under Adml. Graf von Spee.

The British squadron consisted of the armoured cruisers "Good Hope" (flag, Capt. Philip Franklyn: 1902, 14,200 tons, 2 9-2-in., 16 6-in., 21 knots) and "Monmouth" (Capt. Frank Brandt: 1903, 9,800 tons, 14 6-in., 22-3 knots), the light cruiser "Glasgow" (Capt. John Luce: 1910, 4,800 tons, 2 6-in., 10 4-in., 25 knots), and the armed merchant cruiser "Otranto" (Capt. Herbert M. Edwards: 16 knots, 4 4-7-in.). In the case of the first three ships the full sea-going speed is given. The German squadron consisted of the armoured cruisers "Scharnhorst" (flag) and "Gneisenau" (both 1908, 11,420 tons, 8 8-in., 6 5-9-in., 20½ knots) and the light cruisers "Leipzig" (1906, 3,200 tons, 10 4-1-in., 20 knots), "Nürnberg" (1908, 3,396 tons, 10 4-1-in., 22 knots) and "Dresden" (1908, 3,544 tons, 12 4-1-in., 25 knots). The figures, even as they stand, are sufficient to establish a definite German superiority, but they were accentuated by other circumstances. In the heavy weather prevailing at the time the "Good Hope" and "Monmouth" could not fight their main-deck guns, and their broad-side discharge (including "Glasgow") was reduced to 2 9-2-in. and 12 6-in. with a weight of 1,960 lb. against the German 12 8-2-in. with a weight of 2,904 pounds. The Germans in addition had the inestimable advantage of having been in commission over two years and being in a state of prime gunnery efficiency, whereas the "Good Hope" and "Monmouth" were both 3rd Fleet ships, which had been lying idle in the dockyards, manned entirely with reserve men on the outbreak of war. The "Canopus" (Capt. Heathcoat Grant), another 3rd Fleet ship (with 4 12-in. and 12 6-in. guns), had been relegated by Rear-Adml. Cradock to purposes of convoy, as she could steam only 12 knots, and was 300 m. to the S. escorting two colliers when the action began. There can be little doubt that neither in guns nor in gunnery was the British squadron capable of meeting the enemy, and long before the fatal day it should have been reinforced by at least two cruisers of the 1st Cruiser Squadron, all of which were ships in long commission with good armament. ("Defence" carried 4 9-2-in., "Warrior," "Black Prince," "Duke of Edinburgh," 6 9-2-in.) This measure had been suggested, and even ordered in the case of the "Defence," but had never reached fulfilment. The "Black Prince" and "Duke of Edinburgh" were doing convoy work in the Red Sea and Indian Ocean, and the "Warrior" was at Port Said, while the "Defence" was with Rear-Adml. Stoddart on the east coast of South America.

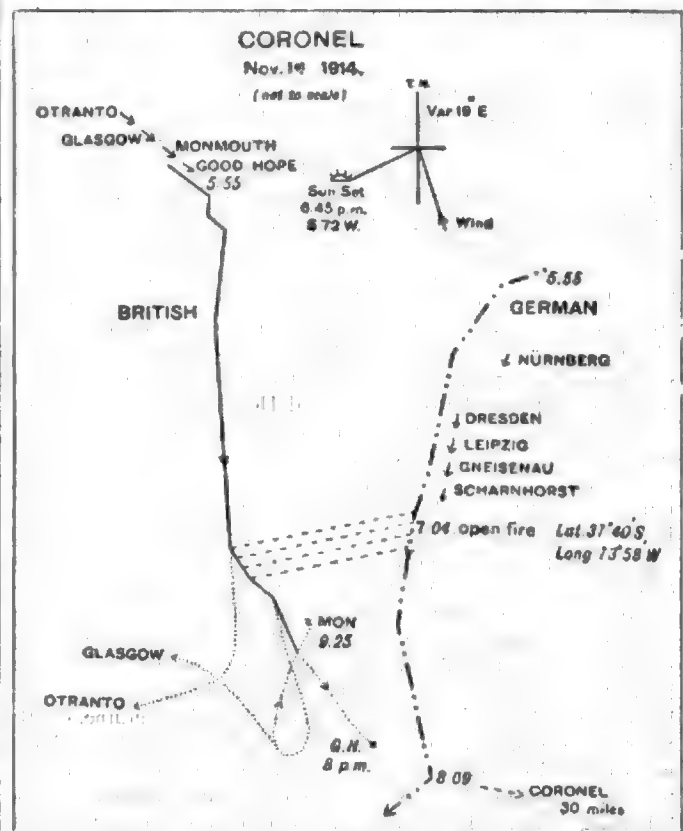

Cradock left Valparaiso (Chonos, Chile) with the "Monmouth" on Oct. 30 and proceeded N., leaving the "Canopus" to remedy engine defects and bring on colliers. The "Glasgow" had been sent on to Coronel (Concepcion) to send and receive telegrams, and a rendezvous had been arranged with her 50 m. W. of Coronel for Nov. 1. The junction took place at 1 P.M., and as the sea was too heavy for boats, the mail was floated to the "Good Hope." It had scarcely been opened, and the rear-admiral was probably just reading his telegrams, when at 1:50 P.M. German wireless sounded loud and clear.

Von Spee had come from Mas-a-Fuera, the last anchorage in his long Pacific trip. On Oct. 30 he had sighted the lofty ranges

of the Andes, and the "Prinz Eitel Friedrich," an armed merchantman, had been sent into Valparaiso to coal, while the squadron cruised at slow speed out of sight of the port. At 3 A.M. on Nov. 1 she sent news of the "Glasgow's" visit to Coronel on Oct. 31 and the German admiral steered S. to intercept her.

Cradock, when the report of German wireless came in, had made a signal to spread 15 m. on a line of bearing N.E. by E. (in the order from westward—"Good Hope," "Monmouth," "Otranto" and "Glasgow"), course N.W. by N., 10 knots, to get in touch with the enemy. At 4:20 P.M. the line was not yet completely formed when the "Glasgow," to the E., sighted smoke and altered course N. 80 E. to get in touch with it. At 4:40 P.M. she reported the "Scharnhorst" and "Gneisenau" steering between S.E. and S. She turned at once to S. 65 W., closing at full speed on the "Good Hope," and the whole line began to close rapidly on the flagship. The "Canopus" was 300 m. to the S., toiling with her colliers in a heavy sea.

Von Spee had been steering S. at 14 knots. The "Nürnberg" and "Dresden" had been detached to examine passing ships, and the former was 25 m., the latter 12 m. in rear. About

4:15 P.M. von Spee was about 40 m. N. of Arauco Bay when the "Glasgow" was sighted to the W., and he turned and followed, working up to full speed. It had been blowing hard from the S.E. (von Spee says S.), and a heavy sea was running, hurling sheets of spray right over the conning towers; the sun was setting in the south-west. When the "Glasgow" sighted the enemy the "Good Hope" was some 26 m. to W. of her, and turned to the E. to join her squadron, as they came closing in. By 5:50 P.M. the British squadron was in line, with the "Good Hope" leading and the "Monmouth," "Glasgow" and "Otranto" behind, on an easterly course. The enemy were about 11 m. away to the E., steering south-westward (see map). Both squadrons now altered course to the S., and by 6:4 P.M. were steering approximately parallel courses at a range of about 14,765 yards. Cradock then seems to have tried to close in order to force an action while the sun was still high enough to dazzle the enemy, but von Spee turned away and Cradock resumed his southerly course. Had he not been hampered by the

"Otranto," which could only go 16 knots, it is possible that he might have attempted to fall back on the "Canopus," for the rest of his squadron was faster than von Spee's and he could have slipped away to the S. during the night and picked up the "Canopus" next morning. But this would have meant forsaking one of his ships, and Cradock was not the man to take this course. He decided to fight, and sent the "Canopus" a message to this effect at 6:18 P.M. At 6:20 P.M. he turned towards the enemy, but von Spee turned away an equal amount. He was now about two points before Cradock's beam, biding his time and waiting for the sun to set.

The "Otranto" asked if she was to keep out of range, and not getting a clear reply drew out of line on the "Glasgow's" starboard quarter, a potent reminder that a ship that has no guns to fight and no speed to run away is a delusion and a snare. The sun was setting (sunset at 6:45 P.M.), and as soon as it dipped beneath the horizon (just before 7 P.M.) the English ships were silhouetted sharply against the red glow of the western sky, whilst the Germans were scarcely discernible against the gathering night clouds in the east. About 7:4 P.M. von Spee turned one point towards the enemy to clear the smoke, and opened fire at a gun range of 11,373 yards. The conditions were rendered difficult by spray, heavy sea and smoke driving down the line, but the shot fell only 500 yd. short. The third salvo hit the "Good Hope" forward at about 7:9 P.M. and sent up a burst of flame. The rest of the German squadron joined in, the "Scharnhorst" engaging the "Good Hope," the "Gneisenau" the "Monmouth," and the "Leipzig" the "Glasgow." The "Good Hope" had now opened fire, but in the failing light the splashes could not be seen and her firing was poor and ineffective. In the next quarter of an hour the German gunners found the target again and again, and by half-past seven the British cruisers were obviously in distress. The roof of the "Monmouth's" fore 6-in. turret had been blown off and the turret was blazing. She had sheered off to starboard about 7:15 P.M., and the "Glasgow," which continued to follow in the wake of the "Good Hope," had to ease down to avoid masking her fire. A fierce fire had broken out amidships in the "Good Hope" and was increasing in brilliance. It was almost dark. Though the moon had risen about 6:30 P.M. it was still low, but the glare of the fires kindled in the British cruisers offered a sufficient target. At 7:45 P.M. the "Good Hope" was losing speed; the range had closed to about 5,000 yards. About 7:51 P.M. two shells struck her between the mainmast and after funnel, and a vast column of smoke and fire rose into the air. When it subsided the ship was still afloat, but she was nothing but a gutted hull lighted by a dying glare, and she fired no more. Thirty-five hits had been counted on her by the "Scharnhorst's" gunners. By 8 P.M. the fire had died down, quenched by the sea. The "Monmouth" had ceased fire and turned away to the W., followed by the "Glasgow," who had been heavily engaged by the "Leipzig" and "Dresden" and had received five hits. The rising moon shone fitfully through the clouds, and the "Glasgow" continued to fire at any ship that showed up, but as this only betrayed her position she ceased fire at 8:5 P.M. The "Monmouth," badly down by the bows and listing to port, turned N. at 8:15 P.M. to get stern to sea. But von Spee had now launched his light cruisers to attack and they were hot upon the trail. The "Glasgow" could only leave the stricken field, and she lost sight of the enemy at 8:50 P.M.

It was the "Nürnberg," which had been making frantic efforts to overtake her squadron, that found the unfortunate "Monmouth." She missed her with a torpedo and opened fire at 800 yards. The "Monmouth" was listing so badly that she could not use her port guns. The "Nürnberg" ceased firing for several minutes to allow her to surrender, then gave her a final broadside, and she went down at half-past nine with flag flying. The "Otranto" had fallen out and was now working gradually round to the S. towards Magellan Straits.

The British shooting was poor. The "Scharnhorst" was hit twice with little injury; the "Gneisenau" received three

hits, one of which bent the flap of the after turret, an injury of little moment. This deficiency must be attributed partly to failing light and an inferior horizon but also to the fact that the ships had had scant opportunity for training and their fire-control equipment was poor. The squadron was weak in guns and gunnery. When the German squadron was sighted it would have been possible to fall back on the "Canopus," but this would have entailed the destruction of the "Otranto," which would have been overtaken by the enemy in two or three hours. Cradock preferred to fight and take the chance of inflicting injury on the German squadron, which was far from any base of refitment and repair. He fought a brave fight, checked von Spee in his onward career, and he and his men take their place in the great roll of naval heroes. His foe was a worthy antagonist. When the Germans at Valparaiso acclaimed him a naval hero, he shook his head. The wide spaces of the Pacific lay behind him, he had fought a famous battle, but the southern waters of the world lay before him, behind loomed the Atlantic, and he knew that Britain's arm stretched far. He found the sequel of his victory at the Falklands (see FALKLAND ISLANDS BATTLE).

(A. C. D.)

CORSON, HIRAM (1828-1911), American scholar (see 7:204), died in Ithaca, N. Y., June 15 1911.

COSTA RICA (see 7:219).—The internal history of Costa Rica is almost continuously concerned with the transmission of the presidential office. In 1889 the first comparatively free election seated José Joaquín Rodríguez, a clerical Conservative. He ruled practically without assistance from the legislature until he made use of it to seat Rafael Yglesias as his successor. Yglesias was reelected in 1898, but gave over the power in 1902 to Asunción Esquivel, after which time serious political revolts were infrequent. Fair liberty of the press was enjoyed, and elections were not abnormally corrupt. Cleto González Víquez was chosen president in 1906, and Ricardo Jiménez in 1910, both by popular vote. Alfredo González was named in 1914 by the legislature after the popular vote had failed to indicate a choice. The radical programme of González led to his forced removal by Federico Tinoco, who was elected to the presidency after his *coup* in 1917. Tinoco's power was minimized by his failure to obtain recognition from the U.S. Government. He was obliged to put down revolts in 1918; in 1919 a popular movement led by Julio Acosta drove him out of the country. Acosta, at first provisional president, was elected and inaugurated in May 1920. Costa Rica prospered under its recent rulers, who promoted public improvements, effected desirable sanitary measures, and promoted education. The landowners, professional men, and habitual politicians controlled the country, their politics being animated by clique and family considerations rather than by genuine differences in policy.

After 1913, the president, members of Congress, and the city officials were popularly elected. The president had large political patronage, dominating Congress. The judiciary was practically independent; its head was the Supreme Court, chosen by Congress. The central Government had more control over local affairs than was usual in Central America. Manhood suffrage was legalized in 1920, and the suffrage was extended to women also. During the World War Costa Rica was among the first of the Hispanic-American countries to evince sympathy with the Allied cause, although the German colony and German influence were strong. On Sept. 21 1917 the Government severed relations with Germany, and on May 23 1918 declared war on Germany. The pact for the Central American Union was signed in Jan. 1921 by Costa Rica, but was later rejected by the National Assembly. For boundary dispute, see PANAMA.

Finance and Economics.—During the period 1910-20 Costa Rican coffee was high-priced and a source of national prosperity. There was not, however, a large class of rich native landowners. On the plateau the small peasantry was prosperous and industrious. Foreigners controlled the mines, banks and commerce. The United Fruit Co. settled numbers of English-speaking people along the E. shore in the banana lands. From 1911 to 1918 the coffee crop ranged from 248,000 to 385,000 sacks, valued at from 8,221,000 to 14,789,000 colones (the colon equals \$0.4653). In 1920 the coffee export was valued at \$4,744,000. In 1918 the banana exportation

was worth 7,129,653 colonos. The exportation of the principal variety, *musa sapientium*, is about 11,000,000 bunches per annum. In 1912 the foreign trade was \$20,043,311. In 1917 the imports were \$5,595,240 and the exports \$11,382,166. In 1917 the national debt was \$20,254,000. The national budget, approved by the President Jan. 7 for the fiscal year 1920, estimated the expenditure at 12,866,533 colonos and the revenues at 13,006,000 colonos, leaving a probable surplus of 139,447 colonos. The estimated pop. in 1919 was 454,995; the area of the republic being about 23,000 sq. miles.

(H. I. P.)

COST OF LIVING.—Till recent years the phrase "Cost of Living" was only used loosely by economists when the balance between movements of wages and prices was in question, but from 1914 onwards during the World War the need of a measurement of the rise of prices gradually resulted in making the expression prominent in industrial and statistical discussions. In popular parlance it has since become a recognized economic problem. It has frequently been assumed that the term "Cost of Living" (or "High Cost of Living"—sometimes abbreviated to "H. C. L.") has a unique and definite meaning, and that accurate measurements can be applied to it, but in fact the meaning is vague and the statistical methods appropriate to it are complex and lead to results whose precision is not of a high order.

The phrase may be regarded as an abbreviation for "the cost in a defined region to persons typical of a defined social or industrial class of goods of a kind usually purchased at frequent intervals, by the consumption of which a certain standard of economic welfare is reached." We may usefully distinguish four cases: (a) where the standard is a physiological minimum; (b) where some conventional or average budget of expenditure is taken and the cost of the items in it is measured at different times or places; (c) where the items are varied but the whole contents of the budget result in an unchanged standard of welfare; (d) where both the contents of the budget are modified and the standard is raised or lowered. Case (b) is that which has in recent years been the subject of measurement, but case (c) is that which is in reality appropriate to the problem of measuring or adjusting real wages.

Case (a).—Prior to the World War attention was directed by Mr. Seeböhm Rowntree (*Poverty, A Study of Town Life*, 2nd ed. 1902) to the cost of obtaining in York (England) and elsewhere food, clothing, heat, light and shelter sufficient for a family to maintain itself in health and efficiency for work, when all possible economy was practised, subject to the availability of commodities and the legal requirements for housing, decency, etc. The minimum of food was computed in relation to the quantity of calories, carbohydrates and protein calculated by Atwater and others as necessary for maintaining health and vigour under various conditions of life, and dietaries were drawn up which contained the necessary constituents at the minimum aggregate cost; to this cost was added the expenditure on clothing, fuel, cleansing materials, etc., and rent, which was found to be customary among persons in regular work at the lowest rates of wages of adult men. The most natural meaning of the cost of living is perhaps the cost of maintaining the minimum standard thus described. The standard is, however, not scientifically definite; apart from questions as to the validity and applicability of the measurement by calories, it is clear that there must be a great difference between the amount of food necessary for work of low and of high efficiency; the Indian, Chinese and Japanese peasants live on a sparser diet and produce a lower output than the English or Americans; definable points are where efficiency is a maximum (which needs a more liberal diet than that considered by Mr. Rowntree) and where the value of additional efficiency exactly equals the cost of the additional food, etc., necessary (for whose ascertainment there are no observations); and Atwater's standard is in fact conventional (see Bowley, *Measurement of Social Phenomena*, chap. viii., 1915). If we drop the word "minimum" and speak of Mr. Rowntree's conventional standard for demarcating poverty, we can properly measure the change in the cost of living at this standard (if the facts are ascertainable). The varying cost of

the official civilian rations, computed in Germany circa 1919, gave a measurement similar to that described. The cost of Mr. Rowntree's standard, and one modified in the direction of ordinary purchasers by Bowley, was worked out for certain English towns in 1913 (*Livelihood and Poverty*, 1915). A legal minimum wage could be based on a standard thus defined, but in fact it is generally related to a higher conventional standard.

Case (b).—The usual method of measuring the change of the cost of living during and since the war has been as follows. Detailed statements of expenditure having been obtained from a number of working-class households (in most countries at some date prior to 1914), an average budget is formed showing so many pounds of meat, bread, etc., with the prices and expenditure in considerable detail. The average prices of the same foods are ascertained from time to time, and the expenditure necessary to purchase the former quantities at the new prices is computed. The cost of living (so far as food is concerned) is then taken as having increased or decreased in the same ratio as this standard budget. In many countries a standard of the same kind is established for clothing, fuel, light, rent, cleansing materials and some other articles, and the cost of the aggregate, including food, is computed from time to time. The result obtained (if the process were complete) would be the relative cost of maintaining a defined standard constant in every detail. It is generally expressed as a percentage; thus if the costs were 25s. and 30s. at the two dates, the ratio is 100:120, the index number at the second date is 120 and the percentage increase 20.

This method cannot be carried out in its entirety for two reasons, namely, lack of information and change of quality of the commodities in the market. In most countries data of expenditure and prices are only obtained for principal commodities (meat, bread, etc.) and not for those on which little is spent (currants, pepper, etc.); unless owing to shortage of supplies there is a run on the articles not included, these omissions cannot affect the result significantly. In some countries expenditure is not known, but only prices, and then the resulting calculation is generally valueless; and in others currency is so variable that the computation is meaningless. In nearly all cases there is no sufficient knowledge of expenditure on clothing either in total or in detail, and it is often difficult to obtain adequate data for fuel and light or for miscellaneous items. The sums included in the calculations, in fact, account for only a part of ordinary household expenditure, but where most care has been given to the question the part is a large proportion of the whole. Classes of expenditure that are not strictly necessary, such as amusements, tobacco, alcohol, etc., are generally omitted, as are occasional expenses (doctors, purchase of furniture, etc.), but in some cases subscriptions to trade unions, etc., insurance payments and travelling to work are included. The miscellaneous expenses omitted become a large proportion of total expenditure as we go up the scale of incomes. The difficulty due to the change of quality of goods which has been so marked since 1914 is even more fundamental. Over any long period the actual constituents and quality of a pound of bread, a cut of meat, a pair of boots, change considerably, but from some points of view these gradual changes are not important. During the war, however, substitution of one commodity or ingredient for another was sudden and common, and the pre-war quality was unobtainable at any price, or if obtainable had a quite altered position in domestic economy. Consequently the prices included in the calculations were frequently not for the same things at different dates and the precision of the measurement was greatly diminished. After the Armistice there was some return to former qualities, but the change has been sufficient to undermine the foundation of the numbers, and a new basis is necessary, as discussed in the following sections.

It should be added that separate budgets ought to be formed (and in some countries have been formed) for different grades of income and for different classes of occupation, and also for single persons and for married persons with dependents.

The structure of the index numbers of the cost of living is shown most clearly by algebraic symbols. If Q_1, Q_2, Q_3, \dots are the number

of units of the commodities in the standard budget, and P_1, P_2, P_3, \dots the prices per unit at the date taken as starting point, and we write $Q_1 \times P_1 = E_1, Q_2 \times P_2 = E_2, \dots$ where E_1, E_2, E_3, \dots are the expenditures on the commodities, then $E = E_1 + E_2 + \dots = Q_1 P_1 + Q_2 P_2 + \dots$ is the whole expenditure at the first date on the standard budget. Let p_1, p_2, p_3, \dots be the prices per unit at a subsequent date; then $Q_1 \times p_1 = e_1, Q_2 \times p_2 = e_2, \dots$ are the presumed expenditures, and $e = e_1 + e_2 + \dots = Q_1 p_1 + Q_2 p_2 + \dots$ is the whole expenditure. The ratio of the cost of the standard budget at the second

date to that at the first, is $\frac{e}{E} = \frac{Q_1 p_1 + Q_2 p_2 + \dots}{Q_1 P_1 + Q_2 P_2 + \dots} = \frac{E_1 r_1 + E_2 r_2 + \dots}{E_1 + E_2 + \dots}$

where $r_1 = p_1/P_1$ (the price ratio for the first-named commodity at the two dates), $r_2 = p_2/P_2, \dots$. The last expression shows that by this method the ratio of the costs of living is a weighted average in which the price ratios are weighted by the expenditures at the first date; hence we only need to know these expenditures and ratios, and not the actual quantities nor prices. In the official measurement in the United Kingdom only the quantities E and r are in fact used; this method is very convenient in dealing with rent (for which there is no natural unit of quantity) and with clothing (for which a general price ratio is obtained without any definition of unit). The general theory of weighted averages shows that a considerable roughness in the estimation of the smaller expenditures is smoothed out in the process of averaging, but that it is important to obtain precision in the case of large items, such as clothing, treated in a single entry, and rent. It is important, however, that the r 's should be accurately known when they differ much from one another, and the quality of the commodities that are priced should be the same at both dates.

The index number for the second date is $\frac{e}{E} \times 100$, and the percentage increase is $\left(\frac{e}{E} - 1\right) \times 100$.

Case (c).—It must be granted that when the cost of living is compared at two places or at two dates we ought not to assume that precisely the same quantities of the same commodities are purchasable in both cases, and in order to make a strict numerical comparison we need a test of equality of standard if not a means of comparing two standards. The problem so stated has not yet been completely solved. A measurement could be made on a strictly nutritive basis and the cost of purchasing in the most economic way the amount of calories (including the necessary protein) considered proper to health and efficiency could be ascertained in both countries or at both periods; but this would only give a theoretic solution, since it ignores the influence of custom and taste in diet, and, in fact, in developed countries relatively few people have been compelled to purchase their nutriment in the cheapest possible way. The actual practical question in England in 1921 was what was the cost of maintaining the pre-war standard of living in nutritive power and satisfaction or pleasure derived from food and clothing, allowance being made for changes in prices and available qualities. This statement introduces the vague word *satisfaction*, which it is not practicable to define exactly, though some mathematical methods based on economic principles have been suggested for ascertaining its equality in two cases.

It has been suggested (Bowley, "Measurement of Cost of Living," *Journal of the Royal Statistical Society*, May 1919, p. 354, and "Cost of Living and Wage Determination," *Economic Journal*, March 1920, p. 117) that an approximation could be reached by devising "a diet, based on available supplies, as nutritious, digestible and not less attractive than the pre-war diet, and estimate at what price it could now be obtained," or "to frame a new budget of goods obtainable, and, in fact, purchased, by housekeepers with the same skill of adjusting purchases to desires as in the case of the earlier budgets. Instead of measuring satisfaction by formula, we may recognize that it is subjective and a matter of opinion, and obtain from representative working-class women a budget which in their opinion would now give the same variety and pleasure as a selected budget of 1914, care being taken that the energy value is the same. The result would give a new conventional budget, the ratio of whose cost to (that of) the pre-war budget would give a rough measure of the change of . . . the cost of living." It should be added that this solution would only be definite if the "satisfaction" was obtained as cheaply as possible, it being assumed that before the war given sums of money were laid out to the best advantage. This method would only be satisfactory if fairly close agreement was obtained as to the equality of the new with the old standard.

Another method has been used in the case of comparison of the cost of living in two places. In 1905 the Labour Department of the Board of Trade (United Kingdom) initiated inquiries about the cost of living in the United Kingdom, United States, France, Belgium

and Germany, and obtained budgets of expenditure in each country; the results are published in the official papers Cd.3864, Cd.5609, Cd.4512, Cd.5065 and Cd.4032. A comparison was made between the cost of living in the United Kingdom and in each other country on a double basis, as follows:—it was found that an English housewife purchasing in 1909 in the United States a week's supply of food as customary in England would have spent 38% more in the first-named country, the ratio of the costs of living being on this basis 100:138; on the other hand, an American housewife purchasing in England a week's supply of food as customary in America would have found her expenses reduced in the ratio 125:100 (Cd.5609, pp. lxvi, lxvii.). If these ratios had been reciprocal, either would measure the difference in the cost of living (so far as food is concerned); as it is, their divergence illustrates the want of definiteness in the problem. Now it is quite possible to obtain in any country a current budget to be compared with a pre-war budget and the method just described can be applied. Thus, in the *Journal of the Royal Statistical Society*, May 1919, p. 344, details are given of the standard pre-war British budget and of the average of budgets collected by an official committee on the cost of living in the last year of the war, in which the standard of living had been modified and had fallen somewhat. A housewife purchasing in 1918 the same qualities and quantities of food as in 1914 would have increased her expenditure in the ratio 100:212, while if she had purchased in 1914 the same qualities and quantities as in 1918 the ratio of the earlier to the later expenditure would have been 100:202. Both these are possible measurements (the first being identical with case *a* above), and where the difference between them is so moderate an intermediate number, such as the arithmetic or geometric mean (which are nearly coincident), 100:207 makes a plausible measurement of the change.

Another method, allied to that just described, gives perhaps the most practical solution, though its adequacy can hardly be proved from theoretic conditions. Obtain typical budgets of expenditure at two dates; compile a new or mean standard of quantities which item by item are the averages of the entries in the budgets; thus, if in one the consumption of 33 lb. of bread is stated, in the other 35 lb., enter 34 lb. in the mean standard; now find the cost of the mean standard at each date and take the ratio of these costs as the measurement of the change in the cost of living. In the example just used this ratio was found to be 100:204. (On the methods formerly used for this problem, see Palgrave's *Dictionary of Political Economy*, vol. iii., article "Wages, Nominal and Real," p. 640.)

If all prices rose in the same ratio the methods now described would necessarily yield the same result; the need for choice arises from inequalities of increase, including the case where the goods are no longer in the market as one where the price is indefinitely great. Now if at one date purchases are made so as to maximize the satisfaction in the outlay of the week's house-keeping allowance, as we may reasonably assume, and prices rise irregularly, it is evident that somewhat less will be bought of the commodities which have risen most and more of those which have risen least if a maximum is still obtained, and that consequently the increase in the expenditure necessary to obtain the same satisfaction as before is less than the increase if exactly the same quantities had been purchased. For example, if oranges are doubled in price and bananas increased only by one-half, more bananas and fewer oranges will be purchased.

If with the notation used above we also write q_1, q_2, q_3, \dots for the quantities purchased at the second date, the measurement ob-

tained by using these quantities is $\frac{q_1 p_1 + q_2 p_2 + \dots}{q_1 P_1 + q_2 P_2 + \dots} = \frac{1}{100} I_2$

(say) instead of $\frac{Q_1 p_1 + Q_2 p_2 + \dots}{Q_1 P_1 + Q_2 P_2 + \dots}$ (as above) = $\frac{1}{100} I_1$ (say). If the

small letters refer to a second place (instead of date), then as between England and America $I_1 = 138$ in the illustration $I_2 = 125$. For two dates the method illustrated from expenditure on food in England gives $I_1 = 212$ and $I_2 = 202$, and the suggested index number is $I_3 = \frac{1}{2}(I_1 + I_2) = 207$. The other method recommended is to take

$I_3 = \frac{\frac{1}{2}(Q_1 + q_1)P_1 + \frac{1}{2}(Q_2 + q_2)P_2 + \dots}{\frac{1}{2}(Q_1 + q_1)P_1 + \frac{1}{2}(Q_2 + q_2)P_2 + \dots} \times 100$. It is easily shown

that I_3 is always intermediate between I_1 and I_2 , and by a more troublesome analysis that I_3 is less than I_1 when prices in general are rising and quantities consumed of individual goods have increased or diminished according as their prices have risen more or less than the average as measured by I_1 ; in fact

$$I_1 - I_3 = 100 \frac{(p_1 - r P_1)(Q_1 - q_1) + (p_2 - r P_2)(Q_2 - q_2) + \dots}{(Q_1 + q_1)P_1 + (Q_2 + q_2)P_2 + \dots}$$

where $100r = I_1$, and the factors in each term of the numerator are both positive or both negative under the conditions named. Hence, I_3 satisfies many of the fundamental conditions of the measurement required. Bowley (*Stat. Journal*, loc. cit., p. 351) suggests as

a measurement of the loss of satisfaction in the case of a falling standard the expression

$$\left\{ (Q_1 - q_1) P_1 + (Q_2 - q_2) P_2 + \dots \right\} / \left\{ Q_1 P_1 + Q_2 P_2 + \dots \right\} \quad \text{i.e.}$$

the ratio of the cost of the decrease in quantity to that of the quantities at the first date, both valued at the prices of the first date; this method leads to I_1 as the index of the increase of cost of living, but it is not of general application for it does not give equal importance to the distribution of expenditure at both dates since I_2 does not involve Q_1, Q_2, \dots

T. L. Bennett ("Theory of Measurement of Changes in Cost of Living," *Journal of the Royal Statistical Society*, May 1920) carries the argument further by important steps. With the notation already used, he supposes that a housekeeper gradually changes her purchases from quantities Q_1, Q_2, \dots at prices P_1, P_2, \dots to quantities q_1, q_2, \dots at prices p_1, p_2, \dots , the quantity of each commodity bought being related to its price by a law of demand. He then shows that the increase of expenditure, when the final is compared with the initial date, viz. $e - E$, is algebraically equal to $X + L$, where

$X = \frac{1}{2}(Q_1 + q_1)(p_1 - P_1) + \frac{1}{2}(Q_2 + q_2)(p_2 - P_2) + \dots$ and $L = \frac{1}{2}(q_1 - Q_1)(p_1 + P_1) + \frac{1}{2}(q_2 - Q_2)(p_2 + P_2) + \dots$ and he identifies X as measuring the increased expenditure necessary to preserve the former standard of living and L as measuring increased satisfaction from increased consumption (or if L is negative a decrease).

This method gives a useful and simple test of the equivalence (as measured by satisfaction) of two budgets at different dates in the same country, for L should be zero, that is $q_1 \cdot \frac{1}{2}(p_1 + P_1) + q_2 \cdot \frac{1}{2}(p_2 + P_2) + \dots$ should equal $Q_1 \cdot \frac{1}{2}(p_1 + P_1) + Q_2 \cdot \frac{1}{2}(p_2 + P_2) + \dots$. This test should be applied if the suggestion made above of constructing an equivalent budget for comparison is carried out.

If L is negative it would be necessary to add to expenditure e to make it equivalent to the earlier expenditure E , and Bennett, having regard to the changed purchasing power of money, suggests a somewhat complex and indefinite method of ascertaining the necessary amount; the index number for the cost of living may be written

approximately $100 \times (e + L \sqrt{I}) / E$, where I is chosen as one of the index numbers already written.

Case (d).—The problem with which many countries were faced in 1920 and 1921 was in reality not that of preserving a standard of living on the level of 1914, but of adapting themselves to a lower average standard, whatever the fortunes of favoured classes. This may be illustrated by the arrangement of the salaries of civil servants in England in Feb. 1920. At that date the official measurement (on method *b*) of the increase in the cost of living over 1914 was 130%. The full increase of 130% was awarded to persons with a wage of 35s. weekly (£91 5s. per annum), 60% was added to the residue of salaries up to £200, and 45% to the residue of the salary. Thus a man whose salary was £400 on the pre-war basis received an addition of £273½ (130% on £91 5s. = £118½, 60% on £108 15s. = £65½, 45% on £200 = £90), about 68% in all. This increment was increased or decreased by one twenty-sixth part for every complete movement of 5 points in the official index number averaged over certain periods. It appears to have been assumed on the

be regarded as the cost of maintaining the standard customary to the social or occupational class concerned at a given time and place. In this sense the cost of living of Chinese labourers is lower than that of the Americans, though they pay the same prices for commodities. When "cost of living" is used in this sense it should always be accompanied by a reference to the standard attained. Thus the British Committee on the Cost of Living in 1918 estimated the average expenditure of working-class families in 1914 and 1918 and at the same time reported on the change of standard. In some of the statistics quoted below a conception of this kind is involved in the figure.

UNITED KINGDOM

(a) *Cost of Food*.—In the United Kingdom the basis of the official measurement of the cost of living is that of finding the cost of a standard budget of expenditure at various dates (see *Labour Gazette*, March 1920, p. 118, and *Report on Working-Class Rents and Retail Prices*, Cd. 6055 of 1913, pp. 299 seq.). The standard budget was obtained from a collection of 1,944 records of weekly expenditure made in 1904; the average weekly family expenditure was 36s. 10d., of this 22s. 6d. was spent on food, and of the food 18s. 6d. is accounted for in the standard used prior to the war. A somewhat altered basis was taken in 1914. Rice, tapioca, oatmeal, pork, coffee, cocoa, jam, treacle, marmalade, currants and raisins (the expenditure on all of which was about 2s. 1d. in 1904) were omitted and fish and margarine added (an addition equivalent to 6d. in each case). It was assumed that, though prices had increased between 1904 and 1914, the relative expenditure (which alone enters into the computation) on the different commodities was unchanged; this assumption is too rigid but not unreasonable, and the facts otherwise known about price movements and consumption show that the error introduced is insignificant.

Relative importance being determined, the next step was to ascertain the movement of prices. Prior to 1914 the records were obtained exclusively for London, but it was shown (Cd. 6055, pp. 299 and 306) that from 1907 to 1912 the average movement was very nearly the same in provincial towns as in London. From Aug. 1914 statements of prices were obtained for 650 towns and villages.

The index numbers of the cost of living, so far as food is concerned, were then obtained by the method *b* described above; prior to 1914, the year 1900 was taken as base and the prices then equated to 100; from the beginning of the war July 1914 was taken as base.

The index number is in the form $100 \times (E_1 r_1 + E_2 r_2 + \dots) / (E_1 + E_2 + \dots)$ where E_1, E_2, \dots are the expenditures on the separate commodities in the standard budget and r_1, r_2, \dots are the ratios of the prices at any particular time to the prices at the basic date. The values actually taken for the E 's were as in Table I., being proportional to the expenditure.

one hand that the expenses of the middle class had not increased so much as indicated by the index number based on working-class expenditure, and on the other that the standard of living must be lowered—the higher the income the greater the fall. A similar scale was adopted at nearly the same date for railway officials. We are thus led to consider a conventional standard of living which changes from time to time. When there is no reference to a physiological minimum, the cost of living may

There are certain weaknesses in the method. It is assumed without explicit evidence that expenditure on meat was in the proportion 2s. on beef to 1s. on mutton, and that British and foreign meat were of equal importance, and the price ratios taken for meat are for four selected joints only; during the period 1915 to 1919, when the relative quantities available varied and relative prices were altered, this assumption affects the index numbers. The weight assigned to margarine is ar-

bitrary. The number of eggs consumed (about 12 per household per week) is based on summer records and is no doubt higher than the average for the year.

The resulting index numbers were as in Table II:—

TABLE II.

Index numbers of retail food prices in United Kingdom. (London only prior to 1914.) Average for year unless otherwise stated.

1903 . . . 92	1909 . . . 96	1914 (Aug. to Dec.) . . . 112

		May . . . 232
		June . . . 218

For the monthly figures from Aug. 1914, see the article PRICES.

During the war the validity of these figures was much weakened by the failure of the supplies necessary for the budget to be realized. In 1918 a committee on the cost of living (Cd.6080) collected 1,400 budgets from the urban working-class of a kind comparable with the standard budget already named. Among the differences found were the following (Table III):—

TABLE III.

Weekly Consumption of a Standard Family.

		1914	1918
Bread and flour	lb.	33.5	34.5
Meat	lb.	6.8	4.4
Bacon	lb.	1.2	2.55
Eggs (number)		13.0	9.1
Cheese	lb.	.84	.41
Butter	lb.	1.7	.79
Margarine	lb.	.42	.91
Sugar	lb.	5.9	2.83
Potatoes	lb.	15.6	20.0

The consumption in 1918 practically exhausted the supply, and the calculation of what the 1914 budget would have cost if the quantities had been available at the prices of 1918 was purely theoretical. The committee found that in fact expenditure on food was 90% higher than in 1914 at a date when the above index number showed an increase of 108%. The committee estimated that the nutritive value (measured in calories) of the 1918 budget was only 3% lower than that of 1914. Similarly a committee on the financial results of the occupation of agricultural land and the cost of living of rural workers (Cmd.76 of 1919) reported (p. 43) that the expenditure on food of agricultural labourers had increased 84% since 1914 at a date when the index numbers showed an increase of 108%, and that the nutritive value had fallen 3% as in the towns. Possible methods of measuring the change of the cost of living under such circumstances have been discussed above; here it is only necessary to say that the official index number is not valid.

After the Armistice supplies tended to return to their pre-war level except in the cases of sugar, eggs, butter and cheese; margarine of an improved quality took the place of butter to a considerable extent. The increase of prices over 1914, however, varied greatly from commodity to commodity; thus in March 1921 British beef and mutton were respectively about 161 and 176%, while imported beef and mutton were only about 109 and 100% above the level of 1914; sugar had risen 310%, butter 145%, eggs 200%, tea only 74% and margarine 67%. With this variation it is certain that an unchanged standard would not be composed of unchanged constituents and that (as argued above) the cost of living had risen less than the index numbers show, unless expensive substitutes had taken the place (e.g.) of sugar. There had been no information obtained, however, as to new arrangement of consumption up to the summer of 1921.

(b) *Other Commodities.*—Next in importance to food comes rent. The figure included in the index number allows for such increases for rates, repairs, etc., as are legally permissible and

is accurate for persons who by remaining in the same house since 1914 have the benefit of the Rents Restriction Acts; the increase for those who have moved must have been very variable and for it no estimate is available.

The cost of clothing, which ranks next to rent in expenditure, is always very difficult to measure owing to the difficulty of defining the garments or stuffs purchased, and of assigning their relative importance in the budget, and also there was great variability in the qualities in the shops during 1914 to 1921. The difficulties can be understood by comparing the estimates and method of the Cost of Living Committee (*loc. cit.*, pp. 21-3) with those of the official index number described in the *Labour Gazette*, April 1921, pp. 178-9; the former found an increase of 96% between July 1914 and the summer of 1918, the latter reaches increases of 210% in June and 240% in Sept. 1918. The differences are partly attributable to the great variability of the increases among the articles in consequence of which the relative importance given to each has great effect, and in this respect the committee's measurement is the more systematic; and partly due to the difficulty of obtaining quotations for the same qualities of goods or in allowing for substitution. The question is too intricate to discuss here; it can only be suggested that the results have little precision, and that the process of obtaining an estimate based on a new budget in which modifications of custom are allowed for is even more necessary than in the case of food.

Fuel and Light present little difficulty when a general average for the country is in question since the retail prices of coal and of gas are ascertainable. The variation from north to south in price and consumption and that between winter and summer is not very important, since where coal is dear, gas is used for cooking, and in working-class households one fire is necessary throughout the year for cooking and this also provides heat.

The official index number allows only one-twelfth of the weekly expenditure for all items not already included, or about 1s. 6d. per household in 1914. This sum is exhausted by cleansing materials with a very small margin for tobacco, newspapers, household replacements, and fares. Insurance and trade-union subscriptions are not included, nor is alcohol.

The five classes of expenditure now named are combined in the following proportions, stated for clearness on the basis of a pre-war urban weekly expenditure of 37s. 6d. Food 22s. 6d., rent (including rates) 6s., clothing 4s. 6d., fuel and light 3s., sundries 1s. 6d. Here the proportions on food, rent and light rest on good evidence; that on clothing, for which the expenditure varies greatly according to the income and personnel of the family and for which there has never been a satisfactory investigation, is little more than a guess based on vague estimates; that on sundries is the residuum when other expenses are met and is probably too low.

The results are tabulated in Table IV:—

TABLE IV.

Official Measurement of Cost of Living in the United Kingdom.

	Food	Rent	Cloth- ing	Fuel & Light	Sun- dries	All combined
Relative im- portances	60	16	12	8	4	100
July 1914	100	100	100	100	100	100
Dec. 1914	116	*	*	*	*	110 (approx.)
June 1915	132	*	125	*	*	125
Dec. 1915	144	*	135	*	*	135
June 1916	159	*	155	*	*	145

Dec. 1918	229	*	360	*	*	220
June 1919	204	105	360	*	*	205
Dec. 1919	234	117	370	185	*	235
June 1920	255	117	325	230	220	250
Dec. 1920	282	142	305	240	230	269
June 1921	278	145	300	255	210	219

The statistics are for the beginning of each month.

* Not stated separately at these dates.

The numerical importance of the criticisms indicated may be seen by computing the number for Dec. 1920 with the following alterations: suppose that the modification of diet (margarine instead of butter, decrease of sugar and eggs and increase of other foods) reduces the food index to 260, that the increase in clothing cost is half that shown (as indicated by the Cost of Living Committee for 1918) and the index is 200 instead of 305, and that rent accounts for 20% of all expenditure, food for 50% and sundries for 10%, instead of 16, 60 and 4% respectively, then the index number would be 225 instead of 260. This is, perhaps, an extreme hypothesis, but it has been suggested (Bowley, *Prices and Wages in the United Kingdom, 1914-1920*, p. 75) that a standard equivalent on the whole to, but modified in detail from, that of 1914 might have been attained throughout by an increase of expenditure equal to four-fifths of that officially stated ($100 + 4/5$ of 169 = 235 in Dec. 1920).

OTHER COUNTRIES

(a) *Cost of Food*.—The experience of other countries has been similar to that of the United Kingdom both in the dates of increase and in the difficulties of satisfactory measurement. Table V contains in summary form the index numbers showing the movement of food prices in all the countries which are known to publish official figures based on 1914 prices. Except in Belgium, where the index numbers are the simple average of prices of selected commodities, the measurement is made on the same method as in the United Kingdom and based on the expenditure found from a collection of working-class budgets, though in some countries the number of such budgets is very small. In some cases, noted in the sequel, some changes in commodities are introduced, and in others alternative measurements based on actual expenditure at different dates are given. These numbers are summarized from time to time in the *Labour Gazette* (London), the *Labor Review* (Washington), in the *International Labour Review* (Geneva), and in the *Monthly Bulletin* of the Supreme Economic Council; they are of course also to be found in the official publications of each country.

Though the movements are by no means uniform, the rise is universal, and, except for a temporary break after the Armistice, continuous in nearly all countries till at least July 1920.

The break in the rise occurred at various dates after June 1920, as shown by figures in Table VI.

TABLE VI.

*Figures for beginning of following month.

The prices are of course strongly affected by the relative value of the currency in the countries, and some indication of the effect may be seen (Table VII) by converting them to a gold basis by means of the exchange on New York. July 1920 is taken as being near the date of maximum prices. Corresponding figures are also given for Jan. 1921.

TABLE VII.

	Food index number	Exchange on New York as percentage of parity	Deduced index number	Deduced index number
			July 1920	Jan. 1921
London	258	76.6	198*	210
Paris	373	39.4	146	151
Rome	318	27.6	88	71
Amsterdam	210	85.5	180	168
Stockholm	297	79	235	230
Switzerland	235	88*	207	193
Australia	194	77 (approx.)	149	142
United States	215	100	215	169

*Obtained by converting through London, thus: $258 \times 76.6 \div 100 = 198$.

Thus if an American had come to London with \$198 in July 1920 he could have converted them into as many £ currency as would buy as much food as \$100 would have purchased in July 1914. In Rome he would have needed only \$88.

New Zealand	100	112	119	127	139	143	144	158	171	174 (Feb.)

*NOTES.—United Kingdom.—The figures relate to the first day of the month following that named.

France, other towns.—The figures include fuel and light; the number 380 relates to June not July 1920.

Switzerland.—The numbers relate to June not July in each year.

Belgium.—The base is April 1914.

Netherlands.—In some accounts 217 is stated for July 1920 instead of 210; the basis in 1914 is the average for the year, not the month of July.

Spain.—The July figures are for the average April to Sept. and the Jan. figures the average Oct. to March each year.

South Africa.—The figures for 1914 to 1918 are the averages for the years, not July only.

It is evident that neither the currency reckoning nor a conversion to a gold basis show the real meaning of the increase of prices; we need also to know the change of income accruing to purchasers, on which some information is given below.

In *Germany* a calculation of a standard food budget based on official maximum prices in 200 localities was made monthly for the years 1914-9 (*Deutscher Reichsanzeiger*, Dec. 19 1919). Since the foods could not generally be obtained and there was much evasion of regulations the numbers have hardly even academic interest, and the more important information is that given below under cost of living. The numbers in question yield the following figures (Table VIII):—

TABLE VIII.
Index Number for Standard German Budget.

	1914	1915	1916	1917	1918	1919
Jan.	102	118	161	214	225	253
July	100	152	213	220	231	328

In *Finland* (*Abo Underrättelser*, Feb. 25 1920) it appears that the cost of 1 litre of milk, 5 litres of potatoes and 1 kilo. each of butter, flour, bread, meat, bacon, sugar and coffee rose from 11.68 to 106.23 Finnish marks between 1914 and the beginning of 1920, an increase in the ratio 100:909.

For *Japan* a correspondent of the *London Economist* (Aug. 9 1919) gave details showing that the expenditure on food of an ordinary family had doubled in Tokyo between the first quarters of 1916 and 1919.

(b) *Other Commodities*.—The preceding tables relate (with certain exceptions) to food only. In many countries index numbers of the cost of living including other expenditure are published with more or less regularity. The relative importance given to classes of expenditure in pre-war budgets is as shown in Table IX, each expenditure being expressed as a percentage of that allotted to food:—

TABLE IX.

	United Kingdom	United States	Norway	Sweden	Denmark	Holland	Rome	Milan	Canada	New Zealand	Uruguay
Food	100	100	100	100	100	100	100	100	100	100	100
Rent	27	35	33	34	35	35	21	18	66	33	77
Fuel & Light	13	14	9	11	11	14	12	7	19	11	—
Clothing	20	43	26	25	28	28	16	19	—	26	56
Other items	7	69 ^a	40 ^b	58 ^c	36	43 ^d	11	16	—	39 ^e	59 ^f

^a including 13 for furniture; ^b including 3 for taxes; ^c including 14 for taxes; ^d including 2 for taxes; ^e including 3 for taxes; ^f fuel and light included in other items.

It is clear that the methods of establishing the original budgets varied greatly from country to country. Since rent has increased little for those who have not moved and clothing has increased greatly in expense a good deal depends on the relative importance allotted to these items.

The various countries have collected information about the cost of living at different dates in rather sporadic ways. Only the United Kingdom has computed a monthly index from the beginning of the war on a uniform system. No doubt the difficulties of measurement and of obtaining data described above have been experienced in all countries and it would require very detailed criticism to ascertain whether the basis of collection was sufficiently wide and whether the prices were typical. The numbers in Table X must only be regarded as approximate both in respect of amount and of date, but they indicate the periods of increase and show in which countries it has been most rapid. In most countries there has been a shortage of houses and a legal restriction on rent; the figures are based in general on rents which have been hindered from rising. Whether the index number of food exhibited in the previous table or that of the cost of living has increased most depends mainly on a balance between rent and the cost of clothing, and the latter must have been uncertain in all countries.

In general the index numbers show a nearly regular increase from 1914 to the end of 1918, stationariness in 1919 and a rapid rise to a maximum at the end of 1920.

Many of the figures have been given from time to time in the *Labour Gazette* (London) and the *Labor Review* (Washington) and in similar publications in other countries. For Table X they have been extracted from the originals in the country to which they relate as far as possible.

^a Average for 1913. ^b The original figures for Amsterdam are based on a calculation for 1910-1; it is estimated from other data that prices rose 7% between 1910 and 1914 and the numbers are adjusted on this assumption, but they can only be regarded as approximate when 1914 is compared with other years; for the sequence beginning 1917 the relative numbers are correct.

In some other countries there have been occasional calculations on a similar basis. In *Uruguay* (*Boletín de la Oficina Nacional del Trabajo*, Montevideo, May-Aug. 1919) the increase in necessary expenditure from 1913 to 1919 is given as 44% for an unmarried and 36 or 37% for a married labourer. In *Argentina* (*Revista de Economía Argentina*, May 1920) the increases in food, rent and other expenses are stated as 32, 16 and 165% respectively from 1914 to 1918 and as 45, 50 and 150% from 1914 to 1919. For *Hungary* (*Labour Gazette*, April 1921) a statement is quoted that whole family expenditure was in Jan. 1921 47 times as great in currency as before the war; rent had only increased 65%. For *Germany* an estimate is given (International Financial Conference, Brussels, 1920, Paper vii., statistics of retail prices) that the index number for food, clothing, rent, fuel, etc., in 28 towns was 373 in April 1919 compared with 100 in Jan. 1914, and if 373 is taken for Frankfurt-on-Main in April 1919 subsequent numbers for that town are: Sept. 1919 433, Nov. 1919 466, Jan. 1920 630 and March 1920 740.

CHANGE OF STANDARD OF EXPENDITURE

In all the tables so far given the index numbers are intended to measure the change in cost of an unchanged and unmodified standard, except that in Denmark there has been a slight change in the relative quantities of butter and other fatty substances. In a few countries, however, the actual change in expenditure ($100\Sigma q_p + \Sigma QP$ in the notation described above, instead of $100\Sigma Q_p + \Sigma QP$, the formula for unchanged standard), and in Amsterdam the index number, has also been calculated by using quantities currently bought instead of the original standard ($100\Sigma q_p + \Sigma qP$).

For the United Kingdom the Cost of Living Committee of 1918 (Cd.8980) compared the expenditure of a standard artisan family in 1914 and the summer of 1918, and found the increase to be 74% to June 1918 and 80% to Sept. 1918, when the increase on the standard budget was 100 and 110%; the difference was partly due to the methods of treating clothing; for food alone in June 1918 the increase in expenditure was 90% and in the cost of the standard budget 108%. The Ministry of Food also made a computation of the change in the cost of the average quantities of some principal foods consumed in the United Kingdom from time to time, yielding the comparison shown in Table XI:—

TABLE XI.

	Expenditure on Principal Foods*	Index Number for Standard Budget
July 1914	100	100
Feb. 1918	144	208
June 1918	181†	208
Sept. 1918	197	216
March 1919	181	220
Jan. 1920	215	236

*The figures in this column are those stated in the *Labour Gazette* for two months later, but it is known that the computation was in arrear of the facts, at least at the earlier dates.

†190 if all the foods of the standard budget were included.

The differences point to important modifications of diet under rationing and control of prices; the Cost of Living Committee found that the nutritive value had fallen very little.

In Switzerland an estimate was made by Dr. Jenny (*Journal de Statistique et Revue économique suisse*, 1918 fascicule i., pp. 76 seq.) of what he calls the "nominal" and the "effective" increase of cost. The nominal increase, viz. that of an unchanged standard of food, was 92% between 1912 and March 1917; the effective increase, viz. the increase of expenditure when allowance was made for the known or estimated diminution in the consumption of bread, meat and the increase in that of potatoes, was only 56.5%.

In Milan the cost of the food actually consumed has been estimated from time to time, and added to the cost of housing, fuel, clothing, etc., these being taken as an unchanged standard after July 1918. Some of the results are shown in Table XII.

TABLE XII.

Index Numbers Based on:

	Actual Expenditure	Cost of pre-war Standard
1914 Jan. to June	100	100
1918 Jan.	162	—
July	205	286
Dec.	259	351
1919 July	265	280
Dec.	287	352
1920 July	376	441
Dec.	441	534

In Holland (Amsterdam) a more elaborate method is used, for not only has the expenditure been ascertained at frequent intervals (unfortunately of only a very small number of families) but it has been computed (see Table XIII) what the quantities actually bought would have cost at pre-war prices.

TABLE XIII.
Index Numbers.

	Actual expenditure on food, rent, clothing, etc., at selected dates	Cost of actual quantities at pre-war prices	Cost of pre-war budget at current prices
1910-1	100	100	100
1917 Feb. March	113	128	132
Aug.	—	138	142
1918 Feb. March	120	146	165
Aug. Sept.	135	166	183
Nov. Dec.	128	161½	177
1919 March . .	136	166	184
June	152	180	195
Sept.	164	183	193
Dec.	173	200	205
1920 March . .	195	214	214
June	194	215	217
Sept.	—	222	223

Table XIII may be thus explained. Expenditure in 1914 was 5.78 fl. (ΣQP) weekly, in Dec. 1919 10.00 fl. (Σq_p), an increase of 73% (first column). If the same quantities had been bought in 1919 as in 1914 they would have cost 11.85 fl. (ΣQ_p), an increase of 105% (third column); but if the 1919 quantities had been bought in 1914 they would have cost 5.00 fl. (ΣqP), and the ratio of the actual cost to this is 2, which multiplied by 100 gives the number in the second column. Thus the third column gives the index number $100\Sigma Q_p + \Sigma QP$, the usual type, and the second gives $100\Sigma q_p + \Sigma qP$ (where q is changed at each date). It is argued above that the true measure of the cost of living lies between the numbers in the second and third columns. It can be seen that considerable modifications of diet took place between 1914 and 1918-9, but that either they had been reversed or that their effect on cost was nil by 1920.¹

(A similar computation of the budgets in 1914 and 1918 in the United Kingdom gives $100\Sigma q_p + \Sigma QP = 185$, $100\Sigma Q_p + \Sigma qP = 202$ and $100\Sigma Q_p + \Sigma QP = 212$, for food only, numbers corresponding in order to the three columns just discussed.)

In Sweden an elaborate investigation (involving about 600 household budgets each kept for three periods of four weeks) was made in 1916, 1917, 1918. Besides calculating actual expenditure (Σq_p) and the cost of a standard budget (ΣQ_p) the food value in calories is computed (see Table XIV).

TABLE XIV.
Index Numbers.

July	Actual expenditure on food	Cost of pre-war budget at current prices	Calories in food consumed	Cost of 10,000 calories
1914	100	100	100	100
1916	124	130	102	121
1917	155	173	90	172
1918	233	267	86	271

Expenditure thus increased less than the cost of a standard budget, but whereas in 1916 the nutritive value of the diet had increased, owing to some change from meat to cereals which afford more nourishment for the same price, in 1917 and 1918 the dietary was inferior owing to actual dearth and the cost of equal nourishment rose as rapidly as the food index number on the ordinary basis.

In Egypt it was estimated by its statistical department that the cost of living measured by the standard reached in March 1920 was for clerks 138% and for artisans 140% greater than that of the same standard in 1914 ($\Sigma q_p : \Sigma Q_p$). For food, fuel and soap only the increases for artisans and labourers on the same basis were to March, July, Aug., Sept., Oct., and Nov. 1920 respectively 180, 181, 180, 180, 185 and 193% in Cairo; in parts of Egypt there was a fall in Nov. 1920.

REACTIONS OF PRICES AND WAGES

Prior to the war there was in the United Kingdom no direct reaction of retail prices on wages, for wage rates were deter-

¹ The double estimate is now given up and the index number is now computed on the standard of March 1920.

mined by the relation of the demand for and supply of labour, the exact rates being settled by the bargaining strength of employers and employed; since, however, real wages (wages expressed in commodities) were believed to be falling in the period 1900 to 1914 the determination of wage-earners to obtain higher money wages was strengthened and supported by a considerable body of public opinion and this no doubt improved their position in negotiations. On the other hand, whatever were the causes that brought about the general rise in prices that began about 1895, under the ordinary play of economic forces the rise, first apparent in wholesale prices, was followed after no long interval by increases in retail prices and in wages, and in general money wages may be expected to change in fairly close accordance with a gradual change in the price level. The immediate effect of rising prices in normal times is to stimulate commercial activity, increase employment (so that earnings rise before wages), and then to increase wage rates.

During the World War a new group of causes had effect. The connexion of currency with gold was broken, new purchasing power was obtained by the sale of securities held abroad, and the British Government was able to increase the amount of currency at will, by ordering goods and issuing new notes with which to pay for them. There was, for example, nothing to prevent the Government paying every week a £1 currency note to every wage-earner who liked to apply for it, and something of this kind was in fact done in the unemployment benefit after the Armistice.

The actual sequence of events appears to have been as follows. The increased demand for labour, due to the simultaneous need for munitions and equipment and the withdrawal of men from civilian occupations, soon resulted in full employment for nearly all persons capable of work; during the first year of the war this complete employment and the patriotic desire not to hinder the successful prosecution of the war (together with the opinion that the disturbance was temporary) deterred wage-earners from pressing for increased rates of wages in spite of the acuteness of the demand for labour. During 1915 it became apparent that retail prices had definitely risen and that there was no immediate prospect of a fall, and that real rates of wages had so far fallen that persons whose hours of work had not increased had suffered a serious fall in the standard of living, and that in the case of unskilled labourers wages were insufficient to purchase necessary food. The ordinary methods of bargaining were to a great extent suspended, partly because the Government was already a very important employer of labour and was provided with a bottomless purse by the printing press.

The first stage was to give a war bonus in many industries, either at a flat rate to all operatives on the ground that all persons required the same minimum ration of food, or on a slightly greater scale to the lowest-paid men on the ground that the better-paid could make more economies. The price of all goods rose to the extent that the wages affected were an element in their cost, with some exceptions, as in the case of railway services, in which the Government bore any loss. Prices of food which depended to a great extent on the world market prices were not directly affected to any great extent, being paid for by the realization of foreign securities, by the export of gold and by loans, but they nevertheless continued to rise.

The second stage was marked by an effort of wage-earners to obtain further increases commensurate with the increased cost of living and in many cases the acuteness of the demand for labour would have resulted in a great rise in wages; but the Government, by its growing importance as a purchaser of goods and its increasing direct control of industries, was in a position to dictate terms in so wide a sphere as to dominate all wages, and it was not strictly bound by the conditions that determined wages before the war. Courts of arbitration were established and by these and other methods wage changes were officially regulated. In determining wages the dominant consideration appears to have been the change in the cost of living

(as determined by the official measurement described above), though the increases awarded were not in strict proportion,—as indeed they could not be.

The series of increases in the middle and latter period of the war had a more direct reaction on retail prices than the earlier changes, for two reasons. The cost of coal rose with miners' wages, and this, together with the increased wage cost of food manufacturing processes and of wholesale and retail distribution and the increase of the farmers' wage bill (especially dairy farmers'), raised the price of many of the commodities ordinarily purchased by the working classes. Secondly, by the end of 1917 the supply of the majority of goods was limited by dearth, control of shipping or rationing, and was no longer sensitive to price; wages tended to be so raised as to command the purchase of nearly the same quantities of goods as in 1914 at the prices of 1917, but when they came to be spent the goods were not available in these quantities and competition raised the prices; in the case of the principal foods and of coal, prices were controlled and the amount purchasable rationed (except that of bread, which was sold at a loss made good by a Government subsidy); the surplus of wages was then expended on less necessary and unrationed goods whose prices rose enormously (eggs and pianos supply instances of this). If prices had not been controlled and wages had moved with the cost-of-living index number, an endless sequence would have been established, in which each increase of wages caused a rise of prices which was followed by a further enhancement of wages, the whole being financed by the issue of paper money, while the quantity of goods purchased was limited throughout to the same total, namely the goods available in the country. Actually the process was checked by the complete control (independent of home cost of production) of many of the foods included in the budget which determined the cost-of-living index number (e.g. of bread, flour, imported meat, cheese, tea, sugar), and by the partial and less successful control of foods influenced by the cost of home labour (potatoes, home-produced meat, fish, milk, butter); of the remaining articles, the supply of bacon of inferior quality was sufficient to make effective control unnecessary, margarine was manufactured by the Government and the price successfully kept low, and eggs (though nominally controlled) rose in price in accordance with the demand for them, coal was both rationed and controlled in price, and rent was restricted. Nearly the full force of the demand accentuated by surplus wages was felt in the price of clothes, and no doubt this had its effect on the increases of the cost of living and of wages during 1917-9 (see WAGES, for the "Cost-of-Living Wage").

After the Armistice, control was progressively relaxed as free supplies became available and the Government's importance as an employer was diminished. The close connexion between wages and the index number of the cost of living was maintained and extended, but the demand of labour was for an increase of wages above the level of 1914 more than proportional to the increase of prices—in fact, for a higher standard of living, and at the same time for a reduction of the hours in a normal week's work. There was a gradual return to pre-war conditions and the freer play of economic forces; wages had to be found by employers without direct reference to the Government's printing press, supplies of most goods became again sensitive to prices, imports had to be paid for by exports and the increased cost of the latter at once reacted (as indicated by the movements of exchange) on the former; so far as cost of labour is a constituent of price, prices of all goods (whether home-produced or imported) rose with that cost. The sequence of prices following wages and wages following prices must have a limit, and this limit appeared to have been reached with the break in prices in 1920 and the unemployment of 1921, but the date and manner of the climax were determined rather by world conditions than by the British labour policy.

How far wages kept pace with prices is shown approximately from the statistics given above and in the separate articles on WAGES and on PRICES.

Prior to the war the movements are indicated by Table XV.

TABLE XV.

	General Course of Rates of Wages	Retail Prices of Food in London
1902	93	91
1903	92	92
1904	92	92
1905	92	92
1906	94	92
1907	97	94
1908	96	96
1909	95	96
1910	95	98
1911	95	98
1912	98	103
1913	100	100
1914 (Jan. to July)	100	100

Both sets of figures in Table XV are computed from the XVIIth Abstract of Labour Statistics, except that the level of wages in 1914 is equated to that in 1913 on the ground of other information as to the absence of any important change. The basis of the computation of wages is not sufficiently wide to ensure minute accuracy, and since it depends only on changes of rates it does not allow for the slow but progressive increase of the average earnings of all workers due to the relative increase of the numbers in the better-paid occupations. The inclusion of fuel among retail prices hardly affects the numbers. Rent, however, is known (Cd.6955, p. xxviii) to have increased on the whole less than food prices between 1905 and 1912. The conclusion is that money wages increased nearly step by step with the cost of living in the 13 years in question.

No official index number of average wages had been published up to 1921 since 1913, but there is enough information to lead to a rough estimate (see Table XVI). It should be realized that the figures have not the necessary precision to allow minute calculations to be based on them (Bowley, *Prices and Wages in the United Kingdom 1914-1920*, p. 105).

TABLE XVI.

	General Course of Rates of Wages	Official Cost-of-Living Index Number
1914 July	100	100
1915 "	105 to 110	125
1916 "	115 to 120	145
1917 "	135 to 140	180
1918 "	175 to 180	205
1919 "	210 to 215	210
1920 "	260	250

The wage figures depend throughout on wages for a normal week (reduced in 1918 and 1919) or on changes in piece rates. During the war-years earnings increased so much more rapidly than wages, owing to various facilities for making additional money, that it is probable that an index number for earnings would show as high figures as those in the second column except in 1917. If, however, we pay attention only to rates for nominally the same work, it is seen that prices rose before wages from 1914 for at least three years. If the view is accepted, as argued above, that the official index number tends to show too great a rate of increase, then by July 1918 wages had caught up with prices, and, while in 1919 and 1920 they had slightly passed the official measurement of prices, in fact real wages increased in these years. In 1921 it was too early to trace the effect on wages of the fall of prices that began in the winter of 1920-1; apart from those cases where wages were bound to the cost-of-living figures by a formula, the first influence was felt in unemployment and consequently diminished average earnings, not on rates of wages.

Some examples of the formulae connecting wages with prices are given in the article on WAGES, and that governing civil service and salaries is stated above. The general effect was to increase or decrease weekly rates in a lower proportion than prices, but where the proportion was applied to a standard wage higher than that in 1914 the whole increase over that date was at some periods greater than that of prices. Thus the

wages arranged in Jan. 1920 for a porter on the lowest scale were as follows:—

Rate of wages	Money wages in relation to pre-war rate	Cost-of-living number	Real wages in relation to pre-war rate
22s. pre-war rate	100	100	100
40s. new standard rate	182	145	125
46s.	209	175	119
51s.	232	200	116
56s. Sliding scale rates	255	225	113
61s.	277	250	111
121s.	550	550	100

If then the cost-of-living index really measures the value of money the porter is better off when prices fall. Where such an arrangement took effect a slight check was put on the circular influence of prices on wages and wages on prices.

So far we have considered the interaction of wages and the prices that enter into working-class expenditure. There is still the question how wages have affected the cost of the unit of output. A bricklayer and his labourer averaged about 143d. an hour between them in the summer of 1914 and 45d. in the summer of 1920, i.e. three times as much as in 1914; owing to the reduction of hours their weekly rates were only 2½ times the former rate. In industries in general the reduction of hours was rather less, probably about one-tenth on the average, and while the index number for weekly wages was 255 in July 1920 that for hourly wages would be about 285 (July 1914=100). There is no certain information by which to connect the change in the cost of an hour's labour with the cost of a unit of output. On the one side it was generally alleged that the pace of work had been more or less intentionally reduced, though this is not substantiated by such figures for piece earnings as are available; and, though in factories there is some diminution of overhead expenses and waste time when the day's work is done in two instead of in three shifts, the general expense of salaries, interest on capital, rents, rates, etc., has to be met out of the diminished hours of work. No doubt the potential energy of the workman per hour is greater in a 48-hour than a 54-hour week, but the increase appears not to have been realized in 1919-20. On the other hand the high cost of labour and of materials (especially coal) stimulates employers to economize their use. In engineering especially many improvements in machinery were made during the war, the use of oil and petrol having replaced in some cases that of coal; in agriculture labour is saved by the use of oil-driven tractors. It is not possible to estimate the net influence of these factors, nor to state numerically in general how far the increase of wages has affected the cost of the product to the purchaser. In the article on WAGES are shown the scanty data relating to the general movement of wages in other countries than the United Kingdom, and these can be brought into relation with the index numbers of food and of the cost of living given above.

In Norway wages in the summer of 1918 were about 90% and the cost of living about 160% above the levels of 1914. In April 1919 various rates of wages were from 130 to 210% and the average had probably increased to 180% above 1914, while the cost of living was the same as in the previous year. In spite of reduction of hours weekly wages appear to have gained on the cost of living during the year May 1919 to May 1920.

In Denmark a more detailed table (see Table XVII) can be given:—

TABLE XVII.

	Hourly earnings	Cost of living
1914	100	100
1918 Aug.	200	182
1919 Feb.	224	190
Aug.	338	211
1920 Feb.	358	242
Aug.	396	262

Hours were reduced in 1919 till at the end of the year an 8-hour day was usual as compared with 10 hours before the war. Real weekly earnings had evidently increased considerably be-

fore 1920, and in April of that year it was agreed that future increases should be proportioned to the cost of living.

In Germany we have the computation shown in Table XVIII. (*Labour Overseas*, Ministry of Labour, London, Oct.-Jan. 1920, p. 51):—

TABLE XVIII.

Date	Average weekly earnings of male adult	Weekly minimum cost of living (four persons)	Earnings in proportion to cost of living
	Marks	Marks	
Aug. 1913 to July 1914	35	29	1.21
Aug. 1919	100	130	.77
Feb. 1920	170	254	.67
Nov. 1920	210	316	.76

The Official Year Book of New Zealand (1919) gives figures which are shown in Table XIX:—

TABLE XIX.

Year	Average minimum hourly rates	Weekly hours	Weekly rates	Retail food prices
1911	1000	1000	1000	1000
1912	1006	1000	1006	1035
1913	1036	998	1034	1055
1914	1087	986	1072	1102
1915	1094	985	1078	1218
1916	1152	983	1132	1290
1917	1200	982	1178	1384
1918	1258	982	1135	1513
1919	1418	979	1288	1537

More than the minimum may have been paid in skilled trades and other items of expenditure may have risen less than food.

Table XX. shows how earnings (as distinguished from rates of wages) moved in New York state in relation to the cost of living:—

TABLE XX.

	Average weekly earnings in factories in New York state	Cost of living index number for the United States
1914 Dec.	100	100
1915	107	101
1916 "	123	115
1917 "	140	139
1918 "	185	170
1919 "	209	193
1920 May	224	June 210

(A. L. Bo.)

COTTON, SIR HENRY JOHN STEDMAN (1845-1915), Anglo-Indian administrator (see 7.254), lost his seat in Parliament in 1910. He died in London Oct. 23 1915.

COTTON, JAMES SUTHERLAND (1847-1918), British man of letters (see 7.255), died at Salisbury July 10 1918. He contributed articles on Indian subjects to the *E.B.* and spent the later years of his life cataloguing European MSS. relating to India in the India Office library.

COTTON, AND COTTON INDUSTRY (see 7.256, 281).—The chief problems which faced the cotton industry after the beginning of the 20th century centred in the question of the supply of the raw material. Up to the outbreak of the World War the outstanding feature was the steady increase of the demand. The industry is unique in possessing fairly reliable statistics of the consumption throughout the world, these having been compiled with increasing completeness by the International Federation of Master Cotton Spinners' and Manufacturers' Associations since 1904. The last issue before the war (March 1 1914) contained actual returns from the owners of 132 million spindles out of an estimated world's total of 145 millions, or 91% of the world's total mill capacity. These figures do not, of course, include domestic spinning, which in many countries, especially India and China, accounts for a large part of the local consumption, so that they must always be incomplete; but this does not greatly affect comparative statistics from year to year.

The possession of such statistics offered an opportunity to attempt a balance sheet of the world's production and consumption such as is given in Table A. During the war it was impossible to continue the world statistics of consumption of cotton of all kinds, but other figures for the American crop alone are available to bring the table down to date as far as was possible in 1921.

The causes of the increase of consumption may be briefly tabulated as follows:—

(1) The increasing wealth of the world, especially of those tropical and subtropical countries whose products are largely raw materials such as cotton, and which for climatic reasons happen to be also the largest cotton-using countries in the world.

(2) Improved methods of manufacture, and the discovery of new processes which made it possible to produce cotton fabrics of an entirely different character, quality and finish from those previously known. The old process of "mercerising," reapplied with new success, produced cotton fabrics with a finish and appearance closely resembling silk, while the additional process known as "schreinerling" produced a surface like satin.

(3) Similar developments enabled cotton to be used not merely as an adulterant of, but as a really satisfactory substitute for, fabrics made from other textile materials, such as wool and linen, e.g. the raising process made it possible to produce cotton goods as much superior to the early attempts at woollen imitations as these were inferior to the real article. Cotton "damask" was also taking the place of the original linen.

TABLE A.—Balance of the World's Production and Consumption, 1904-20.

World's Commercial Crops and Mill Consumption. ¹					American Crop and World's Consumption thereof.

¹For details see "The World's Cotton Crops," Appendix B.

²Hester's figures. (New Orleans Cotton Exchange.)

(4) Many entirely new uses were being discovered for cotton, of which two only need be mentioned on account of the enormous importance they acquired during the war, namely aeroplane cloth and motor-car tire fabric. At the same time the possibilities of cotton in entirely new forms of fabric were being worked out, e.g. in the hosiery trade, where their first use in cheap cotton hose has led to the evolution of entirely new classes of knitted garments and now even knitted piece goods, which is perhaps the most promising future development of all.

Table B shows the three chief crops, namely American, Indian, and Egyptian:—

wages; and second, the annual loss of an increasing percentage of the crop owing to the steady progress of the boll weevil eastward and northward throughout the belt, thus reducing the average yield per acre.

The position before the World War therefore was that the cotton world was faced with a striking application of the economic law of diminishing return. The greater the quantity of raw cotton they demanded from the world's producers, the higher its cost of production was going, with the result that the price was on the whole rising steadily, and more rapidly than the general level of prices as shown by the index numbers.

TABLE I.—Area, Yield and Prices of the World's Chief Crops, 1911-21.

Season	Area	Crop	Yield per acre	Liverpool prices (pence per lb.)

The figures in *italics* are estimates. *A feddan is practically an acre, and a kantar 100 lb. †Sakel. ‡Good Bhowmuggar.

From this table will be seen that the American crop still in 1920 dominated world's supply, forming about 60% of the whole, so that fluctuations in the world's total were practically the same those of the American crop. These latter fluctuations therefore acquired special importance, and a closer study of them revealed the fact that they were not merely accidental, but seemed to follow a certain rule. They presented an almost regular see-saw movement of area, crop and prices which may be summarized as follows:—A large American crop tended to produce a lower level of prices; but owing to the rising cost of production in America, and the fact that the price was barely sufficient to remunerate many of the growers, such a fall in price meant a reduction in the acreage planted the following season. If other things being equal, produced a smaller crop, which meant an inadequate supply and a rise of price again, followed by a return to larger acreage, and so the circle went on, thus the price of American cotton was constantly fluctuating in a way which was injurious alike to consumers and producers.

The real fact of the cotton situation lay in the increasing cost of production in America, which was due to several factors—first, the increased cost of everything used by the planter, and especially the rising labour cost of the crop owing to increased

The Effects of the War.—The first effect of the war was a tremendous slump in the price of cotton, because the expected cessation of demand happened to coincide with the largest American crop on record. All the exchanges were closed and nominal prices fixed. Under these conditions a difficulty very quickly arose with regard to the position of cotton as contraband. In view of its use for munitions as well as for many other semi-military purposes, it should in the interests of the Allies have been placed under embargo at once; but to do so under the then existing market conditions would have produced utter demoralization, and probably a serious dispute with America. It was not for about six months that the question was finally settled by a compromise under which a modified embargo was laid upon cotton; but this was converted into a formal declaration of contraband some months later. In the meantime prices had begun to recover, but not sufficiently to prevent the expected serious reduction of acreage throughout the world for the 1915 crops, which were the smallest on record for many years. In 1916 the American and Egyptian acreages were almost back to pre-war figures, but the average yield that year was poor, with the result that the crops were again much below pre-war normal. During 1916 prices rose sharply as the industry began to realize that demand was recovering in an unexpected way, and that the

huge surplus of the 1914 crop was rapidly being exhausted. It was not till the early summer of 1917, however, that matters came to a head, when the intensive submarine campaign made it impossible to maintain adequate imports of cotton. The Cotton Control Board was set up in Liverpool to ration the limited supplies available,¹ and at a later stage the British and Egyptian Governments set up a control scheme in Egypt to handle the 1918 crop by purchase.

Up to the end of the war, therefore, the supplies actually available remained very limited, and it was only due to the compulsory restriction of the consumption of the Central Powers that the supply was able to meet the demand at all. Unfortunately the Armistice was followed by a temporary period of hesitation and delay in getting things going again, which resulted in a serious fall in the price of cotton. This immediately reacted in a reduction of the acreage again in 1919 in America, and as this happened to coincide with another disastrous season, the 1919 supply was again extremely short. When on the top of this came the great post-war boom of 1919-20, in which the real needs of the world were exaggerated by the speculative hopes of those who saw fortunes in the reopening of the world's markets, prices simply broke all bounds and rose to figures which have perhaps never been equalled in the history of the trade. American cotton was over 2s. 8d. a lb., while the best Egyptian was over 10s. a lb. Indeed one of the features of the period was the extraordinary premiums paid for good staple cotton. This was largely due to the sudden rise of the motor trade in America. When it came out that at the beginning of 1919 there were over six million motor-cars in the United States (since increased to ten millions), it was obvious that the demand for that class of cotton would be large, and the Egyptian varieties were the most desirable for the purpose. The result was practically a corner in Egyptian, which drove the price up to \$200 per kantar (100 lb.) in Alexandria, against an average of less than \$20 before the war.

The subsequent slump in cotton was as dramatic as had been its rise. Within almost twelve months from the very top prices in Feb. 1920, American cotton had again fallen below pre-war prices, while Egyptian, which had so much farther to fall, reached almost the same point. The inevitable effect again was a movement for the reduction of acreage, which once more brought the world's crops for 1921 far below pre-war records.

¹See *History of the Cotton Control Board* by H. D. Henderson (the Secretary) 1921.

In the meantime the world's trade had been brought almost to a standstill by the slump in demand everywhere. The extent of this is shown by the Federation statistics (Table C), which were resumed on July 31 1920 (the date of the cotton "season" having been in the meantime advanced by a month).

In their figures as at Jan. 31 1921, shown in the above table, it was possible to compare the consumption during the height of the boom with that of the pre-war year, and also with that of the first six months of the slump. The fact that the consumption even during the boom was not equal to the pre-war consumption is due, first, to the destruction of textile machinery in the devastated districts of France and Belgium; and, second, to the reduction of the hours of labour throughout most parts of the cotton world, which came into vogue immediately after the war. In 1919 the makers of textile machinery were utterly unable to cope with the demand for new machinery to replace that which had been destroyed during the war, or to make up the arrears of renewals which had fallen behind during the war. New machinery outside of these privileged requirements was practically unobtainable, with the result that the trade was unable to take full advantage of the boom in the demand by increasing its output. The high prices were therefore due not merely (if at all) to the shortage of the raw material, except perhaps in the case of Egyptian and other staple cottons, but rather to a shortage of cotton goods.

Prospects in 1921.—It may seem paradoxical to speak of possible scarcity at a time (Aug. 1921) when the actual demand for cotton goods seemed almost at a standstill, and the world was apparently over-stocked not only with cotton goods, but also with the raw material. Yet there could be no practical doubt that the world would ere long be seriously short of cotton again; because it could only be a question of time till a return to something like normal conditions of demand would again lead to a consumption of cotton substantially in excess of what the world was producing. The abnormally large carry-over which was accumulated during the slump might prevent any scarcity arising within the immediate future, but it could hardly be doubted, unless the world was to face a prolonged period of practical starvation, that the consumption of cotton, which is the cheapest textile in the world for many other purposes besides clothing, could not permanently remain at the low level of 1921. The question was whether, when the demand came again, the supply would be as quick to respond as it was to contract when prices fell. It was extremely unlikely that pre-

*No statistics for China. Estimated total spindles, over 1,600,000; consumption in 1920, 690,000 bales of sundries.

war conditions would ever again be reproduced in America. Then the crop was increasing slowly, but on the whole steadily, and in 1914 the actual growth was probably not less than 17 million bales, though this record total never came "into sight" during the season. It was clear that, at anything like the 1921 level of prices, and indeed under almost any conditions which could then be visualized as possible, the world could not look to America to equal that figure again or to resume the pre-war rate of increase. The difficulties in America were the extremely variable climate, the scarcity and high cost of labour, and the reduction of the average yield owing to the spread of the boll weevil; and although the cost of production would probably be substantially reduced again, it would take a price very much higher than the 1921 level to tempt the growers back again from the policy of diversification, which they had been taught since the war, to their old policy of cotton and nothing else.

The basic fact of the situation in 1921 was that prices were substantially below the cost of production, and this was a state of affairs which could not continue. It is true that where so much of the labour—and cotton is essentially a cheap-labour crop—is supplied by the grower himself and his family, they may for a time submit to a reduction of price which will not cover an adequate wage for their labour; but even where mobility of labour is low, as it is in the American cotton belt, such a state of affairs is bound in course of time to have its effect. It did so very strongly during the war when a large quantity of labour left agriculture in the cotton belt for the more highly paid industries in the Southern towns or in the industrial North; and while the subsequent slump had, for the time being reversed this tendency, it was extremely improbable that the South would again become resigned to a permanent lowering of its standard of living, especially as the policy of diversification in itself enabled them to meet this difficulty by supplying many of their requirements from their own land, instead of putting it all under cotton. The probability was, therefore, that it would require a substantially higher price than in pre-war times to induce America to return to her pre-war acreage.

A further point of detail may be noted. Part of the American crop before the war, the Sea Island crop, grown in Florida and Georgia, and on the so-called "Islands" off the coast of South Carolina, was the best cotton in the world, because its staple was the longest and finest; but this crop had by 1920 been virtually wiped out by the advent of the boll weevil in these districts, and the gap thus created would be extremely difficult to fill. The only supply of a similar kind which America could offer was the small crop of excellent cotton of Egyptian character which had for some years been growing in Arizona and California, especially in the Salt River Valley in the former state. The crop amounted in 1920 to 92,000 bales grown upon a total area of about 256,000 acres; but that was largely due to the high prices of 1919-20 and was not likely to be repeated. For the very best cotton, therefore, the world was entirely dependent on the West Indian Sea Island crop, which, however, was only about 7,000 bales, against the pre-war figure of about 100,000 from Florida and Georgia.

The supply of fine cotton was still further diminished by the serious reduction of the Egyptian crop, due to several causes, of which the most controversial was the view that drainage had not kept pace with irrigation, leading to a rising "water table" and partial water-logging of the lower zones in the Delta. The ravages of the pink boll worm in recent years had also contributed to the reduction of the average yield, which had become serious even before the war, and still more so since 1914. To counteract this reduction would require very heavy expenditure; and the further development of the Egyptian area was apparently dependent on the execution of large irrigation works, the chief of which, the White Nile Dam, above Khartum, had been begun, though work was suspended in the meantime through lack of funds. The most striking development in Egypt, however, had been the replacing of the original Delta type of cotton (Afifi) by the new longer-stapled variety Sakelariides, the best of which has to some extent taken the place of the lost Sea Island.

In view of the reduction of the Egyptian crop the possible development of the Sudan became of the greatest importance. The Gezira scheme, which was expected to provide the larger part of the crop, was also dependent on large irrigation works on the Blue Nile, in course of construction in 1921. Other parts of the Sudan, such as Tokar, Kassala and certain areas on the Nile north of Khartum, were of considerable promise, but large expenditure on transport and irrigation was still required there, especially for the Tokar and Kassala districts.

Great hopes have been entertained of the development of cotton of the ordinary American inch-staple in India, where it is regarded as relatively long-stapled in comparison with the $\frac{3}{4}$ in. to $\frac{1}{2}$ in. staple cotton which forms the bulk of the Indian crop. This development has had the active support of the Government, who in 1917 appointed a special commission to make a survey of the whole position (see *Report of the Indian Cotton Committee, 1919*). For many years to come, however, these improved cottons could not hope to form a large part of the total Indian crop. Since the formation of the British Cotton-Growing Association in 1902 attention had therefore been directed to other parts of the Empire, and much pioneer work had been done in proving the possibilities of many districts, especially in Africa. Distinct success has been achieved in West Africa, where the best cotton is of a good American type, and in Uganda and Nyasaland, where varieties akin to the American long-stapled upland have been produced. The development of all these districts was, of course, seriously checked by the war, and subsequently by the high cost of the necessary development works, such as transport. The war also left a great gap in the supply of skilled men of all kinds, whose services were everywhere required for the development of new cotton-fields. Everything depends in the first place on the maintenance of an adequate seed supply, which involves not only the finding of a suitable variety, but also the maintenance of a pure supply. Much had also been done in promoting improved methods of agriculture, in providing the necessary facilities for the ginning, baling, and handling of the crop, and for its marketing at adequate prices, especially in the case of superior varieties. In South Africa also excellent cotton had been grown in small quantities, but the necessary organization of the trade had still to be provided before it could be a success on a large scale. Other foreign Powers with colonies in Africa had also done a great deal for the development of cotton, but up to 1920 the total quantity produced in all these new areas in Africa (outside of Egypt) was relatively small, and the time when Africa could produce a million bales of cotton was still far distant (see *Report of the Empire Cotton-Growing Committee of the Board of Trade, Cmd. 523, 1920*).

In Australia there was little doubt that cotton could be successfully grown, either by rainfall or under irrigation; but there were problems to be faced with regard to the labour supply as well as the ordinary difficulties of organization.

There are many other countries which could provide large additions to the world's cotton supply if all the necessary conditions of the successful organization of the industry could be secured. Brazil, for example, could undoubtedly yield a very much larger crop than it has ever done (500,000 bales); but political as well as labour and other economic difficulties are apparently serious. The Argentine is also a country where excellent staple cotton has been grown, but labour seems to be the chief obstacle to its development on a large scale. Many of the other Latin-American countries, especially Mexico, also have great possibilities for cotton-growing. Peru produced a small crop (about 200,000 bales) of excellent staple cotton, a little below Egyptian in value, but much of it better than the staple American upland. The supply of the latter from America itself suffered a severe loss when the boll weevil appeared in the Mississippi Valley and drove out the old $1\frac{1}{4}$ in. long-staple cotton that used to be produced there. Subsequently, however, a great development took place in the production of new staple upland varieties of about $1\frac{1}{4}$ in. staple in southern Carolina, the Mississippi Valley and northern Texas; but their total supply probably did not exceed 250,000 bales per annum.

In Asia the chief crops before the war, apart from India, were in China and Asiatic Russia, including Transcaucasia. Statistically, the Chinese crop has always been a mystery, and its amount can only be guessed at about two million bales. The Russian crop had before the war risen rapidly to nearly 1½ million bales, part of which was of indigenous varieties similar to the Indian, and the remainder of good American quality; but this crop had been almost wiped out by the war, and it was not likely to recover as long as Russia remained in chaos.

The Cotton Industry.—The growth of the cotton industry throughout the world has already been indicated by the figures of spindleage given in the appended tables. Perhaps the most interesting feature up to 1921 had been the development of the American, Japanese and Indian sections of the trade. The first was largely due to the growth of the Southern mills, which had increased from ten million spindles in 1910 to 15 millions in 1920. In Japan the percentage increase of spindles had probably been greater than in any other country, though the total in 1921 was still comparatively small. The output of the Indian mills had also advanced in recent years, both in quality and quantity; but this unfortunately raised bitter controversy with regard to the Excise duties, which were imposed on the product of Indian mills in 1896 to balance the 3½% Customs duty¹ imposed for Revenue purposes on cotton goods imported into India. In 1917 the import duty was raised to 7½% without a corresponding increase in the Excise duty; and in 1921 the differentiation was still further increased by an addition of 3½% to the import duty. Table D shows the growth of the Indian cotton industry since 1911.

The facts with regard to the foreign trade of Great Britain in cotton and cotton goods are shown in Table E (See p. 769).

Number of Operatives.—In Table F are given the latest figures obtainable in 1921 as to the number of British operatives engaged in the cotton trade since the date of the Census of Production in 1907:—

TABLE F.—Numbers employed (in thousands).

Date.	Males.	Females.	Total.
1907	218	359	577
July 1914	274	415	689
Nov. 1918	144	349	493
July 1920	218	396	614
Nov. 1920	211	376	587

The controversial question of the employment of half-timers in the trade moved a step forward in England by the Education Act of 1918, which provided for their gradual abolition.

Wages.—With regard to wages, the outstanding feature of the British cotton industry was for many years the excellent organization both of masters and men, as the result of which wage disputes in the trade have, ever since the famous Brooklands Agreement of 1893, been reduced to a minimum. It is

¹ Both duties were originally 3% in 1894.

perhaps also due to this organization that, as a class, the cotton operatives of Lancashire are the most highly skilled, and enjoy the highest standard of living, of any section of the industry throughout the world.

In the Report (1909) by the Board of Trade in England into the Earnings and Hours of Labour of workpeople in the Textile Trades in 1906 (Cd. 4545) the average wages earned in the cotton trade for a full working-week were given as follows:—

Men.	Lads and Boys.	Women.	Girls.	All Workpeople.
26s 9d	11s 6d	18s 8d	10s 1d	19s 7d

The total wages bill for a full week at that time was £512,000 and the total number of operatives employed 523,030. It was also calculated that in 1906 the average annual earnings per head in the cotton trade were about £48. The number of hours constituting a full working-week at that time was 55½. Wages in the cotton trade in the United Kingdom are calculated on the basis of certain standard lists, the chief of which are known as the Bolton List and the Oldham List for cotton-spinning, and the Uniform List for cotton-weaving. In 1906 the wages actually paid were 5% above list prices for the Bolton and Oldham Lists and list prices for the Uniform List. Table G shows the changes since that date:—

TABLE G.—Changes in Wages of Cotton Operatives, 1906-21.

Capital.—Much attention was attracted to the great movement in 1919-20 for the recapitalization of the British industry, which was to some extent inevitable. Owing to the demand for machinery and the high cost of production during the war, the book values of the mills represented only a fraction of the actual market value to which they had risen. The process of writing up the nominal capital of the companies to something approaching the actual market value of the plant was in itself harmless; but when the inevitable reaction came, those who had invested in the industry at the top of the wave seemed likely in 1921 to find it difficult to secure a normal rate of dividend on what had come again to be regarded as inflated values. The

table on next page, founded upon Mr. F. W. Tattersall's list of 100 typical joint-stock companies in the Lancashire industry, gives an interesting indication of the earnings of the trade.

It is obvious that the later dividends, and especially in 1919-20, were extraordinarily high, even after allowing for Excess Profits Duty, but in 1921 the reaction was in full swing.

Cotton-seed.—Since 1910 a great change has come over the relative position of cotton-seed among the innumerable commodities which contribute to the supply of the vegetable and animal oils and fats. Until then oils were classified pretty rigorously, on the one hand as soft and hard, and on the other as edible and non-edible. Soft or liquid oils, such as linseed,

TABLE H.—Earnings of the Cotton Industry, 1907-20.

Year.	No. of Companies.	Capital.		Profit. £-000's	Loss £-000's	Average Dividend
		Share. £-000's	Loan. £-000's

*Amount paid in dividends only.

cotton-seed, rape, whale oil, etc., could not be used, e.g. for the manufacture of margarine or soap, without a certain proportion of hard fat or solid oil, such as lard, coconut or palm oil. But the discovery of a new hardening process made it possible, by the removal of certain constituents from the soft oils, to convert them into a hard stearine, more solid even than tallow, and which could therefore be used for all purposes for which hard fats only had hitherto been employed.

Again, only American cotton-seed had till then been regarded as capable of producing an edible oil. This was due not so much to anything in the seed itself, but to the processes used in manufacture. American cotton-seed, being "white" or "fuzzy," had to be decorticated before crushing, i.e. the whole of the husk or hull, with the short fuzz adhering thereto, was separated from the meat or kernel, and the latter alone was crushed. In the case of the black Egyptian seed, however, which has practically no fuzz, and to a certain extent also Bombay or Indian cotton-seed, which has only a short fuzz, the whole seed was crushed, including the black hull; but the latter gave the oil a very dark colour, and in order to remove this certain chemicals had to be employed which left a distinct flavour in the refined oil, and this was thought to debar it entirely from use for edible purposes. Many other vegetable oils for other reasons were in a similar position; but the discovery of a process of deodorizing oils by blowing superheated steam through them made it possible to remove all objectionable flavour from almost any kind of vegetable oil.

The adoption of these two processes has gone far to revolutionize the relative values of the different vegetable-oil seeds, as now practically any kind of vegetable oil can be adapted for almost any purpose, either for culinary purposes or as a hard fat. They have also made it possible to use oils which hitherto had not been usable at all for either of these purposes.

During the same period considerable further knowledge has been gained as to the use of cotton-seed meal and cake for feeding purposes. A great deal has been done, by the combined use of different cakes possessing counteracting qualities, to make it possible to use certain cakes, such as Bombay, for purposes for which it had not formerly been thought suitable, e.g. Bombay or Indian cotton-seed cake was thought to be too astringent for cattle if used alone, but if given along with linseed or turnips, which possess laxative qualities, a good result can be obtained from the combination. Again, much has been learned as to the advantages of using particular cakes for special purposes; thus linseed cake was found to be the best for feeding cattle for the butcher, while Egyptian cotton-seed cake was looked upon as better than Bombay for dairy cattle.

Further future developments are indicated by the invention of a new method of removing from white cotton-seed, such as American, after the ordinary process of delinting, an additional supply of short fuzz in such a condition that it can be advantageously used for many purposes, such as paper-making, gun-cotton, artificial silk, etc. Indeed, this process of economizing by-products has gone still further, for a plant has within recent years been erected in America which, by a similar process,

removes the final remaining short fuzz from the cracked hulls after decortication, and even these have been put to good use for similar purposes. (J. A. T.')

COUPERUS, LOUIS (1863-), Dutch writer, was born at The Hague June 10 1863, a member of a family of Scottish origin, banished from Scotland for political reasons in the 16th century. His early boyhood was spent in the Dutch East Indies, where his father was a prominent Government official. His first novel *Eline Vere*, written under the influence of Tolstoy, appeared in 1889 and was followed by *Noodlot* (*The Footsteps of Fate*) in 1894 and *Extaze*, the first of his novels to be translated into English (1892). He next produced certain imaginative and idealistic works, such as *Majesteit* (1895) and several volumes of prose poems. But the work by which he is best known in the English-speaking world is the series of "Books of the Small Souls," four novels entitled *Die Kleine Zielen* (*The Small Souls*), *Het Late Leven* (*The Later Life*), *Zielenschmeling* (*The Twilight of the Soul*), *Het Helge Wiken* (Eng. version *Dr. Adriaan*) which, together with *Van Oude Menschen, de dingen de voorbijgaan* (*Old People and the Things that Pass*, Eng. version 1919) raised him to the first rank of European novelists. In this record of an ancient crime, buried deep in the hearts of the aged pair of lovers who committed it, and yet poisoning the lives of their descendants to the third and fourth generation, there is the austerity and inevitability of Aeschylean tragedy. Couperus travelled much in Greece and Italy and embodied his classical researches in historical romances such as *De Berg van Licht* (*The Mountain Light*) and its successor *De Komedianten* (*The Comedians*), and mythological romances such as *Diogenes* (1905) and *Herakles* (1913), as well as volumes of essays, sketches and short stories. The greater part of his work has been rendered into English by A. Teixeira de Mattos. His historical novel *Iskander* (concerning Alexander the Great) appeared in 1920.

COURTHOPE, WILLIAM JOHN (1842-1917) (see 7.327), died at Wadhurst, Sussex, April 10 1917. He published a selection from Martial's *Epigrams* in 1914, and a volume of verse, *The Country Town and other Poems*, with a prefatory *Memoir* of him by A. O. Prickard, appeared in 1920.

See also J. W. Mackail, *W. J. Courthope* (1919).

COURTNEY, LEONARD HENRY COURTNEY, BARON (1832-1918) (see 7.328), died in London on May 11 1918. His brother, **WILLIAM PRIDEAUX COURTNEY**, died in London Nov. 14 1913.

COURTRAI, BATTLE OF (1918): see **YPRES** and **VSER BATTLES**.

COVENTRY, ENGLAND (see 7.342). Pop. (1911) 106,349, showing an extremely rapid increase of 52% over that of 1901. The normal engineering industries of Coventry were almost entirely transformed during the World War to munition production, which was carried on on a vast scale, and to the construction of aeroplanes, tanks, and guns. Among special industries newly established are the making of artificial silk and of telephone and other electrical apparatus. In order to meet the needs of an unusually rapid development, parliamentary powers were obtained in 1920 for the widening of several narrow streets and for the construction of two new arterial roads in the centre of the city. A new council house costing £100,000 was completed in 1917 and officially opened in 1920, and three branch public libraries were opened in 1913. The 14th century tower of Holy Trinity church was restored at a cost of £9,000 in 1918-20, and the 14th century Guildhall was in process of restoration in 1921. Coventry was created a separate diocese in 1918, the church of St. Michael being constituted into a cathedral.

COWDRAY, WEBSTER DICKINSON PEARSON, 1ST VISCOUNT (1856-), was born at Shelley Woodhouse, Yorks., July 15 1856, and educated privately at Harrogate. He entered the family firm of S. Pearson & Co., contractors, ultimately becoming its head. Under him the firm greatly extended, undertaking many important contracts and acquiring large interests in Mexico and South America. In 1892 he unsuccessfully contested Colchester in the Liberal interest, but in 1895 was elected for the same seat, which he held until

1910. In 1894 he was created a baronet, and in 1910 was raised to the peerage. He was in 1917 made president of the Air Board, and the same year was created a viscount. He was elected Lord Rector of Aberdeen University in 1918.

COX, JAMES MIDDLETON (1870–), American politician, was born near Jacksonburg, O., March 31 1870. He was educated in the common schools, worked in a newspaper office, for a short time was a country school teacher, and later became a reporter on the Cincinnati *Enquirer*. Afterwards he went to Washington as secretary to Congressman Paul Sorg, of Ohio. On the latter's retirement he decided to enter again the newspaper field. In 1898 he purchased the Dayton *News* and five years later the Springfield *Press-Republic*, subsequently named the *Daily News*, these papers being known thereafter as the Newspaper League of Ohio. From 1909 to 1913 he was a member of Congress from the Dayton district and served on the Appropriations Committee. He was an active opponent of the Payne-Aldrich tariff measure. He was elected governor of Ohio for the term 1913–15, was defeated for the following term, then was reelected twice in succession (1917–21). At the time of his third election he was the only Democrat to be returned to state office, even the lieutenant-governor being Republican, and two-thirds of the congressional districts went Republican. In 1916 he was delegate-at-large to the Democratic National Convention. His career as governor was notable. Among the many reforms introduced under his guidance were a workmen's compensation law; a survey of occupational diseases with recommendations for health insurance; the elimination of the sweatshop; the establishment of a state industrial commission for dealing with questions of labour and capital; the provision of a minimum wage and a nine-hour day for women; mothers' pensions; ratification of the proposed woman suffrage amendment; the budget system for state expenditures; pure food laws; a "blue sky" law for protecting investors from unscrupulous promoters; the initiative and referendum; a Corrupt Practices Act; the indeterminate sentence for convicts; improvement of rural schools; the establishment of a state tuberculosis hospital and the extension of safety devices on railways and in mines. Many of these reforms were followed as models by other states. He was energetic in suppressing violence in connexion with strikes, his general policy being to hold local authorities responsible without recourse to the state militia. In at least one case he removed a mayor who had called for state troops. He favoured abolishing the Federal inheritance tax, believing that the state alone should have jurisdiction over inheritances. He opposed the excess profits tax but maintained that a small tax should be laid "on the volume of business of a going concern." He was a strong supporter of President Wilson's policies and especially of the League of Nations. He was often charged with opposing prohibition but repeatedly declared that all laws must be enforced. At the Democratic National Convention in 1920 he had from the beginning strong support for the presidential nomination. On the first ballot he stood third (with 134 votes); on the seventh ballot second (with 205½ votes); on the twelfth ballot first (with 404 votes); on the thirtieth ballot he dropped to second (with 400½ votes); on the thirty-ninth vote he again stood first (with 468½ votes); and continued to gain thereafter until he was nominated on the forty-fourth ballot. Following his nomination he "stumped" the country, making the League of Nations the prominent issue but was overwhelmingly defeated by Warren G. Harding, the Republican nominee. The electoral vote was 404 for Harding and 127 for Cox. The popular vote was 16,138,000 for Harding and 9,142,000 for Cox. The vote in Ohio, the home state of both candidates, was 1,182,000 for Harding and 780,000 for Cox. The magnitude of the defeat, unprecedented in American history, was generally considered as due in part to the unwarranted character of the charges made by Cox himself during the campaign, but chiefly to a widespread revolt against the recent course of President Wilson, whose policies Cox upheld.

COX, KENYON (1856–1910), American painter (see 7.353), died in New York, March 17 1910. In 1910 he was awarded the

medal of honour for mural painting by the Architectural League. In 1911 he published *The Classic Point of View*, being lectures delivered that year before the Chicago Art Institute. Other works are *Artist and Public* (1914, largely reprints from periodicals); *Winslow Homer* (1914) and *Concerning Painting* (1917).

COZENS-HARDY, HERBERT HARDY COZENS-HARDY, 1ST BARON (1838–1920), English lawyer and Master of the Rolls, was born at Letheringsett Hall, Dereham, Norfolk, Nov. 22 1838, the son of William Cozens-Hardy, a Nonconformist solicitor in large practice at Norwich. He was educated at Amersham school and afterwards at London University, where he took his degree in 1858. He was called to the bar in 1862, and built up a large and very successful connexion, chiefly in Nonconformist and Liberal circles. He became a Q.C. in 1882, and was raised to the bench in 1899. In 1885 he was returned as Liberal member for Norfolk, retaining the seat until 1899. In 1901 he was made a lord of appeal, and in 1907 Master of the Rolls. In August 1913 he was appointed one of the three commissioners of the great seal during the absence of Lord Chancellor Haldane in Canada. In 1914 he was raised to the peerage, and in 1918 resigned the office of Master of the Rolls, being succeeded by Lord Swinfen. He died at Letheringsett Hall June 18 1920.

CRACKANTHORPE, MONTAGU HUGHES (1832–1913), English lawyer, was born at Nowers, Som., Feb. 24 1832, the son of Christopher Cookson of Nowers. The name of Crackanthorpe was assumed by him in 1888 on succeeding to the estate of Newbiggin, Westmoreland. He was educated at Merchant Taylors' school and St. John's College, Oxford, when he took his degree in classics in 1854, winning the Eldon law and University mathematical scholarships. He was called to the bar in 1859, and soon became well known not only as a barrister but as a keen student of criminology. He became a Q.C. in 1875, and from 1893 to 1899 was standing counsel to Oxford University. He took much interest in eugenics, and was president of the Eugenics Education Society from 1900 to 1911. He published *Population and Progress* (1907). He died in London Nov. 16 1913.

CRADOCK, SIR CHRISTOPHER GEORGE FRANCIS MAURICE (1862–1914), British admiral, was born at Hartford, Yorks., July 2 1862, the son of Christopher Cradock. He entered the navy at the age of 13 and saw service in Egypt both in 1882 and again in the Soudanese expedition of 1891. He commanded the British Naval Brigade at the capture of the Taku forts and the relief of Peking (1900). He more than once performed personal feats of gallantry in saving life at sea and showed himself a bold and fearless leader in action. He was promoted captain after Taku, and rear-admiral in 1910. In 1912 he was granted the K.C.V.O. He published *Sporting Notes in the Far East* (1889); *Wrinkles in Seamanship* (1894) and *Whispers from the Fleet* (1907). Early in the World War he was given command of a British squadron in the Pacific consisting of the cruisers "Good Hope" (flagship) and "Monmouth," the armed merchantman "Otranto" and the light cruiser "Glasgow." His squadron was attacked off the coast of Chile (Nov. 1 1914) by five German warships, the "Scharnhorst," "Gneisenau," "Leipzig," "Dresden" and "Nürnberg." Though inferior in speed and gun-power he decided to attack. The "Monmouth" was sunk and the "Good Hope" was blown up whilst making for shore, Admiral Cradock going down with the ship.

CRAM, RALPH ADAMS (1863–), American architect, was born at Hampton Falls, N.H., Dec. 16 1863. He was educated at the Westford (Mass.) Academy and the Exeter (N.H.) high school. He studied architecture in a Boston office, was for a time art critic on the *Boston Transcript* and in 1889 opened an architect's office in Boston. He had a profound knowledge of mediaeval architecture and was an able advocate of the Gothic style, employed by him in many church and college buildings. Examples of his successful ecclesiastical work include St. Thomas's church, New York; Calvary church, Pittsburgh; St. Paul's cathedral, Detroit; the Fourth Presbyterian church, Chicago; and St. Alban's cathedral, Toronto. He was consulting architect for the cathedral of St. John the Divine, New York. He designed buildings for the Princeton graduate school, Sweet Briar College

(Va.), the Rice Institute (Texas), Williams College, Williamstown, Mass., and Phillips Academy at Exeter, N.H. In 1903 his plans were accepted for remodelling the U.S. Military Academy. In 1914 he was appointed professor of Architecture at the Massachusetts Institute of Technology.

His numerous writings include *Church Building* (1901); *The Ruined Abbeys of Great Britain* (1905); *Impressions of Japanese Architecture and the Allied Arts* (1906); *the Gothic Quest* (1907); *The Ministry of Art* (1914); *Heart of Europe* (1915); *The Substance of Gothic* (1916, Lowell lectures); *The Nemesis of Mediocrity* (1918); *The Great Thousand Years* (1918); *The Sins of the Fathers* (1919); *Walled Towns* (1919) and *Gold, Frankincense, and Myrrh* (1919).

CRAMP, CHARLES HENRY (1828–1913), American ship-builder (see 7.363), died in Philadelphia June 6 1913.

CRAMP, CONCERNED THOMAS (1876–), British Labour politician, was born at Staplehurst, Kent, on March 19 1876. He left school at the age of 12, and worked as a boy gardener to the local squire. At the age of 18 he left his native village and obtained employment as a gardener outside Portsmouth. In 1896 at the age of 21 he joined the service of the Midland Railway at Shipley, near Bradford, as a porter at 16s. a week of seven days of 12 hours each. He was later transferred to Masboro', then to Sheffield, and promoted to a passenger guard. He joined the Amalgamated Society of Railway Servants and first appeared as a delegate at its Birmingham all grades conference, 1907. Later he became delegate to the annual general meeting of the A.S.R.S. and in 1911 was elected to represent his district on the executive committee. He was elected president of the National Union of Railwaymen at the 1917 annual general meeting. During the World War he became a member of several Government committees including the Port and Transit Executive Committee, Committee on Adult Education, Consumers' Council, and Railway Advisory Committee. He stood for Parliament unsuccessfully as Labour candidate for Middlesbrough at the general election in 1918. He was appointed Industrial General Secretary of the National Union of Railwaymen on Jan. 1 1920 and became a member of the Executive Committee of the Labour party.

CRANE, WALTER (1845–1915), English artist (see 7.366), died at Horsham March 14 1915.

CRAWFORD AND BALCARRES, 26TH EARL OF (1847–1913), British astronomer and orientalist (see 7.385), died in London Jan. 31 1913. He was succeeded as 27th earl by his son David Alexander Edward Lindsay (b. 1871), well known under his former title of Lord Balcarras as an art critic and connoisseur. He was appointed a trustee of the National Portrait Gallery, and has published *Donatello* (1903), and *The Evolution of Italian Sculpture* (1910). In 1916 he was included in Mr. Lloyd George's Cabinet as President of the Board of Agriculture and in 1921 became Lord President of the Council.

CREWE, ROBERT OFFLEY ASHBURTON CREWE-MILNES, 1ST MARQUESS OF, English statesman and writer (see 7.432), remained leader of the House of Lords through Mr. Asquith's first administration, and during the Coalition Government of 1915–6. Though he was not Lord Granville's equal in the difficult and delicate task of endeavouring to win the peers' assent to a succession of unpalatable measures of Radical reform, he contrived, by his courtesy and charm, to retain their liking and respect throughout the critical period beginning with the budget of 1909. He succeeded Lord Morley at the India Office in Nov. 1910, and attended, as Secretary of State, the King and Queen on their visit to India in the winter of 1911–2. He was responsible for the high acts of policy announced at the Delhi Durbar; the removal of the capital of India from Calcutta to Delhi, and the reunion of the two Bengals under a Governor-in-Council. At the coronation of King George he was promoted to a marquessate. In the first Coalition Government he was Lord President of the Council. He followed Mr. Asquith in declining to take office under Mr. Lloyd George; and after his resignation he continued to lead the independent Liberal opposition in the Lords.

CRICKET: see SPORTS AND GAMES.

CRILE, GEORGE WASHINGTON (1864–), American surgeon, was born at Chili, O., Nov. 11 1864. After graduating from Ohio Northern University (1884), he studied medicine at Wooster University (M.D. 1887) and later at Vienna, London and Paris. He taught at Wooster from 1889 to 1900. He was professor of Clinical Medicine at Western Reserve University from 1900 to 1911, and was then made professor of Surgery. During the Spanish-American War he was made a member of the Medical Reserve Corps and served in Porto Rico (1898). He was made an hon. F.R.C.S. (London) in 1913. After America entered the World War he became major in the medical O.T.C., and professional director (1917–8). He served with the B.E.F. in France and was senior consultant in surgical research (1918–9). He was made lieutenant-colonel in June 1918 and colonel later in the year. He made important contributions to the study of blood pressure and of shock in operations. Realizing that any strong emotion, such as fear before operation, produced shock, he attempted to allay dread by psychic suggestion, also endeavouring to prevent the subjective shock which affects the patient, even when under general anaesthesia, by first anaesthetizing the operative region with cocaine for several days, if necessary, before operating. Thus nerve communication between the affected part and the brain was already obstructed when the general anaesthetic was administered (see *Anoci-Association*, 1914, with Dr. Wm. E. Lower). For his work in shockless surgery he received a gold medal from the National Institute of Social Sciences in 1914.

Among his works are: *Surgical Shock* (1897); *On the Blood Pressure in Surgery* (1903); *Hemorrhage and Transfusion* (1909); *Surgical Anemia and Resuscitation* (1914); *The Origin and Nature of the Emotions* (1915); *Man an Adaptive Mechanism* (1916); *A Mechanistic View of War and Peace* (1916) and *The Fallacy of the German State Philosophy* (1918).

CROCE, BENEDETTO (1866–), Italian philosopher and statesman, was born at Pescasseroli, in the province of Aquila, Italy, Feb. 25 1866. He came of a family that counted among its members several jurists and magistrates. Born in the part of Italy formerly known as Greater Greece, it may be said of him without paradox that the development of his mind and character represented a modern incarnation of all that was subtle and profound in the Hellenic genius, linked with the best and wisest tradition of Roman civilization and of the Christianity that came to take its place. From the remote township of his birth, however, the branch of the family to which the philosopher belonged transferred itself soon afterwards to Naples, so that, like his predecessor Vico, Benedetto Croce may be correctly described as a Neapolitan. He studied at Rome and in Naples, afterwards adopting the life of an independent student and occupying himself especially with literary and with Neapolitan history. Much of his work that bears upon that period of youth is to be found in the volumes: *La Rivoluzione Napoletana del 1799*; *Saggi sulla letteratura italiana del Seicento*; *La Spagna nella vita italiana durante la rinascenza*; *Storie e leggende napoletane*. But Croce did not altogether neglect philosophy at this period. Towards his thirtieth year the study of philosophy and of history together occupied most of his attention. His principal works are contained in four volumes comprised under the general title *Filosofia dello spirito*: (1) *Estetica come scienza dell'espressione e linguistica generale*, (2) *Logica come scienza del concetto puro*, (3) *Filosofia della pratica: economia ed etica* and (4) *Teoria e storia della storiografia*. These were published between 1902 and 1913. With these may be mentioned certain volumes of essays, among which are to be noted those upon *Historical Materialism and Marxist Economy* (1896–1900); upon *Hegel* (1905); upon *Vico* (1910); and the *New Essays upon Aesthetic* (1920), which complete and carry further the first *Aesthetic*.

Croce only took part in the administrative work of Naples upon rare occasions and in moments of crisis. During the World War he developed a polemic directed against democratic-humanitarian conceptions and particularly those of President

Wilson, whose influence on the peace settlement was regarded by him as injurious to Italy. His writings on this subject have been collected in a volume entitled *Pagine sulla guerra* (Naples, 1919). In June 1920, when the Giolitti Government was formed with the programme of a reconstitution of the Italian State and of radical reforms, Croce (who had been a senator of the Kingdom of Italy since 1920) was asked to accept the office of Minister of Public Instruction. He agreed conditionally upon his programme being carried out. This programme was based upon the idea of a liberal reconstruction: he aimed at the reduction and simplification of the State schools combined with a more rigorous method of teaching, and at affording all facilities to, and indeed inviting the competition of, private instruction, fearless of the confessional school, which in his view would be compelled to modernize itself in order to maintain competition with the State school. In 1921 he retired from office on the resignation of the Giolitti Ministry.

It may be said of the philosophy of Benedetto Croce that it has formulated the truth of the unity of the spirit in the form most acceptable to the Western world. Its fundamental motive is the serious consideration, in a continuous and concrete manner, of that union of philosophy and history which had been glimpsed by earlier thinkers, but had hitherto been pursued in a manner more or less capricious. For Croce, the only knowledge is knowledge of the history, in its widest sense, both of men and of what is called nature, or the history of the spirit. This knowledge, however, is by no means positivistic or empirical, but on the contrary it is dialectical and *a priori* synthetic, brought about by the spiritual categories; and from it there constantly arise new problems, an ever new position of the fundamental categories. The treatment and solution of these problems is what is called "philosophy" in the strict sense of the word, which for that reason coincides with methodology speculatively understood. In the treatment of the spiritual categories, Croce laid special stress upon those which had been least elaborated and least studied.

A vivid new light is shed by him upon certain problems, such for instance as those of the imagination or intuition, the source of Art and the theme of the *Aesthetic*, upon pure will, the source of Economic of Rights and of Politics, treated by *Economic*. The more precise determination and configuration of the categories and their mode of acting, by means of which is negated and solved the concept of an external reality and of nature placed outside the spirit and opposed to it, led Croce to an absolute spiritualism, widely different from the pan-logicism of Hegel and his school, which only seemed to solve the dualism of spirit and nature and really opened the door to the notion of a transcendental God, as became clear in the development of Hegel's theory at the hands of the right wing of his school. In the *Philosophy of the Practical*, but more especially in the work entitled *What is living and what is dead of the Philosophy of Hegel* Croce criticizes the erroneous treatment of the opposites, and shows that on the contrary every opposition has at bottom a distinction from which it arises, and that therefore the true unity is unity-distinction, which is development and, as such, opposition that is continuously surpassed and continually re-appearing to be again surpassed. Another important conception connected with the preceding is the infinity of philosophy, which arises out of history and is as it were a reflection from history, varying at every moment and always solving a problem by placing alongside its solution the premise of a new history and therefore of a new problem and a new philosophy. Croce's substitutes for the old formula "system" the new formula "systematization." He thus admits that to philosophize is to systematize, but holds that every systematization is narrowly circumscribed, and is therefore to be solved and completed with ever new systematization. Thus scepticism and relativism are superseded by a historical philosophy, and the *absoluteness* of truth is affirmed, but the notion of a *definite* truth is at the same time both negated and satirized.

The philosophers from whom Croce learned most are Vico, the author of the *Scienza nuova*, and Hegel, but the thought of all other thinkers flows in his writings, in conformity with its historical character, and for this reason may, for instance, be found in it traces of some of Hegel's most active opponents, such as Herbart.

But the origin of the philosophy of Croce is the need, so keenly felt in our time, of a philosophy that shall be both realistic and idealistic, in which the fact will not drive out thought and thought will not go beyond the fact: in short, of a philosophy of immanence. The religious feature of this philosophy, against which has often been brought the accusation of excluding religion, resides in the consciousness of the unity of all and of the perpetual creation of the world by the spirit, as though it were a poem that the spirit is eternally composing, to which each individual contributes his strophe, or it may be only his line or his word: this poem has its end in itself and in its rhythm has beauty and joy, as well as labour and sorrow. This conception sets us free from the antithesis of optimism and pessimism.

Croce has elaborated the various philosophic sciences in treating of the various theories to which they give rise, and he has completed the doctrines with their history, either, as in the case of the *Aesthetic*, with a masterly historical survey of previous speculation on the subject, or in a more modest form in appendices. It is only possible to allude briefly here to the different conclusions that he has attained in treating the various problems, as for example in *Aesthetic*, the unity of art and language, of intuition and expression, the negation of particular arts, the refutation of literary and artistic classes, the criticism of rhetoric, of grammar and so forth; and in the *Philosophy of the Practical* or of Practice, the conciliation of the antitheses of utilitarianism and moralism, the critique of precepts, of laws and of casuistry, the new conception of judgments of value, the constitution of a philosophic economy side by side with the science of Economy, the resolution of the Philosophy of rights in the Philosophy of economic, and so forth. It is important to note that in conceiving philosophic studies to be all one with historical studies and attaining to this unity in himself, he cultivated historical studies to an equal extent with purely theoretical and speculative studies, concentrating especially upon the history of thought and poetry. Among his principal works upon these subjects may be noted the four volumes of *Letteratura della nuova Italia* (1860-1910); his essays upon Goethe, Ariosto, Shakespeare, Corneille, and the Poetry of Dante; his two volumes *Storia della storiografia italiana del secolo XIX.* and the collection of essays entitled *Una famiglia di patrioti*.

Croce, occupied with such studies as those mentioned, also found time to edit numerous texts and miscellaneous collections and composed many bibliographies, in addition to editing the *Critica*, in many respects the profoundest and widest in scope of all the European literary and philosophical reviews. In the work of this review his chief collaborator was Giovanni Gentile, but Croce contributed most of the literary and much of the philosophic criticisms.

The works of Croce have been translated into many languages. Douglas Ainslie was the first in Great Britain to draw attention to his importance as one of the leaders of European thought, and made him known in many articles and lectures both in Great Britain and in America. He also translated and published the complete *Philosophy of the Spirit* in four volumes (the *Aesthetic*, the *Logic*, the *Practical*, with Macmillan; the *Theory and History of Historiography*, with Harrap). The work on Vico has been translated by R. G. Collingwood, and that on *Historical Materialism and Marxism* by C. M. Meredith, the *What is living and what is dead of the Philosophy of Hegel* (Macmillan), and the *Breviary of Aesthetic* (Rice Institute, Texas), the volume *Shakespeare, Ariosto and Corneille* (Henry Holt & Co., New York), and the *Poetry of Dante* by Douglas Ainslie.

Among the numerous studies of Croce may be mentioned Dr. H. Wildon Carr's work *The Philosophy of Benedetto Croce* (Macmillan), and the further development of the same in his essay *Time and History*, where will be found a parallel and a distinction between Croce and Bergson (*Proceedings of the British Academy*, vol. viii.); and the very full and complete bibliography by G. Castellano, *Introduzione allo studio delle opere di B. Croce: Note bibliografiche e critiche* (Bari, Laterza, 1920).

Croce has himself composed a mental autobiography: *Contributo alla critica di me stesso* (Naples, 1918, limited to one hundred numbered copies for private circulation), and also a brief history of his native place and of his family (*Montenerodomo, storia di un comune e di due famiglie*, Bari, 1919), and another opusculum upon the house in which he lives: *Un angolo di Napoli* (Naples, 1912).

(D. A.; G. C.)

CROCKETT, SAMUEL RUTHERFORD (1860-1914), Scottish novelist (see 7.477), died at Avignon April 20 1914.

CROMARTY (see 7.483).—Before the outbreak of the World War the Cromarty Firth was surveyed as an advanced base for the main battle fleet in the event of a war with Germany, and the erection of defences at Cromarty was begun in 1912 and had made considerable progress by the outbreak of war. When the war began, Scapa Flow (see SCAPA FLOW) was adopted as the chief naval base because of the more restricted space of the Cromarty Firth and in view of the unsuitability of the narrow single entrance to the firth for sweeps into the North Sea and for the guarding of the northern exits. The existence of an anti-submarine defence made Cromarty important in the early months of the war. It was used throughout the war as a coaling station and was one of the nine "Trawler Stations" under the control of the Admiral of Patrols. Cruiser squadrons, with their destroyer flotillas, used Cromarty as their base, and it was from Cromarty that the "Invincible" and "Inflexible" started for the battle of the Falklands. One of the most serious naval disasters of the war occurred in the harbour of Cromarty on Dec. 30 1915, when the armoured cruiser "Natal" was destroyed by an accidental explosion.

CROMER, EVELYN BARING, 1ST EARL OF (1841-1917), British statesman and diplomatist (see 7.484). Lord Cromer's life was prolonged for nearly ten years after his return from Egypt; and, in spite of enfeebled health, culminating in a serious illness in 1914 from which he never completely recovered, he took an important share in political, social and literary movements at home. He was constant in his attendance in the House of Lords, and indefatigable in the work of its committees; he was a leading member of the free trade section of the Unionist party; he was active in opposition to female suffrage, and in combating anti-vivisection propaganda. Besides publishing his two volumes of *Modern Egypt*, he composed several addresses and pamphlets, wrote frequently for the periodicals, and from 1912 onwards was a regular contributor of signed articles and reviews of books to the *Spectator*—his vigorous and informed writing becoming an attractive feature of the paper. When the British Protectorate of Egypt was proclaimed, he completed his history of the modern development of that country in a small volume entitled *Abbas II.*, containing matter which it would have been indiscreet to publish so long as Abbas remained Khedive. While he was forward in promoting the study of Oriental languages, his strongest affection was for the Greek and Latin classics with which he had only become acquainted in mature life; he became president of the Classical Society, and endowed a Greek prize for the British Academy. In the critical period of which the main features were the budget of 1909 and the Parliament bill of 1911, Lord Cromer played an energetic part. He failed to prevent the rejection of the budget by the House of Lords; but he was successful in his untiring efforts to persuade moderate Unionist and cross-bench peers to counter the "Die-hard" movement, and to vote for the Parliament bill rather than force the Government to swamp the House by an unlimited creation. It was in the performance of another patriotic duty, during the World War, that he met his death. In spite of age and indifferent health he accepted the laborious and invidious task of chairman of the special commission to inquire into the abortive Dardanelles operations. The sittings occupied the autumn of 1916, and while engaged on the draft report he was seized in Dec. with an attack of influenza. Before he had recovered, he resumed the work of the commission, which completely broke him down. He died a few weeks after the beginning of the new year. Seldom has there been a life more singly and successfully devoted to the good of his country.

See Lord Sanderson's *Memoir of Evelyn, Earl of Cromer* (1917). (G. E. B.)

CRONJE, PIET ARNOLDUS (1840-1911), Boer general (see 7.501), died at Klerksdorp, Transvaal, Feb. 4 1911.

CROOKES, SIR WILLIAM (1832-1919), English chemist and physicist (see 7.501), died in London April 4 1919. He was given the O.M. in 1910.

CROOKS, WILLIAM (1852-1921), British Labour politician, was born at Poplar April 6 1852. After spending his early years in the workhouse of which he afterwards became chairman of the Board of Guardians, he started work at the age of 14 as a cooper's apprentice, and soon became an ardent trade unionist. His long career of public work began in 1882, when he was made trustee of the parish of Poplar and Library Commissioner. In 1892 he became a member of the L.C.C., on which he worked continuously for 28 years. From 1898 to 1906 he was chairman of the Poplar Board of Guardians, and in 1901 mayor of Poplar. In 1903 he entered Parliament for Woolwich, and, except for one short interval in 1910, continued to represent that constituency until his resignation in 1921. On the outbreak of the World War he entered wholeheartedly into the work of recruiting and in 1916 he was made a Privy Councillor. Continued ill-health compelled his retirement from politics in Feb. 1921, and he died in Poplar hospital on June 5 1921.

CROTHERS, SAMUEL MCHORD (1857-), American clergyman and author, was born at Oswego, Ill., June 7 1857. He was educated at Princeton (A.B. 1874), Union Theological Seminary (1874-7), and the Harvard Divinity School (1881-2).

Ordained as a Presbyterian minister in 1877 he was a pastor in Nebraska, Nevada, and California (1877-81). He became a Unitarian minister in 1882, called to Brattleboro, Vt. (1882-6), St. Paul, Minn. (1886-94), and Cambridge, Mass. (since 1894). An inspiring preacher and a very popular public speaker, he won a still wider audience by his essays, which recall the quaint humour of Charles Lamb.

Among his best known volumes are:—*The Gentle Reader* (1903); *The Understanding Heart* (1903); *The Pardoner's Wallet* (1905); *The Endless Life* (1905); *By the Christmas Fire* (1908); *Oliver Wendell Holmes and His Fellow Boarders* (1909); *Among Friends* (1910); *Humanly Speaking* (1912); *Three Lords of Destiny* (1913); *Meditations on Votes for Women* (1914) and *Pleasures of an Absentee Landlord* (1916).

CROWDER, ENOCH HERBERT (1859-), American soldier, was born in Missouri April 11 1859. He graduated from the U.S. Military Academy in 1881 and while detailed as commandant at the university of Missouri won in 1886 the degree of LL.B. in the law school. He was appointed major judge-advocate in 1895. He served in the Philippine Islands (1898-1901), was observer with the Japanese army in Manchuria (1904-5), and was in Cuba as Secretary of State and Justice (1906-8). He was provost-marshal general from May 1917 to July 1919, and as such had full control of the U.S. machinery of conscription in the World War, which he conducted with much success. He was reappointed judge-advocate general in 1919, and the same year invited by the Government of Cuba to advise in connexion with changes in the election legislation there. General Crowder was recognized as an exceptionally authoritative legal adviser in military affairs. In his book *The Spirit of the Selective Service* (1920), he described the method whereby within 18 months after America had entered the World War 2,000,000 men were in France, almost as many more were in cantonments, and altogether no fewer than 24,000,000 had been registered and classified.

CROZIER, JOHN BAPTIST (1853-1920), Protestant Archbishop of Armagh, was born at Ballyhaise, co. Cavan, Ireland, April 8 1853. After a distinguished career at Trinity College, Dublin, where he took his degree in 1872, he was ordained in 1876. From 1885 to 1897 he was vicar of Holywood, co. Down. In 1896 he became honourable secretary of the General Synod of the Church of Ireland, becoming in the same year a canon of St. Patrick's cathedral. In 1897 he was elected Bishop of Ossory, was translated in 1907 to the see of Down, and in 1911 succeeded Dr. Alexander as Archbishop of Armagh and Primate of All Ireland. In 1912 he took a conspicuous part in the agitation against the Home Rule bill, and presided over the monster meeting of Unionists held at Balmoral, Belfast, on Easter Tuesday. In the Irish Convention of 1917-8, he and Dr. J. H. Bernard (then Archbishop of Dublin), represented the Church of Ireland. At the close of the Convention the Archbishop joined Dr. Mahaffy, the provost of Trinity, in presenting a minority report advocating a solution of the Irish question on the lines of the Swiss federalism. He died at Armagh April 1 1920.

CROZIER, JOHN BEATTIE (1840-1921), British philosopher, was born at Galt, Can., of Scottish parentage April 23 1840. He was educated at the local grammar school, where he won a scholarship to Toronto University, which he was, however, obliged soon to surrender owing to ill-health. He returned to the university four years later and took a course in medicine, graduating in 1872. He then came to England, bought a practice in London, and began a systematic study of philosophy and economics. His first publication, *The Religion of the Future* (1880), attracted little attention; but *Civilization and Progress* (1885) reached a 4th edition and was translated into Japanese. His *History of Intellectual Development* (1897-1901) was followed by the grant of a Civil List pension, some compensation for failing eyesight and the loss of his medical practice. His further publications included *My Inner Life*, an autobiography (1898); *The Wheel of Wealth* (1906); *Sociology applied to Practical Politics* (1911) and *Last Words on Great Issues* (1917). He died in London Jan. 8 1921.

CROZIER, WILLIAM (1855-), American soldier (see 7.520), was detailed in 1912 as president of the Army War College and the following year was reappointed chief of ordnance with the rank of brigadier-general. He was made major-general, chief of ordnance, U.S.A., in 1917, and the provision of munitions in the World War was under his charge until Dec. 1917. He was then made a member of the War Council, and in the discharge of this office was in France and Italy for the first half of 1918. For the remainder of the year he was commandant of the N.E. Department, U.S.A., retiring from active service in December.

CRYSTALLOGRAPHY (see 7.569).—The geometry of the external forms of crystals may be said to have been completely worked out. The 32 crystal-classes differing from one another in their type and degree of symmetry and the six crystal-systems into which these classes can be grouped are now well established. The same is also true of the geometrical conceptions of the internal structure of crystals (though a good general account is still wanting). It is known that there are 230 possible types of homogeneous point-systems and that these are referable to 14 kinds of space-lattices. Recent work has been in the direction of attempting to trace a connexion between the internal structure of crystals and their chemical constitution. Here there is ample scope for speculation; but since 1912, when X rays provided a new method of investigation, some real advance has been made. By this method it is possible not only to determine the internal structure of crystals, but also actually to measure the distance between the atoms.

Crystals consist of a homogeneous assemblage of particles, and these particles are marshalled in certain definite ways. The grouping around any one particle (except those on the boundaries of the crystal) is the same as that around every other particle of the same kind. Further, the particles are arranged at regular intervals along straight lines. Throughout the structure there are several parallel sets of such lines, and these lie in several parallel sets of planes also at regular intervals apart.

An example of such a structure is the simple cubic space-lattice represented in fig. 1. Here the particles (all of the same kind) are placed at equal distances, say a , along parallel lines in three sets at right angles; the distance between the parallel lines in each plane and between the parallel planes of lines being also a . That is, the particles are situated at the points of intersection of a system of lines that form a square network or lattice in three dimensions. Or the structure may be regarded as a stack of small cubes each with a quarter of a particle at every corner; the four adjoining cubes at each corner then providing the whole particle. In this grouping, any one particle is surrounded by a set of 6 similar particles at distance a ; further, it is surrounded by 12 particles at distance $\sqrt{2}a$ (i.e. the diagonal of the square); and by 8 other particles at distance $\sqrt{3}a$ (i.e. the diagonal of the cube).

It is clear from fig. 1 that the three sets of lines are parallel to the edges of the cube, and that they lie in planes parallel to the faces of the cube. But it is to be noticed that the particles also lie in other sets of parallel lines, and that these lines fall in other sets of parallel planes. Certain of these additional lines and planes of particles are represented more prominently in fig. 2, which is drawn on a smaller scale with a larger number of particles (but to avoid confusion only those on the surface of the solid are marked). In this figure the three front edges of a portion of the main cube are truncated by planes of the rhombic-dodecahedron, and one corner has been cut off symmetrically by a face of the octahedron. (Since the octahedron face intersects both the cube and the rhombic-dodecahedron faces, its outline is hexagonal.) It will be seen that the several layers of particles parallel to any one of these faces are continuous over the other faces, although the particles themselves are ranged along lines of different directions. Hundreds of different planes of particles can, in fact, be traced out in such a structure; and it is important to remember that these structure planes are parallel to possible external faces on the crystal. A close relation exists between the Millerian indices of these faces and the number of particles along certain lines in the corresponding planes. The dotted lines on the front cube face in fig. 2 represent the intersections or traces of such planes with the indices: (111), (211), (311), etc.; (221), (321), etc.; (331), (431), etc.; respectively for the lines from right to left. The seven planes of which the indices have just been given necessitate by symmetrical repetition the presence of 93 other structure planes, or, in all, 200 external crystal faces.

It will be further seen from a study of fig. 2 that the spacing between the particles is not the same on each of the faces (allowance being made for foreshortening in the drawing: only on the front

cube face are the particles represented at their true distance apart). On the cube faces the distances each way are, of course, a . On the faces of the rhombic-dodecahedron they are spaced at distance a in one direction, but along the second direction at right angles at distance $\sqrt{2}a$. On the octahedral face there is, instead of a rectangular grouping, a triangular and hexagonal pattern with the particles spaced at distances $\sqrt{2}a$ in three directions. It follows therefore that the number of particles on each of the faces is not the same for equal areas. The network of particles is closer on the cube face than on the rhombic-dodecahedron, and more open on the octahedron. This "reticular density" of the different faces is a question of importance and is closely related to the cleavage of crystals. Minerals with cubic cleavage (e.g. rock-salt and galena) would be expected to be of this structure.

In addition to the spacing of the particles in the planes, there is also to be considered the distances between the planes themselves. This is represented in fig. 3 by means of vertical sections through the structure (fig. 2) perpendicular to the respective planes. In fig. 3a the spaces between the cube planes is, of course, a , and the particles are also spaced at distance a ; the pattern being, in fact, that on a cube face perpendicular to the first. In fig. 3b the distance between the rhombic-dodecahedron planes is given by half the diagonal of the cube face, namely $a/\sqrt{2}$, and the particles are at distances a apart. Here, however, the section-plane intersects lines of particles only in alternate rhombic-dodecahedron planes. In fig. 3c the distance between octahedron planes is given by one-third the diagonal of the cube, namely $a/\sqrt{3}$; and the particles are at distance $\sqrt{6}a$ apart along the traces of the octahedron planes, though only at distances a or $\sqrt{2}a$ across these planes. (In figs. 3b and 3c the section-plane is the same, since it is perpendicular to both the rhombic-dodecahedron and the octahedron, and the particles intersected are also the same; but to avoid confusion in the drawing the two sets of planes are separated in the two figures.) Other section-planes could, of course, be drawn perpendicular to the planes in question, but, whilst the distances between the planes would be the same, the spacing of the particles would be different.

In addition to the simplest type of cubic lattice discussed in some detail above, there are two other types. The three are represented together for comparison in fig. 4. In fig. 4b there is an additional point at the centre of each cube—this may be called the centred cubic lattice; and in fig. 4c there are additional points at the centre of each face, giving the face-centred cubic lattice. The different relations afforded by these types need not be discussed here. But it may be pointed out that in the centred cubic lattice the greatest reticular density is in the rhombic-dodecahedron planes, whilst in the face-centred cubic lattice the particles are most closely packed in the octahedron planes. These would be expected to correspond to cubic crystals showing rhombic-dodecahedral and octahedral cleavage (e.g. zinc-blende and fluor-spar) respectively.

Types of lattices other than the cubic are deduced by varying the distances of the particles along the different axes and by varying the angles between these axes, in a manner similar to that in which the six crystal-systems are deduced. In fact the elements of the elementary cells of the lattice, namely the lengths and inclination of their edges, are identical (except in certain cases) with the parameters $a:b:c$ and the axial angles α, β and γ deduced from the external crystal faces.

The "particles" referred to above may be crystal molecules, chemical molecules, or even atoms. They are represented in the diagrams as spots without committing ourselves as to their shape or size (in relation to their distance apart). Some authors represent them as spheres in contact with one another, regarding these as the spheres of influence of each atom. If the spheres are of equal size, the number of points of contact and the closeness of the packing will vary with the type of lattice. Or again, we may regard the particles (all of the same size) as completely filling space. In this case the particles in the simple cubic lattice will be cubes, each in contact with six other cubes; in the centred cubic lattice they are cubo-octahedra with 14 surfaces of contact; and in the face-centred cubic lattice they are rhombic-dodecahedra with 12 surfaces of contact.

The above outline of the geometrical structure of crystals has been necessary for the purpose of introducing the new X-ray methods of investigating the internal structure of crystals.

X rays, or Röntgen rays, are propagated as waves in the same manner as rays of ordinary light, but they are of much smaller wave-length. The wave-length of yellow (sodium) light is 0.000580 cm. (i.e. of the order 10^{-6} cm.), whilst the wave-lengths of X rays are of the order 10^{-8} or 10^{-9} cm., or one thousand to ten thousand times smaller. The very fine rulings of parallel lines (about 7,000 to a cm.) of diffraction gratings being of a magnitude (10^{-4} cm.) comparable with the wave-lengths of light, they produce well-known diffraction effects. It would be impossible to produce mechanically a grating which would

be fine enough to diffract the much shorter X rays. But it occurred to Dr. Max Laue, of Zurich, that the reticular structure of crystals would supply the necessary grating, since the distances between the atoms in the space-lattices are of the order 10^{-8} cm. When, in 1912, this idea was put to the test a very surprising result was obtained. Plates cut from crystals parallel to certain faces were placed perpendicularly in the path of a thin pencil of X rays, and beyond a photographic plate was exposed. The resulting photograph (known as a Laue photograph or radiogram, Röntgenogram or Röntgen pattern, or spot photograph) shows a larger central spot representing the direct rays, whilst surrounding it is a symmetrical pattern of smaller spots. The spots may also be shown directly by projection on a screen of fluorescent material. This pattern shows the same degree of symmetry as that on the crystal face. Thus a plate from a hexagonal crystal of beryl cut parallel to the basal plane (*i.e.* perpendicular to the principal axis) shows a six-fold arrangement of spots symmetrical about six radial lines at 30° ; whilst when the plate is cut parallel to a prism face of the same crystal the spots are symmetrical about two lines at right angles. Fig. 5 is a reproduction of an actual photograph obtained by passing a pencil of X rays through a basal cleavage plate, 0.81 mm. in thickness, of the pseudorhombohedral chlorite, penninite. This photograph (after H. Haga and F. M. Jaeger, 1915) is selected on account of its comparative simplicity and the obvious three-fold arrangement of the spots.

The results obtained with these Laue photographs were at first explained as due to diffraction, but the problem is much more complex than diffraction by a single system of parallel lines in one plane, since we are here dealing with a lattice in three dimensions in which there are many series of lines in many planes. As explained by Sir William Bragg and his son Prof. W. L. Bragg in their book (*X-rays and Crystal Structure*, London, 1915; 3rd ed., 1918) it is due to the amplification of waves reflected from successive layers of atoms within the crystal. In fig. 6 a beam of X rays AB , $A'B'$, $A''B''$, all of the same wave-length λ , strikes at a glancing angle θ the planes of particles, the distances between which are d (*cf.* fig. 3). They are reflected by successive planes as a single ray BC . Produce $A'B'$ to D (then BD is perpendicular to the planes) and draw BN perpendicular to $A'D$. Then, since $B'B = B'D$ and $AB = A'N$, the length of path of the ray $A'B'C$ is greater than that of the ray ABC by the distance $ND = 2d \sin \theta$. Similarly, $A''B''C$ is longer than $A'B'C$ by the same amount. If, now, this distance is equal to the wave-length of the rays, namely, if $\lambda = 2d \sin \theta$, the rays reflected by successive layers of particles will be vibrating in the same phase and their amplitudes will be added together. If the glancing angle θ be varied but slightly the reflections from the millions of layers will vary in phase and they will mutually interfere. But at certain other glancing angles θ_1, θ_2 when $2\lambda = 2d \sin \theta_1$ or $3\lambda = 2d \sin \theta_2$, there will again be an accumulative effect, giving reflections of the second and third orders. (See fig. 6.)

In the Bragg apparatus, called an X-ray spectrometer, homogeneous ("monochromatic") rays from an X-ray tube emerge through a narrow slit in a leaden screen and strike at a glancing angle the crystal plate mounted on a goniometer. The reflected beam enters an ionization chamber containing sulphur dioxide or methyl bromide and connected with an electroscop. The crystal is slowly turned on the goniometer until a maximum effect is noted in the electroscop, when the angle θ is read. Plotting the readings of the electroscop against those of the goniometer, a curve (X-ray "spectrum") is obtained which shows a series of sharply defined maxima or peaks corresponding to reflections of the first, second, and other orders. Knowing the wave-length of the rays, the distance between the planes of particles can then be calculated from the above fundamental equation; or alternatively, knowing the spacing of the planes, the wave-length of the rays can be determined. As an example, rays from a palladium anticathode ("palladium rays") were strongly reflected from the cube face of rock-salt when the angle θ was 5.9° , 11.85° , and 18.15° . Taking the spacing d between the cube planes of rock-salt as 2.81×10^{-8} cm., the wave-length λ is found to be $2 \times 2.81 \times 10^{-8} \sin 5.9^\circ = 0.578 \times 10^{-8}$ cm., or $2\lambda = 2 \times 2.81 \times 10^{-8} \sin 11.85^\circ = 1.154 \times 10^{-8}$ cm.

To return now to an explanation of the spots shown by the Laue photographs. Here, instead of homogeneous rays, the rays employed are of mixed wave-lengths (as in white light). For such a bundle of rays reflected by a certain set of parallel planes (as explained in fig. 6) there will be some of wave-length that will satisfy the equation $\lambda = 2d \sin \theta$, or at least $n\lambda = 2d \sin \theta$. There will then be a reinforcement in the reflection of these rays from the particular set of planes. Let fig. 7 represent a plate of beryl cut perpendicular to the principal axis of the crystal, the upper and lower boundaries in the figure being then parallel to the basal plane. The rows of particles lie in the traces of two sets of planes respectively parallel to

two possible pyramidal faces of the crystal. Reflection from these will yield two spots on the photographic plate. Now, according to the hexagonal degree of symmetry possessed by beryl, there will be 6 (or 12) similar sets of planes equally inclined to the vertical axis, and corresponding to a hexagonal (or dihexagonal) pyramid; consequently 6 (or 12) similar spots will appear on the photograph equally distant from the centre. For other sets of 6 (or 12) planes inclined at other angles to the vertical axis of the crystal, and parallel to possible faces of hexagonal or dihexagonal pyramids, intensified reflections will take place for rays of other wave-lengths. The result will be a large number of spots on the photographic plate, but all of them in sets of 6 (or 12) symmetrically grouped around the centre.

Some of these Laue photographs are highly complex in appearance, but by analysis they can be reduced to simple crystallographic relations. Since each spot represents a structural plane in the crystal and also a possible external crystal-face, the series of spots lie in zones and their Millerian indices can be deduced. Further, it will be seen from fig. 7 that the distances of the spots from the centre are in direct relation to the inclinations of the various planes. Fig. 8 (after H. Haga and F. M. Jaeger, 1915) shows plotted on a stereographic projection the series of spots of a Laue photograph on the face (010) of anhydrite. The spots are here symmetrical with respect to two lines at right angles, corresponding with the orthorhombic symmetry of the crystal. The zone-circles are drawn in one-half of the diagram and the indices of the planes are given in one-quarter. It is thus possible to deduce from the Laue photographs not only the zonal relations and indices of possible faces (many of which have not been observed as actual faces), but also the angles between these faces and the fundamental elements of the crystal. This information can even be obtained from an irregular fragment showing no external faces and of unknown orientation. Such a fragment is mounted on a two-circle goniometer and a series of Laue photographs taken in various positions; and a special instrument is provided for the analysis of the series of photographs.

A further point to be noticed in the Laue photographs (figs. 5 and 8) is that the spots are of different sizes and intensities (though spots repeated by the symmetry are, of course, identical). The stronger reflections are from planes of greater reticular density and indicate at once the important structural planes and the prominent faces of the crystal.

A third method of investigation has been devised by P. Debye and P. Scherrer in Germany in 1916, and independently by A. W. Hull in the United States in 1917. Here a beam of homogeneous ("monochromatic") X rays of known wave-length is transmitted through the finely powdered crystalline material, and the reflections received on a photographic film. The tiny crystal fragments are in all manner of orientations; and to further ensure all possible orientations in the aggregate, the tube containing the small amount of powder is rotated during the exposure. For structural planes with the spacing d there are bound to be some of the particles in the position shown in fig. 6 in which the equation $\lambda = 2d \sin \theta$ is satisfied: but these will be lying in all azimuths, *i.e.* sloping away in all directions at the angle θ from the axis of the rays. The reflected rays will consequently lie on the surface of a cone, the angle of which is 2θ ; and, instead of a single spot, a continuous series of spots forming a circle will appear in the photograph. Similarly, in other fragments the same set of planes with spacing d may be inclined at angle θ_1 giving a second order reflection as required by the equation $2\lambda = 2d \sin \theta_1$, and producing a wider-angled cone concentric with the first. Further, other structural planes with spacing d_1 and inclined at other values of θ will be provided by other fragments, giving still other conical reflections. Since, however, the experiment is performed with rays of one wave-length, it is only certain values of d that will satisfy the equation, so that the number of reflections is really limited. Even with this limited number, there would appear to be some difficulty in sorting out the reflections of the different orders and those from different structural planes. Since it is only the angles of divergence of the concentric conical sheaths that are to be measured, all that need be photographed is a narrow strip through the centre. This strip is made semicircular, in order to embrace a wide field of reflected cones. Knowing θ and λ , the equation gives, as in the Bragg method, the spacing d between the structural planes of the crystal.

Although the Debye-Scherrer method may be regarded as a modification of the Laue method, yet the results it gives are the same as those given by the Bragg method, namely the spacing between the structural planes of the crystal. The Laue method gives other supplementary information, but it is mainly on the spacing between the planes of particles that ideas of structure are built up. A large amount of experimental work on crystals of different substances has been done in this direction, and deductions have been drawn as to their probable atomic arrangement. In this place only one or two examples can be briefly considered.

Rock-salt (sodium chloride) crystallizes in cubes and possesses a perfect cleavage parallel to the faces of the cube. Plates cut parallel to the faces of the cube (100), the rhombic-dodecahedron (110), and the octahedron (111) respectively give by the Bragg method values for the spacing between the planes of particles in the ratio of $1:1/\sqrt{2}:1/\sqrt{3}$. These ratios are the same as those mentioned above for the simple cubic space-lattice (figs. 1-3), and the conclusion

CRYSTALLOGRAPHY

may be drawn that this represents the structure of rock-salt. The two kinds of atoms, sodium and chlorine, may be placed alternately along the three directions, as shown in fig. 9. As so represented the structure may also be regarded as an interpenetration of two space-lattices of the face-centred cubic type (fig. 4c), with the sodium atoms on one lattice and the chlorine atoms on the other. One lattice can be brought into the position occupied by the other by a parallel shift along a cube edge through the distance between two consecutive planes. The actual distance between the cube planes, and consequently also between the atomic centres, has been determined to be 2.81×10^{-8} cm., or rather more than a hundred-millionth of an inch. In the drawings, the scale of the lattice is enormously enlarged and only an infinitesimal portion of the crystal is represented. Some idea of this may be conveyed by saying that if we took a cubic inch of rock-salt and represented the whole of the structure on the same scale as in fig. 9 the drawing would be rather more than a thousand miles across. The same structure is also shown by galena (lead sulphide, PbS), the crystals of which also possess a perfect cubic cleavage: the two kinds of atoms shown in fig. 9 here represent lead and sulphur. Other examples are potassium chloride, potassium bromide, etc.

Examples of crystals with the structure of the centred cubic lattice (fig. 4b) are those of the metals iron, sodium, tungsten, etc. The face-centred cubic lattice (fig. 4c) is represented by crystals of the metals copper, silver, gold, platinum, etc.

A special type of cubic lattice, known as the "diamond lattice," consists of another kind of interpenetration of two face-centred lattices. In fig. 10, to avoid confusion, only one such lattice is represented in detail—the white particles clearly having positions shown in fig. 4c. Four black particles belonging to the other lattice are placed each at a centre of alternate sub-cubes in the first lattice. Through the whole structure there are, of course, equal numbers of the white and black particles. The positions of two more black particles are indicated in the next storey above of the white-particle lattice. Now it will be seen that around each black particle there is a tetrahedral arrangement of four white particles; and around each white particle a tetrahedral arrangement of four black particles (but, conversely, it is only alternate tetrahedral groups of each kind that have a particle of the other kind at their centre). The front outlines of two of these tetrahedra are indicated in the figure. The upper tetrahedron of four black particles has at its centre the white particle in the centre of the top cube face; and one of these same black particles is at the centre of the tetrahedron of white particles at alternate corners of the upper, front, right-hand sub-cube. The first tetrahedron can be brought into coincident position with the second by sliding it downwards and forwards along one-quarter of the diagonal of the cube, and then rotating it through 90° about a cube edge. The same is also true of the whole lattice; i.e. one lattice can be brought into exactly the position of the other by these two successive operations. The symmetry of the whole model is that of the tetrahedral class of the cubic system; but, in addition, the two sets of particles are directed towards different directions. Regarding the particles as spheres of equal size and in contact with one another, then each one is touched by only four others, the latter with a tetrahedral arrangement; much of the space is thus vacant, and more spheres of the same size could be dropped into the larger interspaces. Or again, if the particles (all of the same size) entirely fill a space, they will have the form of regular tetrahedra the four corners of which are each replaced by three faces of the rhombic-dodecahedron (much as in fig. 33, vol. 7, p. 375, but with the faces of the tetrahedron cut off to regular hexagons).

This type of structure is shown by diamond, silicon, grey tin, and zinc-blende, and also by copper-pyrites (a tetragonal mineral, but with very nearly cubic angles). In the first three, being chemical elements, the atoms on the two lattices are of the same kind. In diamond each carbon atom is surrounded tetrahedrally by four others at a distance, between the centres, of 1.53×10^{-8} cm. In zinc-blende (ZnS) the zinc atoms lie on one lattice, whilst the sulphur atoms lie on the other. Since the two lattices are identical and superposable, it is immaterial whether the black particles represent sulphur or zinc atoms. In copper-pyrites ($CuFeS_4$) the sulphur atoms are said to lie on one lattice and the copper and iron on the other; the copper and iron atoms being in alternate horizontal layers perpendicular to the principal axis of the crystal. It is, however, to be remarked that these three minerals, to which the same type of structure is ascribed, exhibit marked differences in their cleavages. Diamond has a perfect octahedral cleavage, zinc-blende a perfect rhombic-dodecahedral cleavage, whilst copper-pyrites has none. Again, the high density and the extreme hardness of diamond would seem to suggest that there should be less unoccupied space in the structure.

A fuller account is given in Bragg's book quoted above. A series of excellent summaries of this and other matters relating to chemical crystallography are given by T. V. Barker in the *Annual Reports of Progress of the Chemical Society* (London, 1913 et seq.). In the latter will also be found the best available account of the extraordinary work of the Russian crystallographer, E. S. Fedorov, who perished in Petrograd in 1919.

REFERENCES.—A comprehensive and general treatise is A. E. H. Tutton's *Crystallography and Practical Crystal Measurement* (London

1911; 2nd ed. 1921). A popular work of the same author is *Crystals* (International Scientific Series, London 1911). Structure theories are discussed by P. Niggli, *Geometrische Kristallographie des Diskontinuums* (Berlin 1918); F. M. Jaeger, *Lectures on the Principle of Symmetry* (Amsterdam 1917; 2nd ed. 1920); J. Beckenkamp, *Statische und kinetische Kristalltheorien* (Berlin 1915); see also Bragg and Barker quoted above. Elementary text-books are: T. L. Walker, *Crystallography, an Outline of the Geometrical Properties of Crystals* (New York 1914) in which the subject is treated from the point of view of two-circle goniometry; Sir Wm. P. Beale, *An Amateur's Introduction to Crystallography from Morphological Observations* (London 1915); P. Groth, *Elemente der physikalischen und chemischen Kristallographie* (Munich 1921); J. Beckenkamp, *Leitfaden der Kristallographie* (Berlin 1919). A collection of thousands of drawings of crystals with critical lists of forms is given by V. Goldschmidt, *Atlas der Kristallformen* (several 4to vols., in progress, Heidelberg 1913, etc.). New crystal-forms together with other crystallographic constants are listed in the international *Tables annuelles de constantes et données numériques* (4 vols., Paris 1912, etc.). An historical sketch of the early development of crystallography is given by Hélène Metzger, *La genèse de la science des cristaux* (Paris 1918). (L. J. S.)

CSAKY, ALBIN, COUNT (1841–1912), Hungarian statesman, was born on April 18 1841 at Krompach, in the county of Szepes, and studied law at Kassa (Kaschau) and Budapest. Deputy in 1865, he was from 1868 to 1880 *Obergespan* (lord-lieutenant), in which capacity he gained the reputation of an excellent administrator. In 1884 he pleaded eloquently in the House of Magnates for the establishment of civil marriage, and in 1888 was Minister of Education in the Cabinet of Koloman Tisza. Together with Szilagy, the Minister of Justice, Csaky was one of the most decided champions of obligatory civil marriage and of the rights of the Jews. He resigned in 1894, and in 1900 was appointed president of the House of Magnates, an office which he resigned on the fall of the Liberal party in 1906. Under the Khuen-Hedvary Government he became on June 18 1910 once more president of the House of Magnates.

CUBA (see 7.594*).—From 1909, when for the second time the management of Cuban affairs was turned over by the United States to the Cuban Government, until the end of 1920, there was a steady growth in Cuba's prosperity. This growth was greatly accelerated during the first half of the year last mentioned, but suffered a serious reverse toward the end of the year. The census of 1919 showed a pop. of 2,898,905 (1907, 2,048,980), an average of 65.56 per sq. mile. The total immigration was in 1914, 24,420; in 1918, 37,320; and in 1919, 80,485. Of immigrants in 1919, 39,573 were from Spain. The immigrants from Jamaica, who numbered only 995 in 1914 and 9,184 in 1918, increased to 24,187 in 1919. It is stated that probably 75% of the immigrants return to the country of origin within the course of a year, coming to Cuba only for the high wages paid during the cane cutting and grinding season.

The Sugar Industry.—Sugar is the basis of Cuba's prosperity. The climate and fertile soil are admirably adapted to the growth of sugar cane, and the island has come to be recognized as the "sugar bowl of the world." The high prices that prevailed in 1919–20 enabled the sugar industry to put more of the soil under cane than ever before and to construct many of the most modern and efficient sugar mills in the world. The sugar crop, which in 1910–1 totalled 1,379,609 long tons, steadily increased, except for a slight decline in 1914–5. In 1918–9 the production reached 3,720,000 tons or 61% of the total cane sugar produced by the western hemisphere, 34% of the world's cane sugar production, and 25% of the world's total sugar production, as against an average of 11% in the decade preceding the World War. Production increased more than 50% during the five years 1913–4 to 1918–9. During the period 1909–14, approximately 95% of Cuba's crop went to the United States (almost half of that country's supply), the remaining 5% being used for home consumption. In 1917–8 the entire crop, except that used for home consumption, was purchased by the United States and the Allies, two-thirds for the former, one-third for the latter. The 1918–9 crop was similarly contracted for, but part of the share of the United States was later diverted to other countries. The crop for 1919–20 was 3,730,077 tons. The price, which had been from two to three cents a pound before the war, advanced slowly but steadily during the war. The crop for 1917–8 was sold to the United States at 4.6 cents f. o. b. Cuban ports, and that for 1918–9 at 5½ cents. But the next year the world's shortage (nearly 2,000,000 tons compared with 1913–4), the increased consumption in the United States and the failure of the latter to purchase the 1919–20 crop, although it was offered and could probably have been obtained at about 6½ cents a pound, caused a keen competition for the Cuban supplies,

* These figures indicate the volume and page number of the previous article.

opened the way for wild speculation and led to an unprecedented rise in price. In the early part of the year the price was about 11 cents a pound, but rose rapidly until a peak of 22½ cents was reached in May, when the market broke. Thereafter, the price declined almost as rapidly as it had risen, reaching at the end of Nov. about 3½ cents, near which it continued for several months. To prevent a further decline and, if possible, force an upward reaction, a price-fixing commission was in Feb. 1921 appointed by the president of Cuba and given power to control the sale and exportation of the entire 1920-1 crop.

Other Industries.—Of the island's agricultural products, tobacco ranks next to sugar in importance, the total value of the crop ranging from 40 to 50 million dollars per annum. A high import duty recently placed upon coffee had the effect of stimulating that industry, but the production in 1919 was still far below the requirements of the population. The culture of henequin or "sisal" promised to become important, as did also the production of jute. Cotton was being cultivated experimentally. The cultivation of fruit and vegetables for winter consumption in the United States was quite an extensive industry, the soil and climate lending themselves easily to the production of citrus fruits, bananas, pineapples, coconuts and various garden vegetables. Cuba produced an appreciable portion of the world's supply of sponges. The average output of Batabanó, where 25% of the male population were engaged in this industry, is said to approximate half a million dollars a year. There was a considerable and growing interest in the cattle industry, and hides and skins were exported in increasing quantities. In 1911 a commission was sent to the United States to purchase thoroughbred stock for breeding purposes at the six Government experiment stations. There were, in 1919, about 4,000,000 head of cattle, 780,000 horses, and 64,570 mules. The manufacture of turpentine was a new industry, begun after an investigation of pine trees in the Isle of Pines. Of mineral products, iron continued to be the most important, though mines of manganese, copper and asphalt were important. The iron deposits in the province of Oriente near Santiago de Cuba, in spite of active mining since 1908, can be said to be hardly touched. The iron mines in this district employed over 4,000 workmen and supplied an average of 50,000 tons of ore per month to the United States. Exploitation for petroleum has been going on for several years, but no proof has been found of oil deposits of commercial importance.

Commerce.—Cuba is an intensely commercial country, exporting most of what she produces and importing nearly everything that she consumes. Metals and manufactures thereof constitute about 7% of her total imports; drugs and chemicals 7%; textiles and manufactures 13%; paper 2%; wood and manufactures 3%; animals and their products 5%; machinery and instruments 12 to 13% and foods 35 to 40%; the balance being made up of miscellaneous articles. Of exports, sugar constitutes about 85%, tobacco 8 to 10%, fruits about 2%, minerals and ores 3%. During the fiscal year 1913-4, the last normal year before the war, the total commerce of the island was valued at \$394,805,000, with imports valued at \$134,008,000 and exports \$170,797,000, imports from the United States representing 53.2% and exports to the United States 80% of the total. Sugar represented 70%, and tobacco 20% of the exports, whereas from 1904-7 they had represented 60.3 and 27.3% respectively. Cuba enjoys a preferential duty of 20% on exports to the United States and grants reciprocal concessions of 20 to 40% on all merchandise imported from the United States. This accounts for the dominant position of the United States. During the fiscal years 1912-3 to 1915-6, the United States received on an average 80.6% of the total exports from Cuba. For the years 1916-7 and 1917-8 the average was 71.86%, this reduction in percentage being due to shipments of sugar to the Allies in Europe where production of beet sugar had been lowered by the war. Cuba's international trade for the fiscal year 1918-9 was \$794,000,000, exports totalling \$477,000,000 and imports \$316,000,000.

The United States supplied 74.5% of the imports and received 73.2% of the exports. The import item of greatest value was foodstuffs worth \$115,000,000. Exports of sugar and its products amounted to \$409,629,000, representing 85.6% of the total, while exports of tobacco and its products amounted to \$40,837,000, or 8½% of the total exports. Cuba's total foreign trade during the fiscal year 1919-20 amounted to \$480 per capita, about four times as much as that of the United States during 1920 and probably more than that of any other country for any year. During 1920 the trade of the United States with Cuba was greater than the combined trade with the three next most important Latin-American customers—Argentina, Brazil, and Mexico; and United States trade with Cuba for the same year was only slightly (a little under 10%) less than with all South America. The total value of imports from the United States in 1918-9 was \$235,727,000, compared with \$228,102,000 in 1917-8. Imports from Great Britain in 1918-9 amounted to \$9,349,000; from Spain \$13,332,000; from France \$8,265,000 compared with \$12,308,000, \$11,695,000 and \$6,875,000 respectively in 1917-8. Exports from Cuba to the United States in 1918-9 were \$350,316,000; to Great Britain \$96,814,000; to Spain \$6,057,000; to France \$11,324,000. Exports to these countries in 1917-8 were \$278,704,000, \$76,722,000, \$4,199,000 and \$8,965,000 respectively. During the calendar year 1919, imports from the United States amounted

to \$278,371,222, and exports to United States \$418,610,263. For the calendar year 1920, imports from the United States amounted to \$515,082,549 and exports to the United States \$721,695,905. Thus, the total trade between the United States and Cuba was almost twice as great in 1920 as for the fiscal year 1918-9.

Port Congestion.—When, early in 1920, fabulous prices for sugar prevailed, and all kinds of merchandise sold readily at high prices, goods were ordered abroad more rapidly than they could be cleared through the customs house. This condition grew steadily worse until near the end of the year when, after the appointment of a special supervisor charged with the duty of clearing the ports, recommendations made by a joint Cuban-American Port Congestion Commission which had sat at Havana in Aug. were put into operation. Thereafter, improvement though slow was steady. The situation was aggravated by the desire of many importers to cancel their orders for high-priced merchandise when the general decline in prices held out a prospect of obtaining cheaper goods. In the case of rice, the concerted efforts at cancellation became so general that the Government placed a temporary embargo on further importations of rice except on special licence. The port congestion and the cancellation movement were both intensified by the declaration of a moratorium in October.

Communications.—Cuba had in 1920 four principal railway systems which together extended their lines from one end of the island to the other, namely, the United Railways of Havana, the Cuba Railroad, the Cuban Central Railways, and the Western Railway of Havana. These systems, together with the private lines connecting the larger sugar estates with them, constituted 3,200 m. of railway in 1919 as against 2,329.8 m. in 1908. Considerable attention has been paid in recent years to the construction of good roads, and large sums of money have been voted. In 1919 there were said to be over 1,400 m. of splendid roads for automobiles. A car ferry service between Key West and Havana inaugurated in 1915 greatly facilitated the movement of freight between Cuba and the United States. Direct steamship connexion existed with many of the ports of the United States as well as with Europe and Mexico. Frequent service was maintained to New York, Boston, Philadelphia, Galveston, New Orleans, Mobile, Tampa and Key West, and in 1920 regular passenger and freight service was inaugurated by the Miami Steamship Co. between Jacksonville, Fla., and Havana, with sailings every five days. Air mail service was started late in 1920 between Key West and Havana with two seaplanes, each having a capacity of 1,000 lb. of mail, 12 passengers and 400 lb. of luggage.

Education.—Educational affairs were given increasing attention after 1908. Considerable sums of money were appropriated and many new schools established, among them normal schools in the several provinces, numerous day schools, several night schools, and agricultural experiment schools in Havana. A national military academy was established in 1912. A bill was passed in 1916 granting to rural public-school teachers an increase in salaries aggregating more than \$1,000,000 per year. This raised individual salaries of \$45 and \$50 per month to \$75 and \$80. On Nov. 30 1919 there were 5,877 teachers and 334,671 pupils in the elementary schools. In "Institutes of Secondary Instruction" there were 2,087 students in 1915-6. The university of Havana was said to have, in 1919, nearly 1,600 students.

Finance.—Until recent years Cuba had no money of its own issue, mainly Spanish gold and various other foreign coins having been the medium of exchange; but in 1915, by virtue of an Act passed during the preceding year, a new coinage was put into operation. The monetary unit is the gold peso of the same weight and fineness as the American dollar. Gold coins, of which the issue is unlimited, are 1, 2, 4, 5, 10 and 20 peso pieces, the last three of the same shape, weight and value as corresponding U.S. coins, and the others proportionate; silver coins, of which the issue is limited to 12,000,000 pesos, are 10, 20 and 40 centavo pieces and the peso; nickel coins, limited by executive discretion only, are 1, 2 and 5 centavo pieces. United States coins and paper currency are also legal tender, but not those of other foreign countries unless such payments are specifically contracted for. The revenues of the Government, which in 1912-3 amounted to about 37.9 million dollars, rose to 64.5 millions in 1918-9, and 79 millions in 1919-20. More than half of the revenue is derived from customs duties. Cuba had in 1920 a foreign debt of about \$51,000,000, floated through banking houses in the United States, also a domestic debt of about \$39,000,000.

The Moratorium.—The enormous profits derived from the sale of high-priced sugar during the first half of 1920, instead of being conserved in the form of liquid assets were invested in enlarging the facilities for producing and grinding sugar, in building fine homes and in purchasing luxuries. When, about midsummer, the price of sugar began to decline, an effort was made to check the tendency by refraining from selling the remaining portions of the preceding crop. To continue operations and prepare for harvesting the new crop, large amounts of money were borrowed from the banks, the unsold sugar being pledged as security on what was at the time regarded as a safe basis of 15 or 16 cents per pound. The experiment was unsuccessful. The rapid decline soon carried prices far below the point at which the banks had accepted the sugar as security. Thereupon, it ceased to be an asset and became a liability. Early in Oct. there occurred a run on one of the largest banking institu-

tions in Havana, which had many branches throughout the island. In order to prevent the collapse of this bank, and the extension of the panic to others, a moratorium was declared on Oct. 10 to last for 50 days. On Dec. 1 it was extended until Dec. 31, and again until the end of Jan. 1921. Just before the last date, a Congressional Act provided for the gradual lifting of the moratorium, requiring partial payments running through 105 days for ordinary commercial obligations, and 135 days for banking obligations. A law was simultaneously promulgated providing for the liquidation of insolvent banks under Government supervision; and provision was also made for a reform in banking laws with a view to preventing a recurrence of such a condition.

Political Conditions.—The administration of President José Miguel Gómez and Vice-President Alfredo Zayas of the Liberal party continued from Jan. 28 1900 (at which time the administration of the American Provisional Government ceased) until May 20 1913. During this period there were internal troubles which threatened to assume a revolutionary character. A serious revolt of negroes in May 1912 was followed shortly afterwards by the concentration of a U.S. fleet of battleships at Key West. President Taft assured the Cuban Government that this was not due to a purpose of intervention, but to a desire to act promptly in case it became necessary to protect American life and property. By the middle of the summer the rebellion was suppressed. On Nov. 1 1912, Gen. Mario G. Menocal and Enrique José Varona, Conservative candidates, were elected president and vice-president, respectively, and were inaugurated on May 20 1913. The administration proved to be efficient. The Government's progressive policy was evidenced by the attention given to educational affairs, by the enactment of comprehensive health laws and by large expenditures for the development of the resources of the country and for public works. During 1915 there was considerable political activity looking toward the elections of Nov. 1 1916, the Conservatives supporting Menocal for reelection while the Liberals, under the leadership of Alfredo Zayas, a former vice-president under Gómez, were trying to secure control. Menocal's reelection was declared Nov. 5, but was contested, and not until May 7 1917 was it finally proclaimed by the Cuban Congress. This contesting of the election occasioned a revolt by the Liberals under the leadership of ex-President Gómez, which assumed serious proportions; but by May 20 the revolt had subsided and Gen. Menocal took the oath of office for a second term. On April 7 1917, Cuba declared war on Germany. The president of the republic was authorized to dispose of the land and naval forces and the economic resources of the nation in whatever manner necessity required. Several revenue measures were announced, including normal and extraordinary war taxes on sugar, and taxes on net profits of mining and insurance companies. A bond issue of \$13,000,000 was authorized for a war loan beginning July 1. In 1918 an obligatory military service law was put in force and a Food Administration with extensive powers was established. Diplomatic relations with Germany were renewed on Oct. 27 1920. A new electoral law was passed in Aug. 1919. This new code was compiled with the assistance of Maj.-Gen. Enoch H. Crowder of the U.S. army. It was he who, while serving with the American army of occupation in Cuba, had formulated the existing laws and had supervised the first presidential election. The new law provided for recognition of all political parties and for public counting of ballots. This new law was put to the test on Nov. 1 1920, which marked the end of the most bitter political campaign since Cuban independence. José Miguel Gómez (1856–1921) was the Liberal candidate, and Dr. Alfredo Zayas was the candidate of the National League or Coalition party, the latter having broken away from the Liberal party and, backed by the Menocal administration, parted company with Gómez. The result of the election was doubtful. Charges of unfair practices made investigations necessary. Incorrect interpretations placed upon the new election laws brought about a complete deadlock. Early in Jan. 1921 Gen. Crowder was sent to Cuba as the personal representative of President Wilson. As a result of his interpretation, means were found for facilitating the procedure of the courts in the contested election cases, and supplementary elections were held in March.

(W. R. MA.)

CUMMINGS, WILLIAM HAYMAN (1831–1915), English musician, was born at Sidbury, Devon., Aug. 22 1831, the eldest son of Edward Manley Cummings. He became a chorister at St. Paul's cathedral and the Temple church, and was subsequently appointed organist of Waltham Abbey. Later he was appointed tenor at Westminster Abbey, the Temple church and the chapels royal, being well known for many years as an oratorio singer. From 1879 to 1896 he was professor of singing at the Royal Academy of Music, and from 1896 to 1910 principal of the Guildhall School of Music. In 1900 he received the degree of Mus. Doc. from Dublin University. Cummings was the author of many works on music, including *Lives of Purcell* (1881) and *Handel* (1904), and *The Origin and History of "God Save the King"* (1902). He was also an authority on ancient music, and left a fine collection of old MSS. and early editions. He died at Dulwich June 6 1915.

CUMMINS, ALBERT BAIRD (1850–), American politician, was born at Carmichaels, Pa., Feb. 15 1850. After leaving Waynesburg (Pa.) College he studied surveying and became assistant chief engineer for a railway. He next studied law, was admitted to the bar in 1875, and for three years practised in Chicago. In 1878 he went to Des Moines and ten years later was a member of the Iowa House of Representatives. He was chairman of the Republican State Committee (1892, 1896), candidate for the U.S. Senate (1894, 1900), member of the Republican National Committee (1896, 1900), and a delegate to the Republican National Convention on four occasions. He was elected governor of Iowa in 1902 and reelected for two succeeding terms. He filled the unexpired term of Senator Allison in 1908, and was reelected to the U.S. Senate in 1909 and 1915. He opposed the nomination of Mr. Taft in 1912, but did not bolt his party. He was specially identified with measures concerning trusts and railways, and had a leading part in drafting the so-called Each-Cummins bill under which the Government in 1920 handed back to private control the railways of the United States.

CUNLIFFE, WALTER, 1ST BARON (1855–1920), English banker, was born in London Dec. 4 1855, the son of Roger Cunliffe, a banker of the City of London. He was educated at Harrow and Trinity College, Cambridge, and entered upon his banking career in the City in 1880, establishing ten years later the merchant banking business of Cunliffe Bros. He became a director of the Bank of England in 1895, was elected deputy-governor in 1911 and governor in 1913. He was, therefore, in office as governor when the World War broke out, and, after being raised to the peerage with the title of Baron Cunliffe of Headley in Dec. 1914, he was continued as such by successive re-elections until 1918, a longer period than had ever been served before. During the whole of this period the deputy-governor was Mr. Brien Cokayne, who was knighted in 1917, and who, after succeeding Lord Cunliffe as governor, was created Lord Cullen of Ashbourne on his retirement in 1920. Lord Cunliffe was associated with the working out of all the chief financial problems during the war, and in 1917 accompanied Mr. Balfour on his financial mission to the United States. He died suddenly at Epsom Jan. 6 1920.

CUNNINGHAM, WILLIAM (1849–1919), English economist (see 7.633), died at Cambridge June 10 1919.

CUNNINGHAME-GRAHAM, ROBERT BONTINE (1852–), British author and traveller, was born in 1852, the son of William Cunninghame-Graham Bontine of Ardoch and Gartmore, and was educated at Harrow. He sat in the House of Commons for North Lanarkshire from 1886 to 1892, and during this period became known as an extreme Socialist, taking part with H. M. Hyndman and others in Socialist meetings and processions in London to demand work for the unemployed. He travelled much in North Africa, Mexico and South America, and wrote a number of short stories and vivid studies of life in those regions. Among his books may be mentioned *Mogreb-el-Aksar: a Journey in Morocco* (1898); *The Ipane* (1899); *A Vanished Arcadia* (1901); *Faith* (1909); *Hope* (1910); *Charity* (1912); *A Life of Bernal Diaz del Castillo* (1915); *A Brazilian*

Mystic (1920); *Cartagena and the Books of the Sinu* (1920). Early in the World War he went to South America to buy horses for the British army, and carried out his mission with success.

CURRIE, SIR ARTHUR (1875–), Canadian general and administrator, was born at Napperton, Ont., Dec. 5 1875. On the outbreak of the World War his natural bent for military affairs quickly brought him to the front. He commanded the 1st Canadian Div. 1914–7, and the Canadian Corps in France 1917–9. He gained the confidence of the English military authorities in the field, and when Lord Byng resigned his command of the Canadian troops Sir Arthur Currie was the one Canadian to whom it was felt by the British Headquarters that the command could be entrusted. The manner in which he carried out his command marked him by common consent a military leader of unusual distinction. In the concluding phases of the war the Canadian forces under his command played a notable part. Currie was given the C.B. in 1915, K.C.M.G. 1917, K.C.B. 1918 and G.C.M.G. 1919; he was awarded the French Legion of Honour and the Croix de Guerre both of France and of Belgium, and was created Grand Officer of the Belgian Ordre de la Couronne. In 1920, after Sir Auckland Geddes had finally declined the nomination to the principalship of McGill University, Montreal, on his appointment as British ambassador to Washington, Sir Arthur Currie was elected to the post.

CURTIS, CYRUS HERMANN KOTZSCHMAR (1850–), American publisher, was born at Portland, Me., June 18 1850. He was educated in the public schools of Portland, sold newspapers when a boy, and in 1870 joined a Boston paper as advertising solicitor. In 1876 he went to Philadelphia and became a publisher of the *Tribune and Farmer*, a weekly paper. In 1883 he established the *Ladies' Home Journal*, and in 1891 organized the Curtis Publishing Company. In 1897 he purchased the *Saturday Evening Post*, which was a direct continuation of the *Pennsylvania Gazette*, founded in 1728 by Benjamin Franklin, and in 1911 he bought the *Country Gentleman*. The *Ladies' Home Journal* and the *Saturday Evening Post* attained a circulation of 2,000,000 each, and probably carried more paid advertising than any other publications in the world. For this reason, although the cost of producing a copy of the *Saturday Evening Post* was many times its selling price to the public (5 cents), this magazine was highly profitable to the publisher. In 1913 he purchased the *Philadelphia Public Ledger*.

CURZON OF KEDLESTON, GEORGE NATHANIEL CURZON, 1ST MARQUESS (1859–), English statesman (see 7.665), received an earldom (along with the viscountcy of Scarsdale and the barony of Ravensdale) as one of the coronation honours in 1911. He was conspicuous in that year first by his strong denunciation of the Parliament bill and the whole Liberal attack on the Lords, and then by the leading share which he took, in the final stage, in persuading the bulk of the Unionist peers to abstain from voting in the crucial division and so to permit the bill to pass rather than have their House swamped by hundreds of creations *ad hoc*. During the vehement party conflicts of the next two or three years before the World War he established his position as the chief lieutenant of Lord Lansdowne in the Lords. But much of his time and attention during the period of opposition were given to the affairs of Oxford University, of which he had become chancellor; and he promoted the cause of reform there by personal effort and by publishing a detailed memorandum on the subject. With other Unionist leaders he joined Mr. Asquith's Coalition Cabinet in the summer of 1915, as Lord Privy Seal; and in that capacity he introduced the bill constituting the new Ministry of Munitions under Mr. Lloyd George, and took charge in the Lords of the Munitions of War bill which was to furnish that Ministry with its weapons. In these and other ways he gave proof of a determination to prosecute the war with zeal and energy. He accepted the presidency of the Air Board in May 1916, and in July became a permanent member of the War Committee of the Cabinet. When Mr. Lloyd George formed his Ministry in Dec., he was accorded a still more prominent position. Lord Lansdowne and Lord Crewe—the two leaders of parties in the Lords—both retired, and Lord Curzon

became the leader of the House with the office of President of the Council. He was chosen also to be one of the four ministers (the others being the Prime Minister, Lord Milner, and Mr. Henderson) who constituted the War Cabinet, and were charged with the permanent daily conduct of the war. After the Paris Conference he took over the Foreign Office from Mr. Balfour, retaining his leadership in the Lords. As leader, though not able to claim the sympathetic touch and close familiarity with their lordships' idiosyncrasies possessed by some of his predecessors, he exhibited remarkable intellectual powers and oratorical capacity, and gradually established his ascendancy in the House. In the Foreign Office he found a specially congenial sphere, as he had throughout his life made a study of the external relations of the country, and had travelled extensively. But foreign affairs in the years immediately following the war were still dominated by the Prime Minister, and by the Supreme Council.

Lord Curzon's first wife, by whom he had three daughters, died in 1906, and in 1917 he married, as his second wife, Grace Elvina, widow of Alfred Duggan, of Buenos Aires, and daughter of J. Munroe Hinds, U.S. minister in Brazil. He succeeded to the barony of Scarsdale on his father's death in 1916, and became a K.G. in the same year. He was created a marquess on the King's birthday in 1921.

CUSHING, HARVEY (1869–), American surgeon, was born at Cleveland, O., April 8 1869. He graduated from Yale in 1891 and from the Harvard Medical School in 1895. After doing exceptional cerebral surgery abroad under Kocher at Berne and Sherrington at Liverpool he began private practice in Baltimore. Here at the age of 32 he was made associate professor of surgery at Johns Hopkins University, and at the hospital was placed in full charge of cases of surgery of the central nervous system. Yet he found time to write numerous monographs on surgery of the brain and spinal column and to make important contributions to bacteriology. He made (with Kocher) a study of intracerebral pressure and (with Sherrington) contributed much to the localization of the cerebral centres. In Baltimore he developed the method of operating with local anaesthesia, and his paper on its use in hernia gave him a European reputation. He has also made important contributions to the study of blood pressure in surgery. In 1911 he was appointed professor of surgery in the Harvard Medical School and surgeon-in-chief at the Peter Bent Brigham hospital in Boston. In 1913 he was made an hon. F.R.C.S. (London). In 1915, before the Clinical Congress of Surgeons in Boston, he showed the possibility of influencing stature by operating on the pituitary gland. During 1917–9 he was director of a U.S. base hospital attached to the B.E.F. in France. In 1918 he was made senior consultant in neurological surgery for the A.E.F. He held the rank of colonel in the Medical Corps of the U.S. army.

CUST, HENRY JOHN COCKAYNE (1861–1917), English journalist, was born in London Oct. 10 1861. Educated at Eton and Trinity College, Cambridge, he entered the House of Commons as Unionist member for Stamford in 1890, but lost the seat in 1895. He was returned for Bermondsey in 1900 and sat till 1906. In 1892 Mr. (afterwards Lord) Astor made him editor of the *Pull Mall Gazette*, and for four years he held that post with distinction, gathering round him a brilliant staff (see 19.561). In politics and society his personal charm and *esprit* always gave promise of more than he ever achieved in the way of public life. But in Aug. 1914, at the outbreak of the World War, he founded the Central Committee for National Patriotic Organizations, and a Cust annual lecture "on some important current topic relating to the British Empire" was endowed in Nottingham University to commemorate his work. His *Occasional Poems* appeared in 1918, printed in Jerusalem. He was heir to the barony of Brownlow, a position which at his death fell to his brother, Adelbert Salusbury Cust (b. 1867). He died in London March 2 1917.

CYTOLOGY (see 7.710).—The effect of the work done in cytology up to 1910 may be summarized as follows.

The bodies of animals and plants are made up of units termed cells, which may be compared to the bricks in a brick wall. Each cell

is composed of a viscid semi-fluid material termed protoplasm, surrounded by an elastic membrane termed a cell wall. This wall is composed of cellulose in the case of the vegetable cell and may acquire considerable thickness and firmness; in the animal cell it is almost always very thin, and never consists of cellulose: but appears to agree in composition with the protoplasm, of which it may be considered a condensation. There is reason to believe that in most if not all cases the cell wall is porous, and that adjacent cells are connected with one another by bridges of protoplasm.

The activities of living cells are manifested in four ways, viz.:—

- (1) By movement, which takes the form of alternate contraction and expansion.
- (2) By secretion, i.e. by the production of definite substances which accumulate in the protoplasm, but which are finally extruded from the cell.
- (3) By the transmission of stimuli, so that shocks or stimuli of various kinds applied to one cell result in movement or secretion in a different cell.
- (4) By reproduction, which takes the form of the division of the cell into two daughter cells.

All these activities are dependent for their continuance on the consumption of a certain portion of the protoplasm; and if life is to persist and if the cells are to increase in number this waste must be repaired. This is effected by the taking in and assimilation of food; and this assimilation can only be carried out if there exists in the protoplasm a specially differentiated portion termed the "nucleus," which appears to be of rather different composition from the rest. For this reason it is customary to use the term "cytoplasm" for the extra-nuclear protoplasm.

Cells may be specialized for rapid movement or for the reception and transmission of stimuli or for secretion. Locomotor cells may be provided with freely projecting filaments, termed "cilia" or "flagella," which are capable of rapid vibration, and act the part of oars in propelling the animal, or their cytoplasm may contain threads termed "myonemes" or "muscular fibrils," which are capable of thickening and contracting; and these threads may be simple or cross-striated—i.e. composed of alternate discs of singly and doubly refracting material; cells provided with these threads are termed "muscle cells."

Cells devoted to the reception and transmission of stimuli are known as "nerve cells" or "neurones." Those which are situated at the free surface of the animal, and which are provided with stiff processes of various kinds which are easily affected by stimuli, are known as "sense cells." Those which are more deeply situated have, in place of the stiff processes, one or more root-like branching processes known as "receptive dendrites." Stimuli when received are transmitted by outgrowths of the neurone known as "axons," and these axons, after preservation by fixing fluids, are seen to consist of a series of delicate fibres, the "neuro fibrillae." The axon ends in a brush of root-like processes called "terminal dendrites"; these dendrites are in contact either with the receptive dendrites of another neurone to which they hand on the stimulus, or with a muscle cell in which they cause contraction, or with a secretory cell in which they initiate secretion.

In the case of secretory cells the secretion may be fluid and poured forth at a free surface only, from which it is washed away by the currents of the circumambient medium. Of this type are the mucous cells which give rise to the slime which lubricates the skin of earthworms, or the similar cells which produce the mucus inside the human mouth cavity. On the other hand the secretion may take the form of fibres or another form of solid material and may be extruded from the entire surface of each cell so that the cell becomes in this way separated from its neighbours by masses of the secretion or, as it is now termed, the "intercellular substance." Cells of this kind are known as "connective tissue cells" and give rise to the various supporting tissues such as fibrous tissue, cartilage and bone.

The reproductive cells or "germ cells" are, as their name implies, cells which have the capacity of giving rise to a mass of cells out of which the body of a new individual is built up. They occur in many forms amongst the lowest grades of animals, i.e. the Protozoa, but amongst the higher animals, or Metazoa, they are remarkably constant in general characters, exhibiting practically the same forms throughout the whole range of animals from the sponges to the human race. They appear under two types, viz.:—(1) a small motile male cell, which consists mainly of a head which is a condensed nucleus, to which is added a vibratile flagellum (termed the tail); and (2) a much larger motionless female cell or egg, in the cytoplasm of which there are deposits of food material known as yolk. Normally a male cell must unite with a female cell before development can be initiated, but the eggs of many animals can develop without this union and are then termed "parthenogenetic." In other cases where union with a male cell normally takes place eggs can be stimulated to develop without previous union with a male cell, and these cases are termed "artificial parthenogenesis."

Turning now to the consideration of the nucleus, we find that this is frequently invisible in the living cell, but when it can be made out it appears either as a clear vesicle (as in many eggs) or as a slightly more granular portion of the protoplasm (as in Amoeba). When, however, it is fixed and stained it exhibits a characteristic structure. It then appears as a vesicle containing a fluid termed the "nuclear

sap," and bounded by a membrane termed the "nuclear wall." The sap is traversed by a network of threads known as "linin fibres," and adhering to these fibres—suggesting the arrangement of beads on a necklace—are a number of granules termed "chromatin" because they attract and retain the colouring matter of the staining fluid so strongly. In addition there are usually one or two rounded bodies termed "nucleoli," which also attract stain strongly, but these are apparently not composed of exactly the same chemical substances as the chromatin granules—and it is possible by the use of certain stains to colour them differently from the tint assumed by the chromatin.

We have already seen that assimilation or the building-up of fresh protoplasm is impossible in the absence of a nucleus. This is proved by dividing a uninucleate amoeba into two, when it is seen that the non-nucleate piece, though capable of movement, cannot digest or assimilate food and, after a short period of activity, dies.

The division of the nucleus always precedes the division of the cell and this division is occasionally direct, i.e. by the process of simple constriction into two, or much more frequently indirect by the process termed "karyokinesis" or "mitosis." In this method the chromatin grains were believed to become aggregated into a continuous spirally-coiled thread termed the "spireme," which then became segmented into a definite number of segments called "chromosomes." The chromosomes always appear in the same number in the same species at every division of the nucleus. Meanwhile the nucleolus or nucleoli disappear, apparently dissolved in the cell-sap; and the nuclear membrane becomes dissolved so that the cell sap is mingled with the cytoplasm; and then a small body termed the "centrosome," lying at the side of the nucleus in the cytoplasm, becomes discernible. The centrosome can occasionally be demonstrated lying at the side of the resting nucleus, but when it becomes visible in the process of mitosis it is seen to be in process of division into two. The chromosomes at the same time appear to be split longitudinally, whilst from the daughter centrosomes as they move apart a series of filamentous rays are developed, some of which ("astral fibres") extend out to the periphery of the cell, whilst others ("mantle fibres") become attached to the halves of the split chromosomes, one fibre from each centrosome going to a corresponding half of the chromosome. When the centrosomes have reached positions at opposite ends of the nucleus the mantle fibres proceeding from them have constituted the mitotic spindle: certain other fibres appear running directly from one centrosome to another in the axis of the spindle, which are termed "spindle fibres," whilst the split chromosomes, under apparent tension of the mantle fibres, have assumed positions lying at right angles to the axis of the spindle, and constituted what is called the "equatorial plate."

By a continuance of the apparent tension of the mantle fibres the two halves of each chromosome are dragged apart from one another, and eventually one set of half-chromosomes becomes massed together in the vicinity of each pole of the spindle, that is, close to each daughter centrosome. Each of such sets of chromosomes constitutes a daughter nucleus. The chromosomes become longer and thinner and more entangled with one another until the initial stage of a linin network with adhering chromatin granules is re-established, and round this a new nuclear wall is formed. The stages leading to the segmentation of the spireme thread and the solution of the nuclear membranes are termed the "prophases of mitosis"; those leading to the establishment of the equatorial plate are termed the "metaphase." The stage involving the separation of the halves of the chromosomes is termed the "anaphase," whilst the steps leading to the reconstitution of the daughter nuclei are termed the "telophases" of mitosis.

In the fertilization of the egg it is penetrated by the head of the spermatozoon which carries with it a segment of the tail termed the middle-piece. The middle-piece is distinguished by its diameter from the thinner more distal part of the tail and it includes a centrosome which has been derived from the centrosome active at the last division of the sperm mother cell. Sometimes the distal part of the tail is left behind at the surface of the egg—sometimes it penetrates with the rest of the spermatozoon. In the latter case it remains passive in one cell of the embryo and is absorbed and is without influence on the hereditary potencies of the embryo, since it is never distributed to any but the one cell. All the paternal influence must be carried by the head, which is a condensed mass of chromatin: hence is derived the strong belief that not only is the nucleus the bearer of hereditary powers but that the chromatin is the element of the nucleus in which they are concentrated.

The spermatozoon head, once immersed in the egg, swells up and assumes the characteristic structure of a nucleus: it acquires nuclear sap and a nuclear wall and its chromatin becomes resolved into the same number of chromosomes as are present in the egg nucleus. It is then known as the "male pro-nucleus," whilst the egg nucleus is termed the "female pro-nucleus." The centrosome derived from the middle piece gives rise to an enormous aster with radiating rays which is termed the "sperm-aster"; the two nuclei approach each other, and the sperm-aster then becomes changed into a spindle, and the chromosomes of both nuclei are arranged side by side on the equatorial plate of this spindle: so that when the compound or "zygote" nucleus divides equal portions of maternal and paternal chromatin are distributed to the first two cells of the embryo—and

the same thing follows at every subsequent division of the growing embryo, so that paternal and maternal chromatin is distributed in equal amounts to every cell of the body.

The ripe germ cell consequently possesses only one-half the number of chromosomes which the ordinary body cell possesses, and therefore at some time in its history a reduction of chromosomes must take place. The older view was that this occurred at one of the ripening divisions in consequence of the spireme becoming segmented into half the usual number of pieces: each of these pieces then exhibited a transverse split which was regarded as an indication of the belated appearance of the full number: at the first maturation division these halves were, however, supposed to be distributed to different cells, so that each daughter cell received only half the original number of chromosomes—this division was known as the "reduction division," or "meiotic division."

Since the chromosomes are usually invisible during the resting stage of the nucleus the question has been raised whether they retained their individuality throughout the whole growth cycle. Various considerations lead to the conclusion that their individuality is retained. In some cases where the number is very small, as in the cells of the nematode worm *Ascaris*, the chromosomes or at least their ends can be detected in the resting nucleus: moreover the chromosomes are not all alike, but differ in size and shape from one another, and to each paternal one there is a corresponding maternal one of similar size and shape, and it seems unlikely that, if they vanished in the resting stage, they should reappear in exactly the same form at the subsequent mitosis. It has been surmised that this individuality in form and size was an indication of a difference in function in distributing the hereditary qualities—and Boveri's¹ discovery that, when an echinoderm egg was entered by two spermatozoa, one alone fused with the female pro-nucleus whilst the other acted as an independent nucleus, so that at the first division the egg was divided into four cells—led to the same conclusion. For Boveri showed that under these circumstances an abnormal spindle was formed connecting all four daughter nuclei, and on this spindle the chromosomes were irregularly distributed; and that if the four resulting cells were separated and allowed to develop separately they developed abnormally; whereas Driesch² had proved that it was possible to rear any of the first four cells into which a normally fertilized egg divides into a perfect larva of diminished size. Since an unfertilized egg has also been induced by appropriate stimuli (see EMBRYOLOGY) to develop into a perfect larva, the conclusion is inevitable that one complete set of chromosomes (maternal or paternal) is essential to the normal development, and that cells receiving fewer chromosomes than these cannot grow into normal embryos; hence every kind of chromosome has its appropriate function to play in growth.

Progress since 1910: the Cytoplasm.—If we now turn to the great advances in our knowledge of the cell which were made in the 15 or 20 years ending in 1921, we may direct our attention first of all to the cytoplasm.

About 1890 Hardy published his first paper³ in which he showed that the effect of the usual preservatives used in killing cells was to produce fibrous networks which had no counterpart in the living protoplasm, for exactly the same effect could be produced by the use of these same fluids on dead proteid: that in fact all colloid solutions, which he termed "sols," could be easily induced to pass into a semi-solid or "gel" phase in which the molecules were arranged in strings. From such networks the intervening fluid could be easily forced out, but by gently heating colloid solutions a different form of "gel" was produced, from which a pressure of several atmospheres failed to force the fluid out. In the first case the fluid contents were called the continuous phase and the fibres the disperse phase—but in the second case the fluid is locked up in tiny droplets inside the semi-solid gelatine and then the fluid was the disperse phase and the gelatine the continuous phase.

This discovery led to great scepticism as to the existence in life of the various structures seen in stained protoplasm. Fresh attention was given to the study of protoplasm in the living state and a most ingenious instrument designed by Kite⁴ was used with effect by Chambers⁵ for this purpose. This was an

excessively fine needle point of hard glass, bent at right angles to the glass tube from which it was drawn, fixed so that the point projected into a glass cell from the roof of which in a hanging drop was suspended the living cell or cells it was desired to explore. The needle could be manipulated by screws and the glass cell was mounted on the stage of a microscope. It was discovered that, generally speaking, the cytoplasm of a cell was a sol which was sometimes very thick and viscid and sometimes more fluid, but that the outer layer next the cell wall was a gel, of which indeed the cell wall might be regarded as an intensification. The various inclusions contained in the central cytoplasm, such as coloured granules, oil drops, etc.—could be freely pushed about by the needle. When, however, the nucleus of the cell approached mitosis, a change took place, and the astral rays were found to be strings of semi-solid material, as were also the mantle fibres of the mitotic spindle: the astral rays became connected with the peripheral gel surrounding the cell. On the other hand no centrosome could be detected in the living cytoplasm, but the sphere surrounding the centrosome was found to consist of fluid material which Chambers supposed to be squeezed out from the cytoplasm during the process of gelatinization of the astral rays, and from it proceeded fluid rays visible as clear streaks in the living cell which alternated with the astral rays. When the spindle divided, the mantle fibres passed again in the centre into the sol state, and this change propagated itself towards the poles as the two daughter cells separated from one another.

Examined in the same way, the cross-striped myonemes characteristic of the muscle cells of arthropods and vertebrates turned out to be composed of alternate discs of gels of different consistencies⁶; but no trace could be made out of neuro fibrillae in the living nerve fibre and the nerve cell, i.e. the body of the neuron containing the nucleus when examined in the living condition exhibited Brownian movement—i.e. the granules pulsed under the impact of freely rolling molecules—a circumstance which proves it to be in the sol condition.⁷ On the other hand it should be recorded that Chambers⁸ found that the cytoplasm of the ganglion cells from the central nerve-cord of the lobster was a very viscid substance which could be pulled out into long threads without undergoing essential change. When pulled away from the nucleus a clear empty space appeared on the side of the nucleus in the direction of the pull, which was only slowly filled by inflow of the plasma from the two sides.

It will be observed that in living protoplasm the change from the sol to the gel condition is reversible and very frequently takes place, and many of the phenomena exhibited by living cells will find their explanation in this circumstance. Dr. Gates, professor of botany in King's College, London, has described to the present writer a beautiful demonstration once shown him by Chambers. It consisted of living spermatogonia (immature male germ cells) from the testis of an insect; these when stimulated by the needle could be induced to undergo mitotic division; the chromosomes could be seen like bunches of grapes of a slightly more granular consistency than the rest of the cytoplasm moving along the mantle fibres.

The Brownian movement affords a criterion of whether protoplasm is in the condition of a sol or a gel, although not an absolute one, for Chambers has shown that a sol may be so thick as to prevent this movement and yet it may be possible to move particles in it freely by means of the glass needle. Bayliss⁹ has shown that the actively moving pseudopodia of amoeba show a vigorous Brownian movement, but that when

they are caused to retract by electric shocks the movement ends, showing the conversion of the material into a gel.

Side by side with these observations on living protoplasm have gone renewed observations on its structure by means of more refined fixatives and stains. It has been shown that many of the older preserving fluids which were used to differentiate the nucleus and especially the chromatin of the nucleus from the cytoplasm, had a destructive effect in dissolving out many of the constituents of the cytoplasm.

A more refined technique has demonstrated the existence of bodies in the cytoplasm termed "mitochondria," which take the form of fibres or, less frequently, of small oval granules. What their function in the life of the cell is has not been determined. Meves¹ supposed them to be bearers of heredity like the chromosomes and described them as dividing into two at the division of the cell, the halves being distributed to the two daughter cells. Later researches by Gatenby² have failed to confirm this. He finds that the mitochondria are irregularly distributed at all divisions. Besides the mitochondria another element of the cytoplasm known as the "Golgi apparatus" has come to light. It is so called because it can be demonstrated only by the Golgi method of preservation and a staining, a method which involves the use of preserving fluids which contain osmic acid, followed by treatment with salts of silver. In young cells this apparatus takes the form of a wreath surrounding the centrosphere or area of clear cytoplasm which envelops the centrosome in the young cell—i.e. in the cell just after it has originated by division of the mother cell. During the growth of the cell this wreath dissolves into smaller elements which become scattered throughout the cytoplasm interspersed amongst the mitochondria. These elements in their typical form consist of disc-like bodies made up of a substance which stains faintly, edged for half their circumference by a rim of stains intensely black with the reagents which are used to differentiate the Golgi apparatus. The earlier observers failed to note the disc-like form of these elements and fixed their attention solely on the deeply staining rim, which they regarded as a rod and to which they gave the name "dictyosome," but Bowen³ has brought out clearly the real structure of these bodies. The fact that the Golgi apparatus reacts strongly with osmic acid has been held to prove that it must be partially made up of a substance allied to lecithin, which contains a fat group in the molecule.

The most interesting fact about both mitochondria and the Golgi apparatus is that the elements of both increase in number by transverse division, and hence they cannot be regarded as food reserves, or temporary deposits of excreta, but are in some sense elements of the living cytoplasm. What relation they have to the general metabolism of the cell is not yet clear. Efforts have been made to show that in certain cells they are the centres of fat formation, and in pancreatic cells of the characteristic pancreatic secretion—but these endeavours have not yet carried conviction to the minds of cytologists. Much further work on these lines is needed before certainty can be obtained. In the formation of the spermatozoa of insects and mollusca the mitochondria and the Golgi apparatus play a very definite part which has been elucidated by Gatenby.⁴ The former give rise to a sheath surrounding the base of the tail which forms the middle-piece of the spermatozoon; the latter becomes largely metamorphosed into the "acrosome" or pointed structure which is attached to the front of the head of the spermatozoon, and plays the part of a spear-head when the spermatozoon reaches and penetrates an egg. The remnant of the Golgi apparatus migrates round the head and eventually forms a bead projecting from the tail which is eventually rubbed off. The middle-piece penetrates the egg, but undergoes no growth there; it remains embedded in one cell of the embryo and is eventually absorbed so that the mitochondria can have no function as bearers of heredity. In living cells particles resembling mitochondria⁵ and Golgi discs⁶ in their shape have been observed, oscillating in the typical Brownian manner, whence it is inferred that these bodies really exist as

such in living protoplasm and are not merely artefacts produced by preserving reagents.

Nuclear Structure.—As regards advances in our knowledge of nuclear structure, we may note especially the demonstration of the presence of sex chromosomes in many animals. Already before 1915 the fact was known that in certain cases an odd chromosome was present in the ripening germ cells, that is, a chromosome which in one of the ripening divisions of the germ cells passed without dividing to one pole of the mitotic spindle. But Wilson⁷ showed that not only are such odd chromosomes found in the developing sperm cells of many insects but that their presence is related to the determination of sex. The odd chromosome sometimes divides like the rest at the first maturation division, but at the second passes undivided to one pole of the spindle. Sometimes it migrates to one pole in the first division and divides like the other chromosomes at the second: in either case its presence causes the formation of two types of germ cell, one possessing one more chromosome than the other. In the case of these insects the ripening eggs are all found to possess the same number of chromosomes: and this number is equal to that found in the sperm cells which have the larger number. It is clear, therefore, that when the eggs are fertilized with the sperm, two types of fertilized egg should be found; one characterized by having one more chromosome than the other, and these eggs should give rise to animals all of whose cells should have nuclei with a number of chromosomes equal to those found in the fertilized egg from which each one arose. If we now examine the cells of the males, it is discovered that they have nuclei with the smaller number of chromosomes, whereas the cells of the female enclose nuclei with the larger number of chromosomes. Therefore it is clear that the male has been produced by the fertilization of an egg by a spermatozoon devoid of the odd chromosome: whereas a female arises when an egg is fertilized by a spermatozoon containing this chromosome.

Wilson showed further that sometimes the odd chromosome has a mate with which it pairs but which is much smaller than itself. This mate is denominated by Wilson the Y chromosome, whereas the large one which alone is present in the case of many insects is termed the X chromosome. The male germ cell which receives the Y chromosome gives rise to a male when it fertilizes an egg. Still other modifications, which lack of space prevent us entering into, are recorded by Wilson. There has been a diligent search for these sex chromosomes in the germ cells of other animals, and enthusiastic investigators have announced their discovery in the spermatids of echinoderms, vertebrates and even of man himself. These cases cannot yet be taken as fully proved, mainly owing to the fact that the number of chromosomes in the nuclei of these spermatids is large, and accuracy of count is difficult.

The earlier conception of the preparation for the mitotic division of the nucleus has been that the chromosomes became arranged in a continuous thread termed the spireme, which then became transversely segmented into the characteristic number of chromosomes. This conception has gradually been superseded by a much simpler one, viz. that the chromosomes persist as long looped threads during the resting stage of the nucleus and that these long U-shaped filaments become shorter and thicker as mitosis approaches. To this change of view many workers have contributed, amongst whom we may specially mention Agar⁸ and Hogben.⁹ The free ends of these U's are attached to a spot on the nuclear wall immediately outside which lies the centrosome. In the preparation for the reducing division of the germ cells, when the chromosomes first become distinguishable they are said to be in the "leptotene" stage. These leptotene threads then approach one another in pairs, and these pairs are termed "zygotene" threads. Each pair fuses to form a single thicker thread known as "pachytene," and in this way the number of chromosomes becomes reduced to one half. Though formerly an end-to-end fusion of corresponding chromosomes was strongly believed in, there is to-day no unequivocal evidence that such an end-to-end union (known as "metasyndesis") ever takes place. On the contrary, in a continually increasing number of cases a side-by-side union ("parasyndesis") has been demonstrated.¹⁰ Lately Hogben has shown that parasyndesis takes place in the cockroach, an insect which has formerly been regarded as presenting the typical case of end-to-end union.

¹⁰ The union of two sister chromosomes in the prophase of the reducing division is frequently termed "synapsis." We have avoided this term because it has also been used to denote the bouquet contraction of the chromosomes (see below).

The pachytene stage is characterized by a great contraction of the chromosomes, which leads to their being gathered up in a characteristic "bouquet" at one side of the nucleus—of course that side adjacent to the centrosome. Then the nuclear wall is dissolved and the chromosomes separate as if repelled from one another: this process is known as "diakinesis." During this process the line dividing the sister chromosomes which paired may reappear, and according to Agar in *Lepidosiren* these chromosomes may entirely separate from one another, only to pair again at a slightly later stage in mitosis. In most cases, however, this complete separation does not take place, but only a partial separation, which leads to the compound chromosome assuming the form of a ring or loop. Each half of the ring corresponds to one of the two original chromosomes, and these halves are dragged apart in the ensuing mitotic division. Most frequently each half shows a constriction in the middle of its length, which was formerly interpreted as a precocious appearance of the longitudinal division of the chromosome which is consummated in the second maturation division. For this reason the name "tetrad" has been bestowed on the shortened, thickened and partially split chromosome. Agar¹ has shown, however, that in the vast majority of cases this constriction has no relation whatever to the splitting of the chromosome in the second maturation division.

Modern theories of heredity assume that a chromosome consists of a linear series of rudiments, each of which has its particular part to play in the up-building of the embryo. A side-by-side pairing enables us to see how corresponding rudiments belonging to maternal and paternal chromosomes are brought together: an end-to-end pairing would of course render such a process impossible.

But the side-by-side union of homologous chromosomes does not always take place in a straight line. In the germ cells of the newt *Batrachoseps Janssens*² has shown that one filament becomes spirally wrapped round the other. He believes that he has demonstrated that each filament likewise becomes split longitudinally and that when the two chromosomes separate the now separated chromosomes are no longer the same as those which became united with one another but each has appropriated one strand of the other. Janssens' theory in its extreme form is not accepted by other cytologists; but he certainly has demonstrated cross connexions between the pairing chromosomes, and if the chromosomes are the actual bearers of the hereditary qualities, as seems to be proved from the fact that they alone constitute the head of the spermatozoon, then there are a good many facts (see GENETICS) which seem to require for their explanation an interchange of substance between the two paired chromosomes. This is termed by Morgan the "cross-over."

In the ripening of the egg very peculiar phenomena occur which have only recently received an explanation. The unripe female germ cells or oögonia show nothing peculiar in their mitosis, but during the prophase of the first ripening division an enormous increase in size of the egg cell takes place. The leptotene threads are at first clearly visible and can be seen to pass into the pachytene stage, but then they fade from view. The nucleus becomes very large and gorged with nuclear sap, from which circumstance is derived the name, "germinal vesicle," which the older authors bestowed upon it. The nucleolus becomes large and conspicuous. At the close of the growth period the nucleolus has been completely dissolved; the nuclear wall disappears and the nuclear sap mingles with the cytoplasm: then the chromosomes can again be detected as minute tetrads which begin to arrange themselves on the mitotic spindle of the first ripening division. Now by the examination of specially favourable cases it has been shown that what happens during this episode of growth is that the chromosomes swell up, become pressed against the nuclear wall and almost lose their capacity for absorbing stain. It seems to be clear that a chromosome consists of at least two substances—a framework which does not stain and an embedded material which stains intensely, and to which alone the name chromatin is, properly speaking, applicable, and that during the growth of the egg cell the framework swells up enormously. De Baehr³ has shown that in the male germ cells of the annelid *Saccocirrus*, a similar growth period exists, though it is of very much shorter duration than the corresponding period in the life of the female germ cell, but, short though it is, it is long enough to cause the chromosomes to swell up and temporarily fade from view.

The nucleolus or "germinal-spot" of the older authors, which is so conspicuous a feature in the unripe egg, has formed the subject of some most interesting researches. Hogben has shown that in the cockroach *Periplaneta* the nucleolus becomes vacuolated and that portions of it are extruded and that these can be recognized by their peculiar staining properties, scattered in the nuclear sap and even in the act of passing through the nuclear membrane. They can also be detected in the cytoplasm outside the nucleus. There seems to be no reasonable doubt that it is by this process of vacuolation and emission of pieces of itself that the nucleolus ultimately disappears.

Gatenby⁴ and Hogben⁵ have shown that in certain cases these emitted fragments may assume the appearance of nuclei, since they seem to secrete round themselves both nuclear sap and a nuclear wall. Ultimately they all disappear. Though it has not been possible to connect them directly with the formation of yolk spheres, yet it is an interesting fact that the beginning of this emission from the nucleolus coincides with the first appearance of yolk spheres, and as we know by experimental evidence that the nucleus presides over assimilation, it is a reasonable hypothesis that the absorption of these pieces of nucleolus in the cytoplasm leads directly to the synthesis of yolk. It has recently been asserted by Carleton⁶ that in ordinary tissue cells where the same disappearance of the nucleolus occurs as the cell grows, this is not complete—that a small kernel remains which can be stained in certain silver salts—and that this kernel takes its place on the mitotic spindle at the next division of the cell. This "nucleolus," as Carleton terms it, becomes equally divided into two and the halves pass into the two daughter cells. If these observations should be confirmed we should have in the nucleolus a part of the nucleus as permanent as are any of the chromosomes, the function of which was to form a centre for the synthesis of a mass of chromatin which constitutes the nucleolus and is destined to be emitted into the cytoplasm, where it no doubt profoundly affects the metabolism and determines the formation of cytoplasmic structures.

Parthenogenesis.—We have seen that the normal history of the egg cell is to undergo two ripening divisions, at the first of which the chromosomes are reduced in number by one half. When the egg is fertilized by the spermatozoon not only is the full number of chromosomes restored by the addition of those brought in by the spermatozoon but the division of the egg is initiated by the centrosome which is carried into the cytoplasm of the egg along with the head of the spermatozoon. An interesting question now comes as to what happens in the case of those eggs which develop without fertilization—or, as it is termed, "parthenogenetically."

Now parthenogenesis may be either artificially induced or it may be a natural event in the history of the species. If we take the case of "naturally" parthenogenetic eggs first, we find that a great deal of light has been thrown on the subject by the investigations of de Baehr.⁷ He took for his subject the plant-louse *Aphis palmarum*, the eggs of which develop without the aid of the male throughout the summer. He shows that in these eggs the preparations for the reducing division occur. Out of the apparently irregular chromatin network leptotene threads differentiate themselves. These pair so as to form thicker pachytene threads—but then at diakinesis these pairs become completely dissociated from one another, and the full number of chromosomes is thus established. Then the period of growth supervenes and the chromosomes become indistinct, but when they reappear in the metaphase they are in the full number and only one maturation division takes place at which all the chromosomes are longitudinally cleft. From these facts de Baehr draws the conclusion that the reducing division is suppressed and only the second maturation division takes place.

A somewhat different case is presented by the egg of the bee. The egg which fertilized gives rise to a female but if unfertilized grows into a male. In the latter case of course the resulting animal has in all its nuclei only the reduced number of chromosomes. When the male produces germ cells, the reducing division is suppressed. The nucleus of the spermatocyte enters on the prophase of mitosis and the cell divides, but one of the daughter cells is devoid of a nucleus and dies. The nucleus in the other cell goes back into the resting stage; and then like the egg in *Aphis*, it enters on a single maturation division in which the chromosomes are divided longitudinally, and the spermatozoon has therefore the same number of chromosomes as that possessed by the nuclei of the tissue cells of the male, which is the reduced number as compared to the number in the nuclei of the cells of the fertilized female.

In still other cases, as in the eggs of the small crustacean *Artemia*, the two ripening divisions may occur, but the first one can give rise to a nucleus which is not extruded as a polar body but remains in the egg and, reuniting with its sister nucleus, restores the full number of chromosomes.

Parthenogenesis can, however, be brought about in eggs which normally require fertilization by the application of external stimuli.⁸ This stimulus in the case of the frog's egg may take the form of a prick with a needle. Under these circumstances an immense development of astral fibres takes place, centring on a particle lying

adjacent to the egg nucleus, apparently a centrosome formed from this nucleus. This aster is speedily transformed by division into a short spindle with a radiating aster at each end of it. If this spindle lies near enough to the surface of the egg to initiate a division furrow, parthenogenetic development may begin. It is interesting to observe, however, that the mitotic spindle formed by the nucleus of the unfertilized egg is only $\frac{1}{10}$ of the length of the spindle formed by the fertilized egg, so that the size of the spindle is directly related to the number of chromosomes.

In the sea-urchin's egg the primary stimulus, which is usually momentary immersion in a fatty acid (such as butyric), only produces an aster on which the chromosomes are distributed but which is unable to metamorphose itself into a spindle. If, however, the eggs are subsequently immersed in "hypertonic" sea water—that is, sea water in which the percentage of salt is raised above the normal amount, then one or more accessory asters are formed in the cytoplasm. Whence the particles arise which act as centrosomes for these asters has never been ascertained; that they have previously been emitted from the nucleus is a pure assumption. If only one accessory aster has been formed a mitotic spindle is formed between it and the aster which arises round the egg nucleus. On to this spindle migrate the chromosomes. A regular equatorial plate is formed, and division of the nucleus and of the whole egg ensues and development is initiated. As the accessory aster is usually smaller than the primary egg aster, the two blastomeres into which the egg divides are of unequal size, and we thus learn that the size of the daughter cells into which a given cell divides is related to the relative sizes of the asters at the two poles of the spindle.

Conclusion.—From the foregoing sketch the reader will gather that the science of cytology had attained in 1921 an extremely interesting stage of development. New discoveries had poured in, the exact significance of which was not yet fully understood, and although we had glimmerings of light they serve rather to pose than to answer questions. What, for instance, is the significance of the mitochondria and the Golgi apparatus? They surely must have some very important function in cell life, for the more research is pushed the wider seems to be their distribution. They have been recorded from Protozoa and from tissue cells of both animals and plants, as well as from eggs and spermatozoa, yet the only function which so far can definitely be assigned to them is the production of transient structures in the ripe spermatozoon. What is the meaning of the centrosome, and how is it related to the formation of astral rays? It cannot be detected in the living cell and yet the study of stained cells would lead us to regard it as a permanent cell organ—typically outside and independent of the nucleus and, like the nucleus, handed on by division from a cell to the daughter into which it divided. Yet, as we have seen, it can be formed *de novo* in the cytoplasm by the action of hypertonic sea water—and Lillie¹ has shown that it can be formed *de novo* from the nucleus. In the fertilization of the eggs of the annelid *Nereis* the spermatozoon penetrates the egg membrane but slowly. Lillie centrifuged eggs in which the head had penetrated but in which the middle-piece with the centrosome were still left outside and he succeeded in tearing away the middle-piece altogether. After the cessation of the centrifugal force the mutilated head completed the penetration of the egg and developed a new centrosome by the emission of a particle from itself which was just as effective in forming the first spindle as the original centrosome.

The astral rays and the mitotic spindle are formed by the gelation of the cytoplasm; yet their formation is dependent on the activities of the chromosomes; for an unfertilized egg responds to stimulation not only by the production of an aster but by the resolution of its chromatin into chromosomes, and the length of the spindle which is formed is dependent on the number of chromosomes.

The nucleus must in some way control the growth of the cytoplasm, and genetic experiments indicate (see GENETICS) that each type of chromosome has a particular function to play in the building-up of the embryo, yet the only emission from the nucleus which has so far been detected has been that of nucleolar material.

Finally, the constitution of living cytoplasm seems to be normally that of a thick colloid solution, which at times changes

to that of the gel condition. It baffles our imagination, however, to conceive how a solution can be the seat of internal structure and how in particular a nerve cell, with all its inherited and acquired aptitudes or "engrams," can be in life nothing more than a thick syrup.

CZECHOSLOVAKIA (*Čiskoslovensko, Čiskoslovenská Republika*).—The republic of Czechoslovakia is a new creation in respect of its name and state-form only. Its modern history as an independent entity begins with the dramatic collapse of the Austro-Hungarian Monarchy at the close of the World War, and the definitive proclamation of Czechoslovak independence on Oct. 28 1918. Some of its constituent territories, however, notably Bohemia and the lands of the Bohemian crown (Moravia, Silesia, Lusatia) enjoyed, up to the year 1620, many centuries of independent existence and played an important, sometimes a dominating, part in the political and religious history of central Europe.

The republic has a pop., according to the census of 1921, of 13,505,818, and an area of about 55,000 sq. m. (approximately the size of England and Wales). It comprises three great natural regions: (1) Bohemia, (2) Moravia and Silesia, (3) Slovakia and Rumania (Sub-Carpathian Russia = *Podkarpatská Rus*). Bohemia, with an area of some 20,400 sq. m., has a pop. of 6,664,932; Moravia, with 8,600 sq. m., 2,660,737 inhabitants; Silesia, 1,800 sq. m., and 670,937 inhabitants; Slovakia, 20,000 sq. m., and 2,993,479 inhabitants; Rumania, 5,000 sq. m., and 605,731 inhabitants. The whole is about 600 m. long and has a maximum breadth of 185 miles. In respect of population it occupies the tenth place among European countries; in respect of size the fourteenth place; in density of population the seventh.

The frontiers were fixed by the Peace Treaties of St. Germain, Versailles and Trianon, while a portion of the ancient principality of Těšín (Teschen) was adjudicated to it by the Paris Conference (July 1920). On the W. and N., where it borders upon Bavaria, Saxony, Prussia and Poland, it is enclosed by mountains, some of them of very considerable height, which form on those sides a natural and strategic frontier. In Bohemia the highest peak Sněžka (Schneekoppe) has an altitude of 5,216 ft., in Slovakia the summits of the Carpathians and of the High Tatra rise to a height of between 7,000 and 8,000 ft. South of these ranges lie fertile and well-watered plains and lowlands extending to the borders of Austria, Hungary and Rumania. Some 60% of the entire area of the republic is included in the basin of the Danube, the rest being traversed by the Labe (Elbe) and the Vltava (Moldau), the former passing in particular through regions remarkable for their rich fertility. Some one-third of the entire surface of the country is covered by forests. The climate of the republic is a medium between a maritime and continental one.

Prague, the capital (677,000 inhabitants), is picturesquely situated on the Vltava and justly famous for its architectural beauty. Bratislava (Pressburg), the capital of Slovakia, with its great Danubian harbour, is the gateway of central European trade to the East and the Balkans. Other towns of importance in the republic are Brno (Brünn), with 200,000 inhabitants, the capital of Moravia, and the centre of an old established and flourishing textile industry; Plzeň (Pilsen) with 100,000 inhabitants, famous for its beer and as the seat of the Škoda iron works; Košice (Kaschau), the commercial centre of eastern Slovakia; and Užhorod (Ungvár), the capital of Rumania. Of German towns in Czechoslovakia (most of them with a considerable Czechoslovak minority), Liberec (Reichenberg), and Jablonec (Gablonz), are important industrial centres. Carlsbad (Karlovy Vary), and Marienbad (Mariánské Lázně), are famous spas. Czechoslovakia indeed is one of the richest states of Europe in mineral and health-giving waters, and possesses more than 200 watering places and health resorts. Besides Carlsbad and

¹ F. B. Lillie, "Studies on Fertilization in *Nereis*," III. and IV., *Jour. Exp. Zool.* vol. xii. (1912).

Marienbad, Franzensbad, Teplice (Teplitz), Poděbrady (in Bohemia), Luhačovice in Moravia, Piešťany, Trenčianske Teplice, Sliac and Štrbské Pleso (4,100 ft. above sea-level) in Slovakia, are noted. At Jáchymov (Joachimsthal), in North Bohemia, radium is produced.

Ethnology.¹—The population of Czechoslovakia is ethnologically of a mixed character. The prevailing element is that of the Czechs (7 millions), with whom the Slovaks (2½ millions) form one people; indeed as long ago as the 9th century the kingdom of Great Moravia, with frontiers roughly identical with the present boundaries of the Czechoslovak Republic, was the creation of the Slav people, who occupied in common a territory stretching from W. Bohemia to the Carpathians.

The Czechs and the Slovaks, or, to give them their united name, the Czechoslovaks, are a branch of the great Slav family of which the Russians are the most numerous and the most important member and to which the Serbo-Croats with the Slovenes, the Poles, the Bulgarians and the Wends of Germany also belong. Even after the conquest of Slovakia by the Hungarians, which resulted in Slovak territory being separated from Czech territory till they were reunited in 1918, an intellectual connexion between the two branches of the one family was always maintained, and some of the foremost names in Czech literature are those of writers who were Slovaks by birth. The difference between the Czech language and the language spoken in Slovakia is merely dialectical and the struggle for independence, culminating in the declaration of the Czechoslovak State, has emphasized and developed the sentiment of Czechoslovak unity. It is not without interest to note that the three principal leaders of the movement for independence were a Moravian of Slovak descent (Masaryk), a Slovak (Gen. Stéfanik), and a Czech (Dr. Beneš).

Of the non-Czechoslovak races in the republic the Germans are the most numerous, numbering some 3½ millions, chiefly dispersed along the W. and N. frontiers of Bohemia and in Moravia and Silesia. Their presence is largely the result, firstly of a colonization which was favoured by the Bohemian kings and princes of the 12th and 13th centuries, and secondly of a policy of Germanization pursued by the Habsburg rulers from the date of the battle of the White Mountain in 1620 (when the Czechs lost their independence) up till the very close of the World War.

On the day following the attainment of Czechoslovak independence, Oct. 29 1918, the Germans of Bohemia and Moravia—the so-called Sudetenland Germans—declared the districts where they predominated a province of the new Austrian State, which had been constituted some eight days previously. It was not until the Treaty of St. Germain was concluded on Sept. 10 1919 and the Austrian Government released the Germans from the oath of allegiance they had taken to the new Austrian Republic, that the Germans desisted from openly fighting against incorporation in the Czechoslovak Republic. Their claim to self-determination was rejected by the Peace Conference. From the mere presence of the Germans within

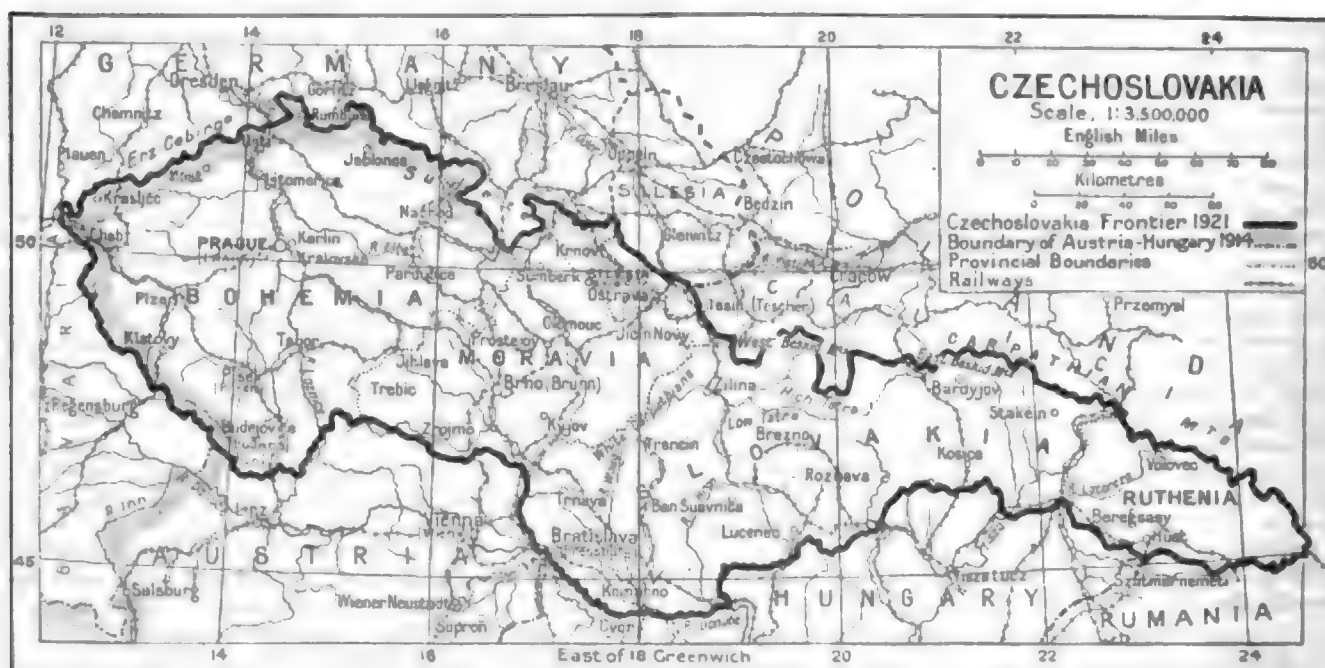

the historic frontiers of the Czechoslovak State it would indeed have been difficult, with justice, to deduce a right of self-determination, that is to say, the right, in this case, of retaining all the fruits of misused power. In Slovakia the Slovaks were subjected to a similar system of Magyarization. The Hungarian census of 1910 purported to show that in Slovakia there were 1,697,552 Slovaks and 901,793 Hungarians. The correct figures, however, were shown by the census of 1919 to be Slovaks 2,141,000, Hungarians 665,000.

Other nationalities occupying portions of the Czechoslovak Republic are Ruthenians 600,000 and Poles 250,000. On the other hand there are some 500,000 Czechoslovaks in Austria, 450,000 in Hungary, more than 200,000 in Yugoslavia and Rumania, and over 800,000 in America.

Special provision is made in the Constitutional Charter of the republic (in accordance with the terms of the Treaty of St. Germain) for the protection of national, religious and racial minorities. Difference in religious belief, confession or language, constitute no obstacle to any citizen in regard to entry into the public services or offices, to the attainment to any promotion or dignity, or to the exercise of any trade or calling. In towns and districts in which there lives a considerable section (20% or more) of citizens speaking a language other than Czechoslovak, schools are to be provided, the instruction to be imparted in the language of that minority. Such a minority has also a right to a proportionate amount of the funds set aside by the State or by the local authorities for purposes of education, religion or philanthropy. The courts of justice and the public offices are also required to pay due regard in respect of language to the desires of a minority which numbers at least 20% of the inhabitants of the locality. Every act tending to force a citizen to abandon his nationality—in other words oppression of a citizen on account of his race—is expressly prohibited.

Creation of the Republic.—When in July 1914 Austria commenced hostilities against Serbia, thus bringing about the World War, this act of aggression took place against the will of the Czechs and Slovaks, at that time subject to Austrian and Hungarian rule respectively. Open protest or organized revolt, however, was impossible owing to the proximity and indeed the presence in overwhelming numbers of German and Hungarian troops, who were expressly garrisoned among the Czech population in order to stifle any possible outburst of national and pro-Ally sentiment. Direct political action was equally impossible, as the Austrian Parliament was suspended. Whenever opinions did happen to be expressed which could be construed as criticism of Austria or Germany the offenders were speedily punished, and it was not long before the political leaders of the Czechs and Slovaks found themselves in confinement, some of them under sentence of death, while the Czech and Slovak press was subjected to a rigorous censorship and many of its organs prohibited from appearing. Some of the political leaders escaped over the frontier—among them Prof. Thomas Garrigue Masaryk and Dr. Eduard Beneš, who were subsequently to lead a success-

¹ For an Austrian view of the nationality question, see the article AUSTRIAN EMPIRE (Ed. E. B.).

ful campaign abroad for the destruction of the Austrian Monarchy and the attainment of Czechoslovak independence.

The persecutions, sometimes revolting in their cruelty, to which (on account of their pro-Ally sympathies) the Czechs were subjected during the first two years of the war, had the effect of uniting all the different political parties into one single national block; and when the Austrian Parliament was at length convoked in May 1917 the Czech parties made a unanimous declaration that it was their aim to work for the union of Czechs and Slovaks as one people in an independent state.

As the war proceeded, further declarations of national and anti-Austrian sentiment were made, the most notable being the "Twelfth Night Manifesto," issued at Prague on Jan. 6 1918, in which all the Czech deputies of the Austrian Reichsrat and of the Diets of Bohemia, Moravia and Silesia unanimously demanded full independence and representation at the future conference which should conclude peace in Europe.

Meanwhile the Czechs, who were as Austrian subjects obliged to serve in the Austrian army, lost no opportunity of passing over to the Allies. Of 70,000 prisoners taken by Serbia early in the war 35,000 were Czechs. Of these 32,000 perished during the Serbian retreat or died of fever or cholera. The remnant, 3,000 in number, proceeded to France and there joined the Czechoslovak legions already fighting on the French front. Of a total of 600,000 Czech troops in the Austrian army over one-half surrendered to the Allies. In Russia a Czechoslovak legion was formed at the outset of the war, and later this grew into a regular army which by 1918 numbered 100,000 men.

The activities of Prof. Masaryk in Russia, England and America, enthusiastically supported by his compatriots living abroad, and especially by the Czechs and Slovaks who had emigrated to the United States, the self-sacrificing valour of the Czechoslovak legions on the French, Italian and Russian fronts, and the work of the Czechoslovak Council with its headquarters at Paris, moved the Allies to acknowledge the last-named body as the *de facto* Provisional Government of the Czechoslovak State. On July 13 1918 a Czechoslovak National Council, representing all parties, was formed at Prague as a complement to the National Council already existing at Paris. This was the first direct step taken at home towards the establishment of the new State.

On Aug. 9 1918 the British Government issued the following declaration:—

"Since the beginning of the war the Czechoslovak nation has resisted the common enemy by every means in its power. The Czechoslovaks have constituted a considerable army, fighting on three different battle-fields and attempting, in Russia and Siberia, to arrest the Germanic invasion. In consideration of their efforts to achieve independence, Great Britain regards the Czechoslovaks as an Allied nation and recognizes the unity of the three Czechoslovak armies as an Allied and belligerent army waging a regular warfare against Austria-Hungary and Germany. . . .

This declaration materially helped to seal the fate of Austria, and implicitly recognized Czechoslovak independence as an accomplished fact. France and Italy, by accepting the assistance of Czechoslovak legions on the French and Italian fronts, had already practically acknowledged Czechoslovakia's claims (Briand, 1916). In the first week of Sept. 1918 the United States of America and Japan issued declarations practically endorsing the British declaration. On Oct. 14 1918 the Czechoslovak National Council was constituted as a Provisional Government with all the attributes of sovereign and independent power. On Oct. 17 the Austrian Emperor Charles issued a manifesto offering the various nationalities of his empire a measure of autonomy on the basis of an Austrian federation. The offer was too partial and came too late. Austria's hour had struck. The Czechs at home declined even discussion with the Vienna Government, and declared that the question of Czechoslovakia must be left to the Peace Conference. On the 18th the Provisional Government at Paris issued a declaration of independence, signed by Prof. Masaryk, Dr. Beneš and Gen. Štěpánik. On Oct. 27 the Austro-Hungarian Government recognized the rights of the Czechoslovaks, and cabled to President Wilson at Washington a request for an armistice and peace negotiations.

Thus, on Oct. 28 1918 the Czechs regained the independence which they had lost almost 300 years before, at the ill-fated battle of the White Mountain on Nov. 8 1620. The National Council at Prague issued a proclamation of independence and took over the reins of government. In spite of the presence of Austrian and Hungarian garrisons in Prague and other towns, there was no bloodshed. Every consideration was shown to the Imperial troops and the Imperial civil authorities, who were allowed to vacate their posts without being subjected to force, and the universal rejoicings of a liberated people were happily marred by no scenes of violence.

On Nov. 16 the first representative body of the Czechoslovak people—the National Assembly as it was called—met at Prague. Its members, 236 in number, were selected from all the different political parties in proportion to their strength as shown by the last parliamentary election previous to the war. The Assembly proceeded to decide upon the form of government to be adopted. The unanimous decision of the Assembly was in favour of a republic, and Prof. Masaryk, at that time still absent abroad, was unanimously chosen as first president. A Cabinet was formed, with Dr. Kramář, who during the war had been sentenced to death for treason and afterwards reprieved, as premier, and Dr. Beneš as foreign minister.

Two days after the declaration of the independence of the Czechoslovak State, which had been signed also by the representatives of Slovakia, the Slovak National Council issued a "Declaration of the Slovak nation," wherein it was solemnly set forth that the Slovaks in blood, in language and civilization form part of the Czechoslovak nation. A considerable time, however, elapsed before the Slovaks were allowed without hindrance to unite fully with the Czechs. The Hungarians (Magyars) declined to surrender the territories inhabited by Slovaks, and it was necessary to call in the military help of the Czechs before the last Hungarian troops, who had initiated a reign of terror in Slovakia, could be driven out of the land.

In the extreme eastern corner of the Czechoslovak Republic, there is situated a little autonomous region of Russia (or Sub-Carpathian Russia), which, together with Slovakia, was part and parcel of the Hungarian Kingdom till the Treaty of St. Germain permitted its incorporation with Czechoslovakia. The National Central Council of the Ruthenians, which met on May 8 1919 at Užhorod, their capital, unanimously adopted a resolution approving of incorporation with Czechoslovakia, on special terms of autonomy. Thus by the express will of their peoples, the various lands represented in the Czechoslovak Republic, viz. Bohemia, Moravia, Silesia, Slovakia and Russia, united to form one State with a single central Government having its seat at Prague. The tasks, almost infinite in number, confronting the new State were of great gravity. The country had been brought by the Austro-Hungarian war policy to the very brink of economic and financial ruin. A starved and decimated population stood face to face with difficulties, not only on every frontier but indeed to some extent within the borders of the State itself. The spirit of courage and endurance which had enabled the Czechoslovaks to achieve their independence was now to inspire a further work of no mean significance—the consolidation of a free, democratic and enlightened republic in the heart of Europe, the most westerly outpost of the great Slavonic world stretching from the banks of the Elbe and the Danube to the Pacific Ocean, and at the same time a nation bound by ties of gratitude and common interest to the Anglo-Saxon and Latin races. "At home we feel sufficiently confident," said Dr. Kramář, the premier, at the first session of the National Assembly, "of being able to rely upon our own powers alone, and that without injustice to others. We shall count upon the devotion of all towards the State and we shall show that not only have we been able to achieve our liberty but that we know how to preserve it and to be really free—worthy of our great past, of our traditions and of our sufferings."

The National Assembly confirmed all the emergency measures which had been passed by the National Council between Oct. 28 and the date of the first session of the Assembly, such for

instance, as enactments declaring the Austro-Hungarian code of laws (with some few express exceptions) as still in force and measures securing continuity in the executive and administrative offices of State. There was thus no appreciable break in political, legal or local administration. The framing of a constitution for the new State was early proceeded with. On Feb. 29 1920, after a parliamentary committee had been at work on its provisions for almost a year, a constitution of the republic was adopted by the National Assembly.

Constitution.—The framers of the constitution were largely influenced by the American and French constitutions, and the American principle of the division and balance of the legislative, executive and judicial powers was followed.

The actual terms of the constitution are introduced by a preamble, which runs:—

"We, the Czechoslovak nation, desiring to consolidate the perfect unity of our people, to establish the reign of justice in the Republic, to assure the peaceful development of our native Czechoslovak land, to contribute to the common welfare of all citizens of this State and to secure the blessings of freedom to coming generations, have in our National Assembly this 29th day of February 1920 adopted the following Constitution for the Czechoslovak Republic: and in so doing we declare that it will be our endeavour to see that this Constitution together with all the laws of our land be carried out in the spirit of our history as well as in the spirit of those modern principles embodied in the idea of Self-determination, for we desire to take our place in the Family of Nations as a member at once cultured, peace-loving, democratic and progressive."

Legislative authority is exercised by two popularly elected bodies, a Chamber of Deputies of 300 and a Senate of 150 members. Of these, the Chamber of Deputies, as the more fully representative of the popular will, possesses greater powers, being enabled in certain cases to carry through its legislation in face of the opposition of the Senate. The Senate was intended to play the part of an organ of supervision, so as to act as a preventive of too hasty or too loosely drawn-up legislation. It has in more than one instance already exercised its power as a checking and restraining authority with good effects—its amendments even on substantial points having been several times accepted by the Lower Chamber.

Suffrage is universal, both men and women who have attained the age of 21 years being able to vote in elections to the House of Deputies. To vote in elections to the Senate the voter must have reached the age of twenty-six.

The president of the republic is elected in a joint session of the two Chambers. His period of office is fixed at seven years, and he may be reelected at the end of his first term for a second period of seven years. For a third term, however, he cannot be elected until after the expiration of seven years from the conclusion of his second term of office. This restriction does not apply to the first president—President Masaryk.

The president of the republic is not answerable at law for his official acts. He may be impeached in one case only—namely, for high treason, on the motion of the Chamber of Deputies; and his only punishment, if found guilty, is the loss of his office and disability ever to hold it again. For each and all of his State acts one minister at least is responsible.

Among other outstanding terms of the constitution are the following:—The Czechoslovak State is declared to be a democratic republic with an elected president at its head. To make any alteration in its frontiers a constitutional law is required—a law which, as opposed to an ordinary law, has to be passed by a three-fifths majority of Parliament. Rumania (Sub-Carpathian Rumania) is granted the widest possible autonomy compatible with the integrity of the Czechoslovak Republic. The Chamber of Deputies is elected for six years, the Senate for eight. Deputies must be at least 26, senators 45 years of age. They possess immunity, but may be handed over to the ordinary courts by resolution of the House to which they belong. Parliament must sit twice a year. Declarations of war and amendments to the constitution require a vote in their favour of three-fifths of all members of both Houses. Cabinet ministers may participate in the meetings of either House and on the request of either House must attend its session.

Finance and army bills must be introduced first in the Lower House, the Chamber of Deputies. A measure passed by the Chamber of Deputies becomes law, in spite of its rejection by the Senate, if the Chamber of Deputies by a vote of the majority of its entire membership repasses the measure.

During the period when Parliament is not sitting, a permanent commission of 24 members (16 from the deputies and 8 from the senators) sits to enact urgent measures which have temporarily the force of law. They lose their validity unless confirmed within two months by the Parliament which subsequently meets.

Cabinet ministers are appointed by the president; they need not be members of either House.

In respect of civic rights no privileges of sex, birth or vocation are recognized. Titles may be conferred only when they refer to office or occupation. The liberty of the press, the right of free expression of opinion by word, writing, printed matter, etc., liberty of conscience and religious profession are guaranteed. All religious confessions are equal before the law.

All citizens of the republic are fully equal before the law and enjoy equal civil and political rights whatever be their race, language or religion; the special provisions for the protection of national and other minorities have already been referred to. The constitutional charter thus represents an honest effort to set up a truly democratic republic which shall fairly meet the demands of the varied races and religions within its borders.

Administration and Justice.—The executive Government is placed in charge of 15 ministries concerned with the following matters:—foreign affairs, interior, finance, commerce, labour, food supplies, railways, health, social welfare, justice, agriculture, public instruction, national defence, posts and telegraphs, and the unification of laws. The collective responsibility of this Cabinet of ministers is expressly laid down in the charter of the constitution. The president of the republic enjoys such executive power as is expressly assigned to him by the constitution, and he has his own office—the president's bureau—presided over by a permanent official, to conduct such matters as fall within his competence and to facilitate communication with the rest of the executive.

For purposes of political administration the republic has been divided into administrative subdistricts, the heads of which are appointed by and directly responsible to the central Government. Local civil government is carried on by popularly elected parish, district, urban and municipal councils.

The tribunals of the republic are the Supreme Court of Justice, which sits at Brno and is the court of final appeal both in civil and criminal causes, two high courts sitting at Prague and Brno respectively, 33 provincial courts and 410 district courts, all of which possess jurisdiction in both civil and criminal causes. Commercial cases are dealt with by the ordinary courts, except at Prague where a special commercial court sits. Litigation in mining matters is conducted before special benches attached to the district courts in mining districts. In large industrial centres there are also industrial courts to deal with disputes between employers and workpeople. At Prague there sits also an electoral court which decides upon the validity of disputed elections or forfeiture of seats and other questions relating to parliamentary or elected bodies. A constitutional court decides whether laws promulgated by Parliament are in harmony with the charter of the constitution.

Previous to 1918 the territories now composing the Czechoslovak Republic were of course subject to the Austrian or Hungarian code of laws respectively. On the collapse of the Austro-Hungarian Monarchy the Austrian code was adopted for the lands of the Bohemian crown and the Hungarian code for Slovakia. A special Ministry—that for "the unification of legislation and administrative organization"—has been entrusted with the unification of the laws for the whole republic; and two commissions of legal experts under the control of the Ministry of Justice were in 1921 at work on a careful revision of the old codes, which when completed would be issued as a uniform code for the entire republic.

Foreign Policy.—"Our policy," said Dr. Beneš in 1921, "is a policy of peace: in domestic affairs our programme is the logical sequel to our foreign policy, namely, social and racial order and justice, and unremitting effort on behalf of social and political democracy. The Great War must have taught us all that a calm and sensible discussion of all our differences is possible." The Czechoslovak Republic was first and foremost concerned, while avoiding all that may smack of chauvinism or imperialism, to maintain its integrity within the frontiers assigned to it by the Peace Conference. To that end it insisted upon the strict observance of the Treaties of Versailles, of St. Germain and of Trianon. It favoured an Anglo-French entente or alliance, seeing therein a substantial guarantee for the due carrying-out of those pacts. An intimate collaboration with England and France was a *conditio sine qua non* for Czechoslovakia. The creation of the so-called "Little Entente," aiming at the preser-

CZECHOSLOVAKIA

vation of the *status quo* in central Europe, was the primary outcome of Czechoslovak foreign policy. Czechoslovakia, Yugoslavia and Rumania became bound together in the Little Entente by a treaty of alliance (Convention with Yugoslavia dated Aug. 13 1920, with Rumania April 23 1921), positive in so far as it aimed at the establishment and maintenance of peace, security and normal economic conditions in central Europe, and defensive in so far as it was directed against all attempts at reaction menacing the existence of the new states. The efficacy of the Little Entente as a counter-reactionary alliance was manifested in April 1921, and again in October 1921, when its concerted action helped to frustrate the two attempts of Charles of Habsburg-Lorraine to recapture the throne of Hungary.

In respect of Austria Czechoslovakia was animated by the desire to assist in relieving the economic situation of the country, while opposed both to the incorporation of Austria with Germany and to the foundation of a Danubian confederation. It was in favour of aiding Austria on a broad basis of financial and economic help, to be rendered generally to the states of central Europe by international agreement. It was in favour of creating in central Europe a new political and economic system by which permanent peace would be secured—a definite understanding between all the "Succession States" of the former Austro-Hungarian monarchy in the matter of communications, post, telegraphs, navigation, finance and banking, exchange of goods and commercial treaties generally, opening up the way to a system of unfettered economics and freer trade—but at the same time jealously guarding the economic and political sovereignty of the Czechoslovak Republic.

In respect of Hungary Czechoslovakia was at one with Yugoslavia and Rumania in holding that a Habsburg restoration would be a *casus belli*. These countries adopted the view laid down by the Paris Conference on Feb. 2 1920, which declared that "it is not within the intention nor can it be regarded as the duty of the principal Allied Powers to intervene in the internal affairs of Hungary or to dictate to the Hungarian people what form of Government or of Constitution they shall adopt: nevertheless the Powers cannot allow the restoration of the Habsburg dynasty to be regarded as a question concerning the Hungarian nation alone. They declare therefore that a restoration of this nature would be in conflict with the very basis of the peace settlement and would be neither recognized nor tolerated."

On the other hand Czechoslovakia was desirous of renewing economic and political relations with Hungary, the more so as agricultural Hungary might be regarded as the complement of industrial Czechoslovakia, supplying her with natural products and providing a market for Czechoslovak manufactures.

With Poland the relations of the Czechoslovak Republic were for a considerable time seriously troubled by the question of Teschen, both countries laying claim to that territory. The Paris Conference in July 1920 decided for the partition of the disputed area; and the decision, though it signified no small sacrifice for the Czechoslovaks and caused deep disappointment throughout the country, was accepted loyally in the hope that by this sacrifice the friendship of the Poles would be secured. In the words of Dr. Beneš, "the Czechoslovak Government regards the conflict with the Poles as definitively ended and is desirous of systematically pursuing a policy of *rapprochement*." It was in this sense that the whole policy of Czechoslovakia towards Poland was directed, and the Czechoslovaks were hopeful that Poland would ultimately join with the Little Entente.

Towards Russia the policy of Czechoslovakia was logically consistent. It had always been opposed to intervention in Russia, and insisted upon Russia desisting from any act that might be construed as intermeddling in the affairs of Czechoslovakia, in particular the pursuit of Bolshevik propaganda on Czechoslovak territory. The Czechs were animated with intense sympathy for the real Russian people, and looked forward to the day when they will be able to coöperate as kinsmen in the reconstruction of a peaceful and well-ordered Russia.

In pursuance of its practical policy of *rapprochement* and economic coöperation in the reconstruction of central Europe

in particular and of Europe in general, Czechoslovakia concluded a series of commercial treaties with her various neighbours and with the Allied Powers.

Political Parties.—Not only was there in 1918-21 a sharp contrast in policy between the Czechoslovaks and the minority races living within the republic—the Germans and the Magyars—but each nationality was split up into a multiplicity of factions. The Czechoslovaks had 100 representatives in the House of Deputies and 103 in the Senate, and this total of 302 members was divided among no less than nine parties. The Germans and the Magyars were also proportionately split up. The strongest party in the republic was that of the Czechoslovak Social Democrats, which up to Sept. 1920 was represented by 74 deputies and 41 senators. The left wing of the party,—22 deputies and 5 senators—after a somewhat violent quarrel, then broke away and formed an independent organization owing allegiance to the Third (Moscow) International. This Communist party established its own organ, the "*Rudé Právo*" (The Red Rights), in opposition to the "*Právo Lidu*" (The Rights of the People), the organ of the Social Democratic party. The Social Democrats were well organized among the industrial workers and agricultural labourers. They pursued a Marxist programme aiming at the socialization of the State, the means of production and consumption: they were opposed to a dictatorship of the proletariat, and were for evolutionary as opposed to revolutionary methods. They supported the peace policy of the Czechoslovak Government in foreign affairs, and were strongly opposed to intervention in Russia. They were also in favour of a closer coöperation with the German democratic element in the State.

The Communists aimed at a dictatorship of the proletariat, the creation of workmen's and military councils and a close hand-in-hand coöperation with Soviet Russia.

The Popular party, composed of Catholics and recruited largely from Slovakia and the country districts of Moravia, was represented by 33 deputies and 18 senators. Its organization was chiefly in the hands of the priests. It championed the rights of private ownership against Socialism, and combated the anti-Rome movement which was taking place throughout the republic. In foreign affairs it supported the Government.

The Agrarian party numbered 42 members, and published an important daily, the "*Venkov*" (Country). It was drawn from the peasant and small-farmer class, was in favour of land reform, private property rights and increased production all round. It was opposed to Socialism.

The National Socialists numbered thirty-four. They pursued a national as opposed to an international social policy, being thus opponents of the Social Democrats and in particular antagonistic to Communism. They were opposed to the Soviets, but while favouring a constitutional Russia were against any intervention in that country.

The National Democrats (Liberals), whose organ was the "*Národní Listy*," numbered twenty-nine. They were led by Dr. Kramář, and, being mostly recruited from the educated, professional and official classes, were more influential than the numbers suggest. They were strongly represented in Prague and other cities. They were, of course, opposed to Marxism and Communism. In domestic politics they were strongly Nationalist and suspicious of the Germans. They were the champions of State authority, order and public morals.

Of the German parties the strongest was again the Social Democratic party, originally numbering 31 deputies and 16 senators, but having subsequently lost three deputies who formed a German Communist party acting more or less in concert with the Czechoslovak Communists.

In 1921 the total number of Socialists of every complexion in the House of Deputies was 141, as opposed to 137 Bourgeois members (Czechoslovaks 100, Germans 72, Magyars 7). In the Senate the Socialists numbered 68, as against 75 Bourgeois members (Czechoslovaks 103, Germans 37, Magyars 3).

The composition of the Chambers sufficiently explained the fact that up to Sept. 1921 the Government of the republic had

remained in the hands of a Coalition Cabinet, or (as at the latter date) of a Cabinet composed of permanent officials supported by a coalition of parties.

Social Legislation.—The democratic sentiment of the Czechoslovak nation, and its maturity in social matters, resulted in the adoption of a social policy which, while proceeding without undue haste, was characterized by a comparatively rapid course of reform. Social legislation first took the form of accident and sickness insurance. In respect of the former an increase of 30% in the payments to the insured as compared with July 1 1917 was made, while at the same time better terms were given in the insurance of miners and of railwaymen; insurance against sickness was completed by extending it to agricultural and domestic workers as well as to the families of the insured. In addition to this, in the course of fixing the premiums to be paid, the amount of State support was several times increased. Sickness insurance was made to include maternity insurance. Old-age and invalidity pensions were not universal; they were made to apply, outside civil servants, to clerks and private officials only.

Pensions were also secured to the widows and orphans of the assured. A universal scheme of old-age and invalidity insurance was before Parliament in 1921. Pensions for war invalids had been granted by special enactments. Insurance against unemployment was originally introduced as an emergency measure, but the economic conditions following the war necessitated the maintenance and extension of this form of insurance, which for normal times has been given legal sanction according to the Ghent system, by State contributions to the payments made by the trade unions.

The most notable accomplishment of the young republic in the field of social-political reform has been the enactment of Dec. 19 1918 establishing an 8-hour day for industrial and agricultural workers (with some specific exceptions). Prohibitions in respect of night work, the work of women (especially mothers) and young persons have been dealt with in the sense of the resolutions adopted at international conferences.

Wages have also been the subject of legislation; special commissions have been empowered to regulate the wages in the so-called "home" industries (sweating), and an arbitration board has been appointed to fix the salaries of clerks in the metal industry, thus minimizing the danger of conflicts in respect of wages having to be settled by means of strikes.

By a far-reaching policy an attempt has been made towards solving the housing problem. A special enactment protects tenants against arbitrary treatment at the hands of landlords in respect of notice to quit and raising of rents. Numerous enactments have also been passed for the encouragement of building operations. The State grants generous support to local authorities and to coöperative societies. These grants amounted in 1919 and 1920 to more than 625,000,000 crowns.

A vast measure of freedom, compared with their position under the Austrian régime, has been granted to women both politically and socially. Politically women are now the equals of men, and there is nothing legally to prevent a woman occupying any position in the various professions or in the administration of the State. In the two Houses of Parliament they were represented in 1921 by 16 members.

Nationalization of the coal-mines and the great industrial concerns was one of the main items on the programme of the Socialist parties. In practice moderate discussion was still proceeding in 1921 with the view of giving a more democratic character to factories and other undertakings and assuring a closer coöperation of the workers in the management. In regard to the mines specialists were in conference as to the part to be taken by the State and by public bodies in ownership and management. A first step towards democratizing industrial undertakings was taken by an enactment touching mining councils. By this enactment it is made possible, where more than 20 workers are employed, for an elected council to coöperate in securing the welfare of the workers, to see to the due execution of contracts and agreements, to settle disputes, and to take part in the management of philanthropic institutions.

Another enactment assures to miners a 10% share of the net profits, this sum to be employed for educative, philanthropic, or other purposes of utility for the benefit of the miners.

On the principle of the mining councils, factory or industrial councils were projected for all industrial undertakings.

The idea underlying these councils was to create, as it were, a certain constitution for factories by which the workman who had hitherto been a mere machine should become a creative factor, closely identified with the organization of the undertaking, conscious of responsibility, and thus making of democracy the same reality in economic life as it had already become in political life.

Land Reform.—Long before the political revolution of 1918 the Czechoslovaks had been convinced of the necessity for a far-reaching measure of land reform, both from a social and economic point of view as well as from national considerations. Vast entailed estates were the property of a small group of landlords (in Bohemia 37.7%, in Moravia 34.4%, in Silesia 39.9% of all land belonged to owners representing 0.1% of the population), while great masses of the people did not own a single acre of their native land. The great majority of the landlords were nobles of foreign origin who acquired

their estates at the hands of the Habsburg conqueror from 1621 onwards, when, after the battle of the White Mountain, the lands of the Czech nobles and yeomen were confiscated, the owners being executed or, as adherents of the Moravian Brotherhood and other Protestant churches, preferring to pass into exile rather than surrender their faith. The demand for the nationalization of the great landed estates was thus not only supported as a social and economic necessity in order to provide the landless population, notably the legionaries, with land, but was, deep in the minds of the people, regarded as a legal rectification of the wrongs suffered through the confiscations which followed the defeat of the White Mountain.

The Act by which the great estates were sequestered was unanimously passed by the National Assembly on April 16 1919. It gives the State the right to "take" (seize) and distribute estates in so far as they exceed 150 hectares (370 ac.) of arable land or 250 hectares (617 ac.) of land of any kind. Estates belonging to the house of Habsburg-Lorraine, property illegally acquired, as well as the property of persons who during the war were guilty of gross offences against the Czechoslovak nation are taken for a compensation paid to the Reparation Commission at Vienna. In all other cases the State gives to the owner a proportionate compensation based on the average prices in the years 1913-7. For the purchase and distribution of the land a "State Land Office" has been set up. A share in the distribution may be claimed on the one hand by private persons to the amount of 15 hectares (37 ac.)—the amount suitable for cultivation by one family; on the other hand by agricultural, housing and coöperative societies. The lands taken over by the State may, of course, be used for other purposes of public utility and remain the property of the State. Even persons without means may obtain land, an enactment enabling them to purchase on credit to the extent of nine-tenths of the value of the land acquired. Special protection is given to small holders. This Land Act was to be carried out in a series of successive periods, during the first of which only estates over 5,000 hectares (12,350 ac.) would be affected.

The Army.—The military forces of the republic were organized, immediately on the attainment of independence, on a democratic basis. The army was formed of the legionaries who had fought in Russia, France and Italy on the side of the Allies, and of those Czechoslovak troops who, on the collapse of Austria-Hungary, streamed back from the various fronts. Recruits now serve for two years, and the strength of the army is fixed at 150,000. This force, which is in essence a militia, is designed to be something different from a mere fighting machine. During their term of service the men are given not only military training but also educational advantages, as well as the opportunity of learning some handicraft. Well-organized continuation schools and systematic courses of lectures aim at providing the young soldier with a complete adult education. The Sokol societies, in collaboration with the army gymnastic clubs and with the Y.M.C.A., devote themselves systematically to the physical and moral welfare of the troops.

Education.—In Bohemia, Moravia and Silesia the standard of education—elementary higher and technical—is excellent, and there are practically no illiterates—a state of affairs attributable to the interest which the Czech nation (imbued with the traditions of Comenius) had ever taken in education. In Slovakia the situation is different. The Slovaks under the Hungarian régime were kept in a backward state—they did not possess a single Slovak school—while still worse conditions prevailed in Rumania, some 75% of the population being unable to read or write. The Czechoslovak Government, between 1918 and 1921, set up some 2,000 additional elementary and some 40 higher schools in Slovakia and Rumania (including 80 new German schools), so that a vast improvement in the educational status of those countries is only a matter of time.

In the entire republic there are four universities, three Czech and Slovak—the Charles University of Prague, the Masaryk University of Brno and the Comenius University of Bratislava—and one German (at Prague). The Masaryk and Comenius Universities are new foundations since 1918. There are four polytechnics enjoying university rank at Prague and Brno, two of them being Czech and two German. At Píbram in Bohemia there is a high school of mines, while two other high schools have been founded at Brno, one for veterinary science and the other for agriculture.

A high standard of physical training is set by the popular gymnastic organizations, known as "Sokols." In addition to the original Sokol Society (founded in 1862) there are the special organizations of the Labour (Socialist) and the Catholic Gymnastic Unions (under Sokol influence). The great Sokol union has a membership of over 300,000 in all, and the programme includes not only physical but also moral and disciplinary training, aiming at the production of citizens of character and patriotism. The Sokol organization and the Sokol spirit were one of the mainstays of the movement resulting, in the years 1914 to 1918, in the formation of the Czechoslovak legions on the various European battle-fronts. The "Scout" movement, too, both for boys and girls, has since 1918 developed with much success, especially in collaboration with the other original Czech gymnastic and sport corporations.

Religion.—The religious history of the lands which now compose the Czechoslovak Republic has a special interest for the English-speaking world owing to the fact that the work of John Hus, the

great Czech reformer (1369-1415) was largely a result of the influence of Wyclif. At the beginning of the 17th century some 90% of the Bohemians were Protestant, but the loss of independence and the effects of religious persecution (the Counter-Reformation) under the aegis of the Habsburg dynasty, caused the position to be reversed, and up to 1918 almost 90% of the Czechoslovak population was entered in the official statistics as belonging to the Roman Catholic Church. This adherence was, and still is, often only nominal, for the statistics take no note of the great mass of indifferentism and liberalism which prevails in the ranks of the Church. Two other tendencies were also manifest during the last few decades before the war: a movement among the intellectual classes, and to some extent among workers also, towards a non-ecclesiastical religious life; and an "Away from Rome" movement which in one aspect helped to recruit the ranks of Free Thought and on the other hand resulted in a growth of the Protestant churches. Between 1918 and 1921 about 1,000,000 persons left the Roman Church, the most conspicuous secession being that which resulted in the formation of a national "Czechoslovak Church." A considerable section of the priesthood demanded some dogmatical reforms, including the abolition of celibacy, the introduction of the vernacular into the Church services, and a more democratic administration of Church affairs. On the Holy See declining to meet these demands the "Czechoslovak Church" was founded in Jan. 1920. It has a membership of some 500,000, and possesses 120 churches. Further large secessions took place in favour of the Free Thought movement. The Protestants number about one million, the largest body being the Evangelical Church in Slovakia with a membership of over 400,000. In Bohemia the Evangelical Church of Czech Brethren represents a spiritual and historical continuity with the old Hussites. It was constituted in 1918 by the fusion of two existing Protestant bodies, the Reformed (Calvinist) Church and the Evangelical (Lutheran) Church. Other Protestant denominations (Presbyterian, Congregational, Baptist) are in smaller numbers. The Greek Church in Slovakia and Sub-Carpathian Russia has a membership of over 500,000, while the Jews number about 350,000.

Economics and Finance.—The economic and financial position of Czechoslovakia showed signs in 1921 of steady recovery from the chaos which succeeded the close of the war. Rich in natural resources and peopled by an intelligent, experienced and frugal population, the country had every reason to look forward to a prosperous industrial development in the future. Without Slovakia the republic would be mainly an industrial State: with it there is a slight preponderance in favour of agriculture, 41.5% of the entire population being occupied on or in connexion with the land and 38% in industry and commerce.

In special branches of industry Czechoslovakia is prominent among European countries, as for instance in the production of sugar and glass. In the manufacture of alcoholic liquors it occupies third place among European countries. It is less favourably placed in respect of the iron and textile industries, having to rely to a large extent upon the import of raw materials from abroad. The coal-mines of the country are capable of producing some 15 million tons of black coal and 24 millions of brown coal (lignite). The yield of iron ore is almost one million tons annually, while gold, silver, tin, graphite and salt are also mined. Iron and steel foundries exist at Kladno near Prague, as well as in Moravia and in Slovakia. Their blast furnaces produce 1,700,000 tons of pig-iron annually. The output of steel amounts to 298,000 tons, iron in bars 400,000 tons, iron girders 130,000 tons and sheet-iron 34,000 tons. Czechoslovakia manufactures and exports agricultural machinery, plant for sugar refineries and distilleries, locomotives, railway carriages and trucks and other rolling-stock, motor-cars, tractors. Aeroplanes are made at Prague and Píseň (Pilsen). In its output of graphite Czechoslovakia takes second place among European countries, Great Britain being the first. Naphtha wells are working with favourable results at Gbely in Slovakia, and researches in progress at other points (Russia) promise results that would make Czechoslovakia independent of foreign sources in respect of petroleum, even if no surplus were produced for export. Potters' clay, kaolin and felspar, which have largely facilitated the development of the flourishing porcelain industry, are found in various parts of the country, which is also fortunate in possessing sand suitable for use in the manufacture of the glass for which Bohemia has long been famous.

The economic importance of Czechoslovakia is strikingly shown by a comparison with the rest of the former Austro-Hungarian Monarchy. Previous to the war the present Czechoslovak territories were responsible for 92% of the sugar produced by Austria-Hungary, for 46% of the spirits, beer 57%, malt 87%, foodstuffs 50%, chemicals 75%, metals 60%, porcelain 100%, glass 90%, cotton goods 75%, woollen goods 80%, jute 90%, leather 70%, gloves 90%, boots 75%, paper 60%. The war, of course, cut off the supply of raw materials for the textile trade, which in 1921 was still suffering from shortage, particularly of raw cotton.

Czechoslovakia is the only European State which can export sugar: it is the second largest beet-sugar producer in the world, having

some 500,000 ac. of beet under cultivation. In 1920-1 some 715,000 tons of sugar were produced, 189 factories and refineries being engaged in the industry, and 300,000 tons were available for export.

Of beer 13 million hectolitres are brewed annually, of which one million are exported. Exceptionally fine hops are grown in the Zatec (Saaz) district of Bohemia, and of these no less than 40% are exported. The republic has 676 breweries and 140 malt-houses.

With an area of over 10 million ac. of forest it is only natural that Czechoslovakia exports not merely large quantities of timber but also furniture, bent-wood furniture, toys, musical instruments, etc. Of the bent-wood furniture 90% is exported and finds a ready market in England and America. Paper is also produced to the extent of some 250,000 tons annually. Of porcelain 30,000 tons is produced annually in 68 factories, Karlovy Vary (Carlsbad) being the chief centre of the pottery industry.

Glass manufacture in Bohemia dates from the 15th century. Bohemian glass enjoys a world-wide reputation, which is well deserved: the crystal ware of Bor (Haida), the imitation jewelry and stones of Jablonec (Gablonz), the paste and semi-precious stones of Turnov, are exported to every part of the globe. Over 60,000 work-people are employed in the glass industry.

Leather is among the more important manufactures of Czechoslovakia. Boot factories employ 40,000 workmen, glove manufactories the same number. Some three-fourths of the entire output in both these wares are exported, largely to England and to Germany.

Czechoslovakia, as already indicated, is not only an industrial State: it possesses at the same time a highly developed agriculture in which over 40% of the entire population is engaged, that is to say, some 5,700,000 persons are workers in some way or other connected with the land. Climate and soil are favourable: beet-root is grown up to an altitude of 1,100 ft. and corn to 1,300 ft. above sea-level. Only 4% of all arable land in the country is unproductive (in Great Britain 15%). The chief agricultural products are potatoes and vegetables, beet-root and hops, wheat, rye, barley and oats. The agriculture of the republic supplies the material for several important industries, including the production of sugar, beer and spirits, starch (120 factories), syrup, glucose, chicory, coffee substitutes from rye and barley, jams. Alcohol and spirits are distilled in 1,100 distilleries employing 18,000 workmen and producing annually some 380,000 hectolitres (1919-20: 1,151,000 hectolitres before the war). Excellent wines are also made, those of Melnik in Bohemia and the Slovakian wines being the best known.

Agriculture is encouraged by a suitable system of education. Since it came into being the republic had by 1921 founded 13 new agricultural schools, and in all there were 180 agricultural and forestry schools (higher and elementary), including the so-called "winter schools," while more than 50 periodicals appeared regularly for the technical instruction of those engaged in agriculture. The agricultural interests were also represented directly in the Parliament by a strong Agrarian party.

The foreign trade of Czechoslovakia was in 1921 growing steadily in volume. Previous to the war the country's products were, of course, classed as Austrian goods: now the description of "Made in Czechoslovakia" was beginning to make its way in the markets of the world. In 1919 the republic exported merchandise to the extent of 566 million tons and imported 183 millions. In 1920 these figures rose to 690 and 200 million tons respectively. In 1919 Czechoslovak exports to Great Britain (exclusive of colonies) amounted to a value of 238 million crowns, imports to 328 millions. Sugar, malt, hops, beer, mineral waters, glass, porcelain, leather, gloves, furniture and toys are the principal articles of export to Great Britain.

While suffering from the symptoms affecting central Europe generally, the republic was distinctly better off as regards its financial situation than any of its neighbours. The budgets of 1919 and 1920 disclosed deficits of 5 billion and 3 billion kronen respectively, but in that for 1921 the revenue slightly exceeded the expenditure. Czechoslovakia was thus the only country in central Europe with a well-balanced budget. The national debt amounted to some 40 billion crowns, against which the state itself possessed assets in the shape of forests, coal mines, the former domains of the Habsburgs, mineral, naphtha, radium and other sources of natural wealth, besides the State-owned railways.

Communications.—As a wholly inland nation, Czechoslovakia has to rely in the matter of transport upon its railways and its waterways, notably the Elbe, which connects the republic with Hamburg and the North Sea, and the Danube, which unites it with the east of Europe and the Balkans. Under the peace treaties Czechoslovakia acquired her own docks and warehouses in the harbour of Hamburg. Before the war the Czechoslovak traffic on the Elbe totalled some 4 million tons annually. On the Danube the amount was 2 millions, but this total bids fair, under normal conditions, to be easily passed, inasmuch as the work of developing the port of Bratislava, the construction of docks, warehouses and shipbuilding yards, was already proceeding energetically. It was also proposed to link up the Elbe and the Danube by a canal which would enable direct transport to be effected from North and Baltic Seas to the Black Sea. A further scheme in contemplation was that of a Danube-Order canal.

The total length of railway track in Czechoslovakia was in 1921 a little over 8,000 m., which represents 1 m. of railway for every 84 sq. m. of area. In the course of a few years this mileage was to be

largely increased, Parliament having voted some 6,500 million crowns for further construction and improvements. Some 4,700 m. of track are State-owned; the rest are in the hands of private companies, but were gradually to be taken over by the State.

Czechoslovakia has 5,000 post-offices, some 10,000 m. of telegraphs, and close upon 8,000 m. of telephone communication. Aerial posts are established with Paris, Warsaw, Berlin, Vienna and Budapest, in addition to which there exist also cross-country services. The republic possesses seven radio-telegraph stations.

Literature, Art and Music.—The Czechs have possessed a notable literature from the 13th century onwards. It has shared the vicissitudes of the nation itself and like it been in danger of extermination at the hands of fanatic foes. The names of Hus, Chelčický and Comenius (Komenský) are connected with the pre-Renaissance religious periods. The revival of the Czechs after a hundred years of torpor, due to the loss of their independence in 1620 and subsequent oppression at the hands of the Habsburgs and the dominant Germans, gave birth, from 1780 onwards, to a literary activity which still continues to yield rich fruit. From the modest and simple art of the patriotic poets and novelists of the first half of the 19th century, whose work nevertheless was an influential factor in the awakening of a national sentiment among the common people, Czech literature, after a period characterized by the romanticism of Mácha and the critical realism of Havlíček, arrived at a school which, while it took its inspiration from the sources of the national spirit, did not shut itself out from foreign influences. Vrchlický, a master of verse and a perfect cosmopolitan, and Čech, who took the material for his epics from Czech history, are the outstanding names of this epoch. Among their contemporaries were Heyduk and Sládek, two poets both belonging in form and in matter to the national school. Sládek was, with his excellent translations, one of the first to make Czech readers acquainted with the riches of English literature (especially Shakespeare). Eminent among the novelists of this generation were Némcová, a good observer of social conditions who reproduced in her works the charm of Bohemian peasant life; her kinswoman Světlá, Arbes and Zeyer. Neruda, a poet of bitter irony but of profound faith in and affection towards his nation, was also the author of novels, notable for their original realism, and numerous belletristic works of a high order. He marks the period of transition to the younger generation of writers, in the forefront of whom stands the poet and novelist Hačar, who revolutionized the conception of Czech patriotism and is famous for his historical glosses. Jirásek, the author of a vast series of novels and short stories, drawing their material from Bohemian history, unites the past with the present generation. By the healthy spirit of patriotism breathed in all his works Jirásek contributed not a little to maintaining among the masses of the people a national consciousness and faith in a better national future. The youngest literary generation in Czechoslovakia was represented in 1921 in particular by three leading poets: Sová, a writer of delicate lyrics; Bezruč, who sings of social and national oppression, and Březina, a profound visionary and pantheistic mystic. Among prose writers the leading contemporary names are Svobodová, Capek, a robust realist, and Srámek, who has also met with success as a dramatist. In Slovakia the foremost name is that of the poet Hviezdoslav.

The Czechs were famous as musicians as far back as the 15th century. The history of modern Czech music commences with the creator of Czech opera, Frederick Smetana. The compositions of Dvořák have become classics. Among contemporary composers in 1921 the foremost were Foerster, Novák, Ostrčil, and Suk; and as executants Ševčík, Kubelík and Ondříček.

Eloquent testimony is given by the beautiful churches and palaces of Prague—largely Gothic and baroque in style—to the architectural genius of the nation. The graceful cathedral of St. Vitus, rising above the castle (*Hrad*) on the heights of the Hradčany (Prague), is a magnificent specimen of Gothic. The beautiful church of St. Barbara at Kutná Hora, the royal castle of Karlův Týn, the Powder Tower, the church of St. Nicholas, the King Charles bridge at Prague, are among the many objects of universal admiration which are to be found in Bohemia.

Of modern sculptors the works of Myslbek and Sucharda are prominent in the public monuments at Prague. The latter, as well as others of the younger school of Czech sculptors, such as Bílek, Kafka and Mafatka, studied under Rodin at Paris.

Modern painting among the Czechs begins with Josef Mánes (1826–71) and Czermak (1831–78), and Aleš. Brožík is known for his historical canvases, among them "John Hus before the Council of Constance," while others worth mention are the marine painter Knuepfer, the landscape painters Slavíček and Hudeček, and Preisler and Svabinský as painters of portraits and allegorical subjects. Mucha has won a name abroad for decorative work and historical canvases. In Slovakia, Joža Úprka and his school have devoted themselves to interpreting peasant life.

Science and Philosophy.—In the course of the new intellectual life, by which after three hundred years of subjection the Czech nation again entered the ranks of the living peoples of Europe, scientific effort early resumed its due place.

At the very threshold of the Czech renaissance men of science were among the first pioneers of national thought, as for example Dobrovský the philologist, and in the ensuing generation Purkyně

(Purkinje) the physiologist, and Palacký the greatest of Czech historians. Scientific effort received an impetus from the establishment of an independent Czech university at Prague in 1881, and from that time there is hardly a branch of science in which workers of profound and creative talent did not arise (in physics Zenger, in biology Vejdovský), while a whole series of eminent names as well in the technical and mathematical as in the historical and philological (e.g. Zubatý) sciences might be mentioned.

Philosophy was early cultivated in Bohemia. At first the influence of German thought, German enlightenment and idealism was apparent, particularly in Kollár (a Slovak); the influence of Kant was seen in Palacký, that of Hegel and post-Kantian speculation in Aug. Smetana, while the philosophy of Herbart had a deep influence on educationists like Lindner, Durdík and Hostinský. To the more recent tendencies of contemporary philosophical thought the way was opened up by Thomas G. Masaryk, who, as a counterpoise to German speculation and the intellectualism of Herbart, emphasized the critical study of English philosophy, notably Hume, Spencer and Mill, and the French Comte; at the same time he fully appreciated the value of Kant in epistemology. Masaryk's work, *Spirit of Russia*, is a close analysis of the Russian philosophy of history, and of the Russian religious, moral and political thought. Enriched by new ethical and religious elements, Czech philosophy manifests itself in Masaryk's works as a new realism or humanism. A whole series of philosophic thinkers—Drtna, Foustka, Rádl and Beneš—followed in Masaryk's footsteps.

CZERNIN, OTTOKAR, COUNT (1872–), Austro-Hungarian statesman, a scion of an old Bohemian noble family, was born on Sept. 27 1872. He adopted a diplomatic career, was attached in 1891 to the Paris embassy, promoted to the rank of unpaid attaché of embassy, and then, after a lengthy period of leave, sent to The Hague in 1902. In that year, however, he retired and devoted himself to the management of his estates. In 1903 he was elected to the Bohemian Diet as a representative of the landed aristocracy. Here he attached himself to the German party, but demanded that every inhabitant of Bohemia should regard himself as an Austrian first, and only second as a German or a Czech. Connected by his wife, née Kinsky, with the Czech nobility, he tried to pave the way for a working alliance of the great landowners supporting the existing Constitution with the Conservative group in the Bohemian Diet, and in 1905 published a brochure with this object. In 1911 he published a signed essay on the measures to be taken to preserve the union of the empire (*Zur Erhaltung der Reichseinheit*), which represented the views of the heir to the throne, the Archduke Francis Ferdinand, with whom he had become intimate. In Feb. 1912 he became a member of the Austrian Upper House, attaching himself to the Constitutional party. His speeches, in which he advocated a vigorous internal and external policy, made a great sensation. Czernin at that time was regarded as Francis Ferdinand's candidate for the office of Foreign Minister. In Oct. he went as Austro-Hungarian minister to Bucharest. His dispatches published in the "Red Book" show that even at that time he was of opinion that the secret treaty signed by King Charles with the Triple Alliance was nothing but a "scrap of paper," and that in an international war Rumania would only be induced to take part on the side of the Central Powers by far-reaching concessions at the expense of the Habsburg Monarchy. He watched with regret the growth

of anti-Austrian sentiment in Rumania, whose attitude after the outbreak of the World War proved the correctness of his judgment. He now sought even at a cost to win over Rumania to fight on the side of the Central Powers. But his efforts proved fruitless, because the leading Hungarian statesmen would not agree to Rumanian demands involving the cession of Hungarian territory. For a long time Czernin succeeded in persuading Rumania to remain neutral. When, at the end of 1916, she finally passed over into the Entente camp Czernin returned to Vienna. The foresight which he had shown as minister at Bucharest, the skill and zeal displayed in his intercourse with the Rumanian court and Government, and his good personal relations with influential circles at Bucharest, decided the Emperor Charles to entrust him with the direction of Austro-Hungarian foreign policy in succession to Count Burian.

Czernin was, and remained, a decided advocate of the view that the Central Powers could not obtain so crushing a victory over the enemy in the field as to be able to dictate the conditions of peace. Therefore, from the day of his taking office down to his resignation he consistently maintained that, even at some sacrifice, they ought to seek the conclusion of a peace which should preserve to them their position as great Powers. Czernin did not indeed contemplate the conclusion of a separate peace with the enemy, but as against German statesmen he insisted that Germany also, especially in the questions of Belgium and Alsace-Lorraine, would have to reconcile herself to concessions. By gloomily painted pictures of the military, political and economic situation of Austria-Hungary he sought to influence the German Emperor and the German higher command, and succeeded in awakening sympathy with his peace ideas among the members of the German Reichstag. Czernin was not only cognizant of the peace negotiations which the Emperor Charles opened with England and France through his brother-in-law, Prince Sixtus of Parma, but he approved of them. He knew nothing, however, of the contents of the letter of March 24 1917, in which the Emperor Charles spoke of his willingness to support the "just demand" of France for the return of Alsace-Lorraine by

any means and by the use of his whole personal influence with his ally. But he himself was simultaneously engaged in trying to influence German statesmen in the same sense, promising in the event of their making sacrifices in the west to compensate them in the east, chiefly by the acquisition of Polish territory. But his efforts, then and later, broke down on the determination of the German army leaders to obtain a military decision. These men saw in Czernin a danger to the political and military interests of the Alliance, and attacked him violently. During the negotiations at Brest-Litovsk from Dec. 1917 to March 1918, the opposition between the views of the Austro-Hungarian delegation led by Czernin and the German delegation became strikingly manifest. In the negotiations leading up to the convention between Russia and the Quadruple Alliance, signed on March 4 1918, Czernin took a conspicuous part. A few weeks earlier peace had been concluded at Brest-Litovsk with the newly founded republic of the Ukraine. The fact that Czernin, in order to secure this "bread peace," had ceded to Ukraine the district of Chelm, to which the Poles laid claim, aroused the most violent resentment among the Poles, and led to unsparing attacks upon him by the Austrian Poles. In the beginning of April 1918 his position was no longer tenable. The immediate cause of his resignation on April 14 1918 was the conflict between him and the Emperor Charles over the "Sixtus letter." Czernin was one of the few active statesmen among the Austrian nobility who sought to continue their political activity under the Austrian Republic. At the end of 1920 he became the representative of the Liberal bourgeois party of central Vienna in the National Parliament.

For Czernin's activity in Bucharest and in the World War see his *Im Weltkrieg* (1919). His despatches from Bucharest are printed in the Austro-Hungarian Red Book, *Diplomatische Aktenstücke betreffend die Beziehungen Oesterreich-Ungarns zu Rumänien, 22 Juli 1914 bis 27 August 1916*. A favourable view of Czernin's attitude in the "Sixtus Affair" is taken by Count August Döblin in *Czernin und die Sixtusaffäre* (1920); the standpoint of Prince Sixtus is represented in *Prince Sixt de Bourbon. L'offre de la paix séparée de l'Autriche* (1921). (A. F. PR.)

D'ABERNON, EDGAR VINCENT, 1ST BARON (1857—), English politician, was born at Slinfold, Sussex, Aug. 19 1857, the youngest son of Sir Frederick Vincent, 11th Bart., of Stoke d'Abernon, Surrey. He was educated at Eton, and was intended for the diplomatic service, being in 1877 head of the examination list for the appointment of student dragoman at Constantinople. The same year, however, he entered the army, but in 1880 was appointed private secretary to Lord Edmond Fitzmaurice, at that time commissioner for Eastern Rumelia. The following year he became a member of the commission for the evacuation of territory ceded to Greece by Turkey, and in 1882 was sent to Constantinople as the representative of Great Britain, Holland and Belgium on the council of the Ottoman public debt, of which in 1883 he became president. In 1883 he was sent to Cairo as financial adviser to the Egyptian Government, remaining there until 1886, when he returned to Constantinople as governor of the Imperial Ottoman Bank, a post which he resigned in 1897. In 1887 he received the K.C.M.G. Sir Edgar Vincent entered Parliament in 1899 as Conservative member for Exeter, but lost this seat in 1906. He unsuccessfully contested Colchester in 1910. In 1914 he was raised to the peerage as Baron D'Abernon, and became very prominent during the World War as chairman of the Central Liquor Control Board. In 1920 he was appointed ambassador to Germany. Lord D'Abernon published in 1881 a *Grammar of Modern Greek*, which was adopted for use by the university of Athens. He married in 1890 Lady Helen Venetia Duncombe, daughter of the 1st Earl of Feversham.

DAHN, JULIUS SOPHUS FELIX (1834–1912), German historian, jurist and poet (see 7.734), published his complete works of fiction, both in prose and verse, in 1903. The final volume of *Die Könige der Germanen* appeared in 1911. He died at Breslau Jan. 3 1912.

DAHOMEY (see 7.734).—An estimate made in 1918 put the population at slightly over 900,000, of whom 65% lived in the coast and adjacent regions. Upper Dahomey, two-thirds in area of the whole colony, has no more than 12 inhabitants per sq. m., compared with 50 per sq. m. in Lower Dahomey. Porto Novo (seat of Government and chief business centre) had about 25,000 inhabitants, including some 400 Europeans. Whydah and Abomey each had a population of 12,000 odd. In all there were over 700 Europeans in Dahomey. There are large numbers of mulattoes in the coast towns, chiefly employed as clerks.

Trade and Communications.—The French devoted much attention to the development of the natural resources of the country and in opening communications. The metre gauge railway from Kotonu (the ocean port of Porto Novo) which runs parallel to the Nigerian frontier reached Savé, 162 m. inland, in 1912. Thence a metalled road (nearly 300 m. long), with substantial bridges was built to the Niger at Madekali, just W. of the British (Nigerian) frontier. Along this *Route de l'Est* a motor wagon service for passengers, mails and goods was opened in 1912. From Pahu, 16 m. from Kotonu, a branch line (20 m. long) runs W. to Whydah and Segborué. The line from Porto Novo to Sakete, near the Nigerian border, was in 1914 extended to Pobé (total length 47 m.). On the Togoland side there is a good metalled road connecting with the middle Niger regions. In the coast region a mail steamer service was opened in 1912 along the lagoons between Porto Novo and Lagos.

Cocoa plantations were largely developed from 1912, and the coconut palm—for the copra trade—introduced in the lagoon districts, while in central Dahomey cotton plantations met with success. Maize is largely grown for export, and there are considerable herds of cattle in the north. But palm oil remains the chief source of wealth of the country; oil palms cover about 600,000 ac. The volume of trade increased during 1905–12 from £1,075,000 to £2,530,000. The trade for 1916 was valued at £1,446,000; in 1918 at £2,332,000 (evenly distributed between imports and exports). The increase in 1918 was largely due to higher prices. Palm kernels and palm oil are the chief exports; maize, cotton, dried fish, copra, shea nuts and shea butter rank next in value. Cotton goods, gin and trade spirits are the chief imports.

Before the war Hamburg took nearly all the palm kernels; during and since the war the kernels have gone mainly to Liverpool. In 1913 Germany had 49.28% of the total trade, France 26.47, the

United Kingdom 23.74; the elimination of Germany told mostly in favour of the United Kingdom. The colony is self-supporting; in 1919 the budget balanced at £237,000. Nearly half the revenue is derived from a poll tax on the natives.

History.—In 1911 the French deposed the chief, a member of the old royal family, whom they had installed at Abomey. He had been intriguing against French rule. His territory was divided among a number of petty chiefs placed under the direct control of the resident at Abomey, and the whole country became the colony of Dahomey and its dependencies. From that time little trouble was experienced in the native administration. In Sept. 1912 a Franco-German convention approved the delimitation of the Dahomey-Togoland frontier which had been made by boundary commissions. Less than two years later, on the outbreak of the World War (Aug. 1914), small columns of French troops entered Togoland and coöperated with the British in its conquest. The energetic action of M. C. Noufflard (the Lt.-Gov.) and of Commandant Mariox (senior military officer) and Capt. Costaing helped to bring the conflict to a speedy close and to keep Dahomey itself peaceful. The natives of Dahomey furnished contingents for the Cameroon campaign and for Europe.

See *Dahomey* (1920), a useful handbook issued by the British Foreign Office; A. Le Hérissac, *L'Ancien royaume du Dahomey* (1911); P. Sprigade, "Die französische Kolonie Dahomey" in *Mit. deutschen Schutzgebieten* (1918); *L'Afrique Française* (Paris, monthly). (F. R. C.)

DAIL EIREANN: see IRELAND, section *Political History*.

DAMROSCH, WALTER JOHANNES (1862—), American musician and conductor, was born at Breslau, Germany, Jan. 30 1862. He came to America in 1871 and ten years later began his career as conductor in Newark, N.J. In 1894 he founded the Damrosch Opera Co. for producing Wagner. In 1896 he produced, as director of the Oratorio Symphony Societies, Wagner's *Parsifal* in concert form for the first time in the United States. Since 1903 he has been director of the New York Symphony Orchestra. He is the composer of *The Scarlet Letter* (1894); *Cyrano* (1913); and music for Euripides's *Medea*, *Iphigenia in Tauris* (Berkeley, 1915) and Sophocles's *Electra* (New York, 1917). At the request of Gen. Pershing he reorganized the bands of the A.E.F. in 1918.

His brother, FRANK HEINO DAMROSCH, was born at Breslau June 22 1859. He was conductor in Denver, Newark, Bridgeport, and New York (the Oratorio Society 1898–1912). From 1905 he was director of the Institute of Musical Art.

DANCING (see 7.794).—The years 1910–20 saw a remarkable revival of the love of all kinds of dancing in England and America. On the one hand the organization popularly known as the Russian Ballet has put new life into stage dancing, while on the other the Americans are responsible for a reawakening of the love of dancing in the ballroom. At the end of the 19th century the ballet in England had become a spectacular show of very little artistic significance; the standard of dancing technique was of the lowest and, except in the case of one or two dancers such as Adeline Genée, it is doubtful whether stage dancing could be called an art at all. In the ballroom, dancing had become a rather perfunctory social function, practised without any particular skill or regard for steps.

Classical Dancing.—The revolution in stage dancing was started in England by Serge Diaghilleff's company of Russian dancers, but no account of modern stage dancing would be complete without some reference to the so-called "Classical Dancing" which came into vogue at the beginning of the 20th century and had such an influence on all the stage dancing of a later date. Classical dancing was a revolt against the form and style of the stage ballet as it then existed. It was an attempt to rescue the art from the artificiality of the older ballet, and bring beauty of line and movement into prominence, instead of the technical skill of the steps alone. In addition to this, classical

dancers laid stress upon the musical side; they sought to interpret the great composers in dancing; vales of Chopin, Mendelssohn's "Spring Song," some of the smaller works of Schubert—all these were "interpreted" in different ways. The dancers sought to catch the mood of each piece of music by an appropriate series of poses and movements, which were intended to be not only expressive of the music but beautiful in themselves. The costume worn was a simple dress in the Greek style, with the feet bare; the strangeness of this costume at the time and the similarity of many of the poses to Greek paintings and friezes led to the use of the word "classical" for this dancing.

The first and greatest exponent of this particular school was Isadora Duncan. Her own point of view with regard to stage dancing is worthy of mention:—

"In my art I have by no means copied, as has been supposed, the figures of Greek vases, friezes, and paintings. From them I have learned to regard nature, and when certain of my movements recall gestures that are seen in works of art it is only because, like them, they are drawn from the grand natural source."

This description epitomizes the whole of the theory of classical dancing, and Isadora Duncan's numerous successors improved very little either on her own theory or practice. Her technique was of her own invention and, although the result looked simple and easy enough, the training to which she subjected herself was severe. Perfect balance, perfect transition from one pose to another however slowly, perfect control of breathing and movement, all these, she found, required as much practice and study as the older style of ballet dancing. There was nothing impromptu, nothing amateurish in her work. The result was entirely novel and at first was received with ridicule both in Europe and America; it was only much later that she achieved the success and received the praise which were her due. She danced on the stage by herself without scenery and with only a simple background of curtains which showed off the movements to their best advantage and kept the concentration of the audience on the dancer only.

It was left to one of Isadora Duncan's successors, Maud Allan (b. 1879), to popularize classical dancing in England. Her strongest quality was the very interesting way in which she interpreted musical phrases and moods. The early musical training she had in Berlin accounted no doubt for this fascinating quality.

The influence of classical dancing on the stage dancing of a later date is very considerable. The ballet which was designed by Nijinsky to the music of "L'Après-midi d'un Faune" of Debussy, and which was danced by him with picked members of Diaghileff's *corps de ballet*, would never have been possible without Isadora Duncan, and her dancing undoubtedly had a great influence in bringing stage dancing back into relation with real life and away from the absurd artificiality of the 19th century stage ballet.

The "Russian Ballet."—England hardly had time to recover from the revolutionary methods of Isadora Duncan and Maud Allan when there appeared a new organization which was acclaimed with rapturous applause and enthusiasm, first of all by the artistic world of London and very shortly afterwards, at their bidding, by the general public. Serge Diaghileff was responsible for the introduction of this company and was the moving spirit in collecting together the various people who contributed to this highly artistic and successful enterprise. He it was who enlisted the services of Léon Bakst and Alexandre Benois, the designers of the scenery and costumes; Michel Fokine, the producer and arranger of the dances; Nicholas Tcherepnin, the musical director; and the leading dancers, Karsavina, Anna Pavlova, Lydia Lopokowa, Vaslav Nijinsky, Adolph Bolm, Léon Massine and Enrico Cecchetti.

The success of this company not only in London but all over the world—they visited all the principal towns of Europe and America—was all the more unexpected because very few people in England were aware that anything so perfect could come out of Russia. The existence of the Imperial Court ballet at St. Petersburg was dimly known, and it was thought at first, quite

wrongly, that Diaghileff's company had some connexion with it. So far from this being the case it can truthfully be said that the connoisseurs of dancing in St. Petersburg had no great opinion of Diaghileff's productions and achievements. The Imperial Russian Ballet was instituted in 1735 and continued up to the revolution and the Tsar's deposition in 1917. The high standard of technique of the Imperial Ballet was very largely due to Didelot, a ballet master of the early 19th century at St. Petersburg, but Diaghileff's troupe was a very revolutionary body, and had very little in common in idea with the Imperial Ballet. True, the *corps de ballet* and dancers of the "Russian Ballet" were trained in the Imperial schools, and Fokine was the assistant ballet master at the St. Petersburg opera, but Bakst and Tcherepnin had no connexion whatever with the Imperial Ballet. The classical ballets performed by the Imperial Ballet at St. Petersburg year after year did not as a rule form part of Diaghileff's repertoire. His outlook on stage dancing differed as much from the official ideas in Russia as those of Isadora Duncan from John Tiller. His aim, like Miss Duncan's, was to bring the ballet into relation with real life and the contemporary arts which go to make up the "production."

The ballets themselves can be divided broadly into two classes: those which are the lineal descendants of earlier ballets, and those which are essentially experiments in new directions. Into the first category fall such ballets as "Lac des Cygnes," "Pavillon d'Armide," "Cléopâtre," "Thamar," "Oiseau de Feu," "Petrouchka," the dances from "Prince Igor" and "Sylphides." With regard to the last-named an interesting point was the use of Chopin's music, orchestrated by well-known Russian composers. This orchestration of what was hitherto considered as essentially piano-music created quite a sensation, and was one of the most successful efforts of the Diaghileff company. The vivid colour schemes of the scenery and dresses, and the modernity of some of the music (as in "Petrouchka"), were as much responsible for the effect of vitality and realness as the standard of the choreography and dancing, which were in themselves higher than any hitherto seen in England. Apart from the setting however, the characterization of the various personages in these ballets was presented in such a way as to make the stage people seem alive and convincing to the audience, every device of stage-craft and orchestration being used to this end.

With regard to the second category of ballets, "L'Après-midi d'un Faune" was an attempt that was only partially successful to bring the plastic arts of Greece on to the stage. "Le Sacre du Printemps" was a return to the "primitive," in the artistic sense. For both these, Nijinsky was mainly responsible as producer, and Stravinsky's music to the latter ballet was furiously "modern" into the bargain. It is doubtful whether these last-mentioned productions or any of the still later ballets, however interesting as experiments, were as satisfying artistically or theatrically perfect as the early ones of Fokine and Bakst. "The Good-Humoured Ladies" and other clever little scenes, charming in themselves, have not gone much further aesthetically, and in 1920 the standard of the dancing and the performance of the music were not on quite so high a level as in the first years of production.

Ballroom Dancing.—In the ballroom a different kind of revolution has been effected by the introduction of new dances and music from America. The only dance that has survived this invasion is the valse, but even this dance has altered so much in style that it now bears very little resemblance to the dance immortalized by Edward and Johann Strauss. The dances in common use (1921) are the fox-trot, one-step and the valse; the one-step is the most energetic of all the modern dances, owing to the clearly defined beats of the music, which is in quick march-time; the fox-trot is the lineal descendant of the polka, although the steps are not the same, and it is danced more smoothly, without the jerkiness of its ancestor. The steps are legion and ever changing with the style of the dancers. There are only three or four steps which are used by all couples and consequently make it possible for a man to dance with a new partner

for the first time. The woman's part in these dances is absolute passivity; she has to follow the man's lead and be responsive to his lightest touch. Every good dancer is now an adept at this, and the variety of steps in common use is surprising.

The evolution of the valse from mid-Victorian days is worthy of note. At the beginning of the 20th century, for some reason which is quite obscure, the tendency of dance bands was to play the valse faster every year than the last. The result of this was that the valse, which was then by far the most popular dance, instead of being slow in time, became a series of fast revolutions. Dancers refused, in consequence, to continue to perform what one may call the one-two-three circular rhythm of the valse at the accelerated pace; they found the solution of the problem was to dance the same steps at a slower rate in cross rhythm against the music. Various other steps were added to enable these couples to manoeuvre successfully among the old-fashioned dancers. These new steps became crystallized, others were added, and the result was finally taught as the "Boston."

The popularity of the "Boston" was short-lived owing to the difficulty of the performance in cross rhythm, and the congestion of traffic in the ballroom on account of the different speeds of the revolving couples. As soon as the new American dances obtained a hold in England the latitude in steps so essential to the new dances was extended to the old valse. The *tempo* of the music slowed down to its original speed and the "Boston" disappeared. Valses were played more slowly and the latitude of steps was the same as in the other dances. The old one-two-three step has very largely gone, and the difference between a valse and a fox-trot is mostly one of rhythm. The modern valse was called the "Hesitation" as opposed to the earlier "Boston."

The "Tango" was the result of an attempt on the part of dancing teachers to introduce a new dance into the ballroom about the year 1913. It came originally from America and is said to be founded on a dance used in the cafés of South America, which would account for its somewhat "Spanish" style; the rhythm of the music is akin to that of the "Habañera." The most remarkable feature of all the dances described above as opposed to the dances of earlier generations is that the personality of the dancers is clearly reflected by the steps they use.

The music of the modern ballroom is almost entirely supplied by the United States. The music used in the American dances is no longer a string band and piano, but consists of various combinations, the most common of which perhaps is:—piano, violin, alto or tenor saxophone, banjo and jazz-drum. This last-named needs some explanation. The word "jazz" signifies noise in America and is in no way a dance. The drummer uses a side drum, a big drum and cymbals played with the feet, and various other instruments on which he beats a tattoo with his drum-sticks in alternation with the side drum. He is in fact a sort of one-man band in himself and adds considerably to the rhythm of the ensemble. There is as much variety in the method of playing dance music to-day as in the dances themselves. Dance bands therefore vary considerably in skill, as might be expected, and the best known command very high salaries. The skill of a modern dance band lies in two essentials: first, good rhythm; and secondly, cleverness in extemporising variations on the tune by the different executors.

The effect of the American dances has not yet permeated the social scale, and the masses among whom dancing has always been a popular pastime, and they continue to prefer the dances of the 19th century. (G. T.*)

DANIELS, JOSEPHUS (1862—), U.S. politician, was born at Washington, N.C., May 18 1862. He studied at the Wilson (N.C.) Institute and at the age of 18 became editor of the *Wilson Advance*. He was admitted to the bar in 1885, but preferred newspaper work, becoming editor of the *Raleigh State Chronicle*. He was printer for the state of North Carolina from 1887 to 1893, and then for two years, under President Cleveland's administration, was chief clerk of the Department of the Interior. From 1904 he was editor of the *Raleigh News and Observer*, with which his former paper was consolidated. He was twice a delegate to the National Democratic Convention, and from 1896 to

1916 was a member of the Democratic National Executive Committee. He early became a supporter of Woodrow Wilson for the presidency and was publicity manager for his campaign in 1912. In 1913 he was appointed Secretary of the Navy by President Wilson. In 1914 he issued an order prohibiting the use of intoxicants on ship-board and within the limits of navy yards and stations. His personal interest in the enlisted men was shown by his provision of opportunities for training in various trades. From the first he advocated increase of the navy. During his first years as Secretary of the Navy he was much criticized, but after America's entrance into the World War the criticism died down. He favoured Government ownership of armour plate plants as well as of telephones and telegraphs. On retiring from the secretaryship of the Navy in 1921 he resumed his duties as editor of his newspaper. He was the author of *The Navy and the Nation* (1919).

DANKL, VIKTOR, FREIHERR VON (1854—), Austro-Hungarian general, was born in Udine. After service in the cavalry he was employed in important staff positions. In the World War he commanded at the outset the I. Army and defeated the Russians in the battle of Krasnik (Aug. 23-5 1914). After the Italian declaration of war he became in May 1915 commander of the defence forces in Tirol. As an army commander in the following years he took a successful part in the offensive against Asiago-Asiero, but shortly afterwards retired from his post on account of ill-health.

D'ANNUNZIO, GABRIELE (1863—), Italian poet, man of letters and soldier (see 2.78). Later years, from 1908 to 1921, were the most active in D'Annunzio's career, not only in the literary field but also in those of war and politics. In 1908 he produced *La nave*, a vivid presentation of the early history of Venice, in which he sets forth his aspirations for Italy's mission as a great sea power, mistress of the Adriatic—a curious forecast of his future political action. The following year *Fedra* appeared, a classical drama, and in 1911 *Le martyre de St. Sébastien*, a dramatic mystery play written by D'Annunzio in French verse and first performed in Paris, with musical interludes by Debussy; it was a remarkable *tour de force* and appreciated as such by French critics, but is hardly one of his greatest achievements. *La Pisanella, ou la mort parfumée* (1913), also written in French and first produced in Paris, is a picturesque reconstruction of the mediaeval Levant set forth in the author's gorgeous colouring. The same year he brought out in Paris *Chère-feuille*, a drama of modern life, with a plot adapted from Hamlet and containing some powerful scenes, and in 1914 he produced a slightly different Italian version of it entitled *Il ferro*. *Parisina*, a lyric tragedy in a Renaissance setting with music by Mascagni, was first performed at Milan, also in 1914. His attraction towards the stage did not wholly suspend his output in the field of fiction, and in 1911 he published *Forse che sì, forse che no*, a powerful but somewhat long-winded novel in which aviation plays a considerable part, and in 1913 *La Leda senza cigno*, a collection of pieces, half essays and half fiction, which originally appeared in the *Corriere della Sera* and were afterwards issued in three volumes with a *licenza* in 1917. His purely poetic output was limited to the *Canzoni della gesta d'Oltremare* (1911), dealing with the Libyan war and containing some admirable verse, and also some violent invectives against the Powers which were hampering Italy in her Mediterranean policy.

The outbreak of the World War did not put an end to D'Annunzio's literary activity. For some years he had been living in France, having had to leave Italy on account of financial difficulties, but the moment the conflict began he became deeply impressed with the vital necessity for Italy to participate in it so as to realize her aspirations towards complete unity and affirm her sovereignty in the Adriatic. His addresses to the Italian people, full of eloquent and inspiring patriotism, were afterwards published in a volume *Per la più grande Italia*. In the spring of 1915 he returned to Italy; his speeches at Quarto for the celebration of Garibaldi's Sicilian expedition and in Rome aroused wide-spread enthusiasm, and undoubtedly contributed very largely to Italy's intervention. From the moment Italy declared

war D'Annunzio's career became one of the extraordinary romances of modern times—the man, hitherto regarded as a sensuous aesthete and a decadent, whose only claim to distinction was his exquisite sense of beauty and his mastery of the language, was now to prove a man of action, a soldier of almost incredible bravery, and a politician who, however his conduct may be regarded, for many months monopolized the attention of the world, and defied powerful Governments.

Although 55 years old, he at once volunteered for active service. Having been a reserve cavalry officer in the Novara Lancers he first joined the cavalry; but as that arm seemed at the time to have little chance of fighting, he got himself attached to the 77th Infantry and spent many months in the Carso trenches, always in the most exposed positions. But even that was not enough for his exuberant spirit, and he soon joined the navy headquarters in Venice, whence he took part in many torpedo and submarine raids. Finally he took to flying, in the hope of achieving immortality even at the cost of his life. His exploits in the air were of the most fantastic nature, and he became an airman of the very first rank. In one of his flights he lost an eye, in another was wounded in the wrist, and many times his airplane was riddled with bullets. In Aug. 1918 he led a flight over Vienna, where no bombs were dropped, but only propaganda pamphlets as it was an unfortified city; the exploit was particularly audacious owing to the great distance over enemy country which had to be covered. He obtained three special promotions for gallantry, attaining the rank of lieutenant-colonel, was decorated with one gold medal for valour (a distinction corresponding to the V.C.), four silver and two bronze medals, and was created officer of the Military Order of Savoy. On being demobilized in June 1919 he received an exceptionally flattering letter from the Chief of the General Staff, regretting that the mobilized army should lose his valuable assistance, adding that he would still remain "spiritually among us," as a brilliant example "for the whole army of faith, heroism and self sacrifice." During the first period of the war he published 10 war poems, some of them of great beauty, and after Caporetto he delivered several eloquent addresses collected in *La Riscossa*; on the Buccari enterprise he wrote *La beffa di Buccari*.

After the conclusion of the Armistice the cold attitude of the Allied Powers, and especially of President Wilson, towards Italy, aroused D'Annunzio's bitter indignation, and his letters and articles in this connexion, collected in the volume *Contro uno è contro tutti*, will occupy a prominent place in the literature of invective. The extreme violence of his language contributed not a little to embitter the relations between Italy and President Wilson. During the Nitti régime D'Annunzio came to personify the patriotic reaction against the Government's policy; while he became the idol of a small body of enthusiasts, he attracted the sympathies of an ever-increasing portion of all the best elements in the country. The Fiume dispute symbolized in his mind the whole conflict between Italy's aspirations and the selfish greed and ingratitude of her Allies. When, in consequence of the decision of the commission of inquiry into the anti-French riots at Fiume, the Italian garrison was to be greatly reduced and the town policed by Maltese gendarmes, a movement was planned by Major Reina of the Granatieri brigade to reoccupy the town in the name of Italy with regular troops and volunteers. D'Annunzio accepted the leadership of the expedition and on the night of Sept. 11-2 he marched from Ronchi at the head of detachments of grenadiers and other troops and reentered Fiume. The movement was vehemently discountenanced by the Italian Government, and D'Annunzio was severely criticized even by many of his admirers for having tampered with the discipline of the army and navy at such a critical moment, even for a patriotic purpose. On the other hand the policy of Signor Nitti and the open hostility of the Allies justified in the eyes of a large part of Italian opinion even so desperate an action. For 15 months D'Annunzio defied the Italian Government and indeed the whole of Europe with success. He assumed the style of ruler or "Commandant" of Fiume and created a new State. His "reign" was character-

ized by a picturesque mysticism, with Italian patriotism as the first article of his creed, and numbers of enthusiastic young, and indeed middle aged, men flocked to his standard from all parts of Italy. Men like Gen. Ceccherini, one of the bravest soldiers in the Italian army, Maffeo Pantaleoni, the eminent economist, and the syndicalist leader De Ambris came to Fiume and loyally served under the "Commandant," and many officers of the army and navy also joined him; the archaeologist Giacomo Boni, the poets Siciliani, Fucini and Orvieto, the aged Risorgimento patriot Senator Di Prampero, the scientist Prof. Cian, Senator Del Lungo the distinguished man of letters, to mention only a few, openly expressed their approval of his action. His position at Fiume ended by going to his head, and his language and actions came to be ever fuller of rhodomontade, verging at times on the ridiculous, while the adventurous nature of his undertaking also attracted many undesirable characters, not all of them Italians, who gradually acquired influence over him and egged him on to blameworthy actions. In his opposition to the official attitude of Italy he came to regard its Government, even after Nitti had fallen, the army itself, except the small part of it which had followed him, and indeed the whole Italian people outside Fiume, as enemies, and on them he poured the vials of his wrath and eloquence, hitherto reserved for foreign Powers. When the Rapallo treaty was concluded he refused to recognize it, as he disapproved of its provisions regarding Fiume and Dalmatia, and his refusal to submit, while causing serious difficulties to the Government, alienated from him the sympathies of many who had approved his action at first and who strongly criticized the treaty. The Government was finally obliged to resort to force in order to carry out the Rapallo treaty, and D'Annunzio after vowing to hold Fiume to the bitter end, submitted in Jan. 1921, and left the city. He then went to live at Gardone on the lake of Garda. During his stay at Fiume he delivered innumerable speeches, addresses and messages, all of a high-flown and exaggerated style, but full of his usual passionate eloquence. Most of these were printed on fly-leaves and in newspapers; a small part of them were collected in two pamphlets *Italia o morte* (1919) and *Italia e vita* (1920). His constitution of the *Reggenza del Carnaro* is a strange mixture of poetic concepts and mediaeval law. His diplomatic correspondence with the Italian Government, published by him in a "Green Book," also belongs to the domain of literature.

DANZIG (Polish Gdansk) (*see* 7.824), a free city constituted in accordance with the provisions of the Treaty of Versailles on Nov. 15 1920. The confines of the territory, extending over some 1,800 sq. km., were laid down by Article 100, the delimitation of the frontier being entrusted to a commission composed of three members appointed by the principal Allied and Associated Powers, one appointed by Germany and one by Poland. The area of the free city, as well as the adjoining Polish territory—formerly part of West Prussia—now divides East Prussia from the rest of Germany.

The pop. of the city in 1910 was 182,468, that of the entire free city territory being some 300,000. The river is navigable from the sea entrance at Neufahrwasser to a distance of 4 m. for ships drawing 27 ft. and for a further 2 m. up the river Mottlau for vessels of about 15 ft. draught. Facilities are available for the repair and maintenance of ships. Up to 5,800 tons these can be accommodated in floating docks of which there are several. There are four dock-yards, viz. Schichau, Danziger Werft (formerly Imperial dockyard), Klawitter and Wogan. Schichau yard has built vessels of 35,000 tons. The Imperial dockyard was largely used during the World War for submarine construction, besides being a repair centre for torpedo craft and a constructional centre for aircraft. The present annual building output of 20,000 tons could be largely increased. The free basin has a wharfage of about 3,600 ft., and vessels drawing from 18 to 24 ft. can lie alongside. Electric cranes and warehouse accommodation are provided and railway connexion exists with the main system. The island of Holm (an important adjunct to the port) has a partially completed basin of great potential value as a commercial harbour. The rifle factory furnished some 1,600 rifles a day during the war, employing 10,000 men and being supplied with the most modern machinery. After the Treaty of Versailles came into force it devoted itself chiefly to the manufacture of domestic articles, the personnel being greatly reduced.

The chief imports are raw materials for manufacture, clothing

on finding nearly all the ammunition for their heaviest ordnance in the Narrows to be used up, viewed the prospect of a possible fresh fleet attack with some apprehension, as they were under the impression that the assailants had been beaten off on the 18th by the guns and not by the mines. This led to a mistaken idea that De Robeck's ships might have succeeded had they renewed their attack at once in spite of losses; the damage which they had done to the batteries had been almost insignificant, and they had not got within 5 m. of their objective.

The Allies had foreseen from the outset that land forces would have to be brought into play sooner or later in their campaign in this region. Even assuming that the fleet forced the Dardanelles, its communications would have to be safeguarded, and there would still be Constantinople and the Bosphorus to be dealt with. Entente troops had already before March 18 been set in motion for the Aegean, and some were in Lemnos. A heterogeneous army, drawn largely from India and Australasia, had also been gathering in Egypt for several weeks past, of which portions could be made available for work elsewhere in the Near East. Gen. Sir Ian Hamilton, who had been chosen as commander-in-chief of the military contingents that were to coöperate in due course with the naval forces in this theatre of war, had moreover actually arrived on the day before the abortive fleet attack upon the Narrows and had witnessed the fight. In view of what had occurred the Allied Governments decided that in further operations full use must be made of the gathering army, and from this time onwards the military began to assume the principal rôle in the effort of the Entente to secure command of the Dardanelles.

But Sir Ian Hamilton judged it to be inexpedient to initiate land operations at once. Reconnaissance had brought to light the extent to which the Turks were making preparations to repel attempted landings, both on the Gallipoli Peninsula, and on the Asiatic coast adjacent to the mouth of the Straits; and everything pointed to the expeditionary force having to start work by fighting its way ashore. A tactical operation of that character demanded most careful prior organization, and it called for a distribution of the attacking force amongst the available shipping based on purely tactical considerations. As a preliminary to his undertaking a serious land campaign on the shores of the Aegean, the general felt himself obliged to concentrate his forces in Egypt, and to prepare them there for the hazardous undertaking to which they were to be committed. A month was lost in consequence.¹ During that month the Turkish V. Army was formed (March 24) to guard the Straits, and Marshal Liman von Sanders, head of the German military mission in Turkey, was appointed its commander-in-chief. Between the last days of March and the day of the landing the defence system was overhauled and greatly developed.²

The Franco-British expeditionary force was to be composed of seven divisions—three, the 20th, the 42nd and the Royal Naval, furnished by the United Kingdom, two formed of Australian and New Zealand troops, and two composed of French colonial troops. At the time however when active operations began the 42nd Division and one of the French divisions could

¹ The chief naval incidents of this month were:—a raid by the Turkish destroyer "Demir Hissar" which sank the British transport "Manitou" on March 16, but had to be blown up next day off Chios to avoid capture; an attempt of the British submarine E15 to enter the Straits, which led to her being forced ashore (April 16) and in the sequel to her destruction by a daring boat's crew from the "Majestic" (April 18); bombardments of the defences of Smyrna on March 28, April 6 and April 22; and operations at Gaza and El Arish on the Syrian coast by the French battleship "St. Louis" and other vessels (April 12-17).

From the Black Sea the Russian naval forces bombarded the Bosphorus defences on March 28; some fruitless operations were then carried out against the "Goeben" and "Breslau" (in the course of which the Turkish cruiser "Medjidieh" was sunk off Odessa (April 3), and on April 25, the day of the landing in the Peninsula, and on May 2, the Bosphorus defences were again shelled.

² The coast defences themselves remained under the command of the German Adml. v. Usedom, who was also responsible for those of the Bosphorus. The German naval forces were commanded by Adml. Souchon, who had brought the "Goeben" and "Breslau."

not be counted on owing to shipping for them not being available. Against this force Liman von Sanders could at the outset pit six divisions. Hamilton had resolved on making the Gallipoli Peninsula his objective, intending to secure high ground which dominated the Narrows from that side. He could conceal his design up to the very last. His adversary had perforce to disperse the defending troops, so that on the morning when the land campaign started two of the Turkish divisions (3rd and 11th) were watching the outer coast on the Asiatic side, two (5th and 7th) were near Bulair to provide against a landing at the neck of the Peninsula, while the remaining two (9th and 10th) under Essad Pasha guarded the places where, in the event, the Allied army made its appearance. Still, if the attacking side enjoyed an advantage in this respect, the possible landing-places were few in number and were therefore well indicated, there had been ample time to protect them with earthworks and barbed wire, and in any disembarkation in face of resistance the tactical conditions favour the defence.

Hamilton contemplated two distinct major operations. One force was to be put ashore about the extremity of the peninsula—an area which it is convenient to designate as "Helles." The other force was to land N. of Gaba Tepe, where there are extensive beaches. Part of the one available French division was, furthermore, to effect a descent at Kum Kale opposite Helles as a subsidiary operation, partly to deceive the enemy and partly to neutralize Turkish guns, which otherwise might intervene in the Helles fighting. Feints were also to be carried out at other localities so as to bewilder the defenders. The effort at Helles was to be entrusted to the 20th Division, supported by the Royal Naval Division, and ultimately to be reinforced by the French division. That at Gaba Tepe was to be carried out by the two Australasian divisions under Gen. Sir William Birdwood. The Anglo-French army concentrated in Mudros Bay, the great natural harbour of Lemnos, in the third week of April and, after a short delay enforced by bad weather, the armada put to sea during the nights of the 23rd-24th and the 24th-25th, so that the transports and the covering warships should arrive at the various rendezvous at or before dawn on the 25th. The day broke calm and still, after a placid night.

A firm footing was gained on shore by the assailants at three out of the five points where disembarkation was attempted, while the effort was also, within restricted limits, successful at the two remaining points. The beaches which had been selected were, enumerating from right to left, "S" in Morto Bay, "V" and "W" on either side of Cape Helles at the south-western end, and "X" and "Y" on the outer shore; "V" and "W" were regarded as of primary importance, as those two beaches offered suitable landing places from the point of view of subsequent operations. The attacks at "S" and "Y" were intended to be subsidiary; but great importance was attached to that at "X" owing to the vicinity of this point to "W." The troops started for the shore in flotillas of boats soon after dawn at all points, their approach covered by the fire of battleships and cruisers, and in all cases the boats were not fired upon until almost the last moment.

As it turned out, the actual disembarkations at "S," "X" and "Y" were carried out without any very great difficulty; but the troops detailed for "W" beach only gained a footing after incurring very heavy losses and by a display of indomitable resolution, while at "V" the operation went very near to failing altogether. In the general scheme of attack the landing at this last point was of primary importance; the largest force had been detailed for it, and the troops were for the most part conveyed to the beach in a steamer (the "River Clyde") which was run ashore; but only some scattered detachments cowering close to the water's edge had established themselves on land by nightfall, and the Allies' position here seemed to be highly critical. The troops detailed for "Y" beach had also got into serious difficulties, and as it turned out they had to be withdrawn next morning. But the forces which had landed at "W" and "X" beaches had joined hands, the one battalion detailed for "S" beach had secured a good position, and during the night the troops still

left aboard the "River Clyde" contrived to disembark. The resistance offered by the Turks had been most determined, and these could reckon upon receiving welcome reinforcements within a few hours; for as soon as the situation declared itself Liman von Sanders had hurried off one of the two divisions (the 7th) at Bulair by water with orders to repair to Helles.

In the meantime a French brigade had, after a tough struggle, effected a lodgment at Kum Kale. The Turks were in strong force in that quarter, and, as the hours passed and the defenders (3rd and 11th Divs.) massed, the situation became such as to render any French advance out of the question; indeed, but for the fire of the warships the troops who had landed could barely have maintained themselves. Still, their presence on the Asiatic side of the Straits was for the time being indirectly helpful to their British comrades who were struggling for a grip on the extremity of the Gallipoli Peninsula.

The invaders of Helles had secured but a precarious foothold on Ottoman soil by the morning of the 26th, twenty-four hours after starting operations; but fair progress was made by them during the course of this second day. What was left of the force originally detailed for the landing at "V" beach contrived during the early hours by stern fighting to occupy some high ground hard by, and also to join hands with the troops landed at "W" beach. Additional infantry was got ashore at "W" and "X" beaches, the first elements of the French division began disembarking at "V" beach in the afternoon, and before evening touch had been gained with the battalion that had made good at "S" beach. That night the French evacuated Kum Kale by arrangement. On the 27th a general move forward took place, the Turks (6th Div.) offering little opposition, and by nightfall the Allies held a line stretching approximately from the north end of Morto Bay to "Gully" beach. But very heavy losses had been sustained by the 20th Division, large bodies of Turkish troops had arrived from Bulair and were being brought round from the Asiatic side of the Straits,¹ and after three days of strenuous combat the British and French had barely secured a depth of 2 m. of country, while their opponents had had time to concentrate their scattered forces. Realizing the urgent need of gaining ground before the enemy was gathered in full strength, and hoping to win the heights beyond Krithia and Achi Baba, Sir I. Hamilton ordered a further attack for the 28th. On this occasion the Turks made a determined resistance; but the Allies' line was advanced by a few hundred yards at most points, and a three days' lull then ensued in the Helles area.

While this embittered struggle had been in progress at the extremity of the peninsula, stirring events had been in progress on its outer coast-line. The arrangements for disembarking Birdwood's Australasians differed from those made at Helles, in that here the whole force was to land at one point, and that an attempt was to be made to effect a surprise just before dawn (April 25). The surprise was effected, but in the darkness the force arrived at a locality about a mile N. of the beach immediately N. of Gaba Tepe which had been the selected goal. The beach on which the landing took place proved to be satisfactory, but it lay at the foot of a steep and rugged declivity, which was therefore a most unsuitable place for putting ashore the stores and impedimenta of an army. At the moment of approach of the first boats the defenders actually on the spot were few, so that the high ground overhanging the landing place (which came to be known as Anzac² Cove) was secured by the assailants at the first rush. But the enemy speedily brought effective flanking artillery fire to bear on the beach and on the boats; the troops, both officers and men, were inexperienced, the ground to be advanced over was hilly, scrub-clad and extremely broken, and considerable confusion arose. The advantage gained in the first instance by the surprise was lost, and the Turkish 10th Div. was able to gather in force during the critical hours of

the morning when the Australasians might, in virtue of their superior numbers, have secured a satisfactory sector of ground. At the end of the day, although the whole of Birdwood's infantry had been ashore for several hours, the position which these troops had taken up remained a haphazard one, no depth had been secured, losses had been heavy, and the situation seemed so threatening that the question of a withdrawal was even considered at one time.

Reinforced by parts of the two Bulair divisions the Turks delivered vigorous counter-attacks on the 26th; but these were beaten off, and on that day and on the morrow the Australasian troops dug themselves in so thoroughly that by the night of the 27th-28th the position which they had taken up, such as it was, was reasonably secure. On the other hand, the Turks, who were commanded by Essad, had likewise dug themselves in, and they could bring an effective artillery fire to bear on the Anzac trenches from three sides, the prospect of the landing force making any effective progress under the awkward conditions of ground in which it found itself was remote, and Birdwood's contingents had in reality been even less successful than had those detailed for Helles as regards securing an adequate area on the enemy's shores before the defence gathered strength. Their situation was unsatisfactory not only in the tactical sense, but also from the point of view of keeping the troops supplied, owing to their being perched on ridges with steep gradients behind them. Water also was found to be scarce, and was sure to become scarcer during the summer months. Lastly, the landing place was much exposed in the event of bad weather.

Although his adversaries had fought their way ashore in two sections of the Gallipoli Peninsula—and he had had to give up his first idea of driving them back to their ships—Liman von Sanders had no grounds for despondency when May opened. The Allies' plan was now unmistakably indicated, and concentration of the defending forces had become possible in consequence. The marshal's Turks had fought gallantly in the strenuous encounters which had taken place, and large reinforcements (2nd, 4th, 13th, 15th, 16th Divisions) were on the move or preparing to move to his aid. His troops were entrenching themselves solidly in face of the invaders both at Helles and at Anzac, so that his antagonists would be obliged to storm lines of earthworks whenever they should attempt to make further progress. It is true that Hamilton was expecting the arrival of the 42nd Division and of the 2nd French Division within a few days; but his losses had been extremely heavy, there were no depôts at hand from which these losses could promptly be made good, and he was inferior to the Turks in artillery both as regards calibre of guns and as regards ammunition. On three successive nights from the 1st to the 3rd the Turks delivered resolute assaults upon the Allies' position at Helles, but they were repulsed on each occasion; they also on the night of the 2nd-3rd launched attacks upon the Australasians, the combat lasting into the next day, but here also they were beaten off.

Two brigades of Birdwood's force were thereupon temporarily transferred to Helles by night, and on the 6th and following two days a mighty effort was made by the invaders to push forward in this southern area and to win the high ground that stretches across the peninsula about 5 m. from its extremity; their front was, however, only advanced by a few hundred yards and a much more pronounced success was called for to render the Allies' position in this area at all a promising one. Much work was done in organizing the area and its communications and landing places, but the tactical situation at Helles remained stationary for the rest of the month. At Anzac similar work was done but the only tactical incident of much importance in that quarter was that Liman von Sanders personally directed a formidable attack upon Birdwood on the night of the 18th-19th, the assailants being defeated with severe loss.

The arrival of German submarines³ during this month proved

¹ The German commander of the 5th Div. (Lt.-Col. v. Sodenstern) was put in charge of the Helles front, Essad taking command on the Ari Burni front.

² The abbreviated designation of the "Australian and New Zealand Army Corps."

³ Already a special German submarine command had been established in the Adriatic, with bases at Pola and Cattaro, and some small boats were sent thither by rail. Two of these (UB1, UB15) were attached to the Austrian submarine force. Three

to be an event of lasting importance. Two British battleships were sunk off the peninsula ("Triumph" May 25, "Majestic" May 27), and owing to the risks run by warships and transports while in the open the Allied troops on shore were thenceforward almost deprived of support from naval gunfire, while reinforcements and stores were mostly brought from Mudros to the various landing places in small craft. Hamilton made Imbros his headquarters, and troops also were sometimes collected there owing to its vicinity both to Helles and to Anzac. Within the Dardanelles the battleship "Goliath" had been torpedoed by the Turkish destroyer "Muavenet-i-Milliye" on May 13; on the other hand British submarines were performing invaluable service, diving under the mine-fields, causing havoc amongst enemy craft in the channel itself and higher up, and threatening Ottoman communications with the peninsula.

That the position of affairs had become one virtually of stalemate was fairly evident to all authorities on the side of the Entente before the end of May. A Russian army destined for the Bosphorus, which had been gathered near Odessa, obliging the Porte to keep strong bodies of troops about Constantinople, had been called to Galicia, thus liberating several Turkish divisions for service at the Dardanelles. Only by dispatching very substantial reinforcements in men, munitions and war material to the scene could the Entente achieve its object. But the military situation elsewhere forbade the allocation of strong British or French contingents to this secondary theatre of war, and there was much delay in London in forming a decision. The 52nd Division was, however, under orders to proceed from England to the Aegean; it arrived at Helles early in June, where there was some severe fighting during that month by which the Allies somewhat improved their position.

But trench warfare was the order of the day, and the British and French were trying to carry this on without that ample artillery support which is almost indispensable when earth-works have to be stormed under modern tactical conditions.

others (UB3, UB7, UB8) sailed for the Straits in the latter part of April. UB3 was lost *en route* but nos. 7 and 8 reached the Straits about the middle of May. They proceeded to Constantinople, and were chiefly employed against the Russian Black Sea fleet. Four small boats of the mine-laying class were also dispatched, of which three (UC14, UC13, UC15) made their way to Constantinople, carrying important technical stores, in the summer months after an intermediate base had been established at Orak near Budrun. Another small boat (UB14) on its way from Orak to the Straits, torpedoed the British transports "Royal Edward" off Cos (Aug. 14), and "Southland" in the Aegean (Sept. 2). Other British transports sunk in the Aegean were the "Ramazan" (Sept. 19) and the "Marquette" (Oct. 26). Of the ships named only the "Southland" was brought into harbour.

More important work was done by the seagoing boat U21, Lt.-Comm. Otto Hensing. This left the Ems after special preparation for the long voyage, on April 25, and reached Cattaro with only half a ton of fuel left on May 13. After replenishing at that base, Hensing sailed on the 20th for the Dardanelles, where, on the 25th and 27th he sank the battleships "Triumph" and "Majestic." U21 then proceeded to Constantinople. On July 4 he came out and sank the French transport "Carthage" off Helles; later after a cruise in the Aegean he tried to reënter the Straits, but finding the British mine defences too formidable, he sailed to Cattaro to take part in the general commerce-destroying warfare in the Mediterranean. This was by now active, four other seagoing boats having followed U21 from the North Sea, and it is claimed that 50,000 tons of shipping were sunk in the Mediterranean and Aegean during Sept. 1915. At the end of that month the Germans had nearly one-third of their total available submarine force in this theatre—14 boats out of 44—of which 5 seagoing, 2 small and 1 mine-laying boats, were working in the open, and 3 small (UB7, 8, 14) and 2 mine-laying (UC13, 15) at Constantinople. In addition, the Austrian boats numbered about 11, large and small, and one of these torpedoed the French cruiser "Leon Gambetta" in Ionian waters on April 27.

Submarine activity in the open Mediterranean and Aegean had no small influence in determining the final abandonment of the Gallipoli enterprise and in preventing its resumption in the later stages of the war. But locally and tactically, no real success was obtained by the new arm after the departure of U21. Liman von Sanders expresses the opinion that the German submarines on the spot were of no assistance to him, and that the British boats, in spite of their frequent raiding of the Sea of Marmora, did not seriously interfere with his water movements.

A general attack was delivered on the Ottoman positions on the 5th, by which some little ground was gained along most of the front. Then on the 21st the French, who were on the right next to the Straits, pushed their line forward as the result of a well-planned local offensive, and this achievement was followed up on the 28th by a successful operation on the part of the British on the extreme left, by which the line at that end was advanced to nearly abreast of Krithia. Satisfactory as were the results of these two affairs at the end of the month from the point of view of the Allies, they did not render their situation at the extremity of the peninsula much less discouraging than it had been before. The front occupied by the invaders at the end of June was indeed for all practical purposes to represent the line that was to be held up to the night of Jan. 8 in the following year. The Turks still occupied all the high ground. They continued to enjoy all the topographical advantage in respect to position. Ottoman guns dominated the entire territory which the invaders had succeeded in the course of two months in conquering, as well as "V" and "W" beaches which were the landing-places chiefly used by them. This Turkish artillery was bearing upon Helles not merely from the uplands facing the Allies' front line, but also from the Asiatic side of the Dardanelles on the Allies' flank. At Anzac the situation remained stationary during June, although there was some sharp fighting at the end of the month.

Both sides, it should be mentioned, were suffering much from sickness, and continued to suffer all through the summer. The heat was great. Flies swarmed. The dust caused much annoyance whenever there was any wind. The British hospital arrangements were not beyond criticism. The water question caused no great difficulty at Helles, but the very limited local supply found within the contracted area occupied by Birdwood's force gave out almost entirely when the dry season set definitely in, and much of that which was brought by sea or condensed had to be conveyed up steep inclines to the trenches. As a result of disease, and of casualties in action and from bombardment, the British divisions recruited in the United Kingdom were constantly far short of establishment, no proper provision having been made for keeping them up to strength. The two Australasian and the two French divisions were better off in this respect; but the number of divisions under Sir I. Hamilton's orders—eight now that the 52nd had arrived—in reality gave a very misleading impression of the strength of the force; his Majesty's Government had, however, during the course of the month decided to dispatch large reinforcements to this theatre of war, and the Allied commander-in-chief had been cheered by the tidings that five further divisions, the 10th, 11th, 13th, 53rd and 54th, had been placed under orders for the Aegean, and would join him between July 10 and Aug. 10. The number of Turkish divisions within the peninsula and in reserve on the Asiatic side of the Straits had, however, grown, and by the end of June Liman von Sanders appears to have had nine under his orders.

July, in so far as the Allies were concerned, was in the main a month of preparation. In view of the anticipated arrival of substantial reinforcements from England there was no great temptation to embark on offensives; and owing to the shortage of artillery ammunition, what there was of it had to be jealously husbanded, although the French divisions were not suffering from this disability so much as the British. A general attack was, however, delivered by the Helles force on the 12th and 13th along the right half of its front, and some little ground was conquered; but the situation was not appreciably modified. Towards the end of the month the 13th Division, the first of the new divisions to arrive, disembarked in this southern area as a temporary measure, bringing welcome relief for the troops in the trenches. At Anzac July passed off quietly. There the rival forces were in close contact, the Turks everywhere enjoying the advantage of command; some sections of the Australasian line were, indeed, completely overlooked by ground in Ottoman occupation. Liman von Sanders was joined by reinforcements from other parts of the Empire early in the month, and the number of Turkish divisions in the peninsula swelled; but, aware that additional British troops were arriving, he felt obliged to

leave forces on the Asiatic side of the Dardanelles in case of a hostile landing on the coast to the S., and of the divisions on the peninsula he kept two about Gallipoli and Bulair.

How best to utilize the fresh troops joining him from England was anxiously considered by Sir I. Hamilton, and he framed his plans well in advance. The French had from the outset favoured operations on the further side of the Straits, and the expediency suggested itself of either throwing the whole Allied army in that direction, or else of diverting the reinforcements thither as a detached contingent. But there were valid objections to either course. A descent S. of the Straits connoted disembarkation in face of opposition, and, even supposing the landing to be successful, the force would start work much further from the Narrows than were either Helles or Anzac. Then again, to plant down a portion of the Allied troops on one side of the Straits, while continuing operations on the other side, would mean voluntary dispersion of resources in place of concentration. The commander-in-chief weighed the pros and cons and he decided against a combination of war on such lines. There were also not wanting inducements for the Allies to attempt a landing near Bulair, seeing that a victory at that point would carry with it the severance of the Turkish land communications with the peninsula. But, here again a disembarkation in face of opposition would have to be risked and a dispersion of resources would arise, while there were strong objections from the point of view of ship transport to conveying troops to a point so distant from the island of Imbros as Bulair; for Imbros was to be utilized as the principal concentration point for the reinforcements from England. That the Ottoman commander-in-chief had to be prepared for his opponent adopting one of these two plans offered a strong argument against adopting either of them.

Hamilton decided that his great effort should be made at, and immediately to the N. of, Anzac. The rugged bluffs on which Gen. Birdwood's force had taken root since April were spurs of a tangled mountain mass known as Sari Bair, from the topmost ridges of which the Straits about the Narrows were partially visible at a distance of 4 or 5 miles. The occupation of these topmost ridges must greatly assist in a further advance across the peninsula here at its narrowest point. The plan decided upon was secretly to augment the force already at Anzac by about a division and a half, and, with the force thus augmented, to secure possession of Sari Bair by a night-attack. But this was only part of the plan. It was also decided that a force of nearly two divisions should, on the same night as the attack on Sari Bair was launched, effect a landing at an entirely new point—Suvla Bay, a few miles N. of Anzac, where the Turkish troops were known to be few. The object of this second operation was twofold—it would indirectly assist the offensive against Sari Bair, it would also furnish the Allies who were planted down on the outer coast of the peninsula with a much more sheltered landing place and base than Anzac Cove. The 13th Division, with some other detachments from Helles and with one brigade of the 10th Division, were the troops chosen to augment Birdwood's force already at Anzac. The new venture further north was entrusted to the 11th Division, which was to assemble in the island of Imbros supported by the rest of the 10th Division; the portions of this latter division not detailed for Anzac were to concentrate partly at Mudros, and partly in a port of Mitylene more than 100 m. from Suvla. The last divisions to arrive, the 53rd and 54th, were to be employed wherever should seem best after the offensive had begun. To land the whole of the reinforcements simultaneously would not have been practicable with the amount of water transport available.

The utmost secrecy was observed by the Allied staff. Appropriate steps were taken to mislead the Ottoman authorities by means of feints and of reconnaissances executed at localities other than those selected for operations. False reports were assiduously circulated by the intelligence department. This part of Hamilton's programme was, indeed, carried out most successfully, for, although Liman von Sanders was aware of the arrival of large bodies of British troops in the islands, he remained entirely ignorant of his rival's real design until this was actu-

ally in execution. The Ottoman commander had organized his forces as a southern group watching Helles and a northern group watching Anzac, with the already mentioned two divisions at the Bulair end of the peninsula. There were large Turkish forces in reserve about Chanak, in addition to substantial contingents disposed to the S. of the outlet of the Straits ready for any move of the Allies in that quarter; but, thanks to a system of jetties erected on either shore at the upper end of the Narrows, and to improved communications, troops could be shifted from side to side of the waterway very rapidly. Numerically, the contending armies would at this very critical juncture of the campaign be almost equal, the invaders rather the stronger; but the Turks were much dispersed, so that the result almost hinged upon the speed with which the attacking side should gain ground before the defenders had time to concentrate.

The offensive started on Aug. 6 with two preliminary enterprises. An onset was made upon some of the Turkish trenches in the Helles area, which led to sharp fighting; the object was to prevent the Turks transferring troops northwards, and it probably served its purpose; apart from that, little was accomplished although the affray went on intermittently for a week. Portions of the Australasian force also broke out of the southern sections of the Anzac position, and were rewarded by the acquisition of some very valuable ground after a violent contest; the real purpose, however, was to occupy the attention of the enemy and to conceal a design of much greater moment.

So dexterously had the assembling of the reinforcements within Birdwood's position been effected, that the Turks had entirely failed to detect how the numbers of their opponents in this area had during the last few nights been nearly doubled. The scheme of operations for the capture of the Sari Bair mountain mass was that the force detailed for this enterprise should move out in several columns from the northern end of the Anzac position along the low ground near the shore, after dark on the evening of the 6th. On reaching their appointed stations the columns were to wheel to the right and were to work their way up certain steep but well-defined gullies that led towards the

topmost ridges, which, it was hoped, would be reached by daylight—a somewhat sanguine anticipation, as it turned out. All went well at the outset. The Turkish posts about the lower spurs were in some cases surprised. The outlets of the gullies were in the assailants' hands soon after midnight. The hostile detachments on guard gave way at all points. But the routes to be followed were difficult to find in the dark, the ascent was rapid, the ground was much broken, and the enemy opposed a stubborn resistance to the advance, with the result that this was greatly retarded, and that at daybreak the most forward of the columns was not much more than halfway up. The Ottoman staff had, moreover, on the first alarm begun to hurry reinforcements on the Sari Bair from the rear, while the Allied troops were so much exhausted by their nocturnal experiences that all attempts to win the upper ridge failed on the 7th.

A rearrangement of the attacking forces was carried out during the following night, and the attempt to gain the highest ground was resumed at dawn on the 8th from the positions that had been acquired 24 hours earlier. The Ottoman detachments on the mountain had by this time been reinforced by at least one division, and they were fully prepared to meet the onset when it came. One of the Allies' columns nevertheless succeeded in establishing itself on a patch of the topmost ridge and in holding on to what had been secured, although the efforts of the assailants miscarried elsewhere. After a fresh reorganization during the night an attempt was yet again made on the 9th to win the mountain, and that day some British and Indian troops actually fought their way on to a commanding summit from which the Narrows could be seen, only, however, speedily to be driven off again. The Turks holding the ridge were, moreover, constantly receiving reinforcements now that Sir I. Hamilton's plan was completely exposed, and so victory definitely decided itself in favour of the defenders early on the 10th. For these, by a sudden onset that morning, recovered possession of the patch of high ground which their antagonists had succeeded in wresting from them on the 8th and in holding ever since. Then, by a resolute if somewhat costly counter-attack delivered from the dominating position which they occupied, the Osmanlis thrust those opposed to them back down the slopes all along the line and could fairly claim to have gained the upper hand. Strenuous fighting thereupon ceased. Both sides had suffered very severely in the furious encounters that had been in progress since the evening of the 6th, and the troops were completely worn out by their efforts.

The attempt to secure Sari Bair thus failed, and the carefully devised scheme by which the invaders had hoped to establish themselves in a dominating position in the Anzac region at almost the narrowest portion of the Gallipoli Peninsula fell to the ground. It is true that as a result of the operations the area in occupation of the Allies in this quarter had been greatly extended in a northerly direction, so much so indeed that little difficulty was experienced by Gen. Birdwood in securing close contact with the contingents that had landed at Suvla on the night of the 6th-7th, and from which substantial support had been expected. As a matter of fact, the Suvla troops had afforded the Anzac columns no assistance at all beyond occupying the attention of one of the two Turkish divisions which Liman von Sanders set in motion south-westwards from about Gallipoli as soon as he had satisfied himself as to where danger lay, and the doings of this newly landed force had now to be recorded.

The plans for bringing the 11th Division and bulk of the 10th Division from the islands to Suvla and disembarking them had been elaborated with meticulous care by the naval and military staffs. As Turkish detachments watching this strip of coastline were known to number only about 2,000 men—the Ottoman authorities never contemplating a hostile landing in force in the locality—the design was to put most of the attacking troops ashore during the night of the 6th-7th as a surprise, and that they should then push on at once and master a range of hills 4 or 5 m. to the east. At Suvla Point the coast (which from there down to about Helles runs roughly N. and S.) turns abruptly to the N.E. to form one side of the Gulf of Saros; along this stretch of the shore a well-defined ridge, starting close to the headland, rises

almost like a wall from the sea and overlooks what may be called the Suvla area from the N., just as the above-mentioned range of hills overlook the area from the east. The area is mostly flat up to the foothills. Close to the bay there is a lake—a marsh in dry weather—which necessarily cramped the movements of troops landed at or near the bay. Army headquarters assumed that the plain, with the high ground to the E. and N., would be in British hands early on the 7th.

The 11th Division from Imbros was to disembark first, and was to be on the right in the subsequent advance. The 10th Division from Mudros and Mitylene was to follow it ashore, and, moving forward on the left, would secure the northerly ridge. Most of the 11th Division was to land just S. of the bay, but one brigade was to gain its footing inside the bay. The work was to begin as early as possible, allowing for the flotilla only quitting Imbros after dark. Especially constructed lighters, with motor power, were to play an important part in the disembarkations, a number of them having recently arrived from England. Elaborate arrangements had been made for water supply to the troops ashore, as the whereabouts and the capacity of wells were doubtful. The secret had been well kept, and a difficult operation of war was in its opening stages most successfully carried out.

The two divisions detailed for this Suvla enterprise both belonged to the British "New Army"; they were unconverted with active service conditions, having come straight out from England, and they were being highly tried in being called upon to execute a landing in force at night in face of opposition. There was, indeed, no precedent for an undertaking of this kind under modern tactical conditions. Nevertheless the whole of the infantry of the 11th Division was on shore before dawn, and its leading battalions had driven off the Turkish detachments met with in the immediate vicinity of the points of disembarkation. The only hitch that had occurred during the night-time had been at the landing-place within the bay, where the water had proved to be inconveniently shallow for the lighters; this had created some confusion and delay. But the urgent need of pressing forward at once was not realized by the attacking side, and the opposition offered by the parties of Osmanlis close to the bay was taken too seriously after daylight. Moreover, when the first portion of the 10th Division arrived from Mitylene soon after dawn, it was decided to put these troops ashore to the S. of the bay, instead of inside the bay as had been intended; so that they found themselves, to start with, on the right of the 11th Division and not on its left, the general line of contemplated advance being to the N. of the lake. They were unfortunately moved from right to left, and this took many hours.

During the forenoon a good landing-place was found inside the bay on its northern side, and the contingent of the 10th Division from Mudros disembarked at this point. But no veritable advance in force took place until comparatively late in the afternoon, and by evening the attacking side, although enjoying a great numerical superiority, had only reached the foot of the hills that lay to the E. of the landing-places and captured one advanced spur. The troops had during the latter part of the day suffered greatly from thirst, the arrangements with regard to water having practically broken down mainly owing to the inexperience of the troops themselves.

When Liman von Sanders (who had fixed his headquarters near Gallipoli) learned during the night of the 6th-7th that the Allies were landing in strong force about Suvla, and were also attacking Sari Bair from Anzac, and after he had satisfied himself that certain threats on the part of his opponents at other points might be regarded as mere feints, he ordered the two Turkish divisions under his immediate orders to proceed towards Suvla with all speed. This, however, meant a two days' march along indifferent roads. The only Ottoman detachments which during the 7th and 8th confronted the two British divisions that had made a descent on this locality were those which had been on guard on the spot when the landing was taking place. Consequently there was still on the 8th a great opening left for the attacking side to complete the first part of its programme, *i.e.* to

gain possession of the heights to the E. of Suvla, which dominated the landing-places and the whole of the area in their immediate vicinity that had been occupied on the 7th. The very few Ottoman guns which had been causing the freshly disembarked troops a good deal of annoyance during the 7th had been withdrawn for fear of capture, the defenders fully expecting a forward move by the Allies. But no move forward took place. The opportunity was allowed to slip by. The Turks remained in possession of the high ground, and that night reinforcements began to join them from the N.E., the troops as they came up being rushed into position in view of impending attack.

That attack was at last delivered early next morning. It failed completely. Enjoying the benefits of occupying a commanding line, the defenders were also being reinforced during the progress of the combat. Although sustained by a fair number of guns and with the moral support of the 53rd Division, which had disembarked during the night, the 10th and 11th Divisions could make no headway. The deliberation of the Allies on the 7th and 8th, when the forces opposed to them were insignificant, had been fatal. The great numerical superiority which they had at first possessed was gone by the 9th, and their task had come to be the ejection of an almost equal enemy from a naturally formidable position. That day was also the last on which any hope remained of the Sari Bair offensive accomplishing its purpose, and on which help from Suvla might conceivably even at the eleventh hour have turned the scale. The defeat suffered by the Suvla troops on the 9th was in reality decisive in so far as the new area was concerned; but, even so, the invaders who had set foot there tried yet again on the 10th to wrest the heights in front of them out of Osmanli keeping. The effort, however, failed, and further offensives in this quarter were abandoned for the moment.

The situation on the 11th offered little encouragement to the invaders. The carefully devised scheme of operations from which they had expected so much had come to naught in its most important features. A footing had no doubt been gained at Suvla, giving the Allies control of a fairly well-sheltered inlet on the outer coast of the peninsula; but as the high ground within easy artillery range of the landing-places, and which overlooked the whole occupied area, remained in the hands of the Turks, much of the benefit hoped for from the acquisition was in reality neutralized. As had been the case at Helles and at Anzac ever since the first opening of land operations in April, only a restricted patch of Ottoman territory had been obtained by the new undertaking, and although the position at Anzac had been extended and improved it remained an extremely bad one. The Allies now occupied many miles of front in the peninsula, but there was hardly a spot where the enemy had not the upper hand in respect to ground—what they required was not breadth but depth, and depth they had failed to secure. They had moreover incurred very heavy losses in the combats of, and since, Aug. 6. There were yawning gaps in their ranks. Except a division from Egypt, coming to fight on foot, no reinforcements were on the way, and the last of the five divisions from England, the 54th, had been swallowed up at Suvla. The defending side had also, no doubt, suffered heavily in casualties, especially on Sari Bair; but the Turkish commander-in-chief could fairly claim that, if some ground had been lost, he had held his own in a contest in which his adversary had enjoyed some notable advantages at the start.

An effort was made on the 15th by the troops on the extreme left of the Allies' position at Suvla to gain ground along the ridge N. of the plain; but nothing came of it. Sir I. Hamilton, however, still entertained hopes of effecting some improvement in his position in this area. The mounted division, and also a division from Helles, were quietly concentrated there, and on the 21st a determined attempt was made to capture some of the high ground which had baffled the essays of the invaders on the 9th and 10th. Large forces were engaged on either side in this battle, and the attack was prepared for by a comparatively speaking heavy bombardment of the Ottoman trenches; in this battleships and cruisers moored in Suvla Bay, in security from submarines, participated. But after a sanguinary contest the assailants met with repulse, and from that date onwards no serious offensive

operation was attempted by the Allies in the Dardanelles campaign. Those conditions of virtual stalemate which had prevailed before the arrival of the five new divisions from England set in afresh, and they continued to the end.

Even before this final reverse, Sir I. Hamilton had cabled home asking for reinforcements and for very large drafts that were needed to bring the depleted units under his command up to their war establishment. The total figure he asked for amounted to 95,000 men, his calculation being based upon the strength of the opposing army, as this was fairly accurately known. He had, however, been informed that no large bodies of fresh troops could be spared for the Dardanelles theatre of war. A temporary change of plan did occur a few days later, owing to the French Government proposing to despatch four divisions to the Aegean with the idea of their operating on the Asiatic side of the Straits; under the circumstances the British Government was also prepared to send fresh divisions to Sir I. Hamilton. But early in Sept. these projects were finally dropped both in Paris and in London, owing very largely to the threatening aspect of affairs that was arising in the Balkans.

The campaign by which the Central Powers and Bulgaria crushed Serbia for the time being, and by their triumph opened communications through Bulgaria with the Ottoman Empire, profoundly influenced the situation in the Gallipoli Peninsula. Not only was all idea of reinforcing the Allied army that was planted down in this region abandoned by the western Governments, but even some of the troops under Sir I. Hamilton's orders were transferred to Salonika. Moreover, the linking up of Turkey with the Central Powers by railway ensured that Liman von Sanders would in due course be furnished with ample munitions of all kinds, and this must make the prospect of Entente forces gaining possession of the Straits remoter than ever.

As early as the middle of Sept. the French Government had come to the conclusion that there was now no hope of victory in the Dardanelles theatre of war. The British Government, on the other hand, influenced to a great extent by anxiety as regards prestige in the East, could not arrive at a decision as to giving up the project. After two or three weeks Sir I. Hamilton was, however, invited to give his views concerning the question of evacuating the peninsula and abandoning the enterprise against the Straits. On the commander-in-chief pronouncing himself as emphatically opposed to such a step, Sir C. Monro was sent out from England to take his place. Impressed by the unsatisfactory positions in which the Allied troops found themselves on the peninsula, by the impossibility of their making any progress at their existing strength, and by the risks that the army ran in remaining on such shores without any safe harbour to depend upon for base in stormy weather, Monro, after examining the situation on the spot in the closing days of Oct., declared unhesitatingly for a complete withdrawal. The British Cabinet thereupon despatched Lord Kitchener to the Aegean to investigate and to report. He had viewed proposals to abandon the campaign with alarm; but after visiting the peninsula he realized that evacuation was the only justifiable course, and he reported to that effect. All this time winter was drawing nearer and nearer and the need for a prompt decision was becoming more urgent, but the authorities in London lost another fortnight before, on Dec. 8, they at last sent instructions to Monro to evacuate Suvla and Anzac while retaining a grip on Helles.

Sept., Oct. and Nov. had been months of stagnation for the armies that confronted each other on the peninsula, as was, indeed, almost inevitable under the strategical conditions which had come about. The Ottoman higher command was well content that the troops under its charge should maintain an attitude of passive defence; they were keeping Allied divisions in idleness which, were they to be transferred to some other one of the theatres of war, might prove invaluable assets to the cause of the Entente. Well concealed in skilfully constructed entrenchments that were excavated on terrain overlooking the invader's lines, the Turkish contingents holding the different fronts could fairly calculate upon beating off any hostile attack unless their adversaries should be heavily reinforced. The defenders could in

fact afford to remain quiescent. The Allies, on the other hand, were practically compelled to remain quiescent. The general situation offered them no inducements to embark on fresh offensives. The great Aug. effort, which had been made when they were enjoying the advantages derived from concentration as opposed to dispersion, and when they were in the position to take the Turks unawares, had miscarried. It would have been folly after that experience to risk defeat and perhaps disaster in assailing formidable positions, effectively held and assiduously fortified. The Allies had in Aug. been rather superior in numbers to their opponents. But during the autumn Liman von Sanders was reinforced by several divisions, and at the juncture when Gen. Monro arrived and recommended evacuation of the peninsula, the Ottoman host gathered about the Dardanelles was already decidedly stronger in point of numbers than was the army which was clinging to patches of littoral without a sheltered base.

If there had been no fighting during these autumn months worthy of mention, much creditable work had been carried out by the invaders in respect to developing communications and to improving jetties and landing-places, especially at Suvla. One British and one French division were moved from the peninsula to Salonika early in Oct., but an additional Australian division had arrived a few weeks earlier. In spite of the discouraging conditions in which they found themselves, and of the constant annoyance suffered from hostile artillery fire, the troops were in fair heart, while the tactical efficiency of the recently created divisions, which had not been of a high standard when they arrived in the theatre of war, had appreciably progressed. The proportion of sick had been high during the summer-time, but it decreased somewhat after Sept. On the other hand a very severe blizzard, lasting two days, swept the whole region towards the end of Nov. and caused havoc amongst the divisions in the Suvla area, which was particularly exposed to the elements; this visitation augmented the numbers in hospital by several thousands. The tempestuous weather, moreover, created serious damage at most of the landing-places, where solidly constructed jetties were in some instances completely demolished by the seas. The Allied forces had been organized as three distinct groups. That at Helles (which included the French contingent, still as at the outset on the right) was under the charge of Gen. Davies. That at Anzac, composed mainly of troops from the Antipodes, remained under Gen. Birdwood. That at Suvla was commanded by Gen. Byng. But as Gen. Monro found himself responsible for the British troops at Salonika as well as for the Allied army of the Dardanelles, he placed the latter under charge of Gen. Birdwood, while Gen. Godley relieved Birdwood at Anzac.

Like their adversaries, the Turks had suffered much from disease during the summer. But as their numbers grew in the autumn, and as their headquarters staff noted how the invaders were dwindling away owing to transfers to Salonika and to no drafts arriving to replenish wastage, it became possible to keep a number of the Ottoman divisions in reserve, well in rear of the fighting fronts or else on the Asiatic side of the Dardanelles. This also permitted of the troops in the trenches being relieved and rested at frequent intervals. The defending side, in fact, came to be in a much more favourable position than was the attacking side in respect to diminishing the strain that is always experienced by fighting personnel when in close contact with an enemy even during periods of virtual inactivity. The Sultan's forces guarding the Straits were not yet at the end of Nov. deriving much benefit from the strategical transformation which had taken place in the Balkans consequent upon communications being opened between Thrace and the Central Powers; but there was every prospect of heavy artillery and munitions shortly beginning to find their way through from Germany and Austria-Hungary to the Dardanelles.

Foreseeing that the British Government must ultimately resign itself to a withdrawal of the Dardanelles army from its dangerous situation on the Gallipoli Peninsula, Monro had already, some days before the permission to evacuate reached him from home, given instructions that certain preparations were to be made towards facilitating that operation. That a retirement

of this kind was a hazardous undertaking was realized from the outset. There was no precedent for large military forces, in close contact with a formidable enemy, embarking within easy artillery range of positions in the hands of the opposing side, and the most sanguine amongst high military authorities in the councils of the Entente feared that a withdrawal could not be carried out without incurring heavy losses. The responsible authorities on the spot perceived that the process of gradually removing the huge accumulations of impedimenta that were massed about the landing-places and of reembarking the troops must take place during the dark hours and step by step, every effort being made to keep the Turks unaware of what was in progress. Sickly men and some stores and animals had been got away before Dec. 8, which lightened the task in prospect. The tactical principle on which withdrawal would be carried out when the time came had been fully considered. The naval authorities had been busy assembling and organizing the available small craft in anticipation of the operation that appeared to be imminent, and jetties damaged in the Nov. gales were being repaired. It should be noted that the matter in hand was, from the point of view of water transport, somewhat facilitated by the British Government's determination to hold on to Helles for the present, as nearly all the lighters, boats, etc., in naval charge could consequently be gathered at Anzac and Suvla.

Birdwood decided, in consultation with Godley and Byng, that the front trenches should be held up to the very last moment on the night of final evacuation, the troops manning them then hastening to the beaches, everything removable, whether animate or inanimate, having already left. There was to be no taking up of successive positions in accordance with the normal practice of rearguard actions. At a given moment the trenches, which at many points were but a few yards from those occupied by the Turks, would be vacated by detachments, which by that hour would have shrunk to mere handfuls of men. Scarcely a shot had since the beginning of Dec. been fired after dark by the British, Australasian and Indian troops, who were holding the long line stretching from the Gulf of Saros to near Gaba Tepe, so as to accustom the foe to quietude during the night watches. The last parties of the Anzac force were to ship at Anzac Cove but for a detachment on the extreme left, which would embark with the Suvla troops. The Suvla area was divided into two sections, the troops in the right (or southern) section retiring S. of the lake and taking to the boats on the southern side of the bay, the other section retiring N. of the lake and embarking on its northern side. The final night was provisionally fixed as that of the 18th-19th, and thanks to favourable weather and to the efficiency of the arrangements, the very critical operation was carried out with triumphant success, just as had been laid down by programme ten days before.

Night after night during the intervening ten days the landing places at Anzac and Suvla were scenes of unceasing activity. Masses of war material and food supplies were in the first instance removed, then most of the animals were got away, lastly portions of the troops began to embark and to proceed to Imbros or Mudros. During the daytime reliefs took place as usual, pretences were made of disembarking animals and stores at the jetties, and the result was that the Turks remained in complete ignorance as to what was going on close to their lines. Large bodies of infantry with a fair proportion of guns still remained on shore on the 17th, but of these roughly half—about 10,000 men and a number of guns in each area—were removed that night, so that on the 18th only a meagre force, composed almost wholly of infantry and disposed almost entirely in the trenches, was holding a long front face to face with a numerically far stronger enemy. But, fortunately for the Allies, their dispositions had been so skilful that the Ottoman staff had not ascertained that the Anzac and Suvla areas had been almost vacated. The critical day passed without incident.

The hour fixed for finally quitting the front trenches in the Suvla area, and the adjacent northern portions of the Anzac area, was 1:15 A.M. on the 19th. Owing to their vicinity to the cove the rest of the Anzac trenches were, however, to be held till a

later hour. At nightfall the very few guns still to go were hurried off to the jetties. Then the troops along the front were quietly withdrawn in successive groups, the fine weather continuing to the end and work at the beaches proceeding without a hitch. Finally the parties still in the trenches slipped away, and when dawn broke the Turks, who had first ascertained that something unusual was afoot from the explosion of a vast mine in the Anzac area, and from conflagrations on the beaches where the few stores to be abandoned were being destroyed, discovered that the invaders were gone. Twenty-four hours later the long spell of calm, a godsend to Godley and Byng, came to an end.

Practically nothing worth mentioning had been left behind at Suvla. At Anzac, where conditions favoured the retreating troops less, it had been necessary to destroy some valuable war material at the last moment, and a few worn-out guns had purposely been abandoned. The casualties in the two areas on the final night had amounted to two. The relaxing by the Allies of their frail hold upon the outer coastline of the Gallipoli Peninsula had been effected more successfully than the most sanguine amongst them had permitted themselves to hope for. Yet, for a week subsequent to their receiving the glad tidings from the Aegean, the British Government remained irresolute with regard to the policy to be pursued at Helles. Then, on Dec. 28, Monro received the expected sanction for evacuating that area also, and Birdwood promptly grappled with this fresh problem.

Taken unawares and signally out-maneuvred at Anzac and Suvla, Liman von Sanders perceived that his antagonists would probably retire from Helles also, and he took measures accordingly. He had at this time 21 divisions at his disposal, while there were only four British divisions to oppose them at Helles (the last French division left for Salonika during Dec.). The Turks, therefore, now possessed a huge numerical preponderance in the theatre of war. They moreover enjoyed an even more marked superiority in respect to artillery, and this the Ottoman commander-in-chief hastened to turn to account; the heavier guns which had been sweeping the Anzac and Suvla areas for months past were promptly transferred to the high ground overlooking the extremity of the peninsula or to positions on the Asiatic side of the Straits from which the extremity of the peninsula could be effectively taken in flank.

The same principles as those which had been so successfully applied during the evacuation of the northern areas, were put in force at Helles. The work of removing stores, war material, animals and personnel was to be carried out on successive nights, the fighting force ashore was to be gradually reduced, the front line of trenches was to be held up till the very last—the final night being fixed provisionally for the 8th–9th—and the detachments vacating it were to hurry straight off to the beaches. So as to deceive the enemy, bombing and rifle fire were to be practised nightly up till 11:30 P.M., after which all activity was to cease. Two possible eventualities had especially to be feared—the sea might get up, or a heavy bombardment of the beaches might be instituted by the Turks while the final evacuation was in progress. As the staff fully foresaw, the enemy would exert greater vigilance than had been the case while the withdrawals had been in progress from the northern areas, these having given the Ottoman authorities warning of what was likely to happen. It ought also to be mentioned that there was a greater accumulation of impedimenta at Helles than there had been at either Anzac or Suvla, so that even if the weather were to remain favourable, it was certain that material of great value would have to be destroyed to prevent its falling into the enemy's hands.

Embarkation operations were carried on almost entirely at "V" and "W" beaches, at both of which there were provisional breakwaters in existence furnishing some shelter when there was an onshore breeze. The weather, as it turned out, was none too favourable on several of the preliminary nights, but, owing to its direction, the wind did not greatly retard the work of removal. The enemy's guns gave a good deal of trouble at the beaches, and caused many casualties. Although steps were taken to conceal what was in progress, the Turkish staff were aware that preparations for evacuation were in full vigour; but they could

not foresee the date on which the final fitting would take place, nor could they make sure how far the number of combatants within the British lines had been reduced. With the object apparently of ascertaining the strength of their opponents, the Ottoman forces on the afternoon of Jan. 7 delivered a half-hearted attack upon the left of the British position, following on a violent bombardment; but the assailants were driven off with little difficulty. Nor would they seem to have discovered how weakly held the trenches were; for a considerable proportion of both infantry and artillery had been withdrawn by that date, as only two more nights remained according to the programme. That night the troops still left at Helles were reduced by one-third, and, on the next day breaking fine, it was decided to complete the operation on the following night as intended at the start.

The right half of the British were to withdraw by "V" beach and the left half by "W" beach, except that the final detachments on the extreme left, representing the 13th Division, were to be got off at Gully beach. A large number of guns had been retained ashore in view of the danger of a determined attack by the Turks on the 8th, when the lines were thinly held; it had been decided to abandon several of these, worn-out ordnance being earmarked for the purpose. The artillery still remaining to be embarked was for the most part got afloat during the early hours of darkness, and the infantry followed; but the wind soon began to rise ominously, blowing home from W. and S.W., and as the hours passed the situation at the beaches became disquieting. The last detachments to quit the trenches moved off simultaneously all along the front at 11:45 P.M., without the enemy noticing their departure, and they were embarked successfully at "V" and "W" beaches according to schedule in spite of the heavy seas. But the detachments designated for Gully beach could not all be got off at the exposed point, and those left over had to march on to "W" beach at the last moment and were not afloat till nearly 4 A.M., their embarkation being effected with great difficulty owing to the surf. Just before the last boats sheered off the masses of stores which it had been necessary to abandon were set on fire, and only from the glare set up by this conflagration were the Turks made aware that their opponents had evaded them yet again.

Although the evacuation of Helles without appreciable loss in personnel reflected great credit on the British staff and the troops concerned in it, as also on the Royal Navy, whose work at the beaches was carried out under great difficulties, the escape of the final remnants of the Dardanelles army from the Gallipoli Peninsula was facilitated by the negligence of the troops opposed to them. Had the Turks kept befitting guard on the night of the 8th–9th, aware as they were that their antagonists contemplated departure, they must have detected that the British trenches had been vacated. Effectual pursuit might not have been practicable; but the guns could have been turned on to the beaches, of which the range was exactly known, and embarkation, impeded as it was by the rough water, could hardly have been carried out without many casualties.

After a few days taken up in collecting the troops from Helles in their different divisions at Lemnos, what was left of the Dardanelles army was shipped to Egypt, whither most of the forces from Anzac and Suvla had already proceeded. The total loss of the Allies' military forces in the eight months' contest mounted up to 130,000 killed, wounded and missing.

Most authorities on the art of war agree that the collapse of the Entente in this memorable campaign was primarily due to the abortive naval effort to force the Dardanelles. By embarking on that venture the fleet gave the Turks sufficient warning of what was in store to ensure that, on the date on which Sir I. Hamilton's army was ready to land, the defenders should be in a position to bring it to a standstill. The only chance of the invaders achieving their object after the first week of land fighting depended on their being joined by very substantial additional forces in a region where a belligerent fighting on the defensive in home territory, as the Osmanlis were, enjoyed marked strategical and tactical advantages. But neither the British nor the French could afford to divert great military resources from the main theatre

of war in western Europe to the Aegean, and so the struggle for the Straits ended in mortifying discomfiture for the Allies.

(C. E. C.)

DARLING, SIR CHARLES JOHN (1849—), English judge, was born at Colchester Dec. 6 1849. He was educated privately, and in 1874 was called to the bar. He became a Q.C. in 1885, in 1888 successfully contested Deptford in the Conservative interest, and in 1892 became a bencher of the Inner Temple. He was raised to the bench and knighted in 1897. He has published some volumes of light verse, including *Scintillae Juris* (1877). In 1917 he was made a Privy Councillor.

DARTMOUTH COLLEGE, Hanover, N.H., U.S.A. (see 7.838), in the period between 1908 and 1921 experienced a great expansion in its plant, endowment and enrolment. Its educational plant in the latter year included 21 buildings devoted to lecture and recitation rooms, laboratories, and administration and similar purposes.

Of these, the extensive alumni gymnasium was erected in 1910, to which was added the Spaulding swimming pool in 1920; the Parkhurst administration building was erected in 1910; Robinson Hall, the home of all undergraduate organizations except athletic, in 1914; and a large chemical laboratory in 1920-1. The plant also included 18 dormitories, of which five were added after 1908, the latest in 1920, capable in all of housing 1,100 students. The value of the plant was over \$2,000,000.

In addition to the educational plant the college had 20 single or apartment houses for the use of its faculty. Its productive investment assets nearly doubled in the 12-year period, approximating \$5,500,000. In 1920-1 it had 150 officers of administration and instruction, and there were 1,875 enrolled students, of whom 54 were in post-graduate courses. The tuition fee was \$250 a year. The constituency of the college, formerly mainly in New England, extended to the whole country. In 1910 62% of the freshmen came from New England. One of the effective influences leading to expansion was the Outing Club, the first college club of its kind, which was open to both faculty and students and had as its object the stimulation of healthful outdoor activities. It owned a chain of seven cabins, extending over 75 m. from Hanover to the White mountains and equipped for the accommodation of its members on their excursions into the country and among the mountains. Its winter activities culminated in a carnival of sports.

Like other American colleges, Dartmouth was greatly affected by the World War. Even before the entrance of the United States, many of its students had joined the Allied armies or served in the ambulance corps in France, and in Feb. 1916 a battalion of 218 men in two companies was formed for military drill. In March 1917, the great majority of the students was enrolled for military training, and in the following fall military training was required of the freshmen. After the United States entered the war, the college became practically a camp, for all able-bodied students between 18 and 21 years of age were inducted into the Students' Army Training Corps and trained under military regulations, and those under 18 were enrolled in the corps, although remaining under college authority. There were also vocational sections of about 350 men who came to the college from outside for instruction in carpentry, cement work, truck driving and repairing, and radio work. All military training came to an end in Dec. following the Armistice, and the college reverted to its former status. In consequence of the war the enrolment fell from more than 1,500 to 761, of whom only 110 were not under military training. Many members of the faculty engaged in war service in the United States or in France, either under the Government or in the organizations supplementary to the military. The total number of undergraduates (from the six classes 1917 to 1922) who entered the war or served in the S.A.T.C. was 1,817 and of the faculty 73. The total number of Dartmouth men, graduates, undergraduates, and faculty, who served in the army, navy or marine corps was 2,603, in the auxiliary service 752.

(E. M. Ho.)

DARWIN, SIR GEORGE HOWARD (1845-1912), English astronomer, was born at Down, Kent, July 9 1845. The second son of Charles Darwin (see 7.840), he was second wrangler and Smith's prizeman at Cambridge, and was elected to the professorship of astronomy and experimental philosophy at his university in 1883. His principal work was on the subject of tides, on which he became the leading authority, and on other physical questions connected with the relation of the earth and moon; the article *Tide* in the *E.B.* (see 26.038 et seq.) represented his matured researches on his special subject. He was made K.C.B. in 1905 and died at Cambridge Dec. 7 1912.

DATO, EDUARDO (1856-1921), Spanish politician, was born at Corunna Aug. 12 1856. He graduated in law at the univer-

sity of Madrid and was elected a deputy in 1884. An under-secretary for the Home Department in 1892, he became minister for the department in 1899, and distinguished himself in the study of social legislation, the fruits of which were special bills regarding accidents, insurance, and women's labour. In Dec. 1902 he became Minister of Justice, in 1907 mayor of Madrid, then president of the Chamber. He was elected a member of the Royal Academy of Social and Moral Sciences, June 20 1905. When in 1913 Señor Maura refused to take power except on conditions unacceptable to the King, Señor Dato, thinking that the Conservative party could not refuse to serve the Crown at a difficult moment, dissented from his chief, carrying with him the majority of his party, which elected him as its leader. He was still in office (1913-5) when the World War broke out, and was responsible for Spain's declaration of neutrality. He adhered firmly to that policy. Becoming prime minister again in 1917, he faced the great crisis of that summer. In 1920 he resumed office, and it was while prime minister that he was murdered in Madrid March 8 1921. Señor Dato had great social charm, persuasive talent and an unswerving will under flexible appearances.

DAUDET, LÉON (1867—), French writer, son of Alphonse Daudet (see 7.848), was born in Paris Nov. 16 1867. He was educated at the lycée Louis le Grand, and afterwards studied medicine, a profession which he abandoned in 1894 for that of literature. He wrote many short stories and novels, and has also contributed to the *Figaro*, *Gaulois* and *Libre Parole*. He is an ardent royalist in politics, and was one of the group which in 1908 founded the royalist organ *L'Action Française*. He published in 1898 a Life of his father, and among his other works may be mentioned *Les Morticoles* (1894); *Les Deux Étreintes* (1901); *La Déchance* (1904); *Les Primaires* (1906); *La Lutte* (1907) and *L'Avant Guerre* (1913). He produced various essays on the World War, and his latest novels include *La Vermine du Monde* (1916); *Le Bonheur d'être Riche* (1917); *Le Cœur et l'Absence* (1917) and *Dans la Lumière* (1919).

See R. Guillou, *Léon Daudet* (1918).

DAUMET, PIERRE JEROME HONORÉ (1826-1911), French architect, was born in Paris Oct. 23 1826. He entered the École des Beaux-Arts in 1845, and was awarded the Grand Prix de Rome in 1855. In 1861 he was attached to the important exploratory expedition and mission in Macedonia, and was commissioned to draw up the report. In the following year he was appointed inspector of works for the then recently created Préfecture of Police, and was later acting architect to the Palais de Justice, succeeding in 1876 Viollet-le-Duc as architect-in-chief. This fine building may be regarded as one of the great and lasting monuments of his career. During the next few years Daumet's talents and artistic equipment, especially in matters of archaeological interest and research, received recognition from the French Government in his appointment to many official positions, culminating in his vice-presidency of the Commission des Monuments Historiques. His brother-artists distinguished him by electing him vice-president of the Société des Artistes Français, and president of the Société des Architectes Français. In 1885 he was elected a member of the Académie des Beaux-Arts, and in the following year an hon. corresponding member of the Royal Institute of British Architects, who further awarded him their gold medal in 1908. One of the highest expressions of his genius was his restoration of Chantilly in close collaboration with the Duc d'Aumale, who later (in 1897) bequeathed it to the French nation, as represented by the Institut de France. Among Daumet's many architectural works may be noted the following:— The Palais des Facultés and the Palais de Justice at Grenoble, the Ecce Homo chapel at Jerusalem, the pension and chapel of the Dames de Sion in Paris and Tunis, his early work at the Asile des Aliénés of Ste. Anne, and the Palais de Justice, Paris, already mentioned. His literary work, besides his important account of the archaeological mission to Macedonia, includes a book on the Château de St. Germain and its restoration for which he was responsible. His

services to the educational side of his art were considerable. His *atelier* produced no less than nine holders of the Grand Prix de Rome—a notable record. He died Dec. 13 1911.

DAVIDS, THOMAS WILLIAM RHYS (1843–), British orientalist, was born at Colchester May 12 1843. Educated at a school in Brighton and at Breslau University he entered the Ceylon civil service in 1866 and also read for the bar, becoming a barrister of the Middle Temple in 1877. He became a close student of Buddhism and of the literatures of India, and in 1882 was appointed professor of Pali and Buddhist literature at University College, London. In 1904 he became professor of comparative religion at the university of Manchester. Amongst his numerous publications are *Buddhism* (1878, 18th ed. 1899); *Ancient Coins and Measures of Ceylon* (1877); *Buddhist India* (1902); *Early Buddhism* (1908); and the articles on *Buddha*, *Buddhism*, *Pali*, *Lamaism*, etc. in the *E.B.* He became president of the Pali Text Society, which he founded in 1882, and a fellow of the British Academy. He married in 1894 Caroline Augusta Foley, herself the author of *Buddhist Psychology* (1900), *Psalms of the First Buddhist* (1910) and other works.

DAVIDSON, RANDALL THOMAS (1848–), Archbishop of Canterbury (see 7.863), in 1920 brought forward in the House of Lords a motion opposing Lord Birkenhead's Divorce bill, which was lost by one vote. The same year he presided over the sixth Lambeth conference.

DAVIES, HENRY WALFORD (1860–), English organist and composer, was born at Oswestry, Salop, Sept. 6 1860. After a preliminary private education he became a chorister at St. George's chapel, Windsor, in 1882, and three years later assistant organist to Sir Walter Parratt there. From 1890 to 1894 he was a pupil and scholar at the Royal College of Music, where in 1895 he became a teacher of counterpoint. There he came first into some prominence as composer with his cantata *Hervé Riel* (1894), but meanwhile he was making his way as organist. After filling several posts he was in 1898 appointed organist to the Temple church, a post he still holds (1921). During the years 1903 to 1907 he was conductor to the London Bach Choir in succession to Stanford, and in 1919 he was appointed professor of music in the University College of Wales, at Aberystwith. For a great part of the World War, with the rank of major, he worked with great success for the right organization of music among the troops both abroad and at home, and in 1918 he was made director of music to the R.A.F.

Walford Davies has written much music in many forms. In his list are two symphonies: *A Solemn Melody*, which attained to a wide popularity, and, for chorus and orchestra, *Everyman* (1904); *Ode on Time* (1908); *The Sayings of Jesus* (1911); *Dante Fantasy* (1914), these having been produced chiefly at provincial festivals; *Heaven's Gate* (People's Palace, 1917). A new choral work was in the programme of the Hereford festival for Sept. 1921. In addition there are seven quartets for various combinations of piano and strings, or strings alone; six violin sonatas and several works for voices and strings, part-songs, choruses, and hymn tunes.

DAVIES, HUBERT HENRY (1876–1917), English playwright, was born in Cheshire March 17 1876. After some years of journalism in San Francisco, where he also produced a few vaudevilles, he returned to England and made a success at the Haymarket theatre in 1903 with *Cousin Kate* and a greater success at Wyndham's theatre with *Mrs. Goring's Necklace*. Among his other comedies were *The Mollusc* (1907), and *Doormats* (1912). He produced *The Outcast* (1914). After overworking himself in France as a hospital orderly during the earlier portion of the World War, he had a break-down in health, and he was found dead at Robin Hood's Bay, Yorks., Aug. 17 1917.

DAVIES, JOHN LLEWELYN (1826–1916), English divine and educationalist, was born at Chichester Feb. 26 1826. He was educated at Repton and Trinity College, Cambridge, where he was bracketed as fifth classic in 1848, and was elected to a fellowship at Trinity in 1851. He was ordained in 1850 and held successively several London livings. He was made chaplain to the Queen in 1876, and in 1889 became vicar of Kirkby Lonsdale, Westmoreland, where he remained till 1908. Davies was

an intimate friend of John Frederick Denison Maurice (see 17.910), and was associated with him in the foundation of the Working Men's College (1854), where he taught for many years. He was elected to the first London school board in succession to Huxley, and in 1873 became principal of Queen's College, Harley St., which had been founded by Maurice in 1848 for the advancement of women's education. He held this post until 1874, and was again principal from 1878 to 1886. Davies died at Hampstead May 17 1916. He was part author of Davies and Vaughan's well-known translation of Plato's *Republic*.

DAVIES, SARAH EMILY (1830–1921), British educationalist, was born at Southampton April 22 1830. She was educated at home, and later identified herself with the movement for the higher education of women, being also one of a group of women who about 1858 were discussing the question of women's suffrage at the Kensington Society. In 1862 she became secretary to the committee which was formed for the purpose of procuring the admission of women to university examinations, and from 1870 to 1873 was a member of the London school board. In 1873 she was elected a life governor of University College, London, and in 1882 became secretary of Girton College, Cambridge, retiring in 1904. She published *The Higher Education of Women* (1866) and *Thoughts on some Questions relating to Women* (1860–1908, 1910). She died in London July 13 1921.

DAVIES, WILLIAM HENRY (1870–), British poet, was born at Newport, Monm., April 20 1870. He was apprenticed to a picture-frame maker, but when his apprentice days were over he tramped through America, crossed the Atlantic many times on cattle boats, became a pedlar and street singer in England, and after eight years of this life published his first volume of poems, *The Soul's Destroyer*, from the Marshalsea prison. Next year appeared in prose *The Autobiography of a Super-Tramp* (1908) with a preface by G. Bernard Shaw, as well as *Nature Poems and Others*. A collected edition of his poems appeared in 1916, and *Forty New Poems* in 1918. He also published a novel, *A Weak Woman* (1911), and volumes of nature studies and essays, including *A Poet's Pilgrimage* (1918).

DAVIS, HENRY WILLIAM BANKS (1833–1914), English painter (see 7.866), died at Glaslyn, Radnorshire, Dec. 1 1914.

DAVIS, RICHARD HARDING (1864–1916), American writer, was born in Philadelphia April 18 1864. He studied at Lehigh University and Johns Hopkins, and in 1886 became a reporter on the *Philadelphia Record*. After working on several papers he served as managing editor of *Harper's Weekly*. He became widely known as a war correspondent, reporting every war from the Greco-Turkish War (1897) to the World War. Of his numerous works of fiction, the earliest are his best, especially *Gallegher and Others* (1891); *Van Bibber and Other Stories* (1892) and *Episodes from Van Bibber's Life* (1899). His other books include: *Soldiers of Fortune* (1897); *Captain Macklin* (1902); *Vera the Medium* (1908); *The Bar Sinister* (1904) and *With the French in France and at Salonika* (1916). His plays include *Miss Civilization*; *The Dictator*; *The Galloper*; *The Orator of Zapata City* and *The Zone Police*. He died near Mt. Kisco, N.Y., April 11 1916.

DAVISON, HENRY POMEROY (1867–), American banker, was born at Troy, Pa., June 13 1867. He was educated at Greylock Institute, South Williamstown, Mass. He was successively errand-boy in the bank conducted by his uncle in Troy, Pa., runner for a Bridgeport (Conn.) bank and paying-teller in the newly opened Astor Place Bank in New York City, remaining there from 1891 to 1894. From 1894 to 1902 he was connected with the Liberty National Bank, New York, successively as assistant-cashier, vice-president and president. In 1902 he became vice-president of the First National Bank, and in 1907, following his activities during the panic of that year, he entered the firm of J. P. Morgan & Co., of which he was in 1921 still a member. In 1908 he was appointed adviser to the National Monetary Commission to investigate the financial systems of Europe. Later he served at the head of a group of American bankers interested in the Six Power Chinese Loan. From 1917

to 1910 he was chairman of the American Red Cross War Council. During his incumbency, \$300,000,000 was raised through popular subscriptions in aid of war sufferers. In 1910 he became first president of the newly formed international organization of all Red Cross bodies, the League of Red Cross Societies.

DAWKINS, SIR WILLIAM BOYD (1838—), English geologist and archaeologist (see 7.873), was knighted in 1910.

DAWSON OF PENN, BERTRAND EDWARD DAWSON, 1ST BARON, English physician. He studied medicine at University College and the London hospital, where in 1806 he became an assistant-physician. He carried out extensive researches on gastric affections, and became one of the leading authorities on this subject. He was appointed physician extraordinary to King Edward VII., and later physician in ordinary to King George V. During the World War he did very valuable work on war diseases, publishing various papers on paratyphoid and infective jaundice. He was made G.C.V.O. in 1918, K.C.M.G. in 1919, and in 1920 was raised to the peerage. He has published *The Diagnosis and Operative Treatment of Diseases of the Stomach* (1908), besides contributions to Allchin's *Manual of Medicine*, and many papers in medical journals on gastric disorders.

DAYLIGHT SAVING AND SUMMER TIME.—The possibility of saving daylight in summer had been pointed out as early as 1784 by Benjamin Franklin in a paper, "Economical Project for Diminishing the Cost of Light," contributed to the *Journal de Paris*. The suggestion that the number of hours during which the use of artificial light is necessary should be reduced by advancing clocks during the summer months was made in Great Britain by the late Mr. William Willett. The first country in Europe to put the proposal into actual operation, primarily as a war measure, was Germany, and the example was followed by Great Britain and most European states; after its wide adoption in Europe, general attention to daylight saving was roused in America in 1916.

In Great Britain, the question had been twice examined by a Select Committee of the House of Commons: in 1908, this Committee reported that "the object was desirable if it could be attained"; but, in 1909, "having regard to the great diversity of opinion as to whether the measure can be attained by legislation without giving rise, in cases involving important interests, to serious inconvenience," the Committee recommended that it should be dropped. In 1916, the need for economy especially in fuel and transport becoming urgent, the "Summer Time Act" was passed, prescribing that, during a period in each year, legal time in Great Britain should be 1 hr. in advance of Greenwich Mean Time, the precise incidence to be determined annually by Order in Council. The period in 1916 extended from 2 A.M. (Greenwich Time) on May 21 to 2 A.M. (G.T.) on Oct. 1 and, with the substitution of "Dublin" for "Greenwich" Mean Time, the bill also applied to Ireland. (Later, on Oct. 1 1916 Ireland adopted the same Standard Time as Great Britain.)

In September 1916, in view of expressions of disapproval of certain sections of the community—agriculturists, munition and other factory workers, miners and others—the Home Secretary appointed a committee to inquire into the social and economic results of the Act. It reported to the effect that the small temporary inconvenience of the transition from normal to Standard Time and back were altogether outweighed by the saving in artificial light and by the general gain in health from the addition of an hour of daylight to the time for exercise and recreation. It therefore recommended the continuance of the Act in 1917 and subsequent years, the period for 1917 to be from the second Sunday in April to the third Sunday in September.

In the United States, after several abortive attempts at legislation to apply to the country generally, a bill was introduced in Congress in 1918, passed both houses, and was signed by the President March 19. It provided that time throughout the United States should be advanced 1 hr. at 2 A.M. on the last Sunday in March and so continue until 2 A.M. on the last Sunday in October. This law came to an end in Aug. 1918 after two years' trial, but though the country as a whole repudiated daylight saving, certain eastern states still continued it.

A new law in New York, passed in 1921, provided for local option, so that daylight saving could continue in New York City and several other cities. In Canada (though there was a strong rural feeling against it) Summer Time continued to be adopted in 1921, the U.S. and Canadian railways running to Standard Time. The Australian Senate repealed the Daylight Saving Act in 1917, and Spain ceased to adopt Summer Time in 1920. In 1918, the Egyptian Government reported against the scheme, which has, in fact, met with little support outside Europe and N. America.

Considerable opposition to the Act was manifested in Great Britain and still stronger in the United States. Among other things, it was alleged that children's sleeping hours would be curtailed; that vitality of body was reduced in the early hours. But reports of police authorities showed that the tendency throughout the country to spend the extra hour out of doors made for improvement in the moral tone, a marked decrease in juvenile offences was noted, and health committees saw no reason to suppose that workers were adversely affected. Many farmers believed erroneously that their former noon hour was the hottest part of the day, although the greatest heat is, in fact, from 2 to 3 hours later; more sound was the objection that the early morning hour was not favourable to farm (especially harvest) work because of the heavy dew, and had to be made good at the cost of overtime. Some complained that milking time was forced ahead abnormally. Confusion arose at first in the record of astronomical and meteorological observation and some series of observations were interrupted. City people as a whole were, however, strongly in favour of the measure, though some pointed out that many were forced to exchange a cooler morning sleeping hour for a warm early night hour. When Summer Time ceased to operate in the United States, some inconvenience was experienced by the reduction of the number of business hours common to the London and New York Exchanges. But saving of coal was probably in excess of the estimate of 2½ million tons in Great Britain, and in the United States the saving amounted to 1½ million tons during the 7 months' period in 1918.

DEAF AND DUMB (see 7.880).—In the census returns for England and Wales for 1911 the figures relating to the deaf and dumb were:—

	Total	Male	Female
Deaf	26,649	10,640	16,009
Deaf and dumb	13,427	7,192	6,235
Dumb	1,695	975	720

432 persons were returned in the tables as blind and deaf, 62 as blind and deaf and dumb, and 55 others in various combinations of deafness, blindness, dumbness and feeble-mindedness. The questions asked in the schedule for the census for 1911 were as follows:—

"If any person included in this schedule is:—

- (1) Totally deaf or deaf and dumb,
- (2) Totally blind,
- (3) Lunatic,
- (4) Imbecile or Feeble-minded

state the infirmity opposite that person's name and the age at which he or she became afflicted."

The report stated that this was the first occasion on which an attempt had been made to obtain information regarding the deaf other than deaf-mutes. This was felt to be desirable both because at previous censuses many persons were returned as deaf who were not stated to be dumb, though the information was not sought for; and because of the progress made in the phonetic training of deaf-mutes, it was felt that reasonable exception might be taken as to the description as deaf-mutes of persons who, while remaining deaf, had the art of intelligent speech.

The variation in the terms of the census questions from those asked on previous occasions renders the task of comparison practically impossible, as the tabulated figures relating to deafness alone in previous censuses were those stated voluntarily and not in response to a direct question, and therefore obviously incomplete—

England and Wales	1881	1891	1901	1911
Deaf and dumb	13,295	14,192	15,246	13,427
Deaf	—	15,088	18,507	26,649

Referring to these figures the report states:—"It will be seen that in 1911 the proportion of deaf and dumb is lower than at any previous census shown in the table, the improvement being shown at nearly all the age-groups. Whether the last ten years only or the whole forty years are considered, the improvement is, as might be expected from the success of modern educative methods, much more marked in early than in later life." From 1881 onwards the census commissioners had stated that the returns are unreliable and in-

complete. In 1881:—"We feel bound to point out how very incomplete are the returns which relate to these afflictions. We have done our best with these unsatisfactory data," etc. In 1891 the report characterized the statistics as "in all probability excessively inaccurate." In 1901 it was pointed out that the machinery of an ordinary census was but imperfectly adapted to furnish the required particulars with the degree of accuracy which is essential for statistical purposes; and in 1911 the report stated:—"We must submit that statistics of this nature obtained through a general population census are most unsatisfactory, firstly on account of the difficulty of framing a suitable form of inquiry defining the degree of disability, and secondly because the definition has to be applied by householders with no technical knowledge, who will interpret it in different ways, and many of whom have a natural reluctance to admit that they or their relatives suffer from any defect." But the choice of wording in the 1911 census schedule was particularly unfortunate and confusing, and might have been avoided if the department had been willing to ask or accept the advice of those bodies, such as the National College of Teachers of the Deaf, and the National Bureau for Promoting the General Welfare of the Deaf, which, for educational and social reasons, were anxious to secure reliable statistics relating to deafness and deaf-mutism in the United Kingdom. "Total deafness" is comparatively rare, whether it is congenital or acquired, and even among the so-called "deaf and dumb" it is generally recognized that there are from 15 to 25% with a useful amount of hearing. This fact and the unwillingness mentioned by the commissioners to the return of children who have fairly successfully been taught speech as "dumb" presented difficulties which even experts, such as the responsible heads of institutions for the deaf, found it hard to overcome in any attempt to give accurate returns. For instance, if the 100 children in a school for the deaf were in the majority of cases neither "totally deaf" nor "deaf and dumb" (i.e. orally taught), what was the headmaster to do? Leave them out?—or insert them?—and, if the latter, where? Mr. B. St. Johns Ackers, the chairman of the statistics committee of the National College of Teachers of the Deaf, in his address before the Manchester Conference in 1911, laid down a broad principle—"statistics, to have their full value, should not only be accurate, full and reliable, but should be on the same plan in all countries. This should apply to census and school statistics," and as the fuller consideration of all forms of defect, not only as to treatment but also as to preventive measures, is now occupying the attention of the newly formed Ministry of Health, it is essential, if State funds are to be spent in collecting information, that such information should be of real value when obtained.

The difficulty of framing a suitable question or questions relating to so wide a subject as deafness and deaf-mutism, in a short and simple form, in the small space available on a census schedule, caused the department to omit any attempt to secure information of this kind from the 1921 census, and further statistics of this kind will not in future be available until some new machinery has been provided. This may be undertaken through the Ministry of Health, or, if undertaken with the assistance of the various educational and social organizations connected with the deaf and dumb, might secure figures not only relative to the actual existence, but also as to the causes of deafness, which might later prove of inestimable value in preventive measures, and so greatly reduce the number of this afflicted class in the community.

Indeed the medical inspection of school children has already begun to operate in this direction and the discovery of children suffering from causes which may lead to partial or total deafness is part of the ordinary routine of the school medical officers in the counties and county boroughs of the United Kingdom. In 1919 Dr. Hamar, chief medical officer to the London County Council, reported that at the school medical inspections 4,211 children (2.2%) were found to have ear disease, of whom 2,823 (1.4%) were referred for treatment, and the London County Council has now established six centres for the educating of children suffering from impairment of hearing short of "deafness" within the meaning of the 1893 Act. About 25% of the children attending these centres suffer from discharging ears and receive nursing attention under medical supervision.

In this connexion it is interesting to note that in a comparison of the conditions in 1915 and 1919 it was found that in the former year 2.1% of the children examined in London were found to be suffering from ear disease, whilst in the latter year there were only 1.85%. At Glasgow it was found that out of 500 cases of deafness and middle-ear disease, 26% originated in measles, 12% in scarlet fever, 20% in simple catarrh and 20% during dentition. Mr. Yearsley, the aurist of the London County Council, found

that of 177 cases certified by him to be deaf or hard-of-hearing, 37 were congenital, in 119 cases it was acquired, and in 21 doubtful. Of the cases of acquired deafness, 61 resulted from suppurative and middle-ear disease, 18 followed infectious fevers, 11 resulted from congenital syphilis and 20 followed meningitis. In the report of Dr. Butterworth (Lancs.) the general conclusions arrived at were that "deafness in school children is largely due to causes which can be removed by simple treatment, but this treatment can only be satisfactorily carried out in a clinic, where the child can attend regularly till it is cured"; and a further suggestion was made that "the ear, like the eye, must be brought under systematic supervision from infancy upwards."

In the report of the chief medical officer of the Board of Education for 1919 the position with regard to the schools was given as follows:—

	No. of schools		Provided	Voluntary	Accommodation	No. on registers
	England	Wales				
Deaf	49	2	37	14	4,622	3,893

In Scotland the latest figures available give 12 schools with accommodation for 1,014 children and 714 pupils in attendance; in Ireland 4 schools with accommodation for 580 children and 525 pupils. There was still no law for the compulsory education of the deaf of Ireland.

In the same report for 1919 the chief medical officer of the Board of Education made the following statement:—"The regulations of the board cover the educational needs of the child from the age of two years upwards, extending to the age of sixteen. From the age of two to the age of seven attendance is optional and only becomes compulsory at seven. The disadvantages of this statutory provision are considerable, and authorities are not as a rule willing to incur the heavy expense of special education so long as the law does not compel them to do so, and the deaf child is involved in a serious educational loss in consequence. The early beginnings of speech which come more easily to the deaf child are withheld from him to a later age and it may safely be said that the majority of the deaf children never make up for the loss sustained by postponing the beginning of education until seven, or, as often happens, till later."

This illiberal policy of depriving the deaf of the early years of instruction occasionally takes a more aggravated form when parents or local authorities, from reasons of economy, allow the children to remain away from school even after the statutory age of seven. In a return in 1920 it was found that among the children admitted to schools for the deaf 109 were eight years of age or older, 47 over 8; over 9, 28; over 10, 13; over 11, 10; over 12, 7; over 13, 3; over 14, 1. To remedy this evasion of the law a resolution was adopted at the Conference of Teachers of the Deaf at Birmingham in 1920 asking that in cases in which the pupil was admitted later than the legal age the school period should be extended to secure to the child the full period of instruction. This would be in conformity with the practice in America, where many states provide a school period of from 10 to 12 years for their deaf pupils, irrespective of the age of entry.

The average attendance in England and Wales in the last school year (according to the report for 1919) was 3,325—2,335 in institutions and 990 in day schools. In 1920 Mr. Story, chairman of the National College of Teachers for the Deaf, stated that of 2,761 children attending 32 of the schools, 170 were semi-mute (i.e. had become deaf after having acquired normal speech), 390 were partial-hearing cases, 20 were mentally defective as well as deaf, 7 were blind and deaf, whilst 2,114 were ordinary cases of deaf-mutism. Referring to the methods of instruction, he gave the following statement relating to the year ended March 31 1920:—"The oral method largely predominates in our schools. The day schools are practically entirely oral, as are also several of the residential schools. In the cases of 2,816 children attending 34 schools, 2,494 are orally taught, 289 by finger spelling and 33 by finger and speech combined."

For the same period the returns of American schools, as published by the *American Annals*, showed that in 169 schools in the United States there were 13,779 pupils, of whom 10,376 were taught wholly or chiefly by the oral method, and a further 862 taught speech in combination with some other method—finger-spelling or "signing."

These figures prove the great advance which has been made in the attempt to remove the abnormality of the deaf. The deaf child of tender years is just like his brother or sister, except for his deafness, but as years pass with no auditory impressions and no development of speech, and the only means of communication open to him that of gesture, his intercourse is narrowed down to those immediately around him, and the divergence from the normal becomes

more and more marked unless special means are used to combat it. The possession of a verbal language in place of a language of gesture, particularly if that language is used in the form of articulate speech, even though artificially taught, and the ability to lip-read and the habit of looking to the face of the speaker for what is being said—all tend to lessen the abnormality induced by their affliction and to render the deaf more capable of taking their part in the workshop and the environment of their home in later life, than a specialized form of instruction such as finger-spelling or signing, known only to those expert in that means of communication.

The general recognition of this fact has led during the past half-century to an almost complete change from silent to oral methods in the majority of schools, both in Europe and America, though there were still in 1921 a few schools on both sides of the water where silent methods were adhered to, or where they formed the basis of ordinary means of intercourse, so that the oral work of the teachers was considerably nullified by the daily usage. A proportion, too, of deaf children in the schools is incapable of acquiring speech and a verbal language of sufficient range to be of practical use, either on account of poor intelligence, poor sight, lack of interest or general incapacity, whilst in some cases this incapability is induced by the lateness above mentioned at which the children begin their education, so that it is impossible to overcome the "signing" habit and to substitute for it an intricate verbal language. This has led to a demand for a classification of the pupils of the schools for the deaf in order to secure for them that form of the education for which they are mentally and physically best fitted.

The discussion of the Danish system of classification of schools for the deaf at the international conference in Edinburgh in 1907 gave an impetus to this question in England, and after careful consideration of the question by teachers in London, and at the general conferences, it has now become an accepted principle that, in order to secure an advance in the success of the oral methods, and to give each child the best educational opportunity of which it is capable, the varying types of deaf children should be segregated into separate schools and institutions and only one method employed in any one school. A similar conclusion has been reached in American schools. At the meeting in 1920 of superintendents and principals of American schools for the deaf, Principal Jones, the head of one of the largest "combined" schools in the States, made the following statement:—

"If I interpret the sentiment of the profession, and those interested in the deaf, correctly, it is that speech and speech-reading cannot be developed to the fullest extent of which they are capable in a congregated combined school. In a combined school there is always that lack of practice which makes it usable and effective. This, therefore, reduces to the lowest value all the efforts of the school and its hardworking teachers. The only remedy that I can see, after many years of laborious struggle to overcome it, is to separate the orally and manually taught children for as many years of their school life as is necessary to fix the speech habit."

Steps in this direction have been taken by the segregation of all backward and mentally and physically defective deaf children from the L.C.C. schools for the deaf to the residential school at Homerton (London), which in 1921 was about to be removed to new premises at Penn, Bucks., and by the establishment of Clyne House for the backward deaf at Manchester. At Homerton the combination of other defects, such as total or partial blindness, with deafness presents unique conditions for the study of psychological problems in conjunction with physiological abnormalities. The gradual removal of all younger pupils from the big institutions for the deaf has also been in operation, and the extension of the British Government regulations allowing children to be received from the age of "two" upwards will no doubt give an impetus to the establishment of infant and nursery schools for the deaf, where those "early beginnings of speech which come more easily to the young child" may have full play.

Provision of this kind had already, by 1921, been made at the Manchester, Doncaster and Mangate institutions, at the Fitzroy Square (London), Moseley Road, Birmingham, and several L.C.C. day schools, to receive these younger children. The removal of partial-hearing and hard-of-hearing cases from the schools was also extended, and increased accommodation was being made for their special treatment, usually in connexion with one of the ordinary elementary schools. Classes have been established in Glasgow, Bristol, London and elsewhere, so that these children might not need to be brought into contact with the ordinary deaf-mute child. In these schools some amount of acoustic training is given, either by means of appliances or by the human voice alone, and the child is taught to supplement his partial hearing by "speech-reading," so that any hiatus caused by his lack of hearing may be overcome by his recognition of the spoken word on the lips. The children attend the ordinary school classes for such subjects as drawing, singing, etc., in which their partial deafness does not prevent their receiving the benefit of the instruction, whilst their association with the normal type of child prevents the growth of idiosyncrasies which might tend to increase their abnormality.

By a modification of the terms of Government regulations the State has now become responsible for 50% of the cost of the education of deaf children incurred by local authorities, and the remainder usually falls on the local rates, parents contributing towards the

cost of "maintenance" of the children (as apart from education, such sums as may be assessed by the local authorities, or, in the case of dispute, as may be fixed by magistrate's order. Thus the last vestige of the need of charity for the education of the deaf has been removed.

The Board of Education in England extended its regulations in 1920 to allow for the payment of grants for the training of young persons beyond the age of 16 in preparation for a trade who had previously been taught in a special school for the blind or deaf. This would enable certain advanced courses of instruction in technical knowledge to receive grants, which had hitherto been entirely supported by private means—such as the J. E. Jones Trade School for the Deaf at Manchester. No attempt had yet been made to establish a school for the higher education of the deaf, though the matter had been repeatedly endorsed as a desirable end to the educational effort for this class in Great Britain.

The organization of a course of training at the university of Manchester for teachers of the deaf was rendered possible by the generous benefaction of Sir James E. Jones, who endowed the Ellis Llywd Jones lectureship in the teaching of the deaf and founded the Ellis Llywd Jones Hostel as a hall of residence for women students. Thus for the first time in the history of the education of the deaf the work became part of the work of an ordinary university. Bursarships have been established by various schools for the deaf and education authorities, to enable students to take advantage of the training thus provided.

A liberal grant has been made by the Carnegie trustees to the university to establish a library of deaf education, and this is housed in a room in the Christie Library at the university, where the books can be consulted by students and others interested in the question on application to the library authorities.

The establishment in London in 1911 of the National Bureau for Promoting the General Welfare of the Deaf was a step of the greatest importance. The famous "Volta Bureau," established in Washington, D.C., by Dr. Graham Bell, with the money he received from the "Volta" prize for the invention of the telephone, is well known, and it is confidently expected that this National Bureau, founded through the generosity of Mr. Leo Bonn, will do for Great Britain even more than its American predecessor. Full particulars of the 60 schools and institutions for the deaf, the 60 or 70 missions to the adult deaf, and the 15 or 16 large organizations, all interested in the advancement of the deaf in various ways, have been filed at the bureau, and the council consists of representatives of every organization working on behalf of this afflicted class, both in child and adult life. The main objects of the bureau are: 1 (centralization), to get into touch with and promote co-operation between all existing agencies; 2 (information), to collect, classify, and disseminate information; 3 (investigation), to promote investigation. Statistics and particulars relating to every existing agency and institution working for the deaf in the United Kingdom have been collected and published by the bureau in a useful form, and these will be kept up to date as changes occur. When public bodies and private individuals realize that complete and accurate information on all matters connected with the deaf may be obtained through the bureau, it will become a "clearing-house" for this branch of effort.

Unfortunately, the outbreak of the World War occurred just as this bureau was becoming recognized as a valuable asset, and owing to the depreciation of its resources it had not been able by 1921 to resume the activities it was so ably carrying on in its early years. Under the auspices of the bureau, Dr. J. Kerr Love gave a series of lectures in London on "The Causes and Prevention of Deafness." These lectures have been published, and contain some definite suggestions for the prevention of deafness both congenital and acquired by the notification and treatment of certain diseases as well as a full inquiry into the causes of hereditary deafness in Britain and America.

During the war special work for the deaf met with the same difficulties in Great Britain as beset every other branch of social effort. As a class the deaf were unable to take active part in military service, though here and there a few individuals managed to pass the medical tests and joined the Forces. Several attempts were made by bodies of deaf men in London, Liverpool and elsewhere to form volunteer units for service in some non-combatant capacity, but it was found impossible to secure recognition, probably owing to the great pressure with which the organizing officers of the army were working, and the matter languished for want of support. The fact that a number of deaf men went out with private firms and did useful work with hut building, etc., showed that there might have been useful units organized for this type of service if there had been time and inclination on the part of the officers to get them established. The great demand for labour of all kinds during the war brought about an unprecedented demand for the labour of the deaf members of the community in civil life, and for several years there was a greater appreciation of their economic value than had ever been accorded before. Unfortunately, with the general trade depression following the war there ensued a corresponding amount of unemployment, in which the deaf suffered in the same way as the hearing. The religious and social organizations working in behalf of the deaf also felt the lack of support which was being experienced by all charitable organizations up to 1921. With the exception of

one official in the capacity of work-seeker appointed by the Board of Trade, no State aid had been given to the deaf, but it was intended to apply for the inclusion of the deaf in the State provision which was set up for the training and employment of the blind.

As a result of the war a large number of wounded and disabled British soldiers and sailors were found to be suffering from deafness and from shell-shock, frequently accompanied by dumbness. In dealing with these men the experience of the schools for the deaf proved most valuable, and their organization and the services of their staffs were drawn on to teach lip-reading to the deafened men and to aid in the recovery of speech among those suffering from dumbness. The ordinary training in the methods of teaching articulation and speech-reading to deaf children was an excellent foundation on to which could be moulded the special requirements of the disabled men. Sir James Dundas Grant, at the head of a special aural board, was in charge of this department of the Ministry of Pensions, and had local expert and medical representatives in all parts of the country. Sir Frederick Milner and Mr. A. J. Wilson were instrumental in establishing hostels for deafened soldiers to provide social clubs for the men whilst undergoing special treatment and training in speech and lip-reading. The necessity for much of this special organization had largely ceased by 1921, but the lip-reading classes were still being carried on in various parts of the country under the direction of the ministry.

The convocations of Canterbury and York in 1918 adopted resolutions recommending that the spiritual welfare of the deaf and dumb should become a definite part of the work of each diocese and should be supported from diocesan funds, but up to 1921 this had not taken general effect. Five ordained clergymen were in 1921 at work among the deaf of London and district and three in other parts of Great Britain, whilst in the various populous centres of the British Isles "missions" to the deaf and dumb are carried on by lay-readers and other workers. (F. G. B.)

DEAKIN, ALFRED (1856-1919), Australian statesman, was born at Melbourne Aug. 3 1856, the son of a coach proprietor. He was educated at the university of Melbourne and was called to the Victorian bar in 1877; but before that date he had already worked as a journalist, and he continued to contribute frequently to the press, especially to the *Melbourne Age*. He entered the Victorian Legislature in 1878 and first took office as Minister of Public Works and Water Supply (1883-6). In 1885 he became Solicitor-General and in 1887 he was senior representative for his Colony at the first Imperial Conference held in London on the occasion of Queen Victoria's Jubilee. He was a member of all the bodies formed to promote the Federation of Australia as well as of the delegation which proceeded to London with the Australian Commonwealth bill in 1900 and, as Attorney-General, he was included in Sir Edmund Barton's first Federal "Cabinet of the Captains" (1901-3), succeeding him as Premier of Australia. During his legislative career in Victoria he was active in promoting social legislation and an ardent advocate of preference in favour of Great Britain. This fiscal policy he pursued during his three Federal premierships (1903-4, 1905-8, 1909-10), and he was also a strong supporter of Australia's coöperation in Imperial defence, being responsible for the acceptance of the measure authorizing Australian naval construction in 1900 and for the invitation to Lord Kitchener to come to Australia to report on the question of defence. He also passed that year an Act enforcing military training upon all able-bodied citizens. He was the leading figure at the Imperial Conference in London of 1907. After 1910 he led the Opposition in the Australian Parliament until ill-health compelled his retirement in 1913. He always refused any titular distinction; but he was credited by many with being the most brilliant orator of the British Empire, and the enthusiasm which he evoked in London was great. He represented "Centre" thought in Australian politics and for a long time was a reconciling influence between the Conservatives and the Labour party. He died Oct. 7 1919.

DEANE, SIR HENRY BARGRAVE PINNELLEY (1846-1919), English judge, was born April 28 1846, the only son of the Rt. Hon. Sir James Parker Deane, K.C. He was educated at Winchester and Balliol College, Oxford, where in 1870 he won the international law essay prize. He was called to the bar in 1870, and was made a Q.C. in 1896. From 1885 to 1905 he was recorder of Margate, and in 1905 was raised to the bench and knighted. From 1897 onwards his work lay mainly in the Probate, Divorce and Admiralty division. In 1917 he retired from the bench, and he died in London April 21 1919.

DE BROQUEVILLE, CHARLES, COMTE (1860-), Belgian statesman, was born at Tostel, Belgium, Dec. 4 1860 of a family which was French in origin. He was privately educated and passed much time at his father's estate. It was his marriage to Mdlle. d'Huart, granddaughter of Jules Malou (see 17.406) the Conservative leader, that paved the way for his entrance into public life. At the age of 25 he became a member of the provincial council of Antwerp, subsequently being elected deputy for Tournhout, and in Aug. 1910 was appointed Minister of Railways, Posts and Telegraphs in the Schollaert Cabinet. On the fall of this Ministry (July 1912) Baron de Broqueville undertook the formation of a new Cabinet, and in Nov. 1912 also became Minister of War, in this position successfully pressing through the bill for strengthening the Belgian army. When in Aug. 1914 the Belgians determined to resist the passage of the Germans through their country, the Belgian premier well expressed the feelings of the nation in his declaration "Nous serons peut-être vaincus, mais soumis, jamais!" On the retreat of the Belgian army towards the Yser, De Broqueville established himself at Dunkirk and there assisted the military authorities to re-create the units of the Belgian army which had been broken in the retreat. He established the Belgian base at Calais, and after the battle of the Yser worked indefatigably for the reconstitution of the army. In Aug. 1917 Gen. de Ceuninck became Minister of War and De Broqueville succeeded Baron Beyens as Foreign Minister. One of his more important actions was to establish a war Cabinet of six members on the model of those in France and England. In Jan. 1918, however, he was succeeded as Foreign Minister by M. Paul Hymans, already a member of the war Cabinet. It was found that in Sept. 1917 De Broqueville had transmitted to M. Briand peace proposals secretly made by the Germans through Von der Lancken, head of the political department in Brussels, without informing his colleagues in the Cabinet, and this incident seriously diminished his power. In Jan. 1918 he took over the charge of the new department of national reconstruction, but in June of the same year his resignation of the premiership was accepted by the King. At the end of the war he became Minister of the Interior in the Delacroix Cabinet, and retained this office until Nov. 1919, when he retired, having the same year been created a count.

DEBS, EUGENE VICTOR (1855-), American labour leader and socialist, was born at Terre Haute, Ind., Nov. 5 1855, of Alsatian parents. On leaving the public schools he became in 1871 a locomotive fireman, and four years later took a position in a wholesale grocery. In 1879 he was elected city clerk of Terre Haute on the Democratic ticket, and in 1881 was reelected. During 1885 he was a member of the Indiana Legislature. Meanwhile, in 1880 he was elected secretary and treasurer of the Brotherhood of Locomotive Firemen and was chosen editor of the *Locomotive Firemen's Magazine*. When the American Railway Union was organized in 1893 he was elected president, serving four years. Under his leadership a strike on the Great Northern railway was won in 1894. The same year he led the strike which, beginning in the Pullman car plants, soon involved the railways leading into Chicago (see 6.124). Debs was arrested on the charge of conspiracy to kill, was acquitted, was later convicted of contempt of court for violating an injunction, and was sent to gaol for six months (May-Nov. 1895). At this time his study of socialism began, and in 1897 he allied himself with the movement, for a year acting as chairman of the National Council of the Social Democracy of America. After this was reorganized into the Social Democrat party in 1898 he was an influential member. In 1900 he was Socialist candidate for president of the United States, receiving 96,116 votes; was again candidate in 1904, 1908 and 1912, but declined the nomination in 1916. In 1907 he was appointed on the editorial staff of the *Appeal to Reason*, and his contributions attracted wide attention. In 1914 he became editor-in-chief of the *National Rip-Saw*, a socialistic paper published at St. Louis. After America's entrance into the World War he upheld pacifism, and in Sept. 1918, after a speech at Canton, O., he was charged with violation of the Espionage Act, was convicted, and sentenced to serve 10

years in the penitentiary. The sentence was upheld by the U.S. Supreme Court March 10 1910, and he entered prison April 13. In 1920, although still imprisoned, he was again nominated presidential candidate by the Socialists and received 915,302 votes, ranging from 25 in Vermont to 203,400 in New York. He was released on Christmas Day 1921, his sentence having been commuted by President Harding, but his forfeiture of rights of citizenship was not affected. He is the author of *Unionism and Socialism: a Plea for Both* (1904); *Liberty*; and *Industrial Unionism* (1911).

DEBUSSY, CLAUDE ACHILLE (1862-1918), French composer (see 7.906), died in Paris March 26 1918.

DE FILIPPI, FILIPPO (1869-), Italian scientist and explorer, was born at Turin April 6 1869. He studied medicine at the university of Turin, and became an assistant in the surgical clinic of the university of Bologna, occupying later the same position at Genoa. He subsequently became reader in operative surgery at Bologna, and pursued researches of great value in physiological and biological chemistry. In 1897 he joined the expedition of the Duke of the Abruzzi to Alaska as scientific observer, and took part in the ascent of Mount St. Elias. In 1906 Signor de Filippi again accompanied the Duke of the Abruzzi on an expedition to the Ruwenzori range of central Africa. The first detailed map of the higher part of this mountain region was a result of this journey, together with many valuable geological and other observations. In 1909 de Filippi went with the Duke's expedition to the western Himalaya and Karakoram mountains, when a peak 24,600 ft. in height, close to Mount Godwin-Austen, or K2, was ascended. He later (1913-4) organized and led an important scientific expedition to the Karakoram mountains and central Asia, under the auspices of the Indian and Italian Governments, and for his valuable investigations received in 1916 an hon. K.C.I.E. from the Indian Government. He has also received many honours from British and foreign scientific societies, and is a gold medallist of the English and Italian Royal Geographical Societies. During the World War he served in the Italian army medical service, and also lectured in England on subjects connected with the war.

He has published *The Ascent of Mount St. Elias* (1900); *Ruwenzori* (1909) and *Karakoram and Western Himalaya* (2 vols. 1912); besides many papers in scientific journals.

DEGAS, HILAIRE GERMAIN EDGARD (1834-1917), French painter (see 7.931). The Impressionist years, in which such typical canvases as "Women in a Café" and "Danseuses à la Barre" (sold in 1912 for 110,100 francs) showed Degas's complete break with the academic painters, his realistic outlook, and his mastery of *matériel*, notably pastel, ended with the eighth Impressionist Exhibition 1886, where he continued his realistic studies of modern life, showing drawings of the nude, of work-women, and of jockeys. This marked his withdrawal from all public exhibitions. In the following years, until his death in 1917, Degas mainly concentrated on drawings and pastels of the nude, chiefly women at their toilets or in the bath, interspersed with returns to his favourite ballet subjects. At one time he almost abandoned the use of colour but returned thereto later. In his last years, ill-health and a forced removal from his studio prevented his working. Besides pastel and oil colour Degas also handled his favourite subjects in etching, aquatint and lithography. His work is to be seen in the Luxembourg (Caillebotte collection), the Louvre (Camondo collection), the Victoria and Albert Museum, the Tate Gallery, the British Museum, Boston (U.S.A.) Museum, the National Gallery, Berlin, and many private collections. Though closely associated with the impressionists and showing their sensitiveness to atmospheric colour, Degas was never one of them. An admirer of Ingres, and the great classical draughtsmen, he was himself a classic in his impersonal outlook. The increasing preoccupation of his art was the expression of form, chiefly by line, and to this must be ascribed his later concentration on the nude and temporary abandonment of colour. His figures are never impressions, but an elaborate synthesis of many sketches and much observation. An uncompromising realist in his subjects, Degas found in the art of

the Far East a starting-point for combining the most ordinary and ungraceful attitudes of everyday life into an original, intricate and harmonious design.

See also P. Lafond, *Degas* (1918); A. J. Meier-Graefe, *Degas* (1920).

DELAHE, MARIE YVES (1854-1920), French zoölogist, was born at Avignon May 13 1854. He became a member of the French Academies of Science and Medicine, professor of zoölogy at the Sorbonne, Paris, and a Chevalier of the Legion of Honour. He was one of the first authorities on animal reproduction and questions of hybridism and heredity (see 23.116, 14.27, 22.478). For his exploit in keeping alive in 1886, in a tank at Roscoff, a specimen of *Leptocephali* until it developed into a conger, see 9.9. He died in Paris Oct. 8 1920.

DELAGOA BAY, Portuguese East Africa (see 7.942).—Improvements in port accommodation during 1910-21 were mainly in connexion with the transit trade with the Transvaal and the development of the coal trade. Coaling plant was erected in 1914-5 and other plant added in 1921, so that altogether 1,400 tons per hour could be loaded direct into ships' holds. A new ferro-concrete wharf, 1,614 yd. long, was completed in 1916. The wharf was amply provided with electric and steam cranes. In 1920 the building of a dry-dock was begun. Dredging vessels maintain a minimum depth of 21½ ft. over the bar. Lourenço Marques drained, given a good water supply, and largely rebuilt, had become by 1920 one of the finest cities in South Africa. Considerable sums had been spent in making marine drives and golf links, in erecting hotels and on other measures to convert the suburbs, notably Polana, into health and holiday resorts in the winter months (May-Sept., average temp. 64° F.). Pop. of Lourenço Marques (1912 census) 13,353—of whom 5,324 were whites, including 668 British. Pop., city and suburbs (1920 estimate) 20,000.

The convention of April 2 1900 between the Transvaal and Mozambique provided (for a period of 10 years) for free trade in the products of the two provinces and for facilities for the recruitment of natives of Mozambique for labour in the Rand mines (from 80,000 to 100,000 Portuguese natives are normally employed in the mines). In return Delagoa Bay was to be given 50 to 55% of the railway traffic in the areas of the Transvaal in which it competed with Union ports, i.e. Durban. This was an effort to adjust conflicting political and economic factors. Had Delagoa Bay been a British port it would have had nearly all the trade of the so-called competitive area, the route from it to Johannesburg being not only some 100 m. shorter than the route to the Rand, but having easier gradients. During 1910-12 the division of traffic favoured Delagoa Bay. Rate adjustments followed and the share of Delagoa Bay in 1916 fell to 31% and thereafter showed no marked recovery. A proposal made by Senhor Freire d'Andrade (sometime governor of Mozambique) that the part of the province S. of the Sabi river—including Delagoa Bay—should join the South African Customs Union found supporters but was not adopted, and pending a new settlement the Mozambique Convention continued in force.

The following table shows the value of imports into and exports from the Union of South Africa via Delagoa Bay in the years named:—

	Imports.	Exports.
1909	£4,826,000	£ 253,000
1913	4,551,000	740,000
1918	2,308,000	1,100,000

Coal bunkered at Delagoa Bay was 136,000 tons in 1912; rose to 426,000 tons in 1917-8 and fell to 251,000 tons the succeeding year. In the same period (1912-9) the coal exported rose steadily from 179,000 to 589,000 tons. Most of the coal exported goes to Indian ports. The coal comes almost entirely from the Witbank mines, Transvaal. Besides coal Delagoa Bay receives from the Transvaal for export copper, tin, asbestos and maize. The export of copper on a considerable scale dates from 1913. It quickly attained the first place in regard to value (£573,000 in 1916 compared with £199,000, the value of the coal exports the same year). Exports of commodities produced in the province developed slowly. In 1913 they were worth £162,000, the chief item being sugar (£62,000); they fell during the period of the World War. Imports for consumption in the province reached the value of £1,083,000 in 1912.

Shipping remained mainly in British hands, though between 1905 and 1913 German shipping increased by 60%. In that year British shipping was 66 and German 18% of the total. After 1914 the shipping was almost wholly British and Portuguese. In 1917 the vessels cleared numbered 736. The Union of South Africa maintains an agency at Lourenço Marques.

The *Manual of Portuguese East Africa* (1920), a British Admiralty publication, gives useful information in respect to the relations of Delagoa Bay to the Transvaal. (F. R. C.)

DE LA GORCE, PIERRE (1846—), French historian, was born at Vannes June 29 1846. He devoted himself to the study in particular of the history of the 19th century, and produced various works of much learning, the chief being *Histoire de la Seconde République Française* (1887), *Histoire du Second Empire* (1896-1905) and *Histoire religieuse de la Révolution* (1909). He was in 1914 elected a member of the French Academy, and in 1918 published a monograph, *Deux Frères: André et Pierre de Gailhard-Bancal*.

DELAND, MARGARET WADE (1857—), American writer, was born at Allegheny, Pa., Feb. 23 1857. She studied in private schools and at Cooper Union in New York, and for a time was a teacher of drawing. She lived in Boston after her marriage in 1880. She appeared as a writer of graceful verse in *The Old Garden* (1887), and in 1888 attracted wide attention with her first novel, *John Ward—Preacher*. This story resembles in theme Mrs. Humphry Ward's *Robert Elsmere*, at that time a centre of discussion. In all her works she deals with religious and social questions, and at first evoked protest in some quarters. Her method is perhaps best seen in *Sidney* (1891); *Philip and His Wife* (1894); *The Awakening of Helena Richie* (1906) and *The Iron Woman* (1911). Her numerous works include *The Story of a Child* (1892); *Old Chester Tales* (1899); *Dr. Lavendar's People* (1903)—in Dr. Lavendar some have seen a character comparable with Goldsmith's Dr. Primrose; *Partners* (1913); *The Rising Tide* (1916); and *The Promises of Alice* (1919), the romance of a New England parsonage.

DE LA REY, JACOBUS HERCULES (1847-1914), Boer soldier (see 7.944), who was concerned in the rebellion headed by Col. Maritz (see SOUTH AFRICA), was shot dead by a police patrol at Johannesburg, Sept. 15 1914.

DELAUNAY-BELLEVILLE, LOUIS (1843-1912), French engineer, was born at Corbeil Nov. 20 1843. Educated at St. Barbe and the École Polytechnique, he entered the Naval Engineering school in 1864 and in 1867 left to join the Belleville works at St. Denis, near Paris. He became a partner and finally head of the firm which produced the well-known Belleville boilers (see 4.145), and also the automobile called by his name. From 1890 he was president of the Paris Chamber of Commerce. He died at Cannes Feb. 10 1912.

DELAWARE (see 7.947).—In 1920 the pop. was 223,003, as compared with 202,322 in 1910, an increase of 20,681, or 10.2%. The number per sq. m. in 1920 was 113.5; in 1910, 103. In 1920 the native whites constituted 77.5% of the total, foreign-born whites 8.9%, and negroes 13.6%. Of 10,508 illiterates in 1920, 4,700 were negroes, 3,373 foreign-born whites, and 2,437 native whites. In 1920 for the first time the urban pop. exceeded the rural; urban 120,817, or 54.2%, rural 102,186, as compared with 97,085 or 45.8%, and 105,237 respectively in 1910. The change was due chiefly to the growth of Wilmington, as Kent and Sussex counties remained strongly agricultural. One county, Newcastle, showed an increase, the other two decreases. Wilmington, a centre of war-time manufactures, had in 1920 a pop. of 110,168, as compared with 87,411 in 1910, an increase of 22,757, or 26%. The pop. of the other chief towns in 1920 was as follows: Dover, the state capital, 4,042; Newcastle, 3,854; and Milford, 2,753.

Manufactures.—Delaware, especially Wilmington and the upper end of the state, was influenced by the great industrial activity of the World War period. Most noteworthy was the part taken by the duPont powder interests in supplying the needs of the Allies. The following table gives interesting comparisons between the pre-war period and the year following the Armistice.

	1919	1914	1909
Number of establishments	668	808	726
Proprietors and firm members	593	735	722
Salaried employees	3,344	2,643	2,024
Wage earners (average number)	29,035	22,155	21,238
Capital	\$148,207,598	\$69,323,927	\$60,905,671
Salaries	7,709,068	3,399,568	2,322,329
Wages	37,265,319	11,382,160	10,295,596
Cost of materials	85,432,938	31,649,265	30,937,801
Value of products	165,073,009	56,034,966	52,839,619
Value added by manufacture	79,640,076	24,385,701	21,901,818

In 1919 the principal industries were leather, pulp goods, cars and general shop construction and repairs by steam railway companies, iron and steel, canning and preserving of fruits and vegetables, and foundry and machine-shop products.

Agriculture.—After the passage of the Agricultural Extension Act (1911) the most significant movement was the development of coöperative associations, and especially (1918-21) the rapid growth of the Farm Bureau movement. In 1920 the number of farms was 10,140, as compared with 10,836 in 1910, a decrease of 606, or 6.4%. The preceding decade had shown an increase of 1,149, or 11.0%. The value of all crops for Delaware, in 1919, was \$23,058,906. The total value of cereals was \$9,638,010; of hay and forage crops \$4,366,174; of vegetables, including potatoes, \$6,271,714; and of fruits and nuts \$2,566,807. As compared with 1909, the total value of all crops showed an increase of 166.6%; cereals 105.4%; vegetables 242.2%; and fruits and nuts 188.3%. These figures, of course, reflect the changed price level. The production of strawberries for 1919 was 4,362,473 qt., of apples 606,286 bus., of peaches 227,375 bus., and of grapes 1,445,121 pounds. The total value of live stock, horses, mules, cattle, swine, in 1919 was \$7,373,260; of dairy products, excluding "cheese sold" (not reported), \$2,442,253.

Education.—The most distinctive development in the decade beginning in 1910 was in the field of education. There was much discussion of educational matters, and an aroused public interest led to various measures for the strengthening of the public-school system. In 1913, a summer school was established for the training of teachers, and four years later the state agreed to pay the expenses of teachers in attendance. In 1913, also, the Women's College of Delaware was founded, affiliated with Delaware College, with the same president and board of trustees and in part the same faculty, but entirely separate in buildings, classes, and student organization. Delaware College showed rapid expansion. It had property worth \$1,800,000 (1921), and an income of \$382,000 (1920). The enrolment (1921) was 478,178 women and 300 men, not counting 80 ex-service men in vocational agricultural work. After 1913, following reorganization and reincorporation, the college was solely a state institution. In 1917 a commission was appointed to investigate educational conditions, and to recommend plans for unifying, revising and developing the public-school system of the state. The commission employed the General Education Board of New York to make this survey, and the results, when presented to the Legislature in 1919, were crystallized in the "New School Code." The advantages claimed were: (1) the codification of the whole body of school law; (2) definite and fixed responsibility of school officials; (3) a modern and fairer system of taxation; (4) a carefully graded system of schools; and (5) a normal school year of 180 days for pupils from 7 to 14 years of age. The whole plan centred in a state Board of Education, composed of five members, with a state commissioner subordinate to them. Also, there were county boards and county superintendents in each of the three counties. In 1920, however, this system was considerably modified in the direction of lower taxation and greater local control, and in 1921, because of these influences, the ultimate fate of the Code seemed very uncertain. Wilmington grew so rapidly that its government, utilities, educational institutions, etc., were no longer adequate to its needs. In 1921 the city schools were surveyed under the direction of the national Bureau of Education and many needed reforms pointed out. At the same time proposals were being made for a new charter, providing for a commission form of government and a city manager.

Finances and Taxation.—The state system of finances and taxation underwent considerable modification and extension. After 1917, Delaware raised and spent about \$1,500,000 annually. For a number of years previously the state's expenditures exceeded the revenues, but at the close of 1918 the balance in the general fund was \$533,692.89, and on Jan. 1 1920 the balance was \$1,367,733.57. This swift change was due both to the creation of new sources of revenue and to the increased returns from old sources, especially the latter. The railway tax was established in 1897, the

corporation tax in 1899, the automobile tax in 1907. One new source of revenue was the state income tax of 1917, the first \$250,000 of this going to the school fund, the surplus, if any, to the highway department. In 1917, also, the collateral inheritance tax was changed to a direct graduated inheritance tax, with a consequent revenue for 1919 of \$199,933. Apart from these sources increased sums came from fees and from the corporation, automobile and franchise taxes. The much-discussed corporation tax became the state's main reliance as a revenue producer. A state banking department was created (1919), with a banking commissioner and a deputy, whose duty it was to examine every bank at least once a year. In 1917 the budget plan was adopted for a two years' trial, but in 1919 it was not continued. In 1921 the plan was again under discussion with a reasonable chance of adoption. State finances were reinforced by the "Federal Aid" revenue. In 1919 the receipts from the Federal Government were \$135,294.52, distributed as follows: (1) \$50,000 to Delaware College under Federal grants; (2) \$9,472.69 for vocational education; (3) \$75,821.83 for road construction.

History.—The two dominant facts in the history of the state in the period 1910–20 are: (1) the passage of a considerable number of modern and progressive laws, and (2) the reaction of the state to the strenuous demands and activities of the World War. In the latter respect, Delaware met the situation squarely and was well organized, with the various war-time activities centred in the state Council of Defense, of which Secretary of State E. C. Johnson was the directing spirit. The number of troops furnished by the state in the World War was 7,484, and the amount raised in Liberty and Victory loans \$103,898,350. In this period two progressive governors, Charles R. Miller and John G. Townsend, by their qualities of leadership, accomplished much for the state. During the administration of the latter, for example, a number of important statutes were enacted, including a Child Labor law (1917), a Workmen's Compensation Act (1917), laws for the regulation of hours of labour for women, an Income Tax law (1917), a Direct Inheritance Tax law (1917), an Act creating a state banking department (1919), and a thorough revision of the school laws, known as the New School Code (1919). These Acts, together with the Agricultural Extension Act (1911), mark a new era in the development of the state. After 1910 the Republicans maintained their control of state affairs, electing the following governors: Simeon S. Pennewill (1909–13); Charles R. Miller (1913–17); John G. Townsend (1917–21); and William D. Denny (1921–). Much of the time, however, the Democrats controlled the House of Representatives, and in 1916 they elected part of their state ticket. In 1921 the senior U.S. senator, Josiah O. Wolcott, was a Democrat; the junior senator, L. Heister Ball, a Republican. In the presidential election of 1921 the Democrats carried the state, in 1916 and 1920 the Republicans won by a considerable margin. A third characteristic of the period should be mentioned. Public-spirited citizens of the state contributed large sums for education, for public highways, for child welfare, for charitable purposes, and for other worthy causes. It has been estimated that the gifts of Mr. Pierre S. duPont to public education total \$3,653,540.35. Gen. Coleman T. duPont completed and presented to the state a modern highway 20 m. in length, extending from Shelbyville to Georgetown. Under a state highway commission this work was extended by a magnificent system of highways, either under construction (1921) or projected.

DELBRÜCK, HANS (1848–), German historian (see 7.952).—Under the old regime Prof. Delbrück vigorously opposed the policy of the Prussian Government in dealing with the Danes and the Poles, with the result that he was twice subjected to disciplinary penalties as a professor and therefore, in Prussia, a civil servant. From 1889 to 1920 he edited the *Preussische Jahrbücher*, the most important political magazine in Germany. He was the author of a great number of articles and works, of which the following were published after 1910:—*Numbers in History* (1913); *Regierung und Volkswille* (1914); *Bismarcks Erbe* (1915); *Krieg und Politik* (1918); *Kautsky und Harden* (1920) and *Ludendorff, Tirpitz, Falkenhayn* (1920). Special attention may be called to the book *Regierung und Volkswille*, in which Prof. Delbrück attempted a defence of the old system of government in Germany and Prussia with particular reference to its "dualism," i.e. parliamentary representation and simultaneously a certain degree of autocracy on the part of the sovereign in Prussia and of the federated Government in the empire. At an early stage of the World War he became pessimistic regarding the possibility of any real success for

Germany except by military and political strategy and tactics of a purely defensive character. He was, on tactical rather than on moral grounds, a strenuous opponent of intensified submarine warfare, and did not conceal his conviction that the result of this method of warfare would ultimately be the intervention of America. After the Armistice of Nov. 1918 he devoted himself mainly to endeavours to prove that Germany could not be made solely responsible for the outbreak of war, although she had formally declared war upon Russia and France. He was one of those who were sent to Versailles during the Peace Conference in order to draw up a statement of the German case with regard to the responsibility for the outbreak of war.

For a succinct statement of Prof. Delbrück's views on this subject and an English reply see articles by Delbrück and J. W. Headlam-Morley in the *Contemporary Review* (March 1921).

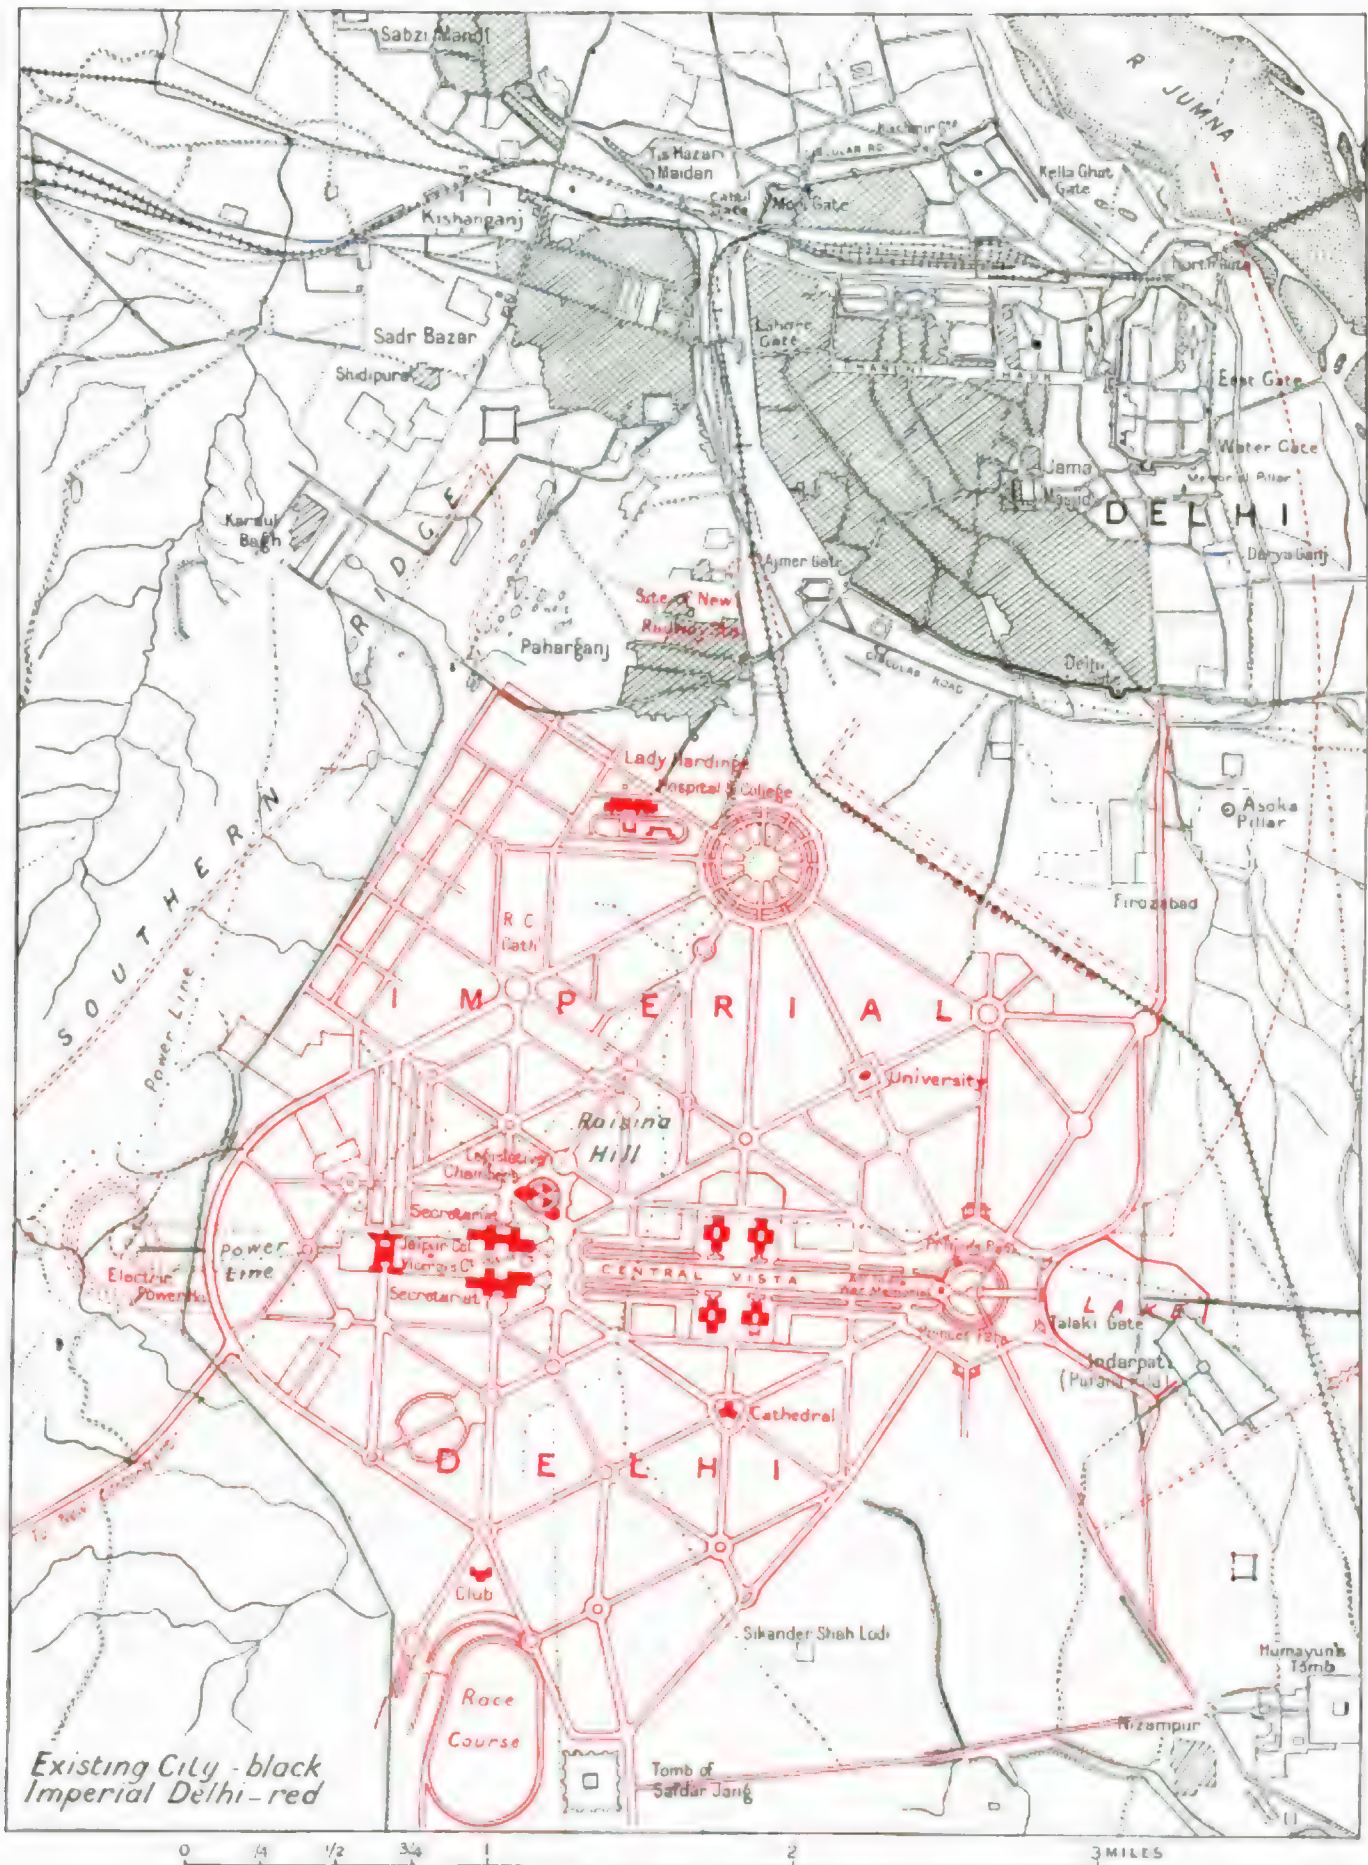

DELCASSÉ, THÉOPHILE (1852–), French statesman (see 7.953), returned to office in the Monis Ministry of Feb. 1911, as Minister for the Navy, a post which he retained when Caillaux succeeded Monis, and in the Poincaré Cabinet which was formed on Jan. 9 1912 after the fall of Caillaux over the Moroccan negotiations. He was appointed ambassador in St. Petersburg on Feb. 20 1913, and became once more Minister for Foreign Affairs in the reconstructed Viviani Cabinet on Aug. 26 1914. In this post he was actively concerned in counteracting the efforts of German diplomacy throughout the world, and particularly in England. He resigned from the Cabinet on Oct. 14 1915, partly on account of differences of opinion as to the advisability of proceeding with the dispatch of the expedition to Salonika in the changed conditions created by the resignation of M. Venizelos, and partly on the grounds of ill health.

DELHI, India (see 7.954).—The planning and laying-out of a New Delhi has been in progress since 1912, as the outcome of the official transfer of the capital of British India to Delhi from Calcutta, announced by the King-Emperor George V. at the Coronation Durbar on Dec. 12 1911. Two inauguration stones were laid by the King-Emperor himself on Dec. 15 1911, when he said: "It is my desire that the planning and designing of the public buildings to be erected will be considered with the greatest deliberation and care so that the new creation may be in every way worthy of this ancient and beautiful city." The first step taken was the appointment of a town-planning committee to advise on the choice of a site for, and a layout of, the new capital. This committee consisted of Capt. G. S. C. Swinton (chairman), Mr. J. A. Brodie and Sir Edwin Lutyens. Mr. V. Lanchester was subsequently consulted by the Government on certain aspects of the question. After a full consideration of all possible sites near the existing city of Delhi on which a new capital could be built, they found two alternative sites, known respectively as the Northern and Southern Sites—the former to the N. of Delhi and to the W. of the range of rocky hills which run S.W. from near the village of Wazirabad (3½ m. N. of the Kashmir Gate), giving a belt of land gradually increasing in width from W. to E. between the hills and the river Jumna; and the latter to the S. of Delhi and to the E. of this range.

The committee's first report was issued on June 13 1912, and with regard to the Northern Site, on which the Durbar camps of 1911 had been pitched and where the inauguration stones were laid, they found it had some general advantages:—This area is upwind and upstream of the existing city of Delhi; the ruins of the Delhis of the past do not cumber the ground; whilst external communications might need improvement, the area is fairly well served by existing railways; roads, canals and internal communications could be made convenient without excessive expenditure, and a good deal of money had already been spent on the area in connexion with the Durbar. But its disadvantages were found to be overwhelming:—the site was too small for the proposed new city, and part of the area was liable to flooding.

The committee therefore recommended the site on the eastern slopes of the hills to the S. of Delhi, on the margin of the area occupied by the Delhis of the past. They found this site free from liability to flooding, with a natural drainage. It was

DELHI

not too much cumbered with monuments and tombs needing reverent treatment and, whilst it was reasonably near the centre of the existing city, it was capable of almost indefinite expansion southward. The committee had also examined other areas in the neighbourhood but found none suitable for the purpose. No good site existed E. of the Jumna. Similarly the Naraina Plain, on the western slopes of the hills to the S. of Delhi, was not recommended mainly because a new city built there could hardly be considered to be Delhi at all, and the area was destitute of historical associations and shut out by the hills from all view of the existing city. This area was, however, found suitable as a site for the new cantonment.

The publication of this first report aroused considerable interest both in India and in England. Articles in the Indian press expressed a preference for the Northern Site, a predilection which had also been felt by the town-planning committee when they commenced their labours. In Dec. 1912 Sir Bradford Leslie read a paper before the Indian section of the Royal Society of Arts in London, in which he set forth plans for building the new capital on the Northern Site and producing a fine water effect by a treatment of the river Jumna. The town-planning committee therefore, in Feb. 1913, issued their second report, in which they restated the arguments for and against the Northern Site.

"The soil is poor on the Northern Site as compared with the Southern. The Southern Site is already healthy and has healthy surroundings. The Northern Site, even after expenditure on sanitary requirements, will never be satisfactory. If the Northern Site is to be made healthy, this involves going outside the site itself and making the neighbourhood healthy also. The building land to the S. is generally good. On the N., to be used at all, it has in places to be raised at considerable cost. There is no really suitable healthy site for a cantonment in proximity to a city on the Northern Site. The exigencies of fitting in the requirements to the limited area of the Northern Site endanger the success of a layout as a whole and tend to make for cramping and bad arrangement. The result of placing a city on the Northern Site appears to the committee to be the creation of a bad example in place of a good one."

In Feb. 1913 a committee was appointed to consider the comparative healthiness of the Northern and Southern Sites. The committee reported on March 4 1913 "that no doubt can exist as to the superior healthiness of the Southern Site, the medical and sanitary advantages of which are overwhelming when compared with those of the Northern Site." The committee therefore, on March 20 1913, issued their final report with a layout for the proposed new city on the Southern Site.

The focal point of the new city (see map) is located on Raisina Hill, and the buildings of the Government Centre are arranged symmetrically about what is practically an E. and W. axis connecting the focal point with the northwestern or Talaki Gate of the old fort of Indrapat or Purana Kila. The two great blocks of secretariats are situated to the N. and S. of this focal point, with Government Court between them. Westward from Government Court, a raised platform or forum connects Raisina Hill with the high ground of the southern ridge, so that the whole Government Centre appears to be built on a spur of the ridge itself. This raised forum is known as the Viceroy's Court and at the western end of this court is situated Government House. The Viceroy's Court is also reached both from the N. and S. by roadways with easy gradients and at the intersection of these roadways with the E. and W. axis of the court is placed the Jaipur Column surmounted by the Star of India.

Government House itself is also approached both from the N. and S. along fine avenues and to the westward of these avenues lies the viceregal estate, with its gardens and parks, wherein are located the bungalows of the viceroy's private and military secretaries, and the surgeon and comptroller, the quarters for the viceroy's troops and bodyguard and for other staffs connected with the viceregal estate. The southern of these two avenues leads from Government House to the residence of the commander-in-chief in India.

Below the eastern façade of the secretariats a forecourt, known as the Great Place, is laid out. This is partially enclosed by a beautiful Sanchi railing in red sandstone and is adorned with six water basins and fountains. In two chambers, one in each basement of the two secretariats, the chambers being entered from the Great Place, are now installed the inaugural stones laid by the King-Emperor, surmounted by the royal insignia cast in bronze.

Eastward again, below the Great Place, is a park known as the Central Vista, planted with lines of jaman-trees and having two water basins, one on either side of the central roadway, for the whole of its length. On either side of this Central Vista are arranged the houses of the members of Council. The Central Vista at its eastern end opens out into a park, hexagonal in shape, in which is to be

built the All-India War Memorial Arch. This central parkway was intended ultimately to terminate at a small lake, the waters of which would wash the base of the northern end of Indrapat.

A second principal avenue of the city intersects at right angles the Central Vista about midway in its length. In the four angles formed by this intersection were planned four large buildings, to accommodate, amongst other institutions, the Imperial Record Office, the Ethnological Museum, the Medical Research Institute, a Library and War Museum. At the northern end of this avenue is situated the business and commercial centre of the city. This consists of a circus, 1,600 ft. in diameter, around which are arranged 12 blocks of buildings, each three storeys high. At this circus the new post and telegraph office is to be located. Of the 12 roads which radiate from this centre, that due N. will give a state entrance to the new joint railway station. This same avenue, southward of the Central Vista, will sight on to the Anglican cathedral, around which are built the residences of the principal officers of Government.

The avenue radiating due N. from the focal point of the city on Raisina Hill sights on to the Roman Catholic cathedral, all around which are situated the houses of the Indian and European superintendents and clerks of the secretariats, the Lady Hardinge Medical College and Hospital for Women being slightly to the north-east.

A little towards the E., the next main avenue passes through the business centre already referred to, and sights in the distance on to the dome of the Jama Masjid in the old city. Immediately below the northern block of the secretariats is placed the building designed to accommodate the Council of State, the Legislative Assembly and the Chamber of Princes. A little farther eastward, the next avenue sights on to the proposed Delhi University.

Facing now due S., an important avenue leads to the club, with the racecourse beyond, a large recreation park being slightly to the W. and Safdar Jang's mausoleum slightly to the east. Turning again a little farther to the E., we overlook the Lodi Park, in which are situated the tombs of the Lodi dynasty.

The eastern side of the city will be largely occupied by the residences of ruling princes and chiefs and prominent Indian gentlemen.

At the Royal Academy in 1914 there were exhibited drawings by Sir Edwin Lutyens and Mr. Herbert Baker (the architects jointly responsible), which showed how it was proposed to treat the main architectural problems of the new capital. Government House and the two blocks of secretariats were planned as one group or capital facing eastward, with the afforested southern ridge behind it to the west. A prolonged "battle of the styles" has been waged over the New Delhi, and if these designs give satisfaction to neither of the extreme and opposed schools, they clearly showed an endeavour to apply, with due regard for Indian sentiment, the spirit of the great traditions of architecture to the solution of structural problems conditioned upon Indian climate and requirements. The inspiration of these designs is manifestly Western, but they combine with it distinctive Indian features without doing violence to the principles of structural fitness and artistic unity.

Government Court has a length from W. to E. of about 1,100 ft. and a width between the two blocks of secretariats of about 400 feet. These buildings have been designed by Mr. Baker. The eastern end of each block is marked by deep loggias looking out over the Central Vista. In the centre of each block is a dome. In the case of the N. block this marks an entrance hall; in the S. block it surmounts a conference hall with a suite of reception-rooms. Each block contains four floors: on the main ground floor are the general offices of the departments; on the first floor are the offices of members of Council, secretaries and other officers; whilst the remaining floors are occupied by clerks' rooms and records. An essential feature of the design, and one which sets the character of the whole building, is the provision of loggias and recessed gateways or exedrae giving views through to the fountain courts situate in the interior of the blocks, and these take the place of the continuous verandahs that are so familiar a feature of Indian buildings. The architect relies for control of temperature on these loggias and recesses, on thick external walls, together with window shutters as adopted so widely in southern Europe, and on the wide chajja characteristic of Oriental buildings. The Viceroy's Court is about 600 ft. in width and 1,300 ft. in length and it will be treated with grass, waterways and fountains and shady trees, and will form a dignified approach to Government House. Here will be erected the column, funds for which were provided by the Maharaja of Jaipur.

The great portico of Government House is raised some 20 ft. above the level of the Viceroy's Court and 35 ft. above the surrounding country. The house itself centres round the great Durbar Hall, a domed structure which dominates the scheme of the buildings surrounding it. Grouped round the Durbar Hall are the state rooms and the great stairways from the entrance courts on the N. and S. sides. Projecting from this central block are four wings: that on the S.W. contains the viceroy's private apartments; in the S.E. wing accommodation is provided for the A.D.C.'s to the viceroy; guests are accommodated in the N.W. wing; whilst the N.E. wing contains the offices of the Viceroy's private and military secretaries. On the W. side of the house will be a raised garden, walled and terraced after the manner of the Moghals. This building, with the subsidiary buildings of the viceregal estate, has been designed by Sir Edwin Lutyens.

The building which will accommodate the Legislative Chambers is circular in plan and surrounded by a colonnade. The plan is divided into six sectors, utilized respectively by the Council Chambers and subsidiary accommodation for the Council of State, the Legislative Assembly and the Chamber of Princes, with three open courts separating these three chambers. A common library is situated in the centre of the building. The foundation stone for this building was laid on Feb. 12 1921 by the Duke of Connaught, and the building has been designed by Mr. Baker.

The All-India War Memorial is to be a monument in the form of a triumphal arch. It will be built in white stone upon a red sandstone base and will rise to a height of 162 feet. It will be surmounted by a flare, so that on occasions of commemoration a column of smoke by day and of flame by night will rise. The structure consists of a mass pierced through from E. to W. by the great arch, 87½ ft. high and 35 ft. wide, which spans the Processional Avenue. The piers thus formed are pierced by smaller arches which run through at right angles to the main arch. The freedom from intricate ornament and the simplicity of the design give the monument an appearance of dignity. Above the great cornice is inscribed the one word "INDIA," flanked by the dates "1914" and "1919." This monument was designed by Sir Edwin Lutyens, and the foundation stone was laid by the Duke of Connaught on Feb. 10 1921.

The estimate of cost for those works in the new capital which were being carried out by Government, according to the revised figures available in March 1921, was Rs. 12,91,80,000 (or at Rs. 15 to the £1, £8,612,000).

On Oct. 1 1912, by proclamation, there was constituted the Administrative Province of Delhi under a chief commissioner. This area was taken entirely from the old Delhi district of the Punjab. Delhi province had originally an area of 528 sq. m., to which was added later an area of 45 sq. m., to the E. of the Jumna river and taken from the United Provinces, to serve as a grazing ground for the cattle of the city. The total area of the province is now therefore 573 sq. m., comprising, on the basis of the census of 1911, a pop. of 412,821. (H. W. M.*)

DELISLE, LÉOPOLD VICTOR (1826-1910), French bibliophile and historian (see 7-964), published in 1909 his edition of the *Rouleau Mortuaire du B. Vital, Abbé de Suvigni*, and also *Les Actes de Henri II.* (vol. ii appeared in 1916). He died at Chantilly July 22 1910.

See R. L. Poole, *Léopold Delisle* (1911); X. Delisle, *Lettres de Léopold Delisle* (1911-4).

DELIUS, FREDERICK (1863-), English musical composer, born at Bradford, Yorks., Jan. 29 1863, was educated primarily at the International College, Isleworth, and was destined by his parents for a mercantile career. To Delius the prospect thus held out was unendurable, though, rather paradoxically, when he declined the business career proffered to him in Bradford, he set out for Florida, where he established himself as an orange planter. His spare time, however, was devoted to such musical study as he could obtain from such books as were in his diminutive library. In this sense he, like Elgar, was self-taught. But he quickly broke away from orange-groves and betook himself to Leipzig, where he underwent a more or less regular course of training at the hands of Jadassohn, though probably he learnt more of practical use from Grieg who at that time was resident in Leipzig studying the art of scoring for a modern orchestra. In or about 1900 Delius took up his abode at Grez-sur-Loing (S. et L.), near Fontainebleau, which subsequently was his principal domicile, though he travelled in many lands. He was in Norway in 1897 when his incidental music was produced to Gunnar Heiberg's *Folkeraadet*, and, by its satirical use of the National Anthem, set the town by the ears. Meanwhile compositions flowed from his ready brain. He gave a concert of some of them in London in 1899 when his *Légende* for violin (composed in 1892) was produced. In 1893 his fantasia-overture *Over the Hills and Far Away* was done by Dr. Haym at Elberfeld, and followed in 1897 by his pianoforte concerto in C minor. This fine work, however, was ultimately recast and produced in London at a promenade concert in 1907 by Theo. Szanto, a Hungarian pianist. But before then, in 1896, Delius's first opera, *Koanga*, was in the making. It was produced at Elberfeld in 1904. His second opera, *Romeo and Juliet in the Village*, was first performed at the Komische Oper in Berlin in 1907, and subsequently was given by Sir Thomas Beecham at Covent Garden in Feb. 1910 and, in a revised version, in 1919. A third opera, *Pennimore and Gerda*, was staged at Frankfurt a/M soon after the Armistice.

In between the intervals of opera-composing, Delius was very busy producing purely orchestral works, or works for chorus and orchestra for the concert room. Thus *Life's Dance* dates from 1898; *Paris: the Song of a Great City* from 1900; *Appalachia* (1903); *Sea Drift* (1904); *A Mass of Life* (after Nietzsche, 1905); *Brigg Fair* (1908); *In a Summer Garden* (1908); *Requiem* (1909); a *Poem of Life and Love* and *Eventyr* (1919). Besides all this Delius composed a violin concerto and a double concerto for violin and violoncello, a violin and a cello sonata, and a string quartet, many songs and several a capella choruses.

DEMOBILIZATION AND RESETTLEMENT.—No labour problem of greater difficulty has ever had to be faced than that of national demobilization, whether military or civilian, after the World War, because of the dimensions to which the calling-up of national man-power had attained. An account of post-war demobilization and resettlement in industry, in the United Kingdom, from the civilian point of view, divides itself into three clearly marked periods: (A.), the preparations during the pre-Armistice period; (B.), the action taken immediately after the Armistice; and (C.), during the first two years of resettlement. (For the Army demobilization, see ARMY.)

(A.) PRE-ARMISTICE PERIOD

There were two lines upon which British Government preparations proceeded during the pre-Armistice period in respect of civilian workers:—

(a) The bringing of workers demobilized from munitions work and war work as quickly and as conveniently as possible to peace work.

(b) The rapid turnover from war to peace so that employment might be available for the largest number at the earliest moment. For the provision for unemployment, see the article UNEMPLOYMENT.

(a) *The Bringing of Workers Demobilized from Munitions Work and War Work.*—In making plans for the demobilization of civilians account had to be taken of the possibly simultaneous demobilization of the armed forces. The ideal would have been to have fitted civilian workers into their places before the forces had been demobilized so that there should be no confusion as between the two masses of demobilized persons. In point of fact it was recognized from the outset that it would be impossible to complete one process before the other began, first because industry could not in many places be started up again without the return of numbers of pivotal men with the forces, and secondly because large numbers of men with the forces had either a statutory right or a promise to return to a particular employment. It was accordingly necessary to frame a scheme for civilian workers which could work conveniently side by side with the scheme devised for the demobilization of the forces. The demobilization of the forces took into account throughout the necessity of approaching the matter, subject to paramount strategic considerations, upon an industrial basis. From the first report on military demobilization, signed in Dec. 1914 by Sir H. Llewellyn Smith and Sir R. H. Brade (as secretaries of the Board of Trade and War Office respectively), right through to the second interim report of the Ministry of Reconstruction Committee on the demobilization of the army, in Oct. 1917, this aspect of the question was steadily faced. It was recognized that demobilization must be so arranged as to render the transition from war to peace as easy as possible, which meant arranging it so far as possible to fall in with the immediate needs of the post-war industrial situation.

The principles upon which the recommendations as to military demobilization proceeded must be briefly explained, in order that the way in which these were related to those laid down for civilian workers may be appreciated.

The objects aimed at were to reduce unemployment to the lowest possible point, but at the same time to make adequate provision for such unemployment as was inevitable. In order to meet the first point it was recommended that demobilization should, subject to military exigencies, be carried out according to the requirements of trade and industry, which meant disbanding first men for whom employment was ascertained to be available or men in trades specified in a priority list drawn up with reference to the relative urgency of the industrial requirements of the country. To meet the second object the committee recommended the provision of a free unemployment insurance policy to be given on demobilization.

The object of the army scheme, which was to get men to the place where they could be employed as rapidly as possible, formed also the first part of the civilian demobilization scheme. The questions of civilian demobilization were considered from this point of view partly by the Civil War Workers' Committee, appointed by the Ministry of Reconstruction, which issued five reports during 1918, partly by the Ministry of Labour, and partly by the Labour Resettlement Committee set up by the Ministry of Labour. The recommendations of these various bodies are arranged not in the order in which they were actually made, but in relation to the order of the events with which they dealt.

The first point to be considered was the order of discharge from munitions works, just as the first point to be considered in army demobilization was the order in which men should be released from the colours. On this it was recommended by the Ministry of Labour—and the recommendation was accepted by the Cabinet—that the order of discharge should be as follows:—

(a) That adequate notice of discharge should be given to each individual worker.

(b) That adequate notice of the discharge ought to be given to the local employment exchange so that the exchange might be able to find employment for the worker.

(c) That the order of discharge should be: first, workers not dependent on industrial employment for a livelihood; second, workers brought from a distance; third, workers who could be readily absorbed in their previous occupation or in one of the staple industries of the district.

It was regarded as of paramount importance that the previous industrial experience of the workpeople who were to be dismissed, and the demand for workpeople of their experience elsewhere, should be adequately considered by factory managements in consultation with the officials of the Ministry of Labour before the selection of the individuals to be discharged was made.

In order that persons discharged should be able to travel to their homes at the earliest possible moment, or to their new places of employment, it was recommended in the fifth report of the Civil War Workers' Committee that free railway passes should be issued to those persons who had changed their place of residence for the purpose of taking up work on munitions or on naval or army contracts, and who might be displaced from such employment owing to the cessation of hostilities. In such cases the worker should have the option of having his or her fare paid either to the usual place of residence, or to some other place at which work is available.

After the question of the order of discharge there was the question to be considered of the actual machinery for bringing workers into touch with possible employers. On this the following recommendations were made by a committee of the Civil War Workers' Committee: (a) Steps should be taken by the Government, through the machinery of the employment exchanges, to assist war workers to return to their former employment. In addition joint industrial councils and similar joint bodies for individual industries should be taken into consultation. (b) Steps should be taken as soon as there was a reasonable prospect of peace to ascertain where war workers would be required. (c) Workers should be encouraged to register their requirements. Proposals were also made as to limiting the flow of juvenile entrants into the rank of wage earners by means of prolonging the school age, and further schemes were proposed for watching the placing of young persons in industry.

Action on these recommendations was possible during the pre-Armistice period only in so far as it would not disturb the munitions output by giving workers the impression that peace was in sight before the facts justified this belief. It was therefore not possible until immediately before the Armistice to take full advantage of the proposals for bringing employers and workpeople into touch.

It was universally agreed that the machinery for demobilization must be found in the employment exchange system. It was, however, suggested that the employment exchange machine might break down under the heavy strain imposed upon it unless it were supplemented. The Minister of Labour had appreciated this aspect of the problem and in 1917 had appointed a series of local employment committees to advise and assist exchanges. These committees (see UNEMPLOYMENT) consisted of equal numbers of employers and employed presided over by a chairman nominated by the Minister of Labour. A committee was attached to each principal exchange area and its duties were generally to advise upon the work of the exchange and particularly to help in the task of the demobilization of civilian workers. The various schemes prepared by the Ministry of Labour were circulated to these committees, so that when the period of actual demobilization came they were fully prepared to handle them. In addition a central committee known as the Labour Resettlement Committee was set up by the Minister of Labour to advise the Ministry nationally, just as the exchanges were advised locally.

In the next place the actual machinery necessary to effect the rapid demobilization and transfer of workers was elaborated in detail by a Departmental Committee set up by the Minister of Labour. This committee divided its report into four parts:— (i) registration of workpeople under notice of discharge; (ii) distribution of completed forms of registration to exchanges or other local offices; (iii) negotiations with the previous or other employers of the workpeople in order that there may be no avoidable interval of unemployment

after discharge from war employment; (iv) placing of workpeople in employment after their discharge.

Under these four heads the committee worked out in detail the registration forms and cards which would be necessary for an effective indexing of the workers. They worked out the system of interchange between the exchange at which a worker was discharged and the exchange at which he was to be reemployed. They suggested a method by which, upon interchange of the forms, the exchange in the neighbourhood where the man sought employment put itself into touch with the employer, and notified the result of this communication to the exchange of discharge. Finally, they made proposals by which a worker previously engaged upon war work, seeking employment, could be traced so that he could be fitted into the general scheme.

Apart from these preparations for action to be taken upon the cessation of hostilities, certain action was being taken in respect of men returning, disabled or unfit, from the colours. This work was undertaken as a result of the recommendation of the Resettlement of Officers Committee under the chairmanship of Sir Reginald Brade, which recommended that "an Appointments Board for officers and men of like standing should be established under the control of the Ministry of Labour to operate with the existing University Appointments Boards or other approved bodies." There had been two departments dealing from different points of view with this problem. In 1915 a special department of the Ministry of Labour had been set up, known as the Professional and Business Register, whose work consisted in finding appointments for persons of the classes covered by its title. During the earlier years of the war its duties principally consisted in finding war employment for persons of the professional classes who were either unable to pursue their pre-war occupation owing to war conditions or who wished to be used upon national service. In addition there was established early in July at the Ministry of Munitions an organization known as the Officers' University and Technical Training Classes. These provided the means by which unfit officers and professional and business men in the ranks could attend universities, technical institutions and other centres of instruction during their period of convalescence. Candidates so trained, if still unfit for active service, were utilized to meet the immediate demands of Government departments.

Following upon the report of the Brade Committee it was considered convenient to combine these two departments under one control, and the Appointments Department of the Ministry of Labour was established in April 1918. Previous to the cessation of hostilities the department performed two functions: (i) the training of the convalescent serving officer, and (ii) the placing in employment of officers, whether trained or untrained, as well as of professional men. The training of the convalescent serving officer was in operation for more than 12 months previous to the Armistice. Some 4,000 cases passed through the training scheme. The officers received training for practically every professional and higher commercial appointment. At this stage, while demands still far outran supply, no considerable difficulties in placing the trained men arose.

These proposals affected officers. The placing of workpeople remained with the exchanges, but the question of the training of disabled members of the forces was also receiving attention. Joint committees were formed by the Ministry of Labour for dealing with this problem for a number of trades. These committees were generally on a national basis and devoted themselves to laying down conditions upon which trainees could be admitted into industry. Both as regards officers and men these two schemes, which formed the foundation of the large schemes, were operated after the Armistice by the Appointments and Training Departments respectively.

(b) *The Rapid Turnover from War to Peace.*—The proposals on this head may be considered under two aspects:—

(a) Proposals as to the way in which the Government should treat its contracts with a view to reducing the dislocation consequent on the change from war to peace to the lowest possible point.

(b) Proposals for development of industries in peace with special reference to the lessons learned during the war.

So far as munitions contracts were concerned there had to be considered (i) termination of contracts for the supply of munitions, (ii) disposal of stores, stock and material, machinery, etc., in the possession of the Government, and (iii) the arrangements for the disposal or post-war use of national factories with their plant and equipment.

With regard to contracts it was plain that to continue manufacture of munitions for a moment longer than the military situation required was in the highest degree uneconomic. At the same time regard had to be had to the fact that a sudden cessation of all contracts would lead to unemployment on a hitherto unexampled scale, and would, moreover, with regard to such munitions as guns and tanks, lead to the abandonment of manufacture at an advanced stage in the process. It was recommended by the Ministry of Munitions, and accepted by the Cabinet, that the manufacture of munitions should be terminated at the earliest possible moment, subject to discretion both as regards creating excessive unemployment and with regard to

the waste that would be engendered by the sudden cessation of the manufacture of expensive articles nearly completed.

With regard to the disposal of stores, the Surplus Stores Department of the Ministry of Munitions had been proceeding for some time with the day-to-day disposal of obsolete munitions, scrap, surplus machinery and other movable property no longer required by the Ministry. Owing to the enormous field covered by the Ministry this was a considerable operation, but one almost negligible as compared with the gigantic business which would have to be undertaken in respect of the accumulation of war stores on the cessation of hostilities. It was pointed out that large quantities of materials had been delivered to contractors to enable them to carry out their contracts, and plant and machinery had in many cases been installed in the works of manufacturers on terms which formed part of the contracts themselves. The Ministry of Munitions were made responsible for the disposal of these stores, and it was at that time considered not improbable that on the completion of this work the Ministry of Munitions would be converted into a permanent Ministry of Supply combining in itself the supply departments of the Admiralty, War Office, Air Force and even of the Stationery Office, and Office of Works.

The question of the post-war use of national factories was discussed as one of general policy. In labour quarters the view was strongly held that these factories should be put into commission immediately upon the cessation of hostilities to provide employment during the transition period, and thereafter should be operated by the Government in competition with private enterprise. These proposals were rejected. In the first place it was pointed out that for the immediate period of transition the factories would be useless. To convert a shell-producing factory into a factory for commercial purposes would take anywhere from six months to a year, and at the end of the year it was hoped that the worst period of dislocation would be over. Apart from this, on general grounds, it was felt that the Government by entering into competition with the private trader would to a great extent decrease rather than increase employment. The Minister of Munitions was therefore authorized to make arrangements for the disposal of national factories.

In fact, all the national factories, with the exception of a small number retained in connexion with the work of the Training Department to the Ministry of Labour, were disposed of. In addition to the cessation of contracts the Government's obligation in respect of placing further contracts in regard to peace requirements was also considered. It had long been maintained by labour opinion that the placing of Government contracts with special regard to possible unemployment would to a certain extent help to reduce unemployment. When, however, the volume of peace-time contracts is compared with the general volume of trade, it becomes apparent that the most careful placing of such contracts can do little to mitigate a situation in which unemployment is really serious. While this is so, in so far as Government contracts and contracts placed by public bodies can alleviate the situation, it was recommended that Government departments and public or semi-public bodies should be urged to place contracts for their peace requirements at the earliest possible moment. In point of fact this recommendation failed of its effect because public bodies (like private employers), being utterly unable to foresee the course of prices during the transition period, were not disposed to run the grave financial risks involved.

Proposals were further made with a view to the development of industry immediately upon the cessation of hostilities. These proposals took two forms: (a) proposals for obtaining new markets and the materials necessary for post-war manufacture, and (b) the actual development of the various industries.

Under the first head it was contemplated that the reconstruction of the devastated areas of Belgium and France would necessarily bring large orders to the British manufacturers. It was accordingly proposed that an International Commission should be appointed to investigate the question of reconstructional work in the devastated areas of Belgium and northern France and to prepare schedules of contracts. Proposals were further made with a view to stimulating those industries, such as dyes and glass, which had during the war taken over processes previously carried on by the Germans.

With regard to materials, the early history of munitions supply had indicated that in the handling of raw materials lay the key to the control of industry. Metal and ore during the war had been controlled by the Priority Department of the Ministry of Munitions, wool and textiles (except cotton) by the War Office, and cotton by the Board of Trade. Two steps were taken to apply similar principles to the period of reconstruction. In the first place a Priorities Committee of Cabinet Ministers was set up as the ultimate authority for the allocation of raw materials. In the second a standing council was established consisting of leading representatives of commerce, industry, labour and the departments concerned to advise the Cabinet Committee. Ancillary to these bodies control departments for building were established under the general direction of the Ministry of Reconstruction. Under these general authorities special committees were set up for various trades to consider the nature and amount of supplies of materials and foodstuffs which, in their opinion, would be required by the United Kingdom during the period which might elapse between the termination of the World War and the restoration of a normal condition of trade.

With regard to the development of industry, the future of engineering, agriculture and electric power were held to be the burning problems of the moment. So far as the employment of women was concerned attention was directed to their rights as competitors with men and the means by which they could be encouraged to revert to domestic service.

Engineering.—The first engineering committee was appointed by the Board of Trade under the chairmanship of Sir Clarendon Hyde and made certain recommendations dealing with essential industries, the amalgamation and joint working of existing firms, apprentices, technical education, trade combination, trade marks and patents. In particular it recommended that "every effort should be made to develop and encourage the medium and light engineering trades, whether already existing in this country or not, thereby making use of the workshop motive power and equipment installed for war purposes, and finding suitable employment for the large body of semi-skilled and female labour recently created."

This last recommendation was accepted by the Government, and the Minister of Reconstruction appointed a further committee, known as the Engineering Trades (New Industries) Committee, under the chairmanship of the Hon. H. D. McLaren:—

"To compile a list of the articles suitable for manufacture by those with engineering trade experience or plant, which were either not made in the United Kingdom before the war, but were imported, or were made in the United Kingdom in small or insufficient quantities and for which there is likely to be a considerable demand after the war, classified as to whether they are capable of being made by (1) women, (2) men and women, (3) skilled men, and setting out the industries to which such new manufactures would most suitably be attached; and to make recommendations—

"(a) On the establishment and development of such industries by the transfer of labour, machines and otherwise;

"(b) As to how such a transfer could be made, and what organization would be requisite for the purpose, with due regard to securing the co-operation of labour."

This committee appointed sub-committees to deal with the various branches of engineering.¹

Agriculture.—So far as agriculture was concerned, in 1915 the Prime Minister appointed a committee under the chairmanship of Lord Selborne. Their first report resulted in the setting up of the Agricultural Wages Boards which have regulated the wages of agricultural workers. The final report, presented in Jan. 1918,² dealt with the problems of small holdings, land reclamation and drainage, credit facilities for land settlers, village reconstruction, and rural transport.

Electric Power.—Two committees were set up to deal with electric power supply. The first, appointed by the Board of Trade, under the chairmanship of Sir Archibald Williamson reported:³ (a) that a highly important element in reducing manufacturing costs will be the general extension of the use of electric power supplied at the lowest possible price; (b) that the present system under which a supply of electricity is provided in a large number of small areas by separate authorities is incompatible with anything that can now be accepted as a technically sound system; (c) that a comprehensive system for the generation of electricity, and, where necessary, reorganizing its supply, should be established as soon as possible.

The problem was further considered by the committee of chairmen on electric power supply.⁴ They reported (a) that the development of electricity should take place on a national scale and under the control of the State; (b) that an Electricity Board should be set up to advise upon and control the carrying out of the national scheme, assisted by an operating executive; and (c) that the first duty of the Board would be to plan out a comprehensive scheme for the whole country, and then by degrees to secure the development of electrical power over the whole of the United Kingdom by such methods as they might find suitable to the requirements of different areas.

In this way the committee of chairmen reduced the general principles enunciated by Sir Archibald Williamson's committee to practical proposals, though proposals still on a universal scale. The electricity commissioners under the Ministry of Transport were the tangible result of these recommendations.

(B.) IMMEDIATE POST-ARMISTICE PERIOD

On Nov. 11 1918 the Ministry of Munitions issued to contractors, sub-contractors and workpeople engaged on work for the Department, a notice indicating the line of action to be followed. The instruction proceeded on the following lines:—

1. There should, as far as possible, be no immediate general discharge of munition workers.

2. All workers, however, who desire to withdraw from industry or to leave for any reason, and all workers who can be absorbed elsewhere, should at once be released. Production on contracts for guns

⁴ Cd. 93.

and gun munition, machine-guns, small arms and small-arms munition, trench mortars, bombs and stores, pyrotechnic stores, aerial bombs, or accessories of the above stores, aircraft and air engines, and the manufacture of explosives, should be reduced in the following ways: (a) all overtime should be immediately abolished; (b) systems of payment by results may be temporarily suspended; (c) where reduced hours are worked upon a time-work basis, the number of hours worked must not be less than one-half of the hours in the present normal working week. If the earnings of workpeople fall below certain figures they will be made up to them by the State.

3. The adoption of half-time may cause discharges, but these should be spread out for as long a period as possible.

4. Free railway facilities will be provided for workpeople from the place of employment to their homes or to places where they have new employment.

At the same time, the first announcement was made of the institution of a temporary non-contributory scheme for unemployment which would remain in force pending the introduction of a general contributory scheme, the main provisions of which were that unemployed men were to receive 24s. per week and women 20s. (later increased to 30s. and 25s.), with additional allowances for dependants. Almost immediately afterwards instructions were issued in respect of war munition volunteers, war work volunteers, national service and war agriculture volunteers indicating that the schemes would be terminated at Dec. 14 1918. A notice was issued at the end of Nov. dealing with soldiers released from the colours, and army reserve munition workers.

These instructions indicated the methods by which the employment of these men under war conditions would be terminated. They followed to a large extent the lines of the recommendations prepared by the committees mentioned above; but it was felt by the Government that it was necessary to constitute a special department for dealing with problems of civil demobilization. Accordingly, at the end of Nov. a Controller-General of Civil Demobilization and Resettlement was appointed and his department was attached to the Ministry of Labour. This department was made responsible for:—

(a) the actual machinery of the return both of the men from the forces and civilian workers to their previous occupations through the employment exchanges;

(b) attempting to remove from the labour point of view obstacles to the restarting of industry; and

(c) the administration of the Appointments Department which dealt, on a rapidly increasing scale as demobilization proceeded, with the training and placing of ex-officers and men of similar educational qualifications. To these functions were added later the responsibility for the Civil Liabilities Resettlement Scheme.

The first few months were a time of great difficulty and strain. On the one hand the machinery devised for demobilization of the forces was found to be too slow to meet the situation and a new scheme was introduced which enormously expedited the procedure. This led to a position when very large numbers of both ex-civilian workers and ex-service men were out of work at the same time. Immediately, therefore, protests were made, against the rapid closing down of factories engaged upon war work. Deputations were constantly received both by the Minister of Labour and the Minister of Munitions protesting against the closing of factories engaged upon war work, and during the end of 1918 and the early months of 1919 it was found necessary to keep certain factories engaged on munitions at work even though their products were not likely to be required. Every effort was made by the newly created Civil Demobilization and Resettlement Department to make the transition from war to peace work as easy and as rapid as possible. For this purpose at the end of 1918 it was decided to set up for each of the areas covered by the Ministry of Labour Employment Exchanges a divisional council, elected from members of the local employment committees to which reference has already been made. The business of these councils, which operated till the later months of 1919, was to coördinate the work of the local employment committee and particularly to help in the transition from war to peace. In order to assist the councils in their work a number of officers known as Resettlement Officers were appointed by the Minister, whose business was to travel round the country and investigate the causes which impeded the

turnover from war to peace. Such conditions as a temporary shortage of materials, shortage of rolling stock, inability to recover premises required for business purposes commandeered by the Government, housing difficulties, and many other matters of this type were investigated and dealt with by these officers under the directions of the Minister and of the divisional councils. At the end of the year, the Government set up a minister in general charge of reconstruction problems, with a council designed to review the position generally and give instructions to the various departments concerned in the work. This council terminated its functions upon the formation of the Lloyd George Government at the beginning of 1919.

(C.) THE FIRST TWO YEARS OF RESETTLEMENT

The success of the preparations which had been made, and of the method in which the machinery was worked, is indicated by the figures of re-absorption of men demobilized. For six months after the Armistice there was a steady increase in the number of ex-service men unemployed, and at the beginning of May 1919, when about 3,300,000 men had been discharged, over 400,000 were recorded as drawing out-of-work donation. From that date, although the numbers discharged continued to rise, there was an almost uninterrupted fall in the number unemployed, until, at the end of July 1920, when demobilization was practically complete and over 5,000,000 men had been discharged, less than 150,000, or only 3%, were registered as unemployed.

These figures relate only to ex-service men, and in order to discover how far the ex-civilian workers had been reabsorbed, it is necessary to look at the unemployment figures for the same period. After the Armistice the number of civilian workpeople unemployed rose continuously until the beginning of March 1919, when nearly 800,000 were recorded as receiving out-of-work donation. After that date, however, there was a rapid improvement, and by the end of Sept. the number had fallen to about 100,000. Owing to changes in administration and in some cases to the exhaustion of benefit, the figures, no doubt, overstate the extent of the improvement, but, even when due allowance is made for these factors, it is clear that there was a remarkable recovery after March 1919. The evidence so furnished is confirmed by the statistics of unemployment among the members of certain trade unions which make regular returns to the Ministry of Labour. In these unions (mainly composed of skilled workmen) the proportion unemployed, which was 0.4% at the end of Oct. 1918, rose month by month after the Armistice until it reached 2.0% at the end of March 1919. From that date, however, it fell, and at the end of Sept. 1919 it was only 1.6%. There was a further rise in the winter of 1919-20, due to the strikes in the railway service and in the iron foundries; but the percentage fell again in the spring of 1920, and from March to June of that year, when demobilization was almost completed, it varied between 0.9 and 1.2%, much below the figure for any month in 1913, which was itself a year of good employment.

The consideration of these figures indicates that the turnover from war to peace had been effected with surprising speed and with remarkable lack of trouble. But while in the first 18 months after the Armistice trade would have rapidly recovered, provision was urgently required for certain large classes of ex-service men which may be grouped as follows:—

(a) the disabled who, although in receipt of pensions, required training to enable them to enter upon some occupation;

(b) youths whose apprenticeships had been interrupted;

(c) women thrown out of work by the turnover from war to peace;

(d) the ex-officer who, as a result of the war, was either unable or, for adequate causes, unwilling to resume his old occupation; and

(e) the large number of men who had had some small business or undertaking which had been seriously affected by the war.

So far as the first class was concerned two steps were taken—the first to place men in immediate employment, the second to train them for employment later.

Placing of Disabled Men.—During 1917 a scheme had been proposed by Mr. Rothband, of Manchester, for absorbing a proportion of disabled men in each industry. This scheme was fully canvassed during the later years of the World War, and finally, in Aug. 1919, was adopted by the Government. In that month the King's National

Roll for disabled men was inaugurated by Royal Proclamation, and the scheme itself was actually launched on Sept. 15. The basis of the scheme was to ask each industry to take disabled men into its ranks to a proportion of 5% of the total employees. Individual employers who agreed to come into the scheme were given a certificate to that effect, and were entitled to use a special seal saying that they were inscribed upon the National Roll. Industries, of course, vary considerably in their power to absorb disabled men, and the 5% was not rigidly enforced, but they were invited to take as large a percentage as the nature of the work permitted. The scheme worked with considerable success. At Feb. 19 1921 the number of employers on the roll was 24,278. The total staffs covered by them was 4,167,171; the number of disabled ex-service men employed was 270,552.

The Roll was headed by the King and Queen Alexandra. H. M. Treasury were entered upon the Roll in respect of Government departments and Government industrial establishments, and the Roll included the staff of the Houses of Lords and Commons and of the Law Courts. Special efforts were made to include local authorities upon the Roll, and at the date mentioned above there were 751 upon the Roll in England and Wales, and 68 upon the Roll in Scotland. In addition arrangements were made by which preference was given in allocating Government contracts to employers whose names were upon the Roll. It may be noted in this connexion that when the scheme was launched in Sept. 1919 the number of disabled ex-service men who had registered themselves as unemployed was 41,616. There is no doubt that in addition to the men registered there was a considerable number, perhaps as many as 20,000, who had not reported themselves—a fact which is proved by additional registrations which followed upon the inauguration of the scheme. As a result of the scheme the figure fell to 14,849 in Sept. 1920. Of these a considerable number were in Ireland, where the National Roll, for various reasons, could not operate.

Training dealt with three main classes: The disabled ex-service man who could not, owing to his disability, return to his pre-war occupation; the man whose apprenticeship had been interrupted by war service and could not be renewed without assistance from the State; and the woman who, by entering munitions work at an early age, had failed to acquire a woman's trade. In addition to these classes there was the fit ex-service man whose enlistment in the army or navy at an early age had prevented him from acquiring a skilled trade. For industrial reasons it was soon found that little could be done unless he had commenced an apprenticeship before the war.

On Aug. 1 1919, when the industrial training of disabled ex-service men was taken over by the Ministry of Labour from the Ministry of Pensions, about 10,000 men had already been trained, about 12,000 were under training, and some 75,000 more were estimated to be awaiting training. In dealing with this problem the policy of the Training Department was to associate the administration of industrial training with local education authorities, to retain and increase the co-operation already established in training matters with the trades and industries concerned, and to repair the shortage of training facilities by the establishment of Government instructional factories. The organization set up was based on the division of the country into 17 administrative areas, each under a divisional director.

The co-operation of the employers and workpeople of the industries and trades in which men were being trained had already been secured after protracted negotiations with the leading British industries, which were conducted in 1916 and 1917 by the late Mr. St. George Heath of the Ministry of Labour. These negotiations resulted in a series of agreements to which representatives of employers' organizations, trade unions and the State were contracting parties, providing for the precise length of the training courses, the regulation by each trade of the number of men admitted to training in it, and the proportion of the men's pay respectively contributable by the employer and the State. The training schemes were drawn up by the National Trade Advisory Committees, composed of equal numbers of representatives of employers and workpeople, and their supervision was carried out by Local Technical Advisory Committees, similarly constituted, without whose consent no man was to be placed into training.

The policy of concentrating training in the Government instructional factory, based on the closest possible imitation of the management, discipline, machinery and productive work of the ordinary factory, but differing from the latter in that its primary function is the output of trained men instead of finished goods, was the outcome of the great and growing demand during the war for semi-skilled workers, capable of setting free the skilled man for more complicated operations. The impossibility of obtaining a rapid supply of such workers through the ordinary workshop, which was too intent upon production to occupy itself with the scientific up-grading of unskilled labour, or through the existing machinery of the technical schools, which were out of touch with the requirements of modern large-scale manufacture, compelled the Government to set up institutions of its own. In these was evolved a system of intensive training capable of teaching in two or three months, to a woman hitherto accustomed only to house work, one or two of the simple operations involved in specialized repetition work and of turning her, for example, into a competent capstan hand. The considerations which led to the adoption of this system for the purpose of dilution applied even more strongly to the case of the disabled man.

Up to Jan. 1921 some 50,000 men had been trained or were in training under the Ministry of Labour in addition to the 10,000 already trained when they took over from the Ministry of Pensions. Fifty Government instructional factories had been set up with accommodation for 20,000 men, providing training in most skilled trades in the country and engaged on productive work ranging from the building of houses to the repairing of watches and clocks.

The chief trades in which training was given were mechanical and electrical engineering, building in all its branches, furniture-making and wood-working, boot- and shoe-making and repairing (hand and machine), tailoring (wholesale and retail), watch- and clock-making and repairing, brush-making, basket-making, motor mechanics and commercial work, besides a great number of smaller trades, or trades, such as textiles and pottery, in which the amount of training given has been more limited. A considerable number of men were trained entirely in employers' workshops, but in the majority of cases a preliminary period in an institution, either a technical school or preferably an instructional factory, was given before placing a man for the completion of his training with an employer. The experience acquired during the war, in connexion with semi-skilled workers, that instruction controlled and directed on scientific principles results in a surprisingly high rate of progress on the part of the learner, was amply confirmed when applied to training for skilled occupations.

Interrupted Apprenticeships.—Prior to the Armistice a special committee, appointed by the Ministry of Reconstruction, considered this problem, and, in consultation with the Labour and Resettlement Committee, prepared a scheme to enable those involved to complete their apprenticeship. It was recognized that each industry had its own problems and that no uniform scheme could be adopted. The Committee, therefore, contented themselves with laying down certain general principles which should be observed if State assistance was to be obtained. It was left to each industry, through an organization representative of employers and operatives, to prepare a detailed scheme adapted to the needs of the industry concerned and embodying these general principles, which may be summarized as follows:—

(i) Men in the last year of their apprenticeship on enlistment should be regarded as journeymen.

(ii) The unexpired period of apprenticeship should be reduced by not less than one-third of the time lost by service in H. M. forces.

(iii) The time, if any, during which a man worked at his trade while in H. M. forces should be counted as part of the original apprenticeship.

(iv) After reaching the age when his original apprenticeship would have terminated, or the age of 21, whichever was the earlier, the man should be paid not less than three-quarters of the journeyman's rate for the first half of the resumed apprenticeship and not less than five-sixths for the remainder. Towards such wages the State would pay a grant equal to one-third of the journeyman's rate.

(v) Provision should be made in the scheme for allowing the training in the employer's establishment to be supplemented by training in a technical institute, the State agreeing to pay fees and a maintenance allowance.

(vi) An agreement should be entered into by employer and apprentice under which the employer undertook to train the apprentice as a skilled workman, and the apprentice to complete his training with the employer.

Forty distinct industries, covering about 800 different trades, prepared schemes in accordance with the principles laid down above. These schemes varied in many details, especially as regards the wages payable and the rate of deduction to be made from the unexpired period of apprenticeship in respect of the time served in H. M. forces.

An additional scheme was prepared by the Ministry of Labour to cover unorganized trades and trades where the small number of apprentices did not justify a special scheme.

The number of apprentices brought under the scheme was, at the end of Jan. 1921, 43,500. These figures do not indicate the total number of persons who, whether directly or indirectly, had benefited as a result of the scheme. A large number of important firms, including the majority of the railway companies, took back their ex-service apprentices under conditions as good as, or better than, those laid down in the scheme, but preferred not to ask for State assistance. Government departments, such as the Admiralty, the Ministry of Munitions and the Post Office, adopted a similar course. Persons in their last year of apprenticeship on enlistment were treated as journeymen but did not receive State assistance.

It has been estimated that the number of persons who in this way indirectly benefited under the scheme was at least as large as the number of those who were formally brought within its provisions.

On Jan. 1 1921 the number of apprentices who had applied and were eligible, but for whom employers had not been found willing to enable them to complete their apprenticeship, was 300. It will be seen, therefore, that practically the whole of those desiring to complete their apprenticeship were enabled to do so.

One of the conditions attached to payment of State assistance was an undertaking on the part of the employer that he would give to the apprentice the training necessary to make of him a skilled workman. It became, therefore, the duty of the Ministry of Labour to take steps to insure that this undertaking was carried out. Employers

might otherwise draw State assistance and exploit the labour of the apprentices by keeping them on "repetition" work. A small staff of specially qualified officers was accordingly appointed to visit the firms having apprentices under the scheme, and satisfy themselves that the training given was satisfactory.

The training given to these apprentices was modelled on the training given to boys. Where such was the case it was not possible to take exception to what was in fact the methods customary to industry. But in investigating the training of the ex-service men, the officers were, in effect, making a survey of the methods of training customary in the skilled trades in the case of boy apprentices. No such survey had ever been attempted before.

As stated earlier, each scheme for an industry was prepared by some organization representative of employers and operatives in that industry. Much thought was given by the industry to the preparation of these schemes, and the methods and facilities for training, whether in the workshop or technical institute, were fully discussed. A scheme when finally adopted represented, therefore, a considered agreement within the industry. In connexion with the administration of the various schemes, many difficult questions of interpretation arose. The Ministry of Labour made no attempt to give an interpretation, but referred the question to the trade organization who had prepared the scheme, and accepted their interpretation; acting on the assumption that the only body fitted to give a decision was the organization responsible for the scheme. Where disputes arose between an individual employer and apprentice, it was provided in the agreement between the two that such dispute should be referred to the Trade Panel of the Local Employment Committee and that the decision of the panel should be final.

It will be seen, therefore, that the policy underlying the scheme was one of administration under the advice and direction of the various industries. This policy was adopted after careful consideration. It was felt that, in view of the widespread dislike of Government interference, any attempt to impose a scheme on industry was bound to fail, and that success could be looked for only if the co-operation of industry was sought and secured. This policy has been justified by its results. The Ministry of Labour, throughout, was able to count on receiving the fullest assistance, both from employers' associations and trade unions.

Women's Training.—The first women's training course was opened at the end of May 1919. This was a course of training for domestic service, and 16 young women passed through the 13 weeks' course and obtained good situations at its close. Altogether 84 centres for training in domestic service were established, and just over 2,000 women trained. The experiment proved successful and encouraging. The courses were held in widely differing conditions and localities, but under the excellent teachers the interest of the women was aroused and the majority went straight into service from the schools. These classes were held in various parts of London and the suburbs and in 42 towns throughout Great Britain.

Apart from domestic service, some 7,000 women were trained for industry. The department's training was from the first restricted by the terms of the Treasury grant "to normal women's industries which were women's trades or processes before the war," and to these, notwithstanding much pressure from women's organizations, the women's training branch rigorously confined its activities. Three other conditions limited the sphere of its industrial training, viz. a reasonable prospect of absorption in the industry after training, good working conditions, coupled with fair wages, in the trade, and the consent of the trade unions and the employers concerned to training being given. Exhaustive enquiry and constant watchfulness were necessary in these connexions.

The greatest demand for training, combined with the best prospect of absorption and most favourable conditions, was found in the two chief women's trades—dressmaking and tailoring; and 77 courses were provided, affording accommodation for 3,362 women.

The majority of these training courses came to an end on June 30 1920, though a limited number were continued for varying periods in order that the standard course might in each case be completed, viz. six months for an industrial and three months for a domestic course. From July onwards but few new schemes (and those solely of a domestic type) were started, but by this time the trade slump had begun, and it was useless to train women for industries in which the chance of employment was of the slenderest.

The training referred to above is that of women who were thrown out of employment by the termination of the war. The Women's Training Branch, however, was entrusted with the training of two other classes of women directly affected by the war, viz. soldiers' widows and disabled nurses. The powers of the State to give such training to these women as would enable them to supplement their pensions by employment were first vested in the Ministry of Pensions by Royal Warrant, but were transferred to the Ministry of Labour by Order in Council in the autumn of 1919.

Over 4,000 applications from widows were dealt with, and training found for over 1,800 of those who applied. During the training, which was in all cases free, an allowance was made to the widow in addition to her pension to enable her to meet any extra expense to which she might be put. A large number of widows were trained as practising midwives. Having a home and a pension they were able, as few women were, to accept the precarious livelihood which

this calling offers in a rural district. As all had to pass the examination of the Central Midwives' Board, women of good general education only were selected for this particular branch. Another large group of the widows in training were those learning tailoring and dressmaking, home dressmaking being especially popular, possibly because the department was empowered to make a grant of a sewing machine on the completion of the course and also because the work could be carried out without interference with normal domestic ties and duties. Training in cookery, ladies' hair-dressing, confectionery, photographic studio work, and secretarial work was also given.

Applications received from disabled nurses were relatively few in number, as was to be expected, because those only were eligible who were in receipt of a disability pension under the Royal Warrant, and were not entirely disabled but physically unfit to practise as nurses. After the powers of the Ministry of Pensions were transferred to the Ministry of Labour in the autumn of 1919, 140 disabled nurses had by March 1921 been placed in training, out of 394 applicants. Some very sad cases were brought to light, many of the women proving physically unfit for the training desired, and for such application for assistance was made to the "Officers' Friend." Those remaining under training in March 1921 represented a great variety of occupations, including dispensing, massage and electrical treatment, public health appointments, secretaries and chauffeurs to doctors, poultry farming, etc.

Training and Placing of Ex-Officers.—The Appointments Department came into being during the war. Upon the Armistice its work developed very considerably both as regards training and placing in employment. In the first place, so far as training was concerned, under the decision of the War Cabinet given in Dec. 1918, funds were made available for higher educational training in universities, technical colleges, agricultural colleges, farms, professional firms, business houses, etc. The Board of Education, the Board of Agriculture and the Ministry of Pensions with the Ministry of Labour were made responsible for the administration of the scheme. The Appointments Department, by reason of its experience and provincial organization, operated as the machinery by which all the departments obtained information as to applicants, while the training for agriculture and higher educational training remained respectively with the Ministry of Agriculture and the Board of Education. The professional business and workshop training was transferred from the Ministry of Pensions to the Appointments Department. Under this scheme 17,311 ex-officers and men of similar educational qualifications had been placed by the Appointments Department in training at the end of Jan. 1921, while there were 1,864 waiting.

In connexion with the scheme selection committees were set up throughout the country, composed of prominent professional and business men in each district. The functions of these committees were to interview candidates who applied for grants, and to make recommendations to a body known as the Grants Committee at headquarters. The final decision in such recommendations rested with the London Grants Committee.

These committees worked in turn in conjunction with what were known as Interviewing Boards, whose functions were (a) to decide what applicants properly came within the purview of the Appointments Department; (b) to advise applicants as to their prospects of obtaining employment, and (c) to select applicants as candidates for the vacancies on the books.

So far as placing was concerned, upon demobilization the department undertook the work of acting as official agent between employers and their former employees, who were either officers or men of other ranks of similar educational qualifications. In this capacity the department facilitated the return to their pre-war employment of 169,321 men up to March 26 1919. In addition to this the department undertook special activities with a view to finding new appointments for ex-officers, and up to the end of Jan. 1921 it found employment for 48,860 men, with 10,720 men remaining unemployed.

Resettlement of One-Man Businesses.—In May 1916 the Military Service (Civil Liabilities) Department came into being to help the wives of serving soldiers where military service imposed serious hardship. The scheme was limited to men who had joined the forces since Aug. 4 1914. The general items in respect of which assistance was granted included rent, mortgage interest, payment in instalments of contracts such as the purchase of premises, business or furniture, rates and taxes, insurance premiums and school fees. The maximum amount granted was not to exceed £104 per annum. Up to the conclusion of this scheme on July 31 1920, 475,271 applications had been received and 312,810 grants had been made to a total value of £6,239,670. In Feb. 1919 the Government decided to extend the principle of this scheme with a view to resettling men in their previous businesses when they were, as a result of military service, suffering serious financial hardship. The scheme as amended took two forms: current assistance could still be given in respect of liabilities such as those mentioned above, or alternatively, a lump sum grant towards the restarting of a business might be given.

So far as the second class of case was concerned, the Civil Liabilities Department was not empowered to pay resettlement grants for new businesses except in the case of disabled men. In that case alone the disability was in itself treated as serious financial hardship, and powers were given to make grants for those men in respect of new businesses. Under this scheme up to the end of Jan. 1921, 251,259

applications were received; 95,651 grants were made at a total expenditure of £2,675,665. In addition there was a special scheme for providing tools for workmen who had to return to their pre-war occupations. Under this scheme £21,562 was paid out.

(H. W.F.)

UNITED STATES.—United States troops continued to embark for Europe until the signing of the Armistice Nov. 11 1918. At that time, according to the final report of Gen. Pershing, 2,071,463 officers and men had sailed to serve with the A.E.F. and only some 15,000 had returned to the United States. According to figures compiled by the War Department, the total number of officers and men encamped in the United States on that date was 1,634,499 and more than 300,000 additional men had been ordered to be in camp before Nov. 30 1918. All draft calls were at once cancelled. On Nov. 26 orders were issued for immediate demobilization of the Students' Army Training Corps, which had been introduced Oct. 1 in about 500 colleges and universities throughout the country. This led to the discharge of some 150,000 students during December.

The question of general demobilization presented serious difficulties, and precedent offered slight help toward their solution. It was recognized that with peace would come a drastic curtailment of production in many industries, and it was feared that this curtailment and the sudden release of large numbers of soldiers would result in wide-spread unemployment and suffering. On the other hand the retention of a large army no longer needed would impose an unjustifiable financial burden upon the country. It was decided to discharge all emergency troops as rapidly as they could be dispensed with; but at the same time the Department of Labor was requested to watch carefully the labour situation, so that if desirable the rate of discharge might be reduced locally or as a whole.

The method of demobilization finally adopted differed from that employed by the European Allies. The plan of release by military "classes" based on age and length of service, natural in France and Italy, could not be applied in a country where the system of universal military service was unknown. It would have caused needless delay to attempt demobilization of the A.E.F. before beginning the release of men encamped in the United States. Neither was it feasible to follow England's system of "industrial demobilization." Profiting by the early mistakes of her Allies, America had not drafted indiscriminately into immediate service "key or pivotal men" from essential industries, but had placed them under deferred classification. Any attempt to demobilize by different occupations would have caused useless delay and might have impaired seriously military units overseas. It was therefore decided to demobilize by complete military units. In this way men returned to America under their own officers in orderly fashion. From the beginning, however, attention was given to individual requests for discharge, especially from American camps, if it appeared that men were needed by their families or their service required for industries. Speed of return from overseas was governed solely by transport facilities. About one-half of the American troops had been carried across in British vessels, which now were needed for home and colonial service. At the time of the Armistice transports belonging to the U.S. Government had a capacity of only about 110,000 a month. This was now rapidly increased by the release of battleships and cruisers. Use was made also of German passenger ships, and arrangements were made for the use of Italian, French, Dutch, and Spanish vessels. On June 30 1919, 173 vessels were in use as transports. After the Armistice embarkation camps were organized at Bordeaux, Brest, and St. Nazaire, and later at Havre and Marseilles. Le Mans was selected as a centre of distribution for the ports, and accommodations were ordered there for 230,000 men. There was considerable complaint of congestion and inadequate care of troops, especially at Brest, where there were normal accommodations for only 55,000 men, although that port alone was available for the largest transports. In America, Boston, Charleston, Newport News, and New York City were chosen as ports of debarkation.

Troops began to land in America in large numbers Dec. 2 1918, when the "Mauretania" reached New York with 4,000.

By June 3 1919 there remained in France only 694,745 officers and men. The A.E.F. headquarters were closed in Europe in Sept. on the departure of Gen. Pershing. Practically the last remnant of the A.E.F. in France embarked with Brig.-Gen. Connor in Jan. 1920. There remained in Europe, besides the Graves Registration Service and special commissions, only the Army of Occupation in Germany. By June 30 1920 troops in Europe had been reduced to below 17,000.

Camps and cantonments in the United States formerly used for mobilization were converted into centres of demobilization, and to these were sent troops from overseas as well as those at home. Efforts were made to send each man to the demobilization centre nearest to his home or place of enlistment. Each man was given a rigid physical examination and those suffering from contagious disease were detained until there was no longer danger of infection. Discharge papers were prepared, accounts carefully settled, and an allowance of five cents a mile made each man from camp to his home. To encourage immediate return a reduced railway fare of two cents a mile was conceded those who departed within 24 hours after discharge. During the first three months of demobilization discharge required from four to seven days, but this was soon reduced to an average of two days. Gradually it was possible to reduce the number of centres, and beginning Nov. 25 1919 troops in America were discharged where stationed. Only two large centres were retained, Camp Dix, N.J., and the Presidio in San Francisco, for the use of troops returning from overseas, and even these were dispensed with after March 15 1920.

The following table prepared by the War Department shows the rapidity of general demobilization, month by month and cumulatively during the first year.

	1918.	Officers.	Cumulative.	Enlisted Men.	Cumulative.
Nov. 11-30		593	593	43,000	43,000
Dec.		37,043	37,636	609,000	652,000
1919.					
Jan.		23,563	61,199	358,000	1,010,000
Feb.		14,913	76,112	263,000	1,273,000
March		11,479	87,591	263,000	1,536,000
April		12,185	99,776	298,000	1,834,000
May		14,622	114,398	383,000	2,217,000
June		13,588	127,986	391,000	2,608,000
July		16,404	144,390	361,000	2,969,000
Aug.		15,986	160,376	151,000	3,120,000
Sept.		8,716	169,092	73,000	3,193,000
Oct.		8,690	177,782	33,000	3,226,000

The cost per man of demobilization varied from month to month because the uncertainty of the number of men to be handled required the keeping up of all the demobilization machinery; for March 1919 it was \$69.95 but for June only \$20.07.

At each demobilization centre were stationed representatives of the U.S. Employment Service, and if the discharged man had no prospective job he was registered and a card given him for the local service representative nearest his own home. The Employment Service attempted to coordinate and cooperate with various local organizations, such as chambers of commerce, boards of trade, and patriotic and welfare societies. In Baltimore, Boston, Chicago, New York, and some other large cities, large bureaus were created for securing work for returned soldiers, sailors and marines. It is impossible to estimate the number of places secured through these agencies, as few kept accurate records. But the Employment Service alone, during the 10 months from Dec. 1 1918 to Sept. 27 1919, registered 758,474 men and secured employment for 474,085. It was seriously handicapped, however, by lack of adequate appropriations in 1919 and its operations were practically suspended after October. Although there were some industrial centres which, immediately after the Armistice, experienced a degree of depression, business as a whole was prosperous with the result that the great mass of the returning soldiers, many of whom returned to their old jobs, had little difficulty in finding employment. There was, of course, a certain percentage of discharged men who found it difficult or irksome to adjust themselves again to the conditions of civilian life; these were inclined to drift to the large cities, even though the opportunity for getting employment there was often less favourable than elsewhere. The surprising thing was not that a comparatively small number was unable to get work, but that so large a number could be absorbed without at any time causing an acute unemployment problem. One method early proposed for helping discharged men was that of awarding a soldiers' bonus. The Federal House of Representatives passed a Bonus Bill May 29 1921 by a vote of 289 to 92. The bill carried an appropriation of \$1,600,000,000. Protest, however, arose throughout the country, largely due to the prospect of a great increase in taxation, and the Senate took no action. At its national conventions held in 1920 and 1921 the American Legion was almost unanimous for a bonus for all who had served. Several states have acted on their own initiative and voted on the question of granting a bonus to their citizens who served. According to statistics gathered

for *The American Legion Weekly*, up to the middle of May 1921 some form of bonus had been granted in 13 states, namely, Maine, Massachusetts, Michigan, Minnesota, New Hampshire, New Jersey, New York (later declared unconstitutional), North Dakota, Rhode Island, South Dakota, Vermont, Washington, and Wisconsin. The payment provided varied. In several states a lump sum of \$100 was awarded. In most cases the veteran received a fixed amount for each month of service (usually \$10 or \$15) up to a maximum (varying from \$120 to \$500). Bonus bills had been defeated in 11 states, namely, California, Colorado, Connecticut (relief fund provided, the interest of which is to be used for needy men), Delaware, Indiana, Maryland, Oklahoma, Tennessee, Texas, West Virginia, and Nebraska (relief fund provided, interest to be used for relief). No legislation was contemplated in 14 states, namely, Alabama, Arkansas, Georgia, Idaho, Kentucky, Louisiana, Mississippi, Nevada, New Mexico, North Carolina, South Carolina, Utah, Virginia, and Wyoming. In the other states preparations were being made to act upon the question.

The American Legion.—While the World War was still in progress there arose spontaneously among the American soldiers a wide-spread desire that with the coming of peace there should be created a permanent organization for perpetuating their feeling of comradeship and its ideals. Active steps toward this end were first taken at a caucus held by a number of service men in Paris March 15-17 1919. This was followed by another caucus held in St. Louis May 8-10 1919, when preliminary organization was effected and the name "The American Legion" adopted. Incorporation was secured by an Act of Congress Sept. 16 1919. The first annual convention was held at Minneapolis Nov. 1919. The purpose of the Legion, according to its constitution, is: "To uphold and defend the Constitution of the United States of America; to maintain law and order; to foster and perpetuate a one hundred per cent Americanism; to preserve the memories and incidents of our association in the Great War; to inculcate a sense of individual obligation to the community, state, and nation; to combat autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom, and democracy; to consecrate and sanctify our comradeship by our devotion to mutual helpfulness." The organization is non-sectarian and non-partisan. Any man or woman is eligible to membership who was in the military or naval service of the United States between the dates April 6 1917 and Nov. 11 1918 inclusive; also "all persons who served in the military or naval services of any of the Governments associated with the United States during the World War, provided they were citizens at the time of their enlistment and are again citizens at the time of their application." Exception is made of persons dishonourably discharged from service, as well as persons who refused to perform military duty "on the ground of conscientious or political obligation."

At the head of the Legion are a national commander and five national vice-commanders, elected by the national convention. The active director at headquarters is the national adjutant-general. Each state also is organized under a state commander and other officers. The local unit is called a post. On Sept. 30 1921 the number of posts was 10,795, located in every state of the Union and in the District of Columbia, the Philippines, Panama, Cuba and many other countries, including Canada, Mexico, Argentina, and France. The total membership at the same date was about 785,000.

The Legion strongly endorsed the proposed Federal bonus for all ex-service men; and, especially through its National Legislative Committee, was influential in giving publicity to the needs of disabled soldiers and in securing legislation in their behalf. To its efforts, in part at least, were due the enactment of the Sweet bill, providing for the Veterans' Bureau; the Veterans' Hospital bill, appropriating \$18,600,000 for building or improving hospitals for ex-service men; the publication of lists of draft evaders in the *Congressional Record*; the bringing to the United States of the body of an "Unknown Soldier" for burial in Arlington National Cemetery; the bestowal of the Congressional Medal of Honor upon the British "Unknown Soldier" buried in Westminster Abbey, and upon the French "Unknown Soldier" buried under the Arc de Triomphe. The official publication is *The American Legion Weekly*. The Women's Auxiliary had a

paid-up membership of 107,345 on Sept. 1 1921. At the national convention of the Legion in 1921 distinct organization was effected, and separate officers and headquarters were chosen.

DE MORGAN, WILLIAM FRENCH (1830-1917), English novelist (see 8.10), was born in London Nov. 16 1830 and educated at University College school and later at the college itself. He became a student at the Royal Academy in 1850 and in 1864 began the study of stained glass. Six years later he turned to ceramic work and soon became known in artistic circles as a potter, the "De Morgan" tiles being made remarkable by his rediscovery of the secret of some beautiful colours and glazes. But later in life he became even better known to the literary world through his novels, *Joseph Vance* (1906); *Alice for Short* (1907); *Somewhere Good* (1908); *It Never Can Happen Again* (1909); *An Affair of Dishonour* (1910); *A Likely Story* (1912); *When Ghost meets Ghost* (1914), in which the influence of Dickens and of his own earlier family life were conspicuous. He died in London Jan. 15 1917. In 1919 *The Old Madhouse* was published posthumously. His last but unfinished novel, *The Old Man's Youth*, was published, with additions by his widow (1921).

DENBY, EDWIN (1870-), American public official, was born at Evansville, Ind., Feb. 18 1870. His father, Charles Denby (d. 1904), was minister to China 1885-98. He was educated in the Evansville schools, went to China with his father in 1885, and two years later entered the Chinese imperial maritime customs service. He returned to America in 1904, graduated from the Law school of the University of Michigan in 1896, was admitted to the bar and thereafter practised in Detroit. On the outbreak of the Spanish-American War in 1898 he entered the navy, and as gunner's mate saw action at Santiago. Later he was a member of the Michigan House of Representatives. From 1905 to 1911 he was a member of the National House of Representatives and was allied with the conservative Republicans. He served as chairman of the House Committee on Naval Affairs. When America entered the World War in 1917 he enlisted at the age of 47 as a private in the Marine Corps and was sent to the training station on Paris I., S.C. He was advanced to corporal and sergeant and was highly successful in training recruits. In Jan. 1918 he was commissioned second-lieutenant and passing through the various stages, before the end of the year had been promoted major. After the close of the war he was appointed probation officer of the Detroit Municipal Courts. In 1921 he was appointed Secretary of the Navy.

DENIKIN, ANTON (1872-), Russian general, was of humble descent and held democratic views. After going through the usual military training and service he joined the Russian general staff, and in the earlier period of the World War he rose to the rank of lieutenant-general and to the command of a division on the Danube front. During the Russian revolution he followed Kornilov, and was for some time chief of his staff. He was arrested with Kornilov and imprisoned in Bykova. They escaped together and fled to the Caucasian shore of the Black Sea. There he joined Alexeyev, who was forming a small army of volunteers, chiefly composed of officers. On Kornilov's death (March 31 1918) he became the military commander of the army, while Gen. Alexeyev held power as "Supreme Leader" of the Government and organized recruiting and supplies. They collected the army on the southern border of the Don region, at Metchetinskaya, and established coöperation with a Caucasian detachment, led by Erdeli, with the Don Cossacks under Krasnov, and some 2,000 men who had marched right through the southern steppes under Drozdovsky. By June the army counted some 12,000 men and was able to attempt the reconquest of the Kuban territory. Things had changed considerably since March, when Kornilov's invasion came to a standstill in front of Ekaterinodar. The Kuban Cossacks had had time to ascertain the true character of Bolshevik occupation, and the volunteers moved down the Rostov-Vladikavkaz line and the Black Sea line from Tikhoryetzkaya to Novorossisk. The Reds, in spite of their numerical superiority, melted before this advance and one *stanitsa* (camp settlement) after the other joined the invaders. On Aug. 5 Gen. Alexeyev entered Ekaterinodar, the capital of the Kuban.

and practically all the resources of the prosperous country were henceforward at the service of the volunteers. By the middle of Sept. the army had increased to 60,000 men. The Germans, whose garrisons had advanced to Rostov at the mouth of the Don, did not look on that extension with friendly eyes; they did their best to disintegrate the volunteer fighting forces, and at the same time tried to induce Alexeyev and Denikin to accept a condition of vassalage, similar to that which had been submitted to them by the Don Ataman, Krasnov. But nothing of the kind was possible in the case of Alexeyev and Denikin: their whole energy was directed towards a patriotic reconstruction of Russia, and they declined all overtures from the crafty foe. On Sept. 25 Alexeyev died after an illness which he had contracted during the World War, but against which he had struggled by sheer devotion to his task, never sparing himself, never relaxing his efforts. It was impossible to replace fully this man, who resembled one of the heroes of antique virtue. Denikin, who had to step into the breach, was not Alexeyev's equal in military genius or in statesmanship, but he was worthy of his predecessor in purity of character and in his sense of duty.

The revolt of Siberia and eastern Russia against the Bolsheviks prevented the latter from concentrating their forces against the dangerous volunteers, and the Germans were at the end of their tether in the struggle with the western Allies, and unable to use their position in Russia to any useful purpose. These favourable circumstances made it possible for Denikin to spread his wings wide. The Don Cossacks joined him, he established communications with Astrakhan and Ural Cossacks and the Orenburg province on the right, while on the left, his lieutenant Schilling moved towards Kiev and Odessa. There was some very heavy fighting in the centre, where Stavropol was taken after a struggle of several days, and 35,000 Reds surrendered or were exterminated. Towards the beginning of 1919 Denikin was master in the S. of Russia, and could begin to organize a base for an attack on the main block of the Soviet Republic. The principal Cossack armies had congregated round the nucleus of the Volunteer army. The latter had unfortunately suffered grievous losses in the ceaseless fights of the Civil War, which it had to conduct in miserable equipment, with hardly any ammunition except that which was taken from the enemy, in hunger and cold; some 30,000 of its best men had fallen, and these could not be replaced either by conscripts, driven in by command, or by the Cossacks, who could fight well when they chose, but who did not always want to do so. The difficulty of the political situation became apparent when the question of an arrangement between the various forces under Denikin was seriously raised. On Nov. 1 Gen. Denikin met the Regional Assembly (*Krayevaya Rada*) of the Kuban territory. He made a powerful speech in which he said, among other things:

"Can there be any peace politics on the Kuban? Will your long-suffering settlement be safe from a new and more cruel invasion of the Bolsheviks when the Red power establishes itself firmly in Moscow, when it throws back by weight of numbers the Volga front, when it presses on the Don from north and east and when it moves towards you?—No! It is time that people should cease to wrangle, to intrigue, to seek precedence. Everything should be sacrificed for the sake of the struggle. Bolshevism must be crushed, Russia must be liberated. Otherwise your well-being will not prosper, you will become the plaything of the enemies of Russia and of the Russian people. . . . There can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. These should be one army—the Russian one, and also one front, one Chief Command, endowed with full power, responsible only to the Russian people, as represented by its future supreme authority."

The speech did not produce the desired effect. It was criticized in the lobbies by separatists and by Socialists, but it was at least conceded to the Commander-in-Chief that a Government should be formed in which ordinary provinces, like Stavropol or the Black Sea district, should be subjected to an emergency military régime, while the Kuban and to some extent the Don should be governed by independent institutions, though maintaining a kind of federal allegiance to the High Command. The Kuban obtained, in fact, political autonomy, but agreed to place its forces under the command of Gen. Denikin. Yet the Ukrainian

elements of the Rada contrived to send a special mission to Paris, and negotiated there with representatives of the Allies independently of the Russian "Political Council" and of S. D. Sazonov, the Foreign Minister of the South Russian Government.

For the conduct of the Government Gen. Denikin formed a "Special Council," which combined legislative and executive functions. It consisted of generals of the headquarters staff and the heads of departments, some 18 or 20 in number (Gens. Dragomirov, Lukomsky, Romanovsky, etc.; the civil members—Neratov, J. P. Shipov, N. Astrov, Stepanov, K. Sokolov, M. M. Fedorov, etc.). Most of the members belonged to the so-called National Centre and to the moderate Right. The Left was represented by four Cadets, of whom, however, two had drifted a good deal to the Right. The weight of authority rested with the generals, but there were long discussions and many compromises. It was attempted to steer a strictly "business course," politically colourless, but the Government did not succeed in achieving popularity. Gen. Denikin regarded this Assembly as a consultative organization, and gave his decision after listening to proposals and discussions. He insisted on keeping military restoration to the fore until the Bolsheviks had been laid low or at least until Moscow had been liberated. No pronouncement was allowed as to the form of Government, but the authority of the old Constituent Assembly, which was attempting to gather power in Ufa and Omsk, was rejected as the product of popular insanity. On the whole the Government was clearly leaning towards the Right, but Denikin was averse to any kind of acts of violence and oppression; his rule was, however, not free from contradictions and lacked political initiative. He followed the current more than he directed it.

His military plans were based on the idea that if he succeeded in driving the Bolsheviks out of the Russian provinces the population would reform behind his lines and set up compact patriotic levies against the hateful usurpers. With this purpose in view he pushed forward rapidly in all directions, and it seemed at first as if events justified his previsions. The Bolsheviks were driven back everywhere by the Volunteers and the Cossacks. When they rallied in the East and made a determined attempt to retake Tsaritsyn and turn the line of the Don they were repulsed and finally routed by Gen. Wrangel's Caucasian army. The Cossacks of Mamontov and Shkuro made raids deep into the lines of the enemy; officers and soldiers of the Red army deserted in thousands to the Whites; the population met Denikin's hosts as liberators with processions and the ringing of bells. Kursk, Kharkov, Voronezh, were occupied, and in July the advance guard reached Orel, some 200 m. from Moscow.

This rapid progress proved deceptive. The armies of liberation did not bring law and order with them. Not only were Commissars and prominent Bolsheviks given short shrift, but officers who had served in the ranks of the Reds and gone over to the Whites were subjected to irksome investigations and delays before obtaining "rehabilitation." The badly equipped and badly supplied troops laid hands on all sorts of goods and stores; it was hard to distinguish between requisition and looting. Such administrators as were introduced by the advancing army were more intent on bettering themselves than on looking after the population; the peasants felt themselves menaced by the revenge of the squires.

The people, driven to despair, took to flight, and the more adventurous among them formed "green" bands, which roamed about the country, seized stations, stopped trains, cut off provision columns. The most daring of these brigands, Makhno, made Ekaterinoslav his capital, and nearly overran Rostov in the summer of 1919. The most threatening symptom of all was the lack of union between the various sections of the Whites. The Kuban was preparing for complete independence and negotiating with the Mahomedan mountaineers for a league. Denikin found it necessary to strike hard against the Separatists; the Rada was dissolved; one of the leaders, Kalabukhov, was shot as a traitor, and a new Government was formed from among the supporters of a closer union with the Russian army (Nov. 1919). The "line" Cossacks were favourably disposed, but the *coup d'état* did not succeed in uprooting the movement for an in-

In the middle of the 19th century the market price per *Tønne Hartkorn* (Danish unit of land valuation, equal to 18 ac. good soil) was about 2,000 Danish kroner; in the first half of the 'eighties the 6,500 kr.; prices declined till towards the close of the century, the price then being 5,200 kr., rising later to about 8,500 kr. in 1913. A constant rise took place during the war, prices in 1918 reaching 12,800 kr. per *Tønne Hartkorn*. This decline of prices from the middle of the 'eighties to the close of the century, due to the general fall in corn prices, was met by a change of the whole system of agriculture in consequence of which milk, butter, bacon and seed took the place of corn and live stock as chief product. This development continued till the outbreak of the World War. The new industries were based on the use of home supplies together with imported grain and artificial manure, the result being a very considerable output, especially of dairy produce, pork, eggs, cattle and horses. Only a part was marketable in Denmark itself, and a considerable export trade was developed, dairy products, pork and eggs mostly going to England.

During the war, and after the beginning of the ruthless submarine campaign, conditions were altered, the importation of raw materials being very much impeded. The import of corn and forage, including oilcake, amounted before the war to 1,700,000 tons annually, while Denmark's home production was 2,400,000 tons of grain: allowing 500,000 tons for food supplies and for industrial purposes, about 3,300,000 tons remained for forage. During the war the import of rye, maize, and oilcake partly, and in 1918 almost totally, failed; moreover, the harvest in the country was reduced by one-sixth owing to the want of artificial manure. Denmark was compelled to reduce its live stock. The number of cattle was in 1914 2,500,000 and after 1917 two million. Notwithstanding that the best milch cows were least affected by this reduction of stock, the output of milk and subsequently of butter was reduced by about 50%, butter from 117,000,000 kgs. in 1914 to 67,000,000 kgs. in 1918. But while in 1914 about 95,000,000 kgs. were exported, in 1918 only 15,000,000 kgs. were sent out of the country. Home consumption of butter was much more than double. The number of the import of copra, the raw material for margarine. The number of swine, in 1914 about 2½ million, almost halving the number of the population, was in 1917 reduced to 1½ million and in 1918 to half a million. This reduction manifested itself in the rapidly decreasing export of pork, from 150,000,000 kgs. in 1914 to 9 million, the number of hens fell between 1914 and 1918 from 15 million to 9 million, export of eggs being in the same ratio 450 million and 320 million respectively. The number of hogs and sheep was almost undiminished, about 500,000 of each.

After 1918, with the coming of peace, Danish agriculture recovered rapidly, but the production of butter and pork in 1921 less than before the war. The butter and pork production in 1921 less than before the war. The butter and pork production in 1921 less than before the war. The butter and pork production in 1921 less than before the war.

Two important laws, the control of meat exported from Denmark May 27 1908, dealing April 12 1911, dealing with the control of meat, and a similar law on section 62 of the British Trade-Marks Act 1905, which called Danish farmers to register a common trade-mark as against bacon receives a public trade-mark and a all exported meat showing it to have been passed for export at the Government slaughter-house as first- or second-class produce. Agricultural control stations therefore receive an official trade-mark certificate for goods for export. No butter is allowed to be exported containing more than 16% of water, or other preservatives than salt.

Industry did not develop in Denmark until about the last raw material 19th century, as the country produces no coal and decade of raw material apart from farm products and material for very little cement-making. It thus happens that Denmark as a brick-and-mortar loser in the years of high prices and so-called prosperity whole materials having to be bought abroad at the highest price—and regains the losses in the years of depression. The small-sized factory is typical, but some big factories have been established in connexion with the manufacturing of leather broomware, cement, margarine, textiles, tobacco, spirits, sugar, oil, matches, paper, agricultural machines and iron ships. Of 140,000 persons engaged in factories employing more than 20 working-hands in 1914 more than half belonged to Copenhagen. Most of the larger establishments belong to joint-stock companies. In 1919 there were 994 industrial joint-stock companies with a total capital of 621,000,000 kr., of which three-fourths belonged to companies with a capital exceeding 100,000 kr. each. During the last decades Danish industry has shown an increasing tendency towards centralization. Customs duties were considerably reduced in 1908, but as they are almost always calculated upon weight, the general advance in prices made the protection left to industry completely ineffective. During the blockade industry had to face difficulties regarding the importation of raw material and coal; but the blockade mainly affected industries producing oils and margarine, which were practically at a standstill in 1918. The

failure of the coal supplies was met with the strictest economy in consumption and partially made up for by an energetic utilization of the native fuels—woods, peat and brown coal. In spite of heavy difficulties, Danish industry was to a large extent able to supply the demands of the home market.

On the whole the war period must be said to have been economically favourable to the neutrals, as appears from the formation of a number of new industrial concerns and the extension of many of those already in existence, and the fact that between 1914 and 1920 the number of companies increased by 50% and their capital by 150%. Industrial profits were largely invested in extensions and improvements which could not be turned to full account during the post-war depression. The following table shows the total number of persons, the number of skilled workers, and the horse-power of prime movers concerned in the principal industries in the year 1914:

	Total Number employed.	Skilled Workers.	Power, H.P.
Food	63,000	38,000	81,000
Textiles	17,000	14,400	16,300
Clothing	65,000	35,000	3,500
Building and Furniture	79,000	52,000	21,000
Woodwork	13,300	6,000	18,000
Tanneries	1,200	900	11,400
Earthenware and Glass	20,000	16,000	28,000
Metals	63,000	46,000	34,000
Chemical and Technical	13,000	9,000	15,000
Paper	3,500	3,000	7,600
Printing	12,000	9,700	4,200
Totals	350,000	230,000	230,000

Shipping.—At the close of 1913 Denmark's mercantile marine counted—apart from vessels of four-ton register or less—1,970 sailing vessels with a joint tonnage of about 90,000 tons register, 941 motor vessels of 30,000 tons register and 642 steamers of 420,000 tons register. At the close of 1919 the respective figures were 1,584 sailing vessels of 103,000 tons register, 1,465 motor vessels of 89,000 tons register, 514 steamers of 332,000 tons register. The number of Danish steamers sunk by submarines, torpedoes and mines was 147, representing a tonnage of 229,000 tons register in gross. The gross freight carried in Danish ships—excluding home coast traffic—amounted in 1913 to 110 million kr. and in 1919 to 445 million kroner. The average dividend on steamship shares was in 1919 70%. From 1916–20 foreign-going shipping of the country was controlled by a Freight Board, elected by the shipowners themselves. Rather generous maximum rates were fixed for the supplies of the country. Owners were bound to employ their ships according to the instructions of the board. In July 1917 an arrangement was made according to which all Danish owners put tonnage at the disposal of the Freight Board for the coal supply from the United Kingdom at a fixed rate and quantity.

Commerce.—The total imports and exports from 1912–20 were as follows:—

Year	Imports: Mill. kr.	Exports: Mill. kr.	Excess of Imports: Mill. kr.
1912	818	682	136
1913	855	721	134
1914	795	867	72
1915	1,157	1,120	28
1916	1,357	1,309	48
1917	1,082	1,065	17
1918	945	743	202
1919	2,519	909	1,610
1920	3,142	1,814	1,328

Thus it appears that the excess of imports over exports was in the years preceding the war about 130,000,000 kr., while in the first four war-years export and import were almost equal. Yet in 1914, on account of "hidden exports," the trade balance was actually favourable. In 1918 the balance was 200,000,000 kr., and in 1919 and 1920 it averaged 1,500 million kr. against Denmark. In the years 1914–8 the position was favourable, partly owing to the consumption of stocks and the selling-out of assets, such as the stock of domestic animals, and partly owing to the profits of shipping. It is only natural that the commercial and therefore the financial balance after the war should present a somewhat different aspect. Also it must be borne in mind that some of the war-time profits were invested in extensive purchases in order to replenish the empty warehouses; also considerable contracts were made with a view to subsequent exportation to the Baltic states, a possibility which, however, had not been realized in 1921, and involved many individual concerns in heavy losses. A comparison of the value of Danish imports for home consumption in 1913 and 1918, the last of the war-years, is as follows:—

Imports.

	1913		1918	
	Mill. kr.	Per cent.	Mill. kr.	Per cent.
Raw material for agriculture .	170	23	33	4
Raw material, etc., for industry	130	16	183	20
Partly manufactured articles .	48	6	130	14
Articles of food or luxury .	148	19	56	6
Fuel and illuminants .	81	10	299	33
Articles of industry .	200	26	209	23
Entire import for home consumption	777	100	910	100

The figures show the remarkable changes in the relative values of different imports arising in consequence of the war, but the varying advance in prices must also be taken into account, and the corresponding changes in quantities imported are not indicated. As for fuel, the yearly import before the war was about 3,000,000 tons, while during the war it fell below 2½ million.

A comparison of the exports during the normal year 1913 with the war-year 1918 gives the following:—

Exports.

	1913		1918	
	Quantity: Mill. kgr.	Value: Mill. kr.	Quantity: Mill. kgr.	Value: Mill. kr.
Butter	91	200	15	113
Pork	135	164	3	8
Eggs	454	33	328	68
Horses (number)	28,000	21	29,000	75
Cattle (number)	152,000	48	114,000	70
Meat	15	14	14	39
Other agricultural products	—	71	—	150
Total		551		523
Fish		12		17
Articles manufactured		74		170
Total		637		710

The chief articles of export were the more or less manufactured agricultural products. But between 1913 and 1918 this export was so much reduced that, notwithstanding the great advance in prices, the total value declined. After the Armistice the export of farm products increased. The value of manufactured products and eggs exported was in 1920 about 920 million kr. and of live animals about 110 million kr. The butter export rose in 1920 to 75,000,000 kgr. and the pork export to 45,000,000 kilogrammes. The trade with foreign countries in 1913, 1917 and 1918 was as follows:—

Country	Imports			Exports		
	1913 per cent.	1917 per cent.	1918 per cent.	1913 Home-manufactured articles: per cent.	1917 Home-manufactured articles: per cent.	1918 Home-manufactured articles: per cent.
United Kingdom	16	26	21	63	27	7
Germany	38	22	33	25	50	43
Sweden	8	13	25	2	9	23
Russia	9	1	—	2	1	1
United States	10	20	4	1	—	—
Norway	1	3	5	2	6	16
Other Countries	18	15	12	5	7	10

The export of home-made articles to the United Kingdom in 1913 was 398 million kr., of which butter (180 million kr.), pork (160 million kr.) and eggs (31 million kr.) made up 371 million kr., or more than 90% of the total. Exports to Germany were in 1913 valued at 159,000,000 kr., cattle and meat 65,000,000 kr., and hides 10,000,000 kroner. Before the war Denmark did most of its business with England and Germany, but during the war much business was done with the Scandinavian countries, especially with Sweden. A considerable part of the foreign trade in war-time was conducted by agreements between the countries concerned as to desirable interchanges of supplies. After the war foreign trade partly returned to pre-war lines. The import and export of raw materials and agricultural produce is largely conducted through the farmers' own cooperative organizations. During the war only a limited quantity of goods was admitted from England and America. Agreements to that effect were made with the United Kingdom in Nov. 1915 and with the United States in Sept. 1918, negotiations being conducted between the respective Governments and the Danish commercial and industrial organizations, "Grossererforeningens Komité" and "Industrirådet." These organizations also distributed the imported quantities among such Danish firms as had hitherto been importing or using the articles in question. The export of agricultural produce is mainly conducted through Esbjerg or Copenhagen. Copenhagen is by far the most important commer-

cial city. A part of the retail trade is in the hands of the peasants' own cooperative societies.

Economic Legislation During the War.—Immediately upon the outbreak of the war, on Aug. 7 1914, the Government was authorized to take measures to ensure supplies and to prevent an unfair rise in prices. A special committee was appointed for the regulation of prices and supply of necessities of life and of other articles, and export was either prohibited or required a licence. For such articles as butter, pork, etc., the object of control was not merely to ensure the supply of the home market but quite as much the control and regulation of the export trade.

The special committee commenced immediately to forbid the use of rye and wheat for forage. Till that time home-grown grain had been largely used for feeding swine, horses, etc., bread being based from imported corn, the supply of which completely ceased. In the winter of 1916 the use of sugar and in 1917 of potatoes for forage was prohibited. Licences for potatoes were, however, always granted when supplies for human requirements were sufficient. Maximum prices for home-grown rye and wheat were fixed about Christmas 1914. In May 1915 maximum prices followed for swine and pork. By order in council of Nov. 27 1916 it was notified that any advance in the prices of food decided on by mercantile unions or firms holding monopolies must be notified to and sanctioned by the special committee. On Jan. 31 1917 maximum prices were fixed for potatoes. Sugar production and prices were also placed under observation and control.

Thus Denmark had the distribution of commodities and maximum prices, especially of farm produce of importance to the home market, well under control before the blockade in its severest form took effect. Immediately upon the beginning of the blockade a general decree made it punishable for commerce to raise the percentage of profits above the level of 14. On May 19 1917 orders were issued to prevent the enhancement of prices of commodities as a result of their having passed through more hands than necessary and customary (the so-called "chain-mercer"). The existing maximum prices were retained and new ones were fixed for a constantly increasing number of commodities. In the spring of 1916 the State had already taken possession of the corn harvest, but at the beginning of the blockade it took the sole control of the trade through the Board of Food Control, established in 1917. Before Feb. 1 1917 only sugar had been rationed but had not been materially reduced, home production almost equalling consumption. Grain was rationed in the spring of 1917 and pork in the autumn of 1917. Owing to the increasing scarcity similar measures were taken later with regard to butter, margarine, fuels, illuminants, benzine, coffee, tea, rice and other articles. The scarcity of fat made it necessary to introduce special regulations for the soap industry. At the same time maximum prices were fixed for the articles in question. Several other branches of industry were also put under control. After the war, imports having gradually reached their former level, these rules and regulations were discarded. In the spring of 1921 only a very few were left, such as regulations and maximum prices for bread and sugar and certain regulations of the beer and spirit industries. To ensure thorough economy in the production of spirits the respective concerns formed a combine. These measures for controlling prices were taken after consultation with the different trades.

Taxation and Public Finance.—The basis of taxation of landed property in Denmark was the assessment of *Horthorn* which was based on the quality of the land and had remained unaltered since 1844. For other property there was a variety of taxes of old standing. A law of 1903 introduced a new general assessment of all estates and property. Land rent was based on periodical valuations ("selling value"). A general income and property tax of a progressive per-cent. rate increasing in amount almost every year, and at the same time made more progressive, was introduced in the same year. The indirect taxes are the customs duties and the land taxation of industry and trade. The tariff of 1863 was moderate but became heavier than was intended because of falling prices; and in 1908 it was revised, all necessities of life, raw materials and agricultural produce being relieved of duty; protective duties were made small and duties on tobacco and spirits relatively high. Objects of taxation giving the best return are beer, spirits, tobacco and sugar. In the financial year 1913-4 the revenues of the Danish State amounted to 124 million kroner. Of these 101 million kr. were raised by taxation, 28 million kr. by direct and 73 million kr. by indirect taxes. The war occasioned an increase of taxation, and at the same time a change from indirect to direct taxation was effected. The State revenues of the financial year 1919-20 were 601 million kr., of which 575 million were from taxes, 347 million kr. direct, 248 million kr. indirect. Yet the main part, 235 million kr., of the direct taxes were extraordinary taxes. The national debt was in 1914 301 million kr. and in 1920 925 million kroner. The debt of all the municipalities was in 1914 375 million kr. and in 1920 750 million kroner. It must, however, be borne in mind that the value of State and municipal assets had proportionately increased.

Money and Banking.—Before 1908 the right of the National Bank to issue bank-notes was based on the same system as the Bank of England, but in that year the quota system was adopted. By legislation of 1915 the bank is required to be in possession of gold to the amount of one-third of the notes in circulation, and for the

remaining part there must be security in assets easily cashed according to special rules. The amount circulating in notes in 1900 was about 100, and just before the war about 150 million kroner. In the middle of 1917 it was 365 million kr., in 1919 541 million kroner. In 1914 the duty of the National Bank to redeem its notes with gold was temporarily suspended and it had not been reimposed in 1921. The other big banks of Denmark are the Danske Landmandsbank, with a stock capital of 100 million kr. and a balance at the end of 1919 of 1,421 million kr. (of which more than one-quarter is put under the ample heading: "Sundry Debtors"); Privatbanken, stock capital 60 million, balance 594 million; Københavns Handelsbank 50 million, balance 672 million; Københavns Diskonto og Revisionsbank, 48 million, balance 452 million kroner. In connection with the farming import and export organizations a cooperative banking institute, the Danske Andelsbank, was established in 1914 with a guarantee fund of 11 million kr. paid in. There are also several smaller banks, but in recent years many provincial banks have been absorbed by the big banks.

Prices.—According to an average calculation wholesale prices— if the immediately pre-war index figure is put at 100—rose to 249 by July 1917. The upward tendency continued until the maximum was reached in Nov. 1920 with the figure 430. The general tendency afterwards was downwards, the figure for April 1920 being 270. The advance in the retail prices of necessities of life is illustrated by figures calculated on the basis of household budget for families just belonging to the working classes. The expenses of such a family just before the war being put at 100, the index figure rose constantly till it reached 265 at the close of 1920. The value of the Danish krone was very unsteady during the war compared to other currencies. The minimum was the post-war years the £ and \$ rates declined—the minimum was reached in Nov. 1918, £1 equalling 13 kr. and \$2.80 kroner. The exchanges were afterwards reversed, the maximum being reached in Sept. 1920, when £1 equaled 25.68 kr. and \$1, 7.40 kroner. In April 1921 £1 equalled about 21.50 kr. and \$1, about 5.50 kroner.

Finance.—About 1910 the yearly revenue for income tax, at was estimated on the basis of the assessment, showed a constant increase, 1917-8 disclosing a year's revenue of 2,600 million kr. and 1918-20 of over 3,300 million kroner. Thus since the war the yearly revenue has been multiplied 2½, i.e. is almost the same ratio as the retail price index. The incidence of incomes is more equal in Denmark than in many other countries, though here as elsewhere the contrast between rich and poor was to some degree sharpened during the war. In 1915 about 70% of the adult population (married women excepted) had incomes of less than 1,000 kr., making together some 30% of the total income; about 29% had incomes of between 1,000 and 10,000 kr., about 22% of and nearly 1% had incomes of three-quarters of the adult population the total incomes. While in 1915 (of married women) had incomes of less than 1,000 kr., in 1918 before the war was estimated at 10 amount. The national probably doubled (the assessed property millions, and in 1921 4,400 million kroner). While in 1908 about had risen from 5,000 to 10,000 kr. and property of less than 10,000 kr., the 92% of the adults in 1918 was only 87%.

The corresponding figure for the stock exchange was in 1912 about 800 million, in 1919 2,000 million and in 1921 probably in 1918 about 3,000 million difference of 2,000 million kr., forwards and 1,000 million. They represent individual gains and losses, to again backward suffered by the same persons. (F. G. T.) some extent may be seen in the 'eighties of the 19th century, the

Labour.—Industrial development, an impetus was given to the era of modernization, closely connected with the Social Democratic trade-union both employers and employed are very strongly cratic partly under the two main organizations, the Combined organized and Danish Employers' Organization. The trade Trade Union in 1919 nearly 350,000 members, 277,000 belonging unions combined Trade Unions. In 1910 Denmark was foremost in to the tent, 51% of the workmen employed in industry, commerce the municipalities being organized. Since then the movement has and progress. In most industries nearly all the workmen were members of the organizations. There has also been a considerable inflow of agricultural labourers. The usual basis of classification of the unions is trades, not industries.

Besides the divisions for the different towns there are factory and shop stewards; in some places a system by which chosen representatives exercise an influence over the general conditions of work has grown up in connexion with these clubs. In the summer of 1920 syndicalistic tendencies manifested themselves rather strongly, but in 1921 the movement largely died away.

The Employers' Organization, dating in its present centralized shape from 1898, exercises considerable authority over its members, by whom about 200,000 workmen are employed. After an extensive lockout in 1899 the two main organizations made the so-called "September agreement," deciding, for instance, that a positive majority is required for the declaration of strikes and lockouts, which must, moreover, be notified according to certain rules, and that all differences on the question of the interpretation of existing

contracts and agreements must be referred to arbitration. After a conflict in 1910, on the proposition of the parties concerned, a law was passed adopting the system of conciliation in disputes and the establishment of a special court to decide questions of law. The average number of days lost in labour conflicts over a series of years was only one day a year for each workman, but in the unsettled state of the labour market in 1919-21 much higher figures were reached, chiefly owing to strikes in the Copenhagen building trades and among sailors and navvies. During the transport strikes of 1920 the activities of "Samsundshjælpen," a voluntary civic organization for carrying out indispensable work left undone by the strikes, were of considerable importance.

The Employers' Organization attached great importance to the simultaneous expiration of the labour agreements of the different trades. This often resulted in joint negotiations for the renewal of agreements, in most cases accompanied by threats of extensive stoppages of work, which had, however, until 1921 always been averted at the last moment. In later years yearly agreements were made, adopting an automatic regulation of wages according to the price index of the Statistical Department from the middle of the period. A smaller part of the wages of State employees was also calculated according to this price index. Even before the war Danish industry suffered considerably from unemployment, which amounted to 10% in the period 1903-13. After the close of the war, conditions became still more complicated owing to the after-effects of the blockade and the critical state of affairs generally.

Wages in Denmark were somewhat high compared with other European countries. The average weekly wages for skilled labourers were: in 1897 20 kr.; 1905 25 kr.; and 1920 120 kr.; for unskilled labourers 16, 20 and 100 kroner. During the war wages rose continually, at first slower than prices, later somewhat faster, but in the spring of 1921 a general though not very important reduction of wages took place. Before the war about 20% or 25% of the workmen in industry were paid by the job. The wages of agricultural labourers were: in 1910 700 kr.; 1915 800 kr.; 1918 1,400 kr.; and in 1920—partly owing to the increasing organization—1,800 kroner. The position of Denmark in the matter of working hours has, as was the case in the matter of wages, been something between that of England and the rest of Europe. The average working hours of industry were in 1872 11¼; since then they have gradually decreased. Accordingly, when the eight-hour day was adopted on Jan. 1 1920 by voluntary agreement between the chief organizations, this was a step of comparatively small importance. Denmark joined the international agreement about the eight-hour day, but in May 1921 no law concerning this question had been passed.

At the close of the 19th century a general interest in social questions was greatly awakened. The year 1873 brought the first factory legislation, and in the beginning of the 'nineties came the general decisive acceptance of insurance relief legislation. The leading principle is voluntary State-aided insurance against illness and unemployment, and for the rest public relief, apart from accident insurance, which, as elsewhere, is paid by the employers. The poor law of 1891 not only regulates pauper administration proper but also lays down certain rules, which have been repeatedly extended, for State or parochial relief, directed through the ordinary pauper administration but without the usual unpleasant consequences to the recipients. Such aid is given in cases of a number of chronic diseases, insanity, epilepsy, tuberculosis, blindness and to deaf-and-dumb persons. Medical and obstetric aid is also given and extended aid to members of benefit clubs. Since 1907 every parish has had, besides the poor-rates, a relief fund—*Udhjælpekasse*, with a board of its own, intended to administer relief in cases of urgent need. This fund has, however, in many cases become merely a more respectable form of pauper administration. By the Old-Age Pensions Act passed in 1891, Denmark took the lead in the question of providing for the aged. Certain conditions are laid down as to the need and worthiness of the recipients, and it is especially stipulated that persons who have for five years previously received parish relief are excluded. The age limit is 60 years. The amount of the pension, which is decided upon the merits of each separate case, should suffice for sustenance of life, and medical aid in case of illness is included. In 1919 the number of recipients was 74,000 and the expenditure amounted to 34 million kr., State and parishes contributing each one-half. Denmark has several voluntary benefit clubs, mostly locally organized, but State-aided and under State control, in accordance with the Benefit Club Act of 1892, amended in 1921. Notwithstanding the voluntary system 70% of the working classes and a large number of others of similar standing are members, the total number amounting to two hundred thousand. As children of the members below the age of 15 years are also entitled to the benefits, the full number makes about three-fifths of the population. The chief benefits are hospital treatment, medical aid and subsistence money not exceeding 6 kr. a day. The State aid is 3 kr. per member and one-quarter of the chief expenditure. A considerable economic advantage to the benefit clubs is the very low charges made by the public hospitals for treatment of the members. The clubs recognized by the State have limited self-government under control of the State inspector of benefit clubs.

By three decrees of 1921 persons suffering from chronic diseases were admitted to the sickness insurances without any extra charges;

an insurance against disablement, forming an obligatory supplement to the voluntary sickness insurance, was established; and special rules were laid down concerning "poor-relief without the effects of poor-relief" to be paid to a considerable part of the uninsured disabled. The first Accident Insurance Act relating to a number of dangerous industries and based on the principle of employers' liability was passed in 1898, and after some gradual improvements a general comprehensive Act was passed in 1916. It is the duty of the employer to have all persons employed insured by the private accident companies. For compensation a sum of money not exceeding 24,000 kr. is given. Special rates are paid to the sons of widows. As early as 1907 an Unemployment Insurance Act was passed. The unemployment funds are voluntary and are practically identified with the trade unions. During the critical years 1917-9 the ordinary State aid was very considerably raised, and large sums were distributed according to rules which were less strict than usual.

In 1918 the entire contribution of the State to social insurances and the various forms of relief was, apart from sums arising out of special war-time legislation, 17 million kroner. The municipalities contributed 39 million kr., while the contribution of the members of sickness and unemployment insurance societies was 12 million kr., and the employers paid for the accident insurance 6 million kr., altogether about 74 million kroner. While the social insurance system proper is generally considered satisfactory—though in the recent difficult years the administration of the unemployment funds has been the object of criticism—strong claims were advanced for a modification of the old-age pensions system, which should establish a right to fixed rates, and also for a thorough reorganization of the lower branches of social relief (the pauper administration and relief funds), the administration of which had become complicated and unpractical owing to their gradual development. Danish factory legislation is, notwithstanding its inauguration by the conservative but very far-seeing Ludvig Bramsen (in the 'nineties)—father of the Danish Employers' Liability Act—rather radical and thoroughgoing, and very ably and effectively administered. On the other hand, Denmark has no Wages Board or Minimum Wage system.

Political History.—After the Cabinet of J. C. Christensen—the formation of which in 1905 had led to a split in the ranks of its supporters, the Left Reform party separating from the Radical Left party—had been forced by the Alberti catastrophe to retire, a new Cabinet was formed by Niels Neergaard, a distinguished historian, as leader of the Moderate Left, with the support of the Moderate and Left Reform party (Oct. 12 1908). The problem of defence became the most prominent under this Cabinet, as the defence commission, which had been working since 1902, now reported. The members of the commission had not reached unanimity. The Socialists proposed disarmament; the Radicals wished the military to be replaced by a naval and police guard; while the Right proposed a material increase of military forces. The Government and its supporters in the *Rigsdag* were divided on the question of Copenhagen's land defences, and only after great confusion—new elections had not brought clearness—did the old leader of the Left, Count Holstein-Ledreborg, who had been away from active politics for years, succeed, as premier of a new Cabinet, in carrying through a new arrangement. The army and navy were enlarged; Copenhagen's naval defences were strengthened; and the land defences were to be dismantled not later than March 31 1922.

No party had a majority in the *Folkething*, and the Holstein Ministry was forced to retire in favour of a new Cabinet, formed by the Radicals with C. Th. Zahle, a barrister, as premier. This Cabinet could depend on support from the Socialists in the *Rigsdag*, though without thus acquiring a majority in either of the Houses. Under these conditions the Government announced its intention of postponing the introduction of the Radical programme. With the support of the Right it was able to secure a majority in favour of a proposal to prosecute the two ex-ministers, J. C. Christensen and Sigurd Berg, before the State Parliamentary Court, the *Rigsret*, for neglect of their ministerial duties in regard to Alberti (Mr. Christensen was acquitted and Mr. Berg sentenced to a fine). As the Government proposed a democratic amendment of the constitution and met with opposition, the *Folkething* was dissolved, and at the elections of May 20 1910 the Left, which was still divided on the defence problem, won half the seats. The two moderate Left groups now united into one party, the Left, and one of the old Moderate leaders, Klaus Berntsen, a former teacher in the peasant high schools, formed the new Cabinet on July 5 1910.

King Frederick VIII. died on May 14 1912 and was succeeded on the throne by his son, Christian X.

With the support of the Radicals and the Socialists the Government again raised the constitution problem in 1912, but because of opposition in the Upper House (*Landsting*), where the Right controlled about one-half of the seats, no solution had been reached when the ordinary elections were held in May 1913. At these the Radical and Socialist parties gained control of 63 out of the 114 seats in the *Folkething*; Zahle formed the new Radical Cabinet. The constitution problem immediately became prominent, and the constitutional parties decided to let nothing divide them because of the importance of the issue; under these conditions the Socialists voted for the budget for the first time. The Right raised the most decided opposition against this united democracy; powerless in the *Folkething*, they undertook, by a policy of obstruction in the *Landsting*, to check the further development of the case. As an answer to this the Government dissolved the *Landsting*. The election results were: 29 supporters and 25 opponents of the constitutional amendment. Of the 12 members nominated by the Crown 9 were on the side of democracy, hence the Government was certain of a solid majority.

The outbreak of the war temporarily hindered the final solution of the constitution problem. It was with great anxiety for the future of their country that the Danish people experienced the fateful days Aug. 1914. On Aug. 1 the *Rigsdag* passed a number of laws which the extraordinary conditions made necessary. The mobilization of the emergency army, numbering in all about 70,000 men, began on the same day. All political parties agreed in maintaining the neutrality of Denmark. An attack by Germany was specially feared. A difficult situation arose on Aug. 5 in consequence of an inquiry from Germany as to whether the Danish Government intended to block Danish waters with mines, an intention which could only mean that if Denmark refused Germany would lay the mines. The Government was uncertain as to Denmark's responsibility as a neutral Power, and only after great hesitation was it decided to lay the mines. With this Germany was satisfied, and England sanctioned the action in view of Denmark's precarious position.

It became apparent that the war's effects upon Denmark's economic situation might have serious effects upon Denmark's economic situation. Accordingly the *Rigsdag* on Aug. 7 authorized the Home Secretary to regulate prices and to confiscate all goods on giving full compensation. A Price-Regulating Committee was established. A Price-Regulating Committee was established. Further the Secretary of Justice was advised the minister. exports. The Government exercised the power to prohibit during the following months to secure the necessities of food grains and for other purposes. As in military affairs the Government adhered to the policy of keeping the war, the Government informed of the measures adopted, and in negotiations always in establishing, with both sides, confidence in Denmark's desire for real neutrality, and an understanding of the importance of agreements with Germany and England as to export in fixed

When the first anxiety was allayed the constitution was again taken up. As the opposition of the Right was a result was reached without great difficulty and June 1918, King signed the new constitution. This introduced the suffrage in the elections for both Houses, men and women entitled to vote under identical conditions; the voting age fixed at 35 years for the *Landsting* and was lowered successively from 30 to 25 years for the *Folkething*. Of the 140 members of *Folkething*, 93 are elected in individual districts, 27 in great Copenhagen according to proportional representation, and 2 supplementary seats are divided among the parties that have received too few representatives at the other polls in proportion to their number of votes. The *Landsting* has 72 members, of which 54 are indirectly and proportionally elected in the large districts, while 18 are elected by the retiring *Landsting* according to the same principles. In the case of a constitutional amendment a referendum must take place, and 45% of the eligible voters must vote for it to give it validity. The constitution came into force on April 21 1918.

Other important legislative Acts of the first years of the war, which were passed unanimously, were the Reform of the Administration of Justice (April 11 1916), which separated the administrative and judicial systems, and introduced oral proceedings and publicity—with trial by jury in criminal and political cases—and the Accident Insurance law (July 6 1916), which made it the duty of all employers to insure their employees. The privileged suffrage in elections to the *Amtsråd* (county councils) was abolished with the consent of all parties.

In the late summer of 1916 the comparative quiet which had marked political life since 1914 was succeeded by a bitter struggle. The cause was the announcement by the Government that it had concluded a treaty with the United States ceding to Danish West Indies to that country for \$25,000,000. Both in the *Rigsdag*, whose ratification was essential, and outside strong feeling was aroused against the sale. The Left proposed a postponement till after the war or, if an immediate decision was necessary, the holding of fresh elections under the new constitution. The only solution of the crisis seemed to be new elections, but the King implored the party leaders to avoid such a situation, which would be a danger to the country. The result was a compromise: the Cabinet was supplemented by representatives of each of the political parties (Th. Stannin, the Socialist member, being the first member of the working class to become a minister), and the sale of the islands was to be decided by the *Rigsdag* after a plebiscite of the people. At the polls (Dec. 14 1916) 283,670 votes were cast in favour and 158,157 against, and shortly afterwards the *Rigsdag* ratified the cession.

A contest of like character, but not nearly so far-reaching or bitter, arose in connexion with the rearrangement of the relation of Iceland to Denmark. With increasing demands for political independence and integrity, the opposition of the Conservatives, the support of the Socialists, and the King's decision to pass an Act of Union (Nov. 1918) which Denmark acknowledged the independence of Iceland and made the King joint ruler of both countries and Denmark direct its foreign policy. The Act of Union is valid till 1940.

From 1917 onwards the unrelenting pressure of the Entente, combined with the stricter measures of Denmark. The Government, for whose economic policy the Home Secretary, Ove Rode, was primarily responsible, made further efforts, by means of maximum prices, export prohibitions, and also by the rationing of certain articles, to create tolerable conditions for the people. It sought to mitigate the effects of the war on the State and the communes rendered policy of relief; without means; public officials received direct aid to their salaries had undergone a thorough increase pay unemployed, whose number rose to 70,000 in revision; and they were given extra support. Through an increase of those among others of a tax on exchange business, and the introduction to cover these and the greatly increased the Government's. In the five years of the war 1914-9, the military expenditure of the Government were 156, 185, 251, 360, 616 million respectively (in all 1,577 million kr.), and the total expenditure in all five years 1,343 million kroner. The deficit was covered by loans. While the indirect taxes 1913-4 amounted to 5% were 21% and 62% respectively. A radical anti-war Government had from 1914-9 spent more than 500 million kr. on defence—more than all the Conservative war years together from 1865-1901.

After the spring of 1918 the elections could no longer be postponed. At the elections for the *Folkething*, when women voted for the first time (68% voted to the men's 84%), 72 supporters of the Government were elected, 30 Socialists and 33 Radicals, receiving 263,000 and 106,000 votes respectively; and 68 opponents, 45 Left and 23 Conservatives, receiving 273,000 and 168,000 votes respectively. The *Landsting* was constituted as follows: 17 Conservatives, 26 Left, 13 Radicals and 15 Socialists.

At the time of the Armistice the old problems were viewed differently and new questions arose. The troops were quickly demobilized, the special defence works were razed, and on March 17 1919 a law was passed abolishing the land defence and artillery of Copenhagen. In 1919 the special military administration of justice had ceased. The Government's economic policy, which had caused some dissatisfaction, but as a whole had been supported by all parties, became the object of very strong criticism, as the Opposition thought it time to abrogate the war-time legislation in this respect. Instead of improving, the economic conditions became worse: small exports, the falling value of the Danish krone both at home and abroad, and numerous strikes, partly caused by the syndicalistic agitation, characterized the industrial and economic situation until near the close of 1920.

The Allied victory affected Denmark chiefly through the prospects of a reunion with the Danish part of Slesvig. On the same day—Oct. 23 1918—as the deputy of North Slesvig, H. P. Hanssen-Nörremölle, raised the demand of a reunion with the mother country in the German *Reichstag*, the Danish *Rigsdag* unanimously passed a resolution "that no other change in Slesvig's present position than an adjustment according to the principles of nationality would harmonize with the wishes, feelings and interests of the Danish people." With reference to this and statements made by the leaders of the Danish population in North Slesvig, the Danish Government communicated its wishes to the Allies (Nov. 28 1918), so that, when the Peace Conference in Feb. 1919 reached the discussion of the Slesvig problem, a united Danish North Slesvig delegation was sent to Paris to present the Danish point of view: a plebiscite *en bloc* in North Slesvig (Zone 1), a community ballot in Central Slesvig and Flensburg (Zone 2), and voting rights to all those who were born in the voting districts. The Peace Treaty was presented to Germany on May 7. The fact that it contained a provision for a plebiscite in South Slesvig (Zone 3), and gave voting rights to natives of the districts without consideration of their present place of residence, caused considerable excitement in Denmark. This departure from the wishes of the Government and the *Rigsdag* was due to the influence of a small group of the Danish people who wished the Slesvig question to be solved from a legal and historic point of view. Representations to the Peace Conference by the Danish Government were successful in getting the article providing for a plebiscite in Zone 3 omitted from the Treaty.

On the coming into force of the Peace Treaty on Jan. 10 1920, an international commission, containing among others the ambassadors of England and France, Sir Charles Marling and M. Paul Claudel, took charge of the plebiscite district. The plebiscite in Zone 1 on Feb. 10 gave 75,431 (75%) votes for Denmark and 25,329 (25%) for Germany; even the doubtful Tønder Amt had a majority for Denmark of 59%. On March 14 Zone 2 gave 48,148 (79%) German and 13,029 (21%) Danish votes.

While the plebiscite results in Zone 1 satisfied Danish expectations, this was not the case with the results in Zone 2. In the last years before the war the Danish element had here been yielding in the national struggle, but there seemed to be plain evidence of a change of feeling, especially in Flensburg, during the agitation before the plebiscite. The disappointment over the result was great. The *Zahle* Ministry had for months been the object of the most vehement attacks, because of its cool attitude towards the national propaganda in Central Slesvig, and the assailants made it responsible for the poor result of the plebiscite. In certain circles it was still hoped to prevent the final union of Central Slesvig with Germany by the so-called "Internationalization" of Zone 2. A storm of indignation at the national attitude of the Government in connexion with its economic policy began in the weeks after the plebiscite. When the Government refused to order new elections, with reference to the necessity for a new electoral law, the King dismissed it. A Cabinet of non-politicians, formed by Liebe March 30 1920, took the responsibility for the King's action, which was regarded by the supporters of the dismissed Cabinet as unconstitutional, and had caused the threat of a general strike from the Socialists. During this "Easter crisis" Denmark was not, but may have looked as if it were, on

the verge of a revolution. The mediation of the city council of Copenhagen and others conciliated the Crown and the Socialists, and on April 5 a new Ministry, consisting chiefly of State officials, was appointed to formulate an electoral law and to order new elections. The new law was based on proportional representation in the county districts (*Amtskredse*), and the supplementary seats system was retained in a slightly altered form. At the Folkething elections (April 25 1920) the Left received 351,000 votes (49 seats), the Conservatives 201,000 (28), "Erhvervsparti" (trades party) 29,000 (4), against the Socialists' 300,000 (42), and the Radicals' 122,000 (17). Niels Neergaard formed the new Left Cabinet on May 5.

On July 7 1920 the international commission handed over the executive power in Zone 1, awarded to Denmark by the Allies, to the Danish Government. After the constitutional amendments necessitated by this expansion had been adopted, the Folkething elections were held on Sept. 21 1920. In these the people of North Slesvig took part, and the voting age was 25 years for the first time. The results were 412,000 votes cast for the Left (52 seats), 300,000 Socialists (48), 217,000 Conservatives (27), 147,000 Radicals (18), 27,000 "Erhvervsparti" (3), and 7,000 for the German candidates (1). The Left maintained the leadership, and the Neergaard Ministry continued.

The problems relating to the constitution and to defence, which formerly were of the greatest consequence, had during later years been thrown into the shade by social problems, and the political parties were in 1920-1 developing in an increasing degree as representing economical interests, and as attached to certain classes: thus the Left was supported by the farmers, the Radicals essentially by the small holders, the Socialists by the industrial labourers, and the Conservatives by the capitalists and the middle classes in the cities.

Literature.—Between 1910 and 1921 Danish literature lost by death several of its representatives already famous—Karl Gjellerup (1857-1919), Herman Bang (1857-1912), Peter Nansen (1861-1918), Vilhelm Bergsøe (1835-1911), Sophus Bauditz (1850-1915), Troels Frederik Lund (1840-1921), Edvard Holm (1833-1915) and A. Fredericia (1840-1912). In 1917 Henrik Pontoppidan (b. 1857), the novelist, was awarded the Nobel prize.

While the older generation was still productive, either on the old lines or, as in the case of Karl Gjellerup, taking up new themes (classical, ancient Gothic, Indian), a good many young authors came to the front. Niels Möller (b. 1859) and Ludvig Holstein (b. 1864), in their few but elaborate poems, represented the scepticism and dark views of the 'eighties; Vigo Stuckenberg (1863-1905) and his friend Sophus Clausen belong essentially to the aesthetic renaissance; and partially this may also be said of Sophus Michaelis (b. 1865) and Edvard Blaumüller (1851-1911), although they have some features in common with the younger generation. All these were mostly lyric poets, but Stuckenberg and Michaelis had also written powerful novels.

The foremost younger lyrical poets were Valdemar Rørdam (b. 1872; *Selected Poems*, 1918) and Helge Rode (b. 1870). Thor Lange (1851-1915), as well as Rørdam and Möller, made many excellent translations of English and foreign poems. To the same school belong L. C. Nielsen (b. 1871; *Cantatas, Children's Songs*); Kai Hoffmann (b. 1874; *The Town and the Sea*, 1902; *Selected Poems*, 1916); Olaf Hansen (b. 1870; *Selected Poems*, 1918; *Translations from Icelandic*); Thøger Larsen (b. 1875; *Selected Poems*, 1917); Axel Juel (b. 1883). Of a more pessimistic and satirical type is Harald Bergstedt (b. 1877; *Jack and Elsie*, 1916—"a modern Adam Homo").

Powerful novels were produced by Harald Kidde (1878-1918) and Johannes Buchholtz (b. 1882). Ever since the latter half of the 'nineties the provincial note had been strong in Danish literature, as represented by writers emanating from the farm-houses and workshops. Foremost stands Jakob Knudsen (1858-1917), son of a parson, and for a time himself a clergyman but

descending from and in the closest contact with Jutland peasants, a novelist of extraordinary power, but without artistic refinement. From Jutland also came Jeppe Aakjaer (b. 1866), a peasant's son and a peasant himself; his masterpieces are short stories and lyrical poems, but he has also written novels and historical essays. Johannes V. Jensen (b. 1873, son of a Jutland veterinary surgeon) has shown himself a master in his treatment of the Danish language (*Prehistoric Novels*, 1909-19, translations from Frank Norris and Whitman). From Fünen there is the novelist Morten Sørbø; from Zealand, Thorkild Gravlund (b. 1879), partly novelist, partly folklorist; Knud Hjørtø (b. 1869), a prolific novelist; and from Bornholm, Martin Andersen Nexø (b. 1869), who had given pathetic pictures of the proletarians' lives. H. Bergstedt has manifested a satirical vein of some consideration.

The outstanding name in archæology has been Sophus Müller (b. 1844, director of the National Museum till 1921). Ludvig Wimmer (1839-1920) was supreme as a runologist (*Danish Runic Announcements*, 1895-1908). Folklore has had eminent representatives in H. F. Feilberg (b. 1831; *Jutlandic Dictionary, Danish Peasant Life*), in Evald Fang Kristensen (b. 1843) and in Axel Olrik (1864-1917; *Heroic Legends of Denmark*; in English 1919). Celebrated linguists are Kristoffer Nyrop (b. 1858; *Grammaire historique de la langue française* i-iv.), and Otto Jespersen (b. 1860; *Progress in Language*, 1894; *Growth and Structure of the English Language*, 1905; *Modern English Grammar*, 1909-14). The domestic culture of Scandinavia about 1600 was depicted by Troels Frederik Lund (*Daily Life in Scandinavia*, i-xiv.), while Danish and foreign literatures were treated by Vilhelm Andersen (b. 1864) and Valdemar Vedel (b. 1865).

DENTISTRY (see 8.50*)—The progress of dentistry in the decade 1910-20 was more rapid and more radical than in any previous period. The cause of this progress was the general advancement in knowledge due to the accumulation of data arising from scientific investigation and the application of the knowledge thus acquired to the prevention and treatment of disease. Until comparatively recent times the extent to which abnormal mouth and teeth conditions are responsible for derangements of health was imperfectly understood. The pioneer studies of W. D. Miller, of Berlin, especially as reported (1891) in a series of communications entitled *The Human Mouth as a Focus of Infection*, first called attention to the fact that the oral cavity is the habitat and breeding ground for a large group of micro-organisms, many of them possessing pathogenic character which under conditions of lowered resistance invade other parts of the organism and become the direct exiers of bodily disease. Miller also showed that the mouth is the common portal of entry for most of the disease-producing organisms that infect the human body, and further demonstrated that certain mouth bacteria, when injected into the circulation of a test animal, could pass through the blood stream or lymphatic system and establish metastatic foci of inflammatory action at points and in organs remote from the seat of inoculation. These early findings were afterwards confirmed by other investigators, more particularly by Sir Kenneth Goadby, of London. Recognition of the significance and far-reaching importance of the principles underlying these results of scientific research was only gradually accorded by the general body of the dental profession, and then merely as interesting facts without direct utility in dental practice.

In several communications on septic dentistry, notably in an address delivered in 1910 at the opening exercises of the annual session of the Medical school of McGill University, Montreal, Sir William Hunter, physician and lecturer to the Charing Cross hospital, London, criticised badly conceived and unskillfully executed dental restorative operations, especially in crown and bridge work and the treatment of pulpless teeth, which were performed without regard to surgical asepsis. In this connexion Hunter brought to bear clinical evidence to prove the soundness of his contention that operations so performed leave septic foci

* These figures indicate the volume and page number of the previous article.

that cause septicaemic conditions, as well as infections in remote parts of the body. Hunter's revelation impressed at once the dental and medical professions and his criticisms immediately bore fruit. The general use of the X-ray as a means for study of the apical region of tooth roots, the development and application of specialized bacteriological technique for determining in pulpless teeth the identity and character of the exciters of disease action and similarly those responsible for inflammatory lesions of the retentive structures of the teeth (commonly designated as *pyorrhea alveolaris*), all stimulated by the realization of the profound clinical importance of mouth infections as related to bodily health, quickly followed the communications of Hunter.

The total effect of this evidence, both clinical and scientific, upon the development of dentistry has been little short of revolutionary. From time immemorial it has been believed from empirical observation that an unclean and infected mouth cavity is a source of bodily ill health, and much direct evidence of a clinical character had accumulated to strengthen that belief, but the evidence now at hand has affirmatively established the facts by scientific demonstration. Until this development of knowledge concerning the systemic relationships of disorders of the teeth and their related structures and their bearing upon the bodily health, the major feature of dental interest, and that upon which the attention of the profession was concentrated, had been the development and perfection of manipulative procedure in restorative operations. The ingenuity expended and the excellence of the results attained had become the outstanding characteristics of dental practice; and the restoration by prosthetic or operative means of the masticatory mechanism damaged by partial or total loss of teeth had been its dominating ideal. There is now an enforced recognition in the professional as well as in the lay mind of the importance of the welfare of the tissues and organs of the mouth. In the dental profession the consequent changes of technical procedure and objectives have been fundamental. The ideal of mechanical perfection in the methods and appliances by which the dental surgeon restores the patient's power to masticate has come to be regarded as a remedial measure subservient to the larger idea of normal mouth health.

Oral Hygiene in Schools.—One of the principal factors which extended and popularized this knowledge is the oral hygiene movement, an effort to demonstrate practically the fact that school children, relieved of the disabilities arising from infected mouths and diseased teeth which handicap normal development, will show improved physical and mental efficiency. What is known as the Cambridge experiment, inaugurated in 1907 by the late George Cunningham, of Cambridge, England, was perhaps the earliest practical test. The analogous work of Dr. Ernst Jessen, of Strassburg, resulted in the introduction of oral hygiene into the public schools of a number of towns in Germany. In the United States the oral hygiene movement took practical form in the test of its utility in the Marion school of Cleveland, O., in 1910, and in 1919 there was completed under conditions yielding accurate figures, a five years' test of applied mouth hygiene in the public schools of Bridgeport, under the direction of Dr. A. C. Fones. In this test 20,000 children of the first five school grades were under observation and treatment. The average number of carious cavities was found to be over 7% per child; 30% claimed that they brushed their teeth occasionally; 60% frankly stated that they did not use a tooth brush and 10% were found to have fistulas on the gums, showing outlets from abscesses from the roots of decayed teeth. Systematic application of oral hygiene, the intelligent and systematic use of the tooth brush, and the elimination of accretions, dental decay and suppurative conditions achieved striking improvement in general health and mental efficiency. With respect to general health the statistics of the Bridgeport board of health show that the most common fatal diseases among children in that locality were diphtheria, measles, and scarlet fever. The decrease in deaths from these sources after the introduction of oral hygiene in the public schools is shown by the following table, the figures for 1914 showing conditions before the

	1914.	1918.
Diphtheria	36.6%	18.7%
Measles	20.0	4.1
Scarlet Fever	14.1	0.5

The improvement in mental efficiency is shown by the reduction in the percentage of retarded children. A retarded child as defined by the Bridgeport school board is one who is not less than two years older than the normal age for the school grade to which it should belong. The percentage of retarded children before and after the

introduction of mouth hygiene in the Bridgeport schools is shown in the following table:—

Percentage of Retarded Children.			
Grade.	Sept. 1912.	Nov. 1918.	Drop in retardation.
I.	16.5%	8.1%	51.0%
II.	37.0	15.3	58.0
III.	53.0	24.7	53.0
IV.	59.5	31.7	47.0
V.	61.0	33.1	45.0
VI.	54.0	30.4	44.0
VII.	39.0	19.3	50.0
VIII.	27.0	12.5	54.0
Average.	40.0	20.1	50.0

Since retardation represents inability of the child to continue to advance with his class, it necessitates repetition of his grade work, and therefore becomes an economic question of serious importance to the ratepayer. The cost of reeducation in Bridgeport in 1912 was 42% of the entire budget, and for 1918 only 17%. Among the 20,000 children under observation in the schools of Bridgeport, it was found that 98% had various forms and degrees of malocclusion of the dentures, a condition now generally recognized as being associated with a symmetrical development of the bones of the face and the brain case. Many children with malocclusion owing to the arrested development of the facial and cranial bones suffer from impeded nasal respiration, and moreover develop adenoids and tonsillar hypertrophy, leading to infection with its systemic sequelae and the interferences with bodily nutrition incident to insufficient oxidation of the blood. Orthodontic treatment for the correction of malocclusion in children has come to be regarded as a therapeutic and prophylactic measure having an important health relation rather than as a mere cosmetic procedure for the relief of deformity. The foregoing facts furnish convincing evidence of the desirability of making oral hygiene available to children of school age as a feature of dental public health service on economic as well as humanitarian grounds and on the broader ground of national efficiency.

Work in Armies and Navies.—Analogous considerations resulted in the organization in various countries of army and navy dental service of the nation. From small beginnings upon a contract basis the U.S. army and navy Dental Corps rose to an allotment by law of one dental surgeon for each 1,000 of the army personnel, and before the close of the World War provision had been made to double that allotment and to supply adequate equipment for field and hospital service. Instead of contract service the corps was placed upon a commissioned basis with pay and allowances identical with those of the Medical Corps and rank within the corps through all grades up to and inclusive of colonel. After 1918 full provision was made by the U.S. Government for the dental care of its enlisted men and of those demobilized from service suffering from dental defects or disabilities since demobilization. This latter activity is assigned to the dental division of the public health service. Accurate statistics as to the development of army and navy dental service in forces of other nations are not yet available, but the proportion of dental surgeons to army personnel in 1917, as given by officials of the British Dental Association (see "Man Power and the Army Dental Service," *British Dental Journal*, Feb. 15 1918), for some forces was:—Canadian Expeditionary Force, one per 1,000 men; New Zealand Expeditionary Force, one per 2,500 men; Australian Expeditionary Force, one per 2,600 men. Satisfactory figures for the German army dental service are not obtainable, but according to Dr. Ernst Jessen, head of the dental work in Strassburg, quoted in the *German Dental Review*, there were 810 dental surgeons active in the field in 1915. France, during the World War, had at least 1,500 army dentists working in various parts of the lines as fixed units, in addition to the dental ambulances. The French army dental service furnished a striking example of the practical importance of army dental service in that during the latter part of the war, when the man power of France was seriously depleted, over 250,000 effectives were mustered into the French service as the result of efforts instituted by Dr. Georges Villain, of Paris, by which that number of men who had been previously rejected because of loss of teeth, but were otherwise physically sound, were subsequently fitted with artificial dentures and sent to the fighting line.

The British dental service in the World War was inadequate, owing to the limited number of qualified dental surgeons available and the unfortunate fact that of the 1,050 to 1,100 serving in the army and navy in various capacities about 300 were enlisted as combatants, and of those latter 50 were killed. (See *Report of Parliamentary Committee on the Relation of Military Service to Man Power*, D. F. Pennelfather, Chairman.) Great Britain created by Royal Warrant, issued Jan. 4 1921, a military dental service, the Army Dental Corps, which is administered by the Director General, Army Medical Service. The Army Dental Corps is a joint service for the army and R.A.F., and is on a commission basis with rank through the grades inclusive of lieutenant and lieutenant-colonel. Experience during the war clearly demonstrated to all the belligerent nations the importance of dental service as a

means of mouth sanitation and the practical utility of the latter in maintaining the physical efficiency of the fighting personnel, with the result that definite and active work has been undertaken to extend these health benefits to civilian populations.

Undoubtedly the most notable example of comprehensive planning for the national extension of dentistry and oral hygiene as a favor of the public health service is that proposed in the *Interim Report on the Future Provision of Medical and Allied Services*, made to the British Ministry of Health by the Consultative Council on Medical and Allied Services, May 1920. This report recognizes oral hygiene and dental service as factors of public health and as proper subjects for control and development by the State. Oral hygiene comprehends much more than the correction of dental defects and oral infection due to neglect of the tooth brush; its aim is prophylactic as well as corrective. Corrective procedures such as the filling of cavities of decay, treatment of diseased roots, extraction of useless teeth, correction of irregularities in their position and prosthetic restoration of lost teeth or parts of teeth, merely arrest the progress of disease and mechanically restore damage already done. The entire energies and skill of the whole dental profession are totally inadequate to cope with more than a small fraction of the corrective work needed. To establish the habit of personal care of the mouth in school children is a field of activity that has developed the specially trained dental nurse or hygienist as an adjunct to dental service, whose calling is now legalized in the principal states of the United States. The work of the dental nurse is limited to the surface treatment of teeth, in the removal of deposits and accretions thereon, the training of school children in the systematic use of the tooth brush and their education in the importance of mouth cleanliness. In addition to the physical benefits resulting from oral hygiene among school children there is also a manifest improvement in moral. A child who has learned to use the tooth brush exhibits increased self-respect, greater attention to bodily and mental cleanliness, closer compliance with school regulations and an awakened interest in attendance and studies. The close connexion between oral hygiene and better citizenship is no longer debatable, and the present trend is toward making dental and oral hygiene service in all civilized countries a public health measure.

The many head, face and jaw wounds during the World War created a new field for oral surgery and surgical prosthesis. For the successful treatment of these cases it became evident that surgical measures alone were insufficient, as the loss of tissue from gunshot wounds of the head and face, as well as the unsightly scars resulting from extensive lesions when surgically treated, left the patient in many instances with repulsive deformities. The resources of surgery and dentistry were called into cooperation. Plastic surgery, involving the transplantation of the soft tissues and of bone to supply missing parts, was developed to a degree previously unknown. The rebuilding of the face, including reconstruction of the nose, lips, cheeks, the orbicular region, etc., was accomplished with a perfection in many cases almost miraculous. In this work the aid of dental prosthetic technique was often necessary. The large and increasing number of casualties of the head, face and jaws resulting from trench warfare quickly developed the need for hospitals and specialized equipment devoted entirely to the treatment of this class of wounds. Of these centres of specialized surgical activity the foremost in importance and extent was Queen's Hospital, Sidcup, Kent, England, a unit under British administration with sections for British, Canadian, New Zealand and Australian forces manned by personnel from the respective forces. Cooperation between the medical and dental staffs of the sections was organized with most satisfactory results. The American Ambulance hospital of Paris at Neuilly-sur-Seine, subsequently taken over as American Red Cross hospital No. 1, was an analogous centre of specialized head, face and jaw surgery in which similar cooperation was again successful. These experiences furnished convincing evidence of the need by each profession of a more intimate acquaintance with the work of the other. This need is recognized in the practice of adding a professional dental service to hospital staffs.

A general quickening of scientific research has followed. Bacteriological and histological investigation of dental and oral pathology by numerous investigators has not only added greatly to knowledge in this field, but brought about great improvement in dental and oral surgical technique. Notable progress has been made in the study of dental and oral infections and of physical irritations of nerve terminals in and about the teeth, in their relation to mental disorders and reflex neuroses, that cause disturbances of the special sense organs as well as spastic disorders of a local or general character. Attention has been directed to the endocrine relationships of the teeth and oral tissues, especially as to the probable connexion between the activities of the ductless gland system and the reactions of the salivary secretion, as well as to variations in the calcified structures of the teeth and their susceptibility or immunity to caries. Corresponding changes in the objectives as well as in the character, the content and extent of dental education have taken place in harmony with these developments. Practical teaching has tended toward a closer approximation to the fundamental ideals and methods of general medicine in so far as they represent the principles common to the whole science and art of healing. While the most conspicuous progress in dentistry during the decade 1910-20 has

been in the direction of its vital and hygienic relations, its technical and engineering features have shown a similar development. Until this period the construction of artificial dentures for the prosthetic restoration of lost teeth was almost wholly an empirical procedure depending on the judgment, manual skill and good taste of the operator. Scientific studies of the engineering principles underlying the mechanism of the human masticatory function, initiated about 1890 by W. G. A. Bonwill, of Philadelphia, and since prosecuted by his numerous followers, have brought the knowledge of masticatory movements and of the relations of the teeth and their morsal surfaces thereto to a state of completeness that enables the prosthetist by the aid of mechanical articulating devices to reproduce in the artificial denture a mechanism with possibilities approximating, both functionally and artistically, those of natural dentures.

The work of Alfred Gysi, of Zurich, constitutes the most advanced achievement in this field. In close relation to the progress is the coordinate progress made in the artistic reproduction in porcelain of nature's forms and colouring, brought about mainly by the studies of J. L. Williams, of New York, and N. S. Essig, of Philadelphia.

In 1913 Charles H. Mayo, the distinguished surgeon of Rochester, Minn., expressed the opinion that the next great step in medical progress in the line of preventive medicine should come from the dental profession. A review of the progress since made would seem to indicate a reasonable prospect of the fulfilment of that prophecy.

(E. C. K.)

DEPEW, HAUNCEY MITCHELL (1834-), American lawyer and politician (see 8.56), failed of reelection as U.S. senator on the expiration of his term in 1911. In 1914 he favoured the repeal of the Panama Canal Tolls bill. He assailed pacifism and after the signing of the "Lusitania" (1915) urged a strong stand against Germany. In 1918 he presented to Peekskill, N.Y., a bronze statue of himself, which was erected in Depew Park, a plot of land purchased from the Indians in the 17th century by an ancestor, François du Puy. In 1919 he added much adjoining land to this park.

He is the author of *Some Views on the Threshold of Four-score* (1914), including speeches delivered 1912-14, and *Speeches and Literary Contributions at Four-score and Four* (1918, articles and speeches composed 1916-18).

DERBY, EDWARD GEORGE VILLIERS STANLEY, 17TH EARL OF (1865-), English statesman (see 8.69), was in Jan. 1915 created a Knight of the Garter. In Oct. 1915 he became director of recruiting for the army, and as such was responsible for a new scheme for a total effort on behalf of voluntary service. A large number of recruits were obtained by Lord Derby's scheme, but as the numbers did not equal expectations the Military Service bill was introduced and carried in Jan. 1916. In Feb. 1916 Lord Derby became chairman of the naval and military air service joint committee but resigned in April, becoming Under-Secretary of War in July. On the formation of Mr. Lloyd George's Government in Dec. 1916, he became Secretary of War, and in April 1918 was appointed British ambassador to France. He retired from the latter office in Nov. 1920.

DÉROULEDE, PAUL (1846-1914), French author and politician (see 8.74), died at Mont-Boron, near Nice, Jan. 30 1914. In 1910 he had published a collection of his patriotic speeches, and a volume *La Ligue des Patriotes* containing further extracts from them appeared two years after his death.

DESCHANEL, PAUL EUGÈNE LOUIS (1856-), French statesman (see 8.91). During his absence from the presidential chair in the Chamber of Deputies after 1902, Deschanel carved out for himself a position of some political importance on the Committee of Foreign Affairs. He was president of its important committee when the Franco-German treaty of 1911, confirming the settlement of the Agadir incident, came before Parliament. He was reelected deputy in 1910, and on May 23 1912 he was chosen to succeed M. Brisson in the presidency of the Chamber of Deputies. He was maintained in this office by subsequent ballots in 1913 and 1914. His presidency of the Chamber was marked by much oratory of a literary nature, and by considerable dexterity in the treatment of the rowdy element of the extreme Right and the extreme Left. He aimed at being the impartial Liberal Republican. During the World War he played a great part as the national orator. There were, indeed, few occasions of sorrow or of thanksgiving which his eloquence did not either lighten or intensify. He delivered orations more frequently than he made speeches. Whether it was to hold Ger-

man infamy up to universal execration, to sing the splendours of the dead of France, to pay a glowing tribute to an ally's achievements, or to console the widow and the orphan and spur on the living fighter, he always had at his command the delicate, if somewhat artificial, style of speech of the great Latins, which combined both the structure of the artist and the feeling of a man. Speech did not give to him a sufficient outlet for his literary gifts. He was prolific as a writer in reviews such as the *Revue de Paris*, the *Revue Bleue*, *Revue Hebdomadaire* and the *Nouvelle Revue*. His books number *Figures de Femmes*, *Figures littéraires* (both 1889), and a tribute to his political godfather Gambetta. His talents as a littérateur were recognized by his election to the French Academy on May 18 1899. He married on Feb. 13 1901 Mlle. Germaine Brice, and had three children.

It was a secret to none that M. Deschanel, throughout his long political life, nurtured one great ambition—he desired to become President of the republic. When in Jan. 1920 M. Poincaré's term of office came to an end, it was with some genuine reluctance that Clemenceau allowed himself to be put forward as a candidate in opposition to Deschanel. That reluctance was justified by results. In the preliminary party ballot Clemenceau was beaten, and withdrew his candidature. Deschanel was elected President of the republic by the National Assembly on Jan. 17 1920 by an overwhelming majority. His term of office opened brilliantly, but his health was unable to stand the strain of office. In May 1920, while on an official journey to Montargis, he fell unobserved from the presidential train, and though he found his way to a signalman's box, and suffered no worse consequences than a nervous breakdown, he was temporarily incapacitated. His condition subsequently became such that on Sept. 20 1920 he was obliged to resign his office, and to leave Rambouillet, where he had sought the quiet necessary for the restoration of his health. He then went into a private nursing home at Rueil where he sufficiently recovered to be able to stand successfully for the Senate in the elections at the beginning of 1921, though he no longer took an active part in public affairs. (G. A.)

D'ESPÉREY, LOUIS FRANCHET (1856—), French marshal, was born at Mostaganem, in Algeria, on May 25 1856, and was commissioned from St. Cyr to the infantry in 1876. As a junior officer he saw much service in N. Africa and Tongking. For a time he was aide-de-camp to Freycinet, then Minister of War and premier. He served also in the expedition to N. China in 1900, after which he commanded an infantry regiment at home. He became general of brigade in 1908 and general of division in 1912. For a time he commanded the troops in Morocco, but in 1913 he was appointed to the I. Corps at Lille. He commanded this corps in the V. Army during the battle of the Frontiers, and at Charleroi had the ungrateful task of protecting the right of Lanrezac's army during its deployment on the Sambre; brought up at last on to the battlefield to deliver a decisive counter-stroke, he was at the moment of attack withdrawn again to protect the right rear of the army, the force which had released him having failed to keep the line of the Meuse. In the difficulties of the retreat which followed it was the I. Corps and its commander which formed, according to Lanrezac's own testimony, the soundest element of the V. Army, and when that general was relieved of his command on the eve of the battle of the Marne, Franchet d'Espérey was his obvious successor.

Gen. Franchet d'Espérey commanded the V. Army during the battle of the Marne and the advance to the Aisne, and continued in command till the end of March 1916, when he was appointed to the eastern group of armies, in succession to Gen. Duail. After holding this office for some eight months, he passed to the more active command of the northern group of armies, of which he was in charge throughout the campaign of 1917. In May 1918 he went to Salonika as commander-in-chief of the Allied armies in that theatre. His predecessor, Gen. Guillaumat, had worked out the main features of a general offensive on the Salonika front, and continued, in close coöperation with him, to support the claims and needs of such an offensive in the councils of the Allied High Command at Paris. Men and material were sent out in adequate numbers, and

though Franchet d'Espérey, even with Guillaumat's assistance, was only able to obtain the decisive authorization to attack a few days before the scheduled date, his energy was equal to the task of hastening on the last stages of preparation and on Sept. 15 an offensive was launched that carried all before it. Bulgaria surrendered, and the pursuit was pushed with hardly a check into and through Old Serbia. After the final victory he remained in charge of the Allied forces in European Turkey and Balkan occupied territory, with headquarters in Constantinople. He was created a marshal of France early in 1921.

DÉTAILLE, JEAN BAPTISTE ÉDOUARD (1848–1912), French painter (see 8.110), died in Paris Dec. 24 1912.

DETROIT (see 8.113).—Commencing with the recovery from the industrial depression of 1907–8, the city of Detroit entered upon a period of growth almost without precedent among large cities. The area of the city in 1907 was 35.65 sq. m., but by the end of 1918 had increased to 83.58 sq. m. With reference to a portion of this area a peculiar condition existed. The villages of Hamtramck and Highland Park were originally outside territory into which the population and business of Detroit overflowed. By annexations in 1916 and 1917 their outer boundaries were brought two miles within the city limits, but they still retained their separate municipal administrations. Together they covered 4.83 square miles. The pop. of the city as estimated from the Water Board enumeration of families was in 1907 about 390,000. In 1910 the U.S. census record was 465,766. The census of 1920 gave a total of 1,088,853 within the city limits, distributed as follows: under Detroit municipal administration 993,739; village of Hamtramck 48,615; City of Highland Park 46,499. A canvass made late in 1920 by the various city agencies for Americanization indicated that about 70% of the population was either of foreign birth or foreign parentage. Poles, Germans and Russians represented the largest numbers, though there were large accessions from south-eastern Europe. In a single automobile plant there were 34 nationalities represented. A canvass of the public schools taken in Dec. 1920 showed 55% of the pupils of American-born parentage, 50.5% being white and 4.5% coloured. In 45% of children of foreign-born parents Polish ranked first and Russian next. In the three years ending with 1920 a large amount of work was done by the Board of Commerce, the Board of Education, and leading manufacturers in teaching the English language and the elements of citizenship through public night schools and factory schools.

Manufacturing.—The extraordinary growth of the city was mainly a consequence of the expansion of its manufacturing industries. In 1904 the city was 12th in rank among the industrial centres of the country, with \$91,038,000 in manufacturing capital, 60,150 industrial employees, and a product valued at \$128,247,000. Five years later it was 6th in place, with a capital of \$210,000,000, 103,287 employees and product of \$252,992,000. In 1914 it was 4th, being surpassed only by New York, Chicago and Philadelphia, with a capital of \$405,000,000, 141,188 employees and product valued at \$569,000,000. In 1919 the number of employees had increased to 310,000 and the value of the product was estimated at \$1,450,000,000. In the first half of 1920 industrial activity was at its height, and although there was a decline in the latter part of the year, the total value was estimated at a slight increase over the previous year. By far the most important of the manufacturing industries was the making of automobile parts and accessories and assembling of motor cars. The business began in Detroit in 1899, but was not classed by the Census Bureau as a separate industry till 1904, when it had \$3,447,000 capital, employed 2,191 workers and had a product valued at \$6,240,000. In 1909 the capital employed in the industry had increased to \$28,928,000, the number of persons employed in office and factory 17,437, the number of cars produced 45,560 and the value of the product \$59,536,000. The next year there was a great expansion of the industry, both through the organization of new companies and additions to old plants. With the exception of a slight set-back in 1914, the growth was continuous till the latter part of 1920. At its peak of production in that year there were 25 companies assembling motor cars and 140 whose sole or principal business was the making of automobile parts and accessories. Together they employed about 155,000 persons and put out 1,250,000 cars valued at over \$1,000,000,000. The Ford Motor Co. alone had a maximum of 53,000 men on its pay rolls; Dodge Bros. 23,000; and the Packard Co. 17,000. The distribution of these products was world-wide, the portion set apart for export in 1920 amounting to \$152,000,000. During the decade ending in 1920 there were numer-

ous other changes in Detroit's manufacturing industries. Freight-car building, which was the largest of all up to 1908, has been almost entirely discontinued. The carriage and furniture factories were for the most part changed to the making of automobile accessories, and clothing manufacture diminished. Meantime some of the metal industries increased enormously. The city in 1920 was either first or near the front in the following lines: aluminium castings, brass products, computing machines, druggists' preparations, soda ash and kindred alkalis, stoves and varnishes.

Transportation.—For the accommodation of the increasing traffic caused by this industrial expansion there were great enlargements by the transportation lines. The Michigan Central tunnelled Detroit river and built an immense new passenger station and office building. That road and the Grand Trunk and the Pere Marquette made great additions to their freight yards, stations and sidings, and the outer belt line was extended. The Pennsylvania lines were extended from Toledo to Detroit, with a belt line of their own round a portion of the city, and ample freight and passenger facilities. The Detroit, Toledo and Ironton, which was suffering for lack of funds and equipment, was purchased by the Henry Ford interests, with great improvement in its facilities for service as a coal road. In lake freight transportation 1916 was the maximum year. The number of passages by vessels through the Detroit river that year was 37,852, net registered tonnage 76,677,264, actual freight tonnage 100,907,279, estimated value of freight \$1,069,617,157. There was also in 1919 and 1920 an astonishing development in motor-truck service. There were in 1920 about 20 established lines reaching out from the city in all directions, and covering distances as great as 50 m. or more. At the April election in 1920 by a vote of 89,285 to 51,093 the people approved of a plan for municipal construction and operation of street railway lines. It was intended for the present to supplement, but ultimately to absorb, the privately owned system. A short section was opened Feb. 1 1921.

Miscellaneous.—The manufacturing and population growth was accompanied by similar expansion in other lines. For example: assessed valuation, 1910, \$377,335,980; 1920, \$1,699,149,580; city tax levy, 1910, \$6,837,686; 1920, \$35,086,359; bank capital and surplus, 1910, \$19,130,000; 1920, \$58,343,500; bank deposits, 1910, \$140,183,995; 1920, \$503,944,735; bank clearings, 1910, \$910,835,005; 1920, \$6,109,313,803; building permits, 1910, 5,498, to cost \$17,225,945; 1920, 19,412, to cost \$77,737,365; post-office receipts, 1910, \$2,133,647; 1920, \$6,031,442; internal revenue receipts, 1910, \$6,725,941; 1920, \$304,184,392; imports, 1910, fiscal year, \$13,763,200; 1920, \$91,160,552; exports, 1910, \$82,143,633; 1920, \$339,844,490. Detroit's allotment of the four Liberty loans and the Victory loan was \$233,977,172. The subscriptions actually made amounted to \$299,794,150, from 785,176 subscribers. During 1917 and 1918 contracts for munitions and army supplies to the amount of about \$900,000,000 were taken in Detroit. Of these nearly \$300,000,000 worth were cancelled after the Armistice.

Administration.—Under a charter adopted by popular vote June 25 1918, the methods of municipal government were materially changed. In place of a Board of Education of one member from each ward, there was a Board of seven members, elected two or three at a time on a general ticket and holding office for six years. The old Board of Estimates, consisting of two members from each ward and five at large, was abolished, leaving appropriations and bond issues to be determined by the mayor and common council. The mayor's final judgment was conclusive upon all appropriation items, unless reversed by a vote of seven out of the nine aldermen. The old common council of two aldermen from each ward was displaced by a council of nine members all elected at one time on a general ticket. The mayor, city clerk and city treasurer were elected, but all other administrative officers and commissions were appointed by the mayor, without reference to the council, and were subject to dismissal by him without trial. Nominations, two for each office to be filled, were made at non-partisan primaries. Blanks for voting were also non-partisan, and the time of election was separated from that of the state and national contests. By special legislative enactment the police and recorders' courts were combined in one with seven judges, holding office for four years and having jurisdiction of all criminal and ordinance cases. The judges were all chosen at one time on a non-partisan ticket. (W. St.)

DE VALERA, EDWARD [EAMONN] (1882—), Irish republican leader, was born Oct. 14 1882, near Charleville, Co. Cork. His father, Vivian de Valera, was a Spaniard; his mother, whose maiden name was Kate Coll, came from near Bruree, Co. Limerick. He spent his childhood and boyhood among his mother's people, and was educated first at the national school and later at the Christian Brothers' school, Charleville. He then went to Blackrock College, Co. Dublin, where he gained a reputation both as a student and an athlete. Here he worked at Latin, Greek, French and English literature, and at his favourite subject, mathematics. He won a middle grade exhibition in 1899, and in 1900 one in the senior grade. Entering the Royal University in 1901, he won the next year a second class mathematical

scholarship. He went as teacher to Rockwell College, and while there graduated with a pass B.A. degree in mathematical science in 1904, and proceeded to the B.Sc. degree in 1914. In 1910 he passed the examination for the diploma in education (teaching). For a time he worked at a thesis on quaternions for his M.A. degree, but he never presented it. He also attended lectures in mathematics at Trinity College, Dublin, where he unsuccessfully competed for a scholarship. Returning to Dublin, he taught mathematics, Latin, and French in the principal Roman Catholic colleges, including the old University College, St. Stephen's Green; Belvedere; Clonliffe; Dominican College, Eccles Street; Loreto College, St. Stephen's Green; and Carysfort Training College for teachers. He examined in mathematics for the Irish Intermediate Board of Education in 1912 and following years. He unsuccessfully attempted to become an inspector of national schools. He was very popular with his pupils. He also rapidly acquired a knowledge of Irish (Gaelic), and in 1914 he was able to read difficult bardic Irish poetry. He took charge of the Irish Summer College at Tawin founded by Casement.

On the foundation of the Irish Volunteers in 1913, he threw himself heart and soul into the new organization. Sinn Féin had turned to the use of violence in 1909, and to this organization De Valera belonged, though he assumed no leading share in it till the Easter rebellion of 1916. When Casement was captured he countersigned the order of Thomas MacDonagh on April 23, cancelling the inspection and manoeuvres ordered for that day. When, nevertheless, the rebellion broke out De Valera was in the outer circle of Dublin held by the rebels, which ranged from Ringsend to Ballsbridge. He commanded the insurgents holding Boland's bakery, which was valuable in two ways: it assured the rebels of a supply of foodstuffs, and it offered a commanding position for rifle fire. Though there was heavy firing day and night in this district, there were not many casualties, as there was much cover for both sides. The real leaders of the rebellion were P. H. Pearse and J. Connolly. When an order from the former reached De Valera commanding him to surrender, he at first refused to believe that it was genuine. When he satisfied himself, on Sunday, April 30, he submitted and surrendered with the hundred men of his garrison. He was sentenced to death, but the sentence was commuted to penal servitude for life, and he was committed to Lewes prison, but was released in the general amnesty of June 15 1917. No conditions had been attached to the release of the prisoners, and De Valera himself openly ascribed this action of the Government not to generosity, but to fear. As the only surviving leader of the rebellion, he found at once that he had achieved importance in the eyes of the majority of the Roman Catholic Irish, who had meanwhile swung round violently in the direction of Sinn Féin. When the ex-prisoners left the boat at Kingstown De Valera marched at their head, and his entry into Dublin was a triumphal process. His triumph was increased in the same month by his election for East Clare by a large majority, his opponent being P. Lynch, who had been the crown prosecutor and now stood as a Nationalist. The importance of this election rivalled that of the famous Clare election of 1828, when O'Connell stood. De Valera's sweeping victory gave an immense impetus to the Sinn Féin cause.

From this time until his re-arrest in the spring of the following year De Valera was the heart and soul of the Sinn Féin movement. A facile writer and speaker, both in English and Gaelic, he was a master of the type of unmeasured eloquence that appeals to the Irish temper, which is impatient of compromise. In Dublin, on the day after his election for Clare, while in the hall of the convention the representatives of the N. and S. were engaged in seeking a formula of union, in the street outside De Valera was telling a cheering crowd that "if Ulster barred the way, Ulster must be coerced." A similar violence characterized all his speeches. The Sinn Féin convention of Oct. 26-27 1917 elected him "President of the Irish Republic."

In the agitation, in the early part of 1918, against "conscription" De Valera took a leading part. But in May the discovery by the Government of another plot for a rising, to be combined with a German invasion, led to his re-arrest together

with some 150 other prominent Sinn Feiners. He was imprisoned at Lincoln, in England, but on Feb. 3 1919 he, with two other Irish prisoners, escaped and, ultimately, made his way to the United States. Here, working with the same restless energy as in Ireland, he was successful for a time in enlisting a large amount of public sympathy for the Sinn Fein cause, especially in Irish and German-American circles. He was received as "President" by the civic authorities of New York (under Mayor Hylan's Tammany administration) and in other cities where the Irish vote predominated, presented with their "freedom," and otherwise honoured. His attempt, however, to persuade the party conventions, assembled to nominate candidates for the presidency, into making the independence of Ireland a plank in their programmes, completely failed, and the Irish question was not mentioned in the programme of either party. With the election of Mr. Harding to the presidency, it became clear that De Valera's efforts to involve the United States in a quarrel with Great Britain about Ireland had broken down, and in the spring of 1921 he returned to Ireland, where in June and July negotiations were opened with him by the Government with a view to an Irish settlement (see IRELAND: History).

In 1910 De Valera was married to Miss Sinéad N. Fhlannagain, one of the most popular teachers and earnest workers of the Ard Craobh and Colimille branches and of the Jeinster College.

DEVENTER, SIR JACOB LOUIS VAN (1874-), S. African general, was born in the Orange Free State in 1874. A colonel on the permanent staff of the S. African Defence Force, Van Deventer served in the German S.-W. Africa campaign, 1914-5, where he had a distinguished record in active service. His real gifts as a general, however, were not fully appreciated till he went to German E. Africa, to fight in Gen. Smuts's campaign against the Germans there. So well did he acquit himself in that field that when Gen. Hoskins, who had succeeded Gen. Smuts in the chief command, ceased to hold that post in 1917, Van Deventer was appointed commander-in-chief of the Empire Military Forces in E. Africa. He was then a major-general, and was given the temporary rank of lieutenant-general on becoming commander-in-chief. Shortly afterwards he was created K.C.B., in recognition of distinguished services in the field. As commander-in-chief he showed the same qualities which had secured for him this high promotion and it was under his auspices that the campaign was brought to a successful end. Van Deventer left E. Africa at the end of 1918, sending a message of thanks to the administrator of Southern Rhodesia, in which he expressed his sincere thanks for the "unfailing co-operation of the Rhodesian troops, British and African, in the campaign."

DE VILLIERS, JOHN HENRY DE VILLIERS, BARON (1842-1914), first Chief Justice of the Union of South Africa, was born at Paarl, Cape Colony, in June 1842. Descended from the Huguenots who settled in that part of the Cape, he was educated at the South African College, Cape Town, and went to Utrecht and Berlin universities. In 1865 he was called to the bar by the Inner Temple, and in the same year returned to South Africa and began practice as an advocate of the Supreme Court of Cape Colony. His success was immediate. Entering Cape politics in 1866, he was elected a member of the House of Assembly, became attorney-general of the Colony in 1872, and two years later was appointed Chief Justice of the Cape. In that high office he speedily confounded critics of his appointment. The Roman-Dutch law of the Colony, admirable in its logic and symmetry, was ill-fitted to the complications of modern conditions, and it was the life-work of de Villiers to adapt it to these needs. This he did with a conspicuous success which has secured for him a place high on the roll of those great judges who have done the work of British civilization in many parts of the world. De Villiers was knighted in 1880, was created a K.C.M.G. a year later, and in 1910 was raised to the peerage on his assumption of the post of Chief Justice of the newly formed Union of South Africa. He died Sept. 2 1914.

In the work of moulding the instrument of union he had borne a great if not a decisive part. Throughout his career he had taken a constant interest in the politics of Cape Colony and of

South Africa—an interest which had never degenerated into partisanship, which had throughout been inspired by a true and enlightened patriotism, which had never lacked the touch of courageous plain speech at the many moments of crisis through which his country had passed. Universal recognition of these outstanding qualities made the appointment of de Villiers as president of the National Convention inevitable, though it must be said that, as the work of the Convention drew towards completion, there were murmurs—and not without justification—that long years on the bench had done something to affect his natural aptitude for presiding over the deliberations of such a body. These criticisms, however well justified, should not detract from the greatness of his achievement, both as a judge and as a figure in the tortured public life of South Africa during the hazardous years of his career. As a judge he touched genius. Acute, unbiased, learned in the crabbed texts of Roman-Dutch law, he added to these gifts the art of keeping steadily in mind the practical needs of the life of his country as affected by his judgments. Equity rather than precedent was his mentor. With the bar his relations were those of a wise and revered adviser. During repeated visits to Great Britain he shared with known distinction in the work of the Judicial Committee of the Privy Council, and the value of his assistance to that body was recognized more than once in public by his colleagues.

DEVONPORT, HUDSON EWBANKE KEARLEY, 1ST VISC. (1856-), English politician and man of business, was born at Uxbridge Sept. 1 1856, and educated at Cranleigh school. He entered the firm of Kearley & Tonge, tea merchants and shippers, of London and Calcutta, subsequently becoming senior partner. In 1892 he entered Parliament as Liberal member for Devonport, and from 1905 to 1909 was parliamentary secretary to the Board of Trade. In 1908 he was created a baronet, and in 1909 was elected chairman of the Port of London Authority, being prominent in this capacity during the strike of transport workers and lightermen at the London docks in 1912. In 1910 he was raised to the peerage. He was appointed first Food Controller in 1916, and in 1917 became secretary to the Sugar Commission, but had to retire owing to ill-health. The same year he was created a viscount.

DEWAR, SIR JAMES (1842-), British chemist and physicist (see 8.137), published (with G. D. Liveing) *Collected Papers on Spectroscopy* (1915). In 1916 he received the Copley medal of the Royal Society, and the Franklin medal of the Franklin Institute of Philadelphia in 1919.

DEWEY, GEORGE (1837-1917), American naval officer (see 8.139), died in Washington Jan. 16 1917, and three days later was buried in the Arlington National Cemetery. By special provision Admiral Dewey was never retired but continued in active service up to his death, for the last seven years being president of the General Board of the navy. To the last he continued to urge the building of large battleships, citing their superiority in the battle of Jutland in the World War. He published his *Autobiography* in 1913.

DIAZ, ARMANDO (1861-), Italian general, was born in Naples Dec. 6 1861. He entered the artillery and served in that branch and in various staff appointments, until his promotion to major, when he transferred to the infantry. He served in the Italo-Turkish War in command of a regiment and was wounded at Zanzur in Sept. 1912. In 1914 he was promoted to major-general, and, after commanding the Senna Brigade for a short time, was transferred to the general staff. On Italy's entry into the World War he was attached to the supreme command as chief of the operations department. He held this post till June 1916, when he was promoted lieutenant-general and took command of the 40th Division, which in Nov. of that year distinguished itself by the capture of Volkovnjak, an important position on the northern rim of the Carso. He visited the French front in Jan. and Feb. 1917, and in June he was given special promotion and confirmed in command of the XXIII. Corps, which he had held temporarily from its formation two months previously. Under his direction in the following Aug. this corps won a considerable success between Korite and Selo, on the Carso.

In Nov. 1917, after the Caporetto disaster, Diaz succeeded Cadorna as chief of the general staff. He was confronted with a very serious situation, but he brought to bear upon it all the needful understanding and resolution. Under his direction the battle front was successfully reconstituted, and the work of reorganizing the Italian army was carried out. At the instigation, and under the close personal supervision, of Diaz much was done to improve conditions for the soldiers at the front and for their families at home. Under his command the double attack of Boroevich and Conrad was broken up at the battle of the Piave (June 1918) and the armies of the Dual Monarchy were destroyed by the battle of Vittorio Veneto (Oct.-Nov. 1918). For his services Diaz received the collar of the Annunziata, the highest Italian order. In Nov. 1919 he was nominated army general and retired from his position as chief of staff, and later, upon the reorganization of the army and Ministry of War, he was appointed vice-president of the Army Council. He also became a Senator and in 1919 he received the freedom of the City of London.

As a division and corps commander Diaz displayed high military qualities. His position as chief of the general staff was rendered delicate by the fact that the British and French divisions which were sent to Italy after Caporetto were not at first placed directly under his command, and his personal qualities were specially adapted to render collaboration easy. Diaz has been criticized for excess of caution in delaying his final attack upon the Austro-Hungarian armies. It is possible, though by no means certain, that he might have attacked with success sooner. But an earlier victory might very well have been less complete, and anything less than complete victory would not have served the cause of Italy or of the Allies.

DIAZ, PORFIRIO (1830-1915), president of the republic of Mexico (see 8.172), died in Paris July 2 1915. In April 1910 he was elected president for the eighth time, but as the result of widespread opposition to what was regarded as a prolonged dictatorship, a revolution broke out the following Nov., headed by Francisco I. Madero. Because of his age the President could not head his army personally, and in May 1911 was forced to resign. With his family he went to Spain, and thereafter until his death lived in various European capitals.

DICEY, EDWARD (1832-1912), English writer (see 8.178), died in London July 7 1911.

DIÉRIX, LÉON (1838-1912), French poet (see 8.210), died in Paris June 11 1912. His *Poésies Posthumes* appeared in 1913.

DIESEL, RUDOLF (1857-1913), German engineer, was the inventor of the Diesel oil-engine (see INTERNAL COMBUSTION ENGINES); the possibilities of which, however, had hardly been realized till after his untimely death. He fell overboard the Antwerp-Harwich mail steamer on Sept. 30 1913, and was drowned.

DIGGLE, JOHN WILLIAM (1847-1920), English divine, was born at Strawberry Hill, Pendleton, March 2 1847. He was educated at Manchester grammar school and Merton College, Oxford, where he graduated in 1870, being ordained in 1871. After many years of energetic work in various parishes he was in 1892 made examining-chaplain to the Bishop of Carlisle, Dr. Bardsley. Four years later he became archdeacon of Westmorland and canon residentiary of Carlisle. In 1902 he became rector of St. Martin's, Birmingham, in 1903 was made archdeacon of Birmingham, and in 1905 became Bishop of Carlisle, where his energy and industry brought him a great reputation. He died at Rose Castle, Carlisle, March 24 1920.

DIGGLE, JOSEPH ROBERT (1849-1917), English educationist, was born in Lancs. May 12 1849. He was educated at Manchester grammar school and Wadham College, Oxford. He took orders, but resolved later to devote himself to public work. In 1870 he was elected for the Marylebone division to the London school board, on which he remained until 1897, being chairman from 1885 till 1894. Diggle was an active member of many committees for the betterment of the conditions of the working classes, and published *Pleas for Better Administration upon the London School Board* (1881 and 1885). He died at Oxford Jan. 16 1917.

DILKE, SIR CHARLES WENTWORTH, 2ND BART. (1843-1911), English statesman (see 8.271), died in London Jan. 26 1911, and was succeeded by his son, **CHARLES WENTWORTH DILKE** (1874-1918), who died in London Dec. 7 1918. The baronetcy went to Sir Fisher Wentworth Dilke (b. 1877), a cousin of the 3rd Bart.

DILLON, JOHN (1851-), Irish Nationalist politician (see 8.273). The Irish members endeavoured unsuccessfully to censure the conduct of the Speaker in regard to the suspension of Mr. Dillon on March 20 1902. He was prominent that year in Parliament in his attacks on the Government for the revival of the Crimes Act, and in the following year he helped forward Mr. Wyndham's Land Purchase Act. For several subsequent years he played a comparatively subordinate part both in Ireland and in Parliament; but in 1909 he appeared as a leading apologist of cattle-driving, telling the House of Commons that the grazing system in Ireland had become an abomination. He aided the parliamentary progress of the Home Rule bill mainly by a judicious silence. In the years before the World War he had been very critical both of the increased naval preparations, which he said were the result of a bogus naval scare, and of Sir Edward Grey's policy in Egypt and Morocco. But he followed his leader, Mr. Redmond, in urging Ireland to take her share in the war against Germany, and spoke at the meeting in the Dublin Mansion House on Sept. 23 1914, when the platform was occupied by the Lord Mayor, the Lord Lieutenant, Mr. Asquith (Prime Minister), the Chief Secretary, and Mr. Redmond. In Parliament, however, he showed himself opposed to compulsory service and the setting up of a Munitions department; and after the Dublin rebellion he said he was proud of the rebels, accused the Government of washing out the word Nationalist in a sea of blood, and declared that Sir John Maxwell's system of military rule had done more to spread disaffection in Ireland than all the organisers of Sinn Féin. He did not show himself very sympathetic or hopeful in regard to the various suggestions of Mr. Lloyd George for settling the Irish question. In July 1918, as Mr. Redmond's successor in the leadership of his party, he brought forward a motion that the Irish policy of the Government was inconsistent with the principles for which the Allies were carrying on the war, advised calling in President Wilson to settle the question, and bitterly denounced what he called the outrageous coercive system in force in Ireland. But the violence of his language did not save him from the vengeance of Sinn Féin who now dominated that country; he, along with almost the whole of the Constitutional Nationalist party, lost his seat at the general election of Dec. 1918.

DINANT, Belgium (see 8.274).—The town was almost completely destroyed at the beginning of the World War by German forces invading Belgium, who here endeavoured to force the passage of the Meuse, the left bank of which was held by the French. On Aug. 23 1914, the Germans rushed the town, and, on the pretext that the civil population had fired on them, they set fire to the town and shot numbers of the inhabitants *en masse*. In all 665 persons, or about one-tenth of the total pop., were massacred, among them being 71 women and 39 infants, many of the latter only a few weeks old. Of 1,653 houses only about 600 remained. A minute inquiry into the charge, held subsequently, completely established the innocence of the inhabitants. The rebuilding of the town was being actively pursued in 1921.

DINES, WILLIAM HENRY (1855-), English meteorologist, was born in 1855, the son of G. Dines, also a meteorologist. He was educated at Woodcote House school, Windlesham, and afterwards entered Corpus Christi College, Cambridge, where he obtained a first-class in the mathematical tripos in 1881. He afterwards carried out some investigations for the Royal Meteorological Society on the subject of wind forces, and in connexion with this work designed the Dines pressure-tube anemometer. In 1901 he commenced researches into the problems of the upper air, and designed or perfected several instruments for use with kites, as well as a form of the Hargreaves box-kite, which proved of great value. In 1905 he was appointed by the Meteorological Office director of experiments in connexion with the investigation

of the upper air, and in 1907 designed a meteorograph for use with balloons. He also produced, in conjunction with Dr. Napier Shaw, the microbarograph and a recording mercury barometer, as well as various other instruments. From 1901 to 1902 he was president of the Royal Meteorological Society and in 1905 was elected a fellow of the Royal Society. He was a member of the International Commission for Scientific Aeronautics, and became an hon. or corresponding member of various foreign scientific societies. He is the author of many important papers on the meteorology of the upper atmosphere which appeared in the *Transactions of the Royal Society*, the *Geophysical Memoirs of the Meteorological Office* and elsewhere.

DIPLOMACY (see 8.204).—The general effect of the World War on the principles and practice of diplomacy, defined as the science and art of conducting negotiations between sovereign states, has been very great, for better or for worse; but in general it may be said that the war did not give the initial impulse to, but merely greatly strengthened, forces which had been long at work modifying the traditions of diplomacy and adapting it to new social and political conditions.

Long before the war the gradual development of a sense of the community of interests among civilized nations, and of the public law which was the outcome of this sense, had raised diplomacy to a far higher plane than that which it had occupied in the 18th century. Before the war, too, the progress of democracy had produced great changes in diplomatic practice. Delicate negotiations were, indeed, still conducted in secret, as they always must be; but publicity had already become a recognized diplomatic weapon to be used on occasion, and ambassadors, though still accredited to courts and governments, were sometimes—notably in the case of the United States and Great Britain—selected for qualities likely to appeal to peoples. Already, too, democratic sentiment was demanding open diplomacy, with popular control, while a host of publicists had long been busy devising schemes for an international order which, were it possible to realize it, would revolutionize diplomacy by establishing among the nations—to use President Wilson's language—"not a balance of power, but a community of power; not organized rivalries, but an organized common peace."

General Effects of the War on Diplomatic Practice.—These tendencies received a fresh impetus from the outbreak of the war. This disaster was widely ascribed to the machinations of diplomatists, who were denounced as representing not peoples but a class, as in league with capitalists and munition manufacturers to stir up war, as fraudulent trustees of the nations' welfare, who in their pitiful game of international chicanery habitually used language "false-friendly, circumlocutory, and non-committal, full of duplicity and secret reserves" (e.g. J. A. Hobson, *Towards International Government*, pp. 67, 69). The cure for this was to be to sweep away the diplomatic tradition altogether; to replace the trained diplomatic service by men directly representing popular opinion; and to secure effective "democratic control" by giving the deciding voice in all international questions to legislative bodies. These remedies for an assumed evil had the support of many sociologists and of many democratic politicians, especially in countries where parliamentary action on treaties was already required. Extend the system of democratic control, they argued, and crown the international edifice with a legislative assembly representing collective humanity, and peace will be forever assured, since the "peoples" never want war. This solution of the international problem, which ignored the fundamental difficulties, seemed to receive support in the highest quarters when President Wilson put forward his "programme of the world's peace." The very first of the Fourteen Points condemned "secret diplomacy." In future there were to be "open covenants openly arrived at, after which there shall be no private international understandings of any kind, but diplomacy shall proceed always frankly and in the public view." A "general association of the nations" was to be formed, in place of the partial alliances of former times (Point XIV.), and peace was to be made secure "by the organized major force of mankind."

The incorporation of the Covenant of the League of Nations in the Peace Treaty was an effort to realize the President's ideal.¹ From the point of view of the present article its main interest lies in the fact that it set up permanent machinery for that "diplomacy by conference" to which the work of settlement after the war gave a powerful development. For the rest, it cannot be said that the history of diplomacy from the time of the Armistice onward revealed any striking change in the old methods. Indeed, in so far as the traditional methods were departed from, the change was sometimes for the worse. The sounding phrases which had heralded the Peace Conference had only—as President Wilson himself confessed—raised in the hearts of millions of people hopes which could not be realized; and the enforced departure of the victorious powers from the promises and professions which they had made in their time of trouble did not inspire admiration for the new diplomatic morality. Nor was the assertion of this morality in the great Treaty a happy one. The preambles of treaties of peace in earlier times had perhaps been tinged with hypocrisy, since it was customary to describe the peace to be concluded as "Christian, universal and perpetual"—which nobody believed to be the truth. But even this pretence had its use, since it at least placed on record an ideal. In addition to this, however, it was usual to state that there was to be "complete oblivion of the past," a treaty of peace being conceived as a settlement of all outstanding differences and as clearing the ground for an entirely fresh start in the relations of the contracting parties (Satow, ii., p. 180). Whatever may be said of the guilt of the German nation in respect of the origin and conduct of the war, as justifying a departure from this tradition, the fact that in the Treaty of Versailles it was departed from is momentous. For the first time a treaty of peace was made to contain a confession of guilt on the part of the vanquished party, a confession permanently humiliating to a whole people. The old diplomacy, which was wholly practical, would not have made the mistake of introducing into what was intended as the foundation of the permanent order of the world a full charge of political dynamite of this description. The Allied statesmen of a hundred years ago did not thus humiliate France, even after the fresh outburst of the Hundred Days, though they were equally persuaded of her guilt and public opinion clamoured for her humiliation and dismemberment. But they were trained diplomatists, able to look into a future in which France, regenerated if not repentant, would again become a useful member of the European body politic. They cared not a rap for public opinion.

In general it may be said that the Peace Treaty of 1919 was the work of politicians, not of diplomatists; and this fact marks a significant change in the practice of diplomacy. Before the war the conduct of international affairs was, in Europe at least, in the hands of the trained diplomatic body working in connexion with the various Foreign Offices; and this international business was conducted according to an elaborate code of rules, established by custom or by convention, which had been devised as the result of long experience, to ensure its smooth working. At the Conference of Paris diplomatists were present, but they played but a secondary part. This was perhaps inevitable in view of the passionate interest of the peoples in certain aspects of the settlement, which forced those responsible for it to combine the functions of diplomatist and demagogue. But it had an unfortunate repercussion on the professional diplomatic service, of which it lowered the prestige.

This was especially the case, perhaps, in Great Britain. Even before the war there had been a tendency to pass over the professional diplomatists in making appointments to important embassies, which were occasionally, though as yet exceptionally, given to eminent party politicians. It is the system which has always prevailed in the United States, sometimes with excellent results—as in the notable succession of ambassadors to the Court

¹ For Mr. Wilson's conception, see his address to the Senate, Jan. 22 1917. Compare Mr. Asquith at Ladybank, Feb. 1 1917:—"A real European partnership, based on the recognition of equal right, and established and enforced by a common will."

of St. James's—but more often perhaps with results less satisfactory. Whatever may be said for this system, however, there can be no doubt that its considerable extension by the British Government since the war has dealt a severe blow at the diplomatic service; for how can men be expected to serve a long and arduous apprenticeship to a profession when they realize that its great prizes are given to outsiders who have served no apprenticeship at all?

Less obviously harmful was the outcome of the attacks from democratic quarters on the system of recruiting the diplomatic service in England. The object of this system, which demanded of candidates for examination nomination by the Foreign Secretary on the recommendation of persons of position and proof of the possession of an income of £400 a year, was to ensure the manning of the service by gentlemen, that is to say by those who had "at least had the opportunity of mixing in society where good manners are to be expected." In this system certain modifications were made as the result of a report issued in 1914 by the Royal Commission on the Civil Service. One of its recommendations was that the diplomatic establishment of the Foreign Office and the diplomatic corps abroad should be amalgamated, up to and including the grades of assistant under-secretary of state and minister of the lowest grade. This involved the abolition of the property qualification, which did not apply to the Foreign Office; and it was recommended that, in place of this, members of the service employed abroad should receive a suitable foreign allowance. After the publication of the findings of the Commission the recommendation of the Foreign Secretary was made dependent on the report of a board of selection composed of members of the Foreign Office and of the diplomatic service. In this there was nothing revolutionary; and the effect of the putting in force of these recommendations has been to widen the area of selection for the service. The danger lies in the denunciation as undemocratic of any principle of selection other than by the strict result of written examination. But the qualities required for a diplomatist, as Sir Ernest Satow rightly points out, cannot be ascertained by means of a written examination, which only affords evidence of knowledge already acquired, but does not reveal the essential ingredients of character (ii, p. 183). The character required for an efficient diplomatist will always be that implied in the best sense of the word "gentleman," meaning a man honourable, well educated, of good address and manners, and able to hold his own without self-consciousness in any company.

The whole body of rules and conventions for the regularizing of international intercourse, which is known as International Law, is the work of diplomacy, and it is the work of diplomatists to apply them. It follows that to be efficient they must be trained, and it is folly to suggest that the place of the trained diplomatist can be taken by a popular representative without experience or technical equipment. As Mr. Denys P. Myers has pointed out, by far the greater mass of diplomatic work consists in giving particular application to rules already universally admitted, a matter straightforward enough, but demanding technical knowledge. The remaining portion of the work is disproportionately difficult, since it consists in adjusting disputes about matters to which the application of existing rules is doubtful, or to which they admittedly do not apply, or which stand beyond all rules as questions of high policy. In such debates the diplomatist is necessarily an advocate; his object is not justice, but the advantage of the country he represents; and therefore "the art of which Socrates spoke, of making the worse cause appear the better, is inherent in every negotiation" (Myers, p. 298). Certainly the attempt of President Wilson to set up a standard of Right as the "acid test" of all claims between nations has altered nothing in this, and can alter nothing so long as nations differ in their conceptions of what Right is. Diplomacy must continue to be, in this aspect of its activities, frank advocacy of particular interests, even though the dispute be heard before the high court of the League of Nations. But this advocacy has been subject to certain rules, and in the interests of peace—which it has been the main purpose of diplomacy to preserve—it

has in course of time elaborated a highly technical phraseology of which the object has been to convey a plain meaning without being unpardonably offensive. This method may be "circumlocutory," but it is more calculated to keep the peace than democratic "plain-speaking." A peccant Government informed that such and such an act will be considered "unfriendly" will perfectly understand the threat conveyed, and it will be easier for it to yield than if the threat had been uttered in more unequivocal fashion. In short, the conventional forms used in diplomatic intercourse have a very practical use. In the words of the late Mr. E. C. Grenville-Murray, "they regulate the precise words of respect and courtesy necessary to be used on every occasion; they deprive argument of its heat and expostulation of its acrimony."¹

Secret Diplomacy and Democratic Control.—In spite of President Wilson's denunciation of secret diplomacy, the negotiations before and after the Conference of Paris followed almost exactly the old practice. The organization of the conference itself was modelled closely on that of the Congress of Vienna in 1814. As at Vienna, all business of first-class importance was settled by the representatives of the Great Powers in secret conference, and the plenary sessions, to which alone the Press was admitted, were almost admittedly mere full-dress parades intended to produce an illusion of publicity. By a curious irony it was indeed President Wilson himself who was most violently attacked for neglecting the principle that diplomacy must always proceed in the public view. In the course of the long controversy between the President and the Foreign Relations Committee of the United States Senate about the Covenant of the League of Nations, which ended in the refusal to ratify the Treaty of Versailles, complaints were loud and reiterated that the Committee were kept completely in the dark as to the progress of the negotiations in Paris, although under the Constitution their treaty-making power was coördinate with that of the President. It was also urged against President Wilson that, in order to secure his sole control of foreign affairs, he had largely extended the custom of superseding, for the purpose of particular negotiations, the accredited agents of the United States—whose appointment was also subject to the advice and consent of the Senate—by personal agents of his own (Corwin, p. 64). The victory of the Senate over the President in the matter of the Treaty of Versailles was widely assumed to have settled in favour of the Senate's view the long controversy—it had raged intermittently since the days of Washington—about the powers of the President and the Senate respectively over the conduct of foreign affairs. President Harding, however, was hardly in office before he asserted as vigorously as any of his predecessors the sole right of the President to conduct negotiations. The right of the Senate to ask for papers has long been admitted, but the right of the President to refuse, in the public interest, to submit them seems equally clear (Corwin, p. 84 *seq.*).

The outcome of this controversy illustrates the fact that the war and the negotiations which followed have left the questions of secret diplomacy and of democratic control very much as they were before. So far as democratic control is concerned, wherever parliaments exist foreign relations come under their review, and can be controlled by their power of the purse; and it is their own fault if this control is not effective. "The ultimate misfortune of war," says Mr. Myers, "depends everywhere upon legislative financial support." But while control of broad policies is thus assured, there is no control of the processes of negotiation. It is, indeed, hard to see how such control could be attempted without creating a hundred difficulties and dangers for one which it would obviate. The point was admirably stated by Mr. Arthur Balfour in the House of Commons on March 19 1918, on a motion for a Standing Committee of Foreign Affairs:—

"I think the British world perfectly understands the broad ends for which British diplomacy works. . . . What is not simple, what is not plain, what is not easy, is the actual day-to-day carrying out of the negotiations by which these ends are to be attained. A Foreign Office and a diplomatic service are great instruments for preventing,

¹ *Embassies and Foreign Courts* (2nd ed., 1836).

as far as can be prevented, friction between states which are, or which ought to be, friendly. How is the task of peace-maker—because that is largely the task which falls to diplomatists and the Foreign Office which controls diplomatists—to be pursued if you are to shout your grievances from the house-top whenever they occur? The only result is that you embitter public feeling, that the differences between the two states suddenly attain a magnitude they ought never to be allowed to approach, that the newspapers of the two countries agitate themselves, that the parliaments of the two countries have their passions set on fire, and great crises arise, which may end, have ended sometimes, in international catastrophes."

Mirabeau had said much the same thing in the French National Assembly in 1790, and subsequent history bore out its wisdom. It was not the diplomatists but the oratorical heat of the Legislative Assembly that plunged Europe into the wars of the Revolution. It was not public opinion, but the wisdom of the diplomatists, on either side, which saved Great Britain and the United States from a renewal of war during the critical years that succeeded the Peace of Ghent in 1814. Had Castlereagh listened to the outcry of the British press and Parliament, had James Monroe and John Quincy Adams listened to the outcry of the American press and Congress, there would have been no hundred years of peace between the two countries. Instances might be multiplied. The world remembers the wars which diplomacy has failed to avert; it has forgotten, or has never known of those—and they are many more—which diplomacy has averted by a conspiracy of silence.

Diplomacy by Conference.—The most striking development of diplomatic practice since the beginning of the World War has been the increasing practice of direct negotiations in conference between the heads of governments, or between the principal ministers of departments concerned in the subjects under discussion. The practice is, of course, not new. The similar circumstances of the great war against Napoleon had produced similar results in the long series of conferences from that of Châtillon early in 1814 to the Congress of Verona in 1822; and Castlereagh had at the outset commended the convenience of the system, which promised to endow the councils of the Powers "with the efficiency and almost the simplicity of a single State." The practice arose in both cases from the necessity of reaching swift decisions. It is clear, indeed, that the problems to be solved by the Allies during the war were too varied, too technical, and generally too urgent to be dealt with solely through the ordinary diplomatic channels. The practice of direct negotiation between the heads of governments was an obvious counsel of expediency, and began early in 1915 with the visit of M. Millerand to London. In Feb. of the same year there was a meeting of Finance Ministers in London; but the first meeting of the heads of the Allied Governments was that at Calais on July 6. On Nov. 17, at a conference in Paris, it was decided in principle to establish a permanent machinery for coördinating the efforts of the Allies; and on Jan. 19 1916, at a meeting of Mr. Asquith and M. Briand in London, rules for the establishment of an Allied Committee were approved by them. This plan was first applied at the great conference opened at Paris on March 26, at which the prime ministers of France, Italy, Belgium and Serbia were present, together with representatives of Japan, Russia and Portugal. It is unnecessary to give here a list of the further conferences that followed. The significant thing is—to quote Sir Maurice Hankey—that "in the forcing-house of war the governmental machinery of a veritable League of Nations had grown up, whereby the will of the Allied peoples to win could be put into effect" (p. 15). The system of diplomacy by conference thus revived reached its fullest development, of course, in the great Peace Conference at Paris; and in the League of Nations an attempt was made to give it a permanent organization.

In addition to the advantage of rapidity of decision arising from this system, the claim has been made for it that the statesmen ultimately responsible for the policy of their respective countries become personally well acquainted, and that the intimacy and even friendship which tend to develop out of these meetings make possible an interchange of confidences which would otherwise be impossible. This is, of course, perfectly true. It is also true that, in view of the closer interdependence of the

nations and the vast complexity of their economic relations alone, the old system of diplomacy is no longer sufficient and that "diplomacy by conference has come to stay" (*id.*, p. 25). If this means that the conferences of experts on this or that matter of international interest are to continue, there is nothing to be said against it. If it means that periodical meetings of heads of governments are to be erected into a permanent system, the case is far more doubtful. It may be doubted whether the cause of peace will permanently gain by taking the conduct of all serious international negotiations out of the hands of trained diplomatists and putting them into those of politicians unversed in diplomatic technique and sensitive to every shifting current of public opinion. Certainly the unrestful world left by the Peace Conference gives evidence enough of the disastrous results of the sounding phrases which heads of governments had used with so much effect on public platforms. Nor is a rapid decision on matters of controversy by any means always a good thing. The world has often been saved from war by the diplomatic dragging out of negotiations until public excitement on either side has subsided. Finally, there is the objection to too frequent conferences urged by the British Government at the time of the Congress of Aix-la-Chapelle in 1818, which has not lost its validity. They tend, as Lord Bathurst put it, to "keep the mind of Europe afloat," by suggesting to discontented peoples that no settlement is final and that, the machinery for change being permanent in the conferences of the powers, a long and loud agitation will suffice to set it in motion. It may be that the conference system will—as the creators of the League of Nations maintain—provide a safety-valve for the expansive forces of nationalism; but there is a danger that it may operate in another way, by not allowing these forces to cool. The introduction of an organized legislative element into international relations is thus somewhat of an experiment, and no one can say confidently how it will work out. In any case, however, there will still be room for the old diplomacy in its quasi-legal function of applying the acknowledged public law, and in its trained ability to adjust differences lying beyond it.

Functions and Rights of Diplomatic Agents.—The new and far more complicated conditions under which the World War was fought naturally added fresh problems to those which the old writers on diplomacy had discussed, as to the activities proper to those representing the interests of their Prince at a foreign court. Such questions were raised during the war more especially by the activities of the diplomatic agents of the belligerent states accredited to neutral governments. The duty of these agents being to forward the interests of their own states, what limitations was it proper and necessary to observe in carrying out this object? In effect, the answer to this question was found, not in establishing new principles, but in applying old principles to new conditions. The old definition of the ambassador as "an honourable spy" certainly applied during the war. In all neutral countries it was the duty of diplomatic agents to collect information useful to their governments; and to act as centres for an active propaganda of their views and aims. In certain cases, e.g. Switzerland and Holland, neutral countries were made the bases of propaganda and espionage in enemy countries, and these activities were carried on more or less under the supervision of the ministers accredited to the neutral countries. So long as this propaganda did not pass certain bounds there was nothing in this that did violence to the traditional principles of diplomacy, though propaganda had never before been organized on so vast a scale. Nor was the organization of a spy system, centred in neutral countries, a violation of diplomatic propriety, since in this respect all the belligerent nations exercised equal rights.

It was otherwise when diplomatic privileges and immunities were used to cover indirect attacks on the enemy through neutral interests. The most outstanding instances of this arose from the efforts of the Central Powers to interrupt the supply of arms and ammunition to the Allies from the United States. In Sept. 1915 the interception of a letter from Dr. Dumba, Austro-Hungarian ambassador in Washington, to Count Burian proved that the Austrian embassy, with the approval of the German, was con-

templating financing strike movements on a large scale in the United States in order to hamper the manufacture of munitions. At the instance of the United States Government Dr. Dumba was recalled. Count Bernstorff had previously been forced to apologize for his want of diplomatic courtesy in publishing, without first submitting it to the American Government, a denunciation of the un-neutral conduct of that Government in permitting the export of munitions of war to the Allies. Even more serious, however, was the subsequent discovery (Oct.) that Captain Boy-Ed and Captain von Papen, the naval and military attachés to the German embassy, had been active in a plot to destroy American munition factories and American ships carrying munitions. Their subordinates, who were not covered by diplomatic immunity, were imprisoned; the two attachés were recalled at the instance of the United States Government. The same fate befell Count Luxburg, German minister in Buenos Aires, the author of the famous advice that ships carrying food from the Argentine to the Allies should be "spurlos versenkt" (sunk without leaving a trace). These notorious cases, characteristic of many others, involved no new statement of principle, for they were clearly condemned by the traditional standards of diplomacy. "The ambassador," Callières had written in the 18th century, "may suborn the Prince's subjects for the purpose of obtaining information, but not for the purpose of plotting against their master." Equally clear was the principle condemning the practice of the German diplomatists, especially in the United States, of plotting attacks on enemy states (e.g. Canada, Ireland) under cover of their immunities. This was an abuse of diplomatic privilege, since it injured the state in which the plots were hatched by imperilling its neutrality.

See Sir Ernest Satow, *A Guide to Diplomatic Practice* (2 vols., 1917); Denys P. Myers, "Notes on the Control of Foreign Relations," in part iii. of the *Resueil de Rapports de l'Organisation Centrale pour une Paix durable* (The Hague, 1917), pp. 285-382, an invaluable study of the essential conditions under which diplomacy works; Edward S. Corwin, *The President's Control of Foreign Relations* (1917); Sir Maurice Hankey, *Diplomacy by Conference* (1921). In *Democracy and Diplomacy* (1915) Mr. Arthur Ponsonby, who was in the diplomatic service from 1894 to 1903, puts the case for "democratic control"; an appendix contains the findings of the Royal Commission.

DISARMAMENT CONFERENCE: see WASHINGTON CONFERENCE.

DIVORCE (see 8.334).—(I.) UNITED KINGDOM.—In the law of divorce administered in England and Wales there was no change between 1910 and 1921 except as to procedure by poor persons, and in Scotland and Ireland there was no change at all. But in England since 1910 the subject has become one of acute controversy, and there has also been a remarkable increase in the number of divorces granted. The report of the Royal Commission appointed in 1909 was not published till 1912. The appointment of the Commission, and the Majority Report advocating increased facilities for divorce, were both backed by an influential body of prominent persons outside the Commission itself. The inquiry was dominated throughout by the late Lord Gorell (formerly Sir Gorell Barnes) who had previously practised in and presided over the Divorce Court, and who held very strong views in favour of the extension both of the reasons and facilities for divorce in all classes of society. But the recommendations of the Majority Report have been strenuously opposed, especially in the Church of England, which has been practically unanimous in condemning the present system of divorce and opposing its extension.

Most of the recommendations of the Commission were, however, embodied in a bill which passed the House of Lords in 1920, but was abandoned in the House of Commons. A new bill was introduced in the House of Lords in 1921 by Lord Gorell, the son of the chairman of the Commission mentioned above. The bill is based on the recommendations in which all the members of the Commission were in accord. The Lord Chancellor has also presented a report embodying the reform of procedure so as to give easier divorce to the poorer classes.

The Commission took evidence from lawyers and officials to a much greater extent than from any other class, and much of the Majority Report was highly technical and official. The point of

view of the ordinary man and woman is better represented by the Minority Report, published in 1912 in the same Blue Book (Cd. 6478). Women were represented on the Commission by Lady Frances Balfour and Mrs. H. J. Tennant—the latter of whom added a valuable separate memorandum to the Majority Report. The Minority Report agrees to certain changes in procedure intended to bring divorce within the means of labour and the poor middle-class, but strongly warns the public on the experience of France and America not to extend the reasons for divorce.

The recommendations of the Commission are given below, those embodied in the two bills presented being distinguished from those rejected or ignored. Following the report of the Commission, the scheme of bill No. 1 was to save expense by bringing the court locally to the home of the applicant. This was to be effected by rules giving power to certain selected county court judges to act as judges in divorce and other matrimonial causes. Each cause for divorce or nullity or judicial separation was available by this bill to either husband or wife so that it was intended that, e.g. adultery or desertion alone should in future enable a wife to obtain a divorce and vice versa, the sexes being treated on an absolute equality.

The causes for divorce included in No. 1 bill (1920) are (a) adultery, (b) desertion, (c) cruelty, (d) insanity continuous for five years and certified as incurable, (e) "incurable habitual drunkenness." Any one of these causes was to be sufficient. A cause rejected by the bill was imprisonment in lieu of commuted sentence of death. Causes rejected by the Commission were disease (except as below), unconquerable aversion, and mutual consent. In addition to the above the causes in the bill for which nullity of a marriage can be obtained are (a) physical incapacity, (b) unsound mind or epilepsy at the time of marriage or within six months after, (c) venereal disease communicable at the time of marriage, (d) pregnancy at the time of marriage caused by some person other than the husband. Permanent judicial separation is allowed in the (1920) bill on any ground available for divorce, and the court may in its discretion convert the decree for judicial separation into a decree nisi for divorce, unless the applicant prefers to have the application dismissed. These last provisions are as recommended by the Commission to meet the conscientious scruples of the vast majority of the Church of England as well as of Roman Catholics and others who object to any divorce which enables either party to remarry.

Besides the consideration of what should be the grounds for divorce in future, the commissioners were most anxious to bring "the benefits of the law" to the poor and to remove the complaint that divorce is still the privilege of the comparatively rich. This the majority recommended should be done by selecting some of the county court judges to go round and hold divorce courts locally. A step in this direction was taken in the Administration of Justice Act (Dec. 23) 1920, which provided for divorce cases being heard at Assizes. The right to a jury was retained.

The bill presented by Lord Gorell in 1921 makes adultery by either husband or wife sole cause for divorce, but a marriage can be made null and void for (a) incapacity or wilful refusal to consummate, (b) unsound mind or epilepsy under certain conditions, (c) venereal disease at the time of marriage or (d) pregnancy by some person other than the husband existing at the time of marriage. With regard to (b), (c), and (d) the applicant must prove that at the time of marriage he or she was ignorant of the fact alleged; proceedings must be taken within a year from marriage and marital intercourse must not have taken place after discovery of the fact alleged by the applicant. Connivance, collusion and collusion by the applicant bar his application and remain absolute defences as before. The Court is to have a discretion to override the following defences: adultery, cruelty, desertion, unreasonable delay, neglect or misconduct by the applicant. Judicial separation can be obtained for habitual drunkenness if the applicant has used all reasonable means to reform the defendant and has not caused or conducted to it by his own conduct. Presumption of death can be decreed by the Court in proper cases and in particular where defendant has not been known by the applicant to be living for seven years. Juries in matrimonial cases are abolished by the bill, as are damages against the co-respondent beyond the actual pecuniary loss sustained by the applicant, but the co-respondent may be ordered to pay the whole of the costs and to settle property or make payments to "the parties to the marriage or either of them or the children of the marriage" according to his or her ability. It is clearly intended to make women

liable as co-respondents. There are improved provisions as to the custody and maintenance of the children and for preventing the parties from getting rid of their property during the proceedings. A British subject domiciled in England or Wales but resident in any other British possession who has obtained a divorce there may apply to the High Court in England to register the decree as a decree nisi. The wife whose husband has deserted her or been deported and whose domicile was at the time of desertion or deportation in England or Wales shall be considered so domiciled for the purposes of matrimonial causes. In cases where the wife so domiciled has married a foreigner and the marriage has been declared null and void by the Court of the husband's domicile, the High Court may pronounce the marriage null notwithstanding that the marriage was valid according to the law of the place where it was celebrated. This is to meet the very hard cases of French and other laws. In France the want of the parents' consent makes an otherwise valid marriage which has taken place in England void, so that the English subject so married remained tied in England though unmarried in France. The rule that refusal to comply with a decree for restitution of conjugal rights is "desertion" it is proposed to abolish, but on the other hand refusal of marital intercourse without reasonable cause is to be deemed desertion, and if one party has in good faith requested the other to return to cohabitation the refusal so to do within "a reasonable time" is to be deemed desertion. Neither desertion nor cruelty without adultery was to be a good ground for divorce (see below). The bill further proposes to regulate separation and maintenance orders by Courts of Summary Jurisdiction to be granted for cruelty, habitual drunkenness, or venereal disease. The bill provides for the orders to last two years only unless converted into decrees for judicial separation in the High Court. The applicant who obtains one of these summary orders is to have police protection against the defendant, and maintenance is to be collected by a court official. An important proposal of the bill is to make it contempt of court to publish any report or pictorial representation of the matrimonial proceedings until the conclusion of the case, and to exclude the public but not the reporters in the discretion of the judge.

This bill was almost uncontroversial as originally introduced but the advocates of divorce insisted on desertion being made a sole ground, and the bill (May 1921) was so printed in the House of Commons. This produced a reaction and the increase of divorce cases in 1920-1 accentuated the differences of opinion.

The reasons for the recommendations of the Commission on other points also demand more notice. The most serious problem raised is the question of allowing adultery by the husband to be the sole ground for divorce. This was treated by the majority very superficially as a question of the equality of the two sexes before the law; but in reality it is a much more serious problem. The idea of divorce by mutual consent is rejected by the majority, not so much on principle as on the ground that there is no demand for it. But divorce by mutual consent is already *de facto* in existence, and if the husband's adultery is made a sole cause it will be greatly extended. This is a point on which, among those well acquainted with the facts, there is no great difference of opinion (see Minority Report p. 180; evidence Mr. Justice Bargrave Deane, p. 848). It has been recognized law in England for a generation past that refusal by the husband to obey a decree to return to his wife, coupled with proof of adultery, entitles the wife to an immediate divorce. It has therefore become the common practice, where both parties desire a divorce, for the husband to leave the wife, who writes him a letter asking him to return. He refuses. She brings her suit. An order is made on the husband to return in 14 days, which he disobeys. He lets the wife know where proof of adultery can be found and a divorce is the result. This is not "collusion" in law, but it is what the public mean by collusion, and the number of these cases was even in 1918 nearly as great as the whole number of divorces in 1857 and has been greater since. If there were any desire to decrease the number of divorces this should be stopped. But the 1921 bill on the contrary proposes following the Majority Report that the husband's adultery alone should be a sufficient ground for divorce. No wife will ever commit adultery in order to get a divorce; because her adultery, if acknowledged, makes her a social outcast; but there is no such ostracism of the husband. At present the husband is deterred from seeking a divorce if he is obliged to admit cruelty. Desertion for three years, as proposed in both the bills, is not quick enough to be any temptation to collusion. But there could be no doubt that if the husband's adultery alone is made a sufficient ground it would greatly increase the number of divorces.

The increase in number was already enormous, as will be seen by the figures given below, taken from the official "Civil Judicial Statistics" (Part II, up to 1919).

The average number of petitions of divorce (apart altogether from suits for nullity and judicial separations, as to which there was no increase) for the years 1885 to 1900 was:—

	1885-90	1891-5	1896-1900
Petitions	541	543	650
Decrees Nisi	378	391	504
Restitution Orders	21	18	24

The number of petitions seems as important in considering the disturbance in married life as the number of divorces.

The annual number of cases between 1900 and 1919 was:—

	Petitions (Divorce)	Decrees Nisi	Decrees Absolute	Restitution Ordered
1901	750	601	477	30
1902	889	608	601	33
1903	825	614	606	31
1904	720	634	528	35
1905	752	623	604	45
1906	767	650	546	54
1907	734	598	644	49
1908	846	672	638	65
1909	787	685	694	72
1910	755	588	596	69
1911	859	655	530	90
1912	920	690	587	125
1913	998	870	577	135
1914	1,075	693	833	158
1915	1,143	1,060	668	136
1916	1,163	686	972	159
1917	1,423	946	683	159
1918	2,323	1,407	1,082	236
1919	5,085	2,610	1,629	310

It will be seen from the table that the number of petitions for divorce (apart from those for judicial separation) increased from 750 in 1901 to 2,323 in 1918, that is at a rate of over 224% in 18 years. An even larger number was shown in 1919: 21. The population of England and Wales in the same years increased by regular increments from 32,612,022 in 1901 to 36,800,000 in 1919. The latter year is taken to avoid complication as to demobilization. The increase is a little over 12%, so that if the increase of population were the only cause the number of petitions would in 1918 have been about 840 instead of 2,323.

The rate of marriage is rather more variable. The number of marriages in England and Wales was:—

1901	1902	1903	1904	1905
259,400	261,750	261,103	257,856	260,742
1906	1907	1908	1909	1910
270,038	276,421	264,940	260,544	267,721
1911	1912	1913	1914	1915
274,943	283,834	286,583	294,401	300,886
1916	1917	1918	1919	
279,846	258,853	287,163	369,411	

The years 1915 and 1919 were abnormal years, and in both the number of marriages was much higher than in any previous year. This is accounted for by mobilization in 1914-5 and demobilization in 1919. If the rate be taken on the figures 1901-19 the increase was only a little over 18%. The increase of petitions in 1913 is almost exactly at the same rate as the increase in marriages. But the rate of increase in petitions in 1919 was more than double the increase in the marriage rate. If the petitions continue to increase at the same rate for another 18 years there will be 5,152 of them in 1936. The proportion of petitions to marriages in 1901 was less than one-third of 1%. It was nearly two-thirds of 1% in 1919. The registrar-general of births, deaths and marriages in his Report for 1919 (Cmd. 1017) says "the number of divorces obtained in 1919 was about 50% greater than in 1918, which was itself the highest up to that date, and with the increase in divorces there has been a corresponding increase in the number of persons who on remarriage described themselves as divorced." He adds that the war is "largely responsible for the sudden increase of the last two years, but as the frequency of divorce as recorded in the table has been increasing for many years it can hardly be expected that the pre-war level will be restored." The warning of the Minority Report is illustrated by these figures. In 1918 the number of divorces petitions exceeded the number in 1917 by 900, and in 1919 rose to a total of 4,317, or an increase of 1,994. Petitions by husbands have largely increased since 1910. Petitions by wives have fallen off since 1914. The figures as to "poor persons" suits under the system initiated in 1914 show that nearly five-sixths of these cases were for divorce. There were no fewer than 10,108 applications in the five

years, of which, however, nearly half were refused. The total number of husbands' petitions in 1917 were 1,067 against 638 by wives. There were no children in 660 of these 1,705 cases. In 1918 the husbands' petitions rose to 1,837 and the wives' to 857 for all classes of cases. There were no children in 1,043 of these cases. The duration of these marriages is another interesting point. The marriages which had lasted over five years and less than twenty were 1,149 out of 1,705 in 1917 and 1,788 out of 2,688 in 1918.

Scotland.—In Scotland, after the Reformation, adultery was introduced as a cause for divorce without statute, apparently upon scriptural grounds, and as a consequence of the abolition of the pope's jurisdiction in Scotland. Prior to the Reformation, marriage had been looked upon in Scotland, as in other Roman Catholic countries, as a sacrament; after the Reformation it came to be regarded from the point of view of a contract, of a peculiarly solemn and far-reaching nature, but which might be dissolved consistently with public morality, and divorce for adultery was at once introduced. Wilful desertion was confirmed by statute in the year 1573 as a ground for divorce, four years being then fixed as the period for which the desertion must subsist, and that period has been maintained until the present day. From the evidence of Lord Salvesen (vol. I, p. 254) it appears that in 1908 110 decrees for divorce were granted for adultery, of which 59 were at the instance of the husband and 51 at the instance of the wife; and that, in the same year, 81 decrees for divorce were granted for desertion, of which 20 were at the instance of the husband and 61 at the instance of the wife; and the statistics show that the number of divorce cases has, relatively to the population, continued about the same.

It has been the statute law in Scotland since 1600 that the guilty spouse cannot marry the paramour during the lifetime of the other spouse, but in practice this has been generally evaded by not putting the name of the paramour into the decree of divorce. The large proportion of the divorced husband's property allowed to the wife and children by the law of Scotland is believed to have a considerable effect in reducing the number of divorces.

Ireland.—In Ireland, where the majority of the population are Roman Catholics, and where, apparently, conditions of life differ materially from those in England, divorce *a vinculo* of parties there domiciled is only obtainable (as in England before 1857) by private Acts of Parliament, after a divorce *a mensa et thoro* has been granted by the King's Bench Division of the Irish High Court (which now exercises the powers of the old Ecclesiastical Courts), and (if the suit be by the husband) after judgment has been obtained in an action in the Irish courts for crim. con., the minimum expense of such proceedings being between £450 and £500 (evidence Mr. Roberts, 42,603; 42,627). Since the passing of the Divorce and Matrimonial Causes Act, 1857, there have been 39 Private Divorce Acts (Mr. Roberts, 42,624).

Isle of Man.—Divorce *a vinculo* can only be granted by Act of Tynwald, founded on a decree of judicial separation granted by the Chancery Division of the High Court of Justice in the Isle of Man, which, by the Ecclesiastical Civil Judicature Transfer Act, 1884, has jurisdiction in matrimonial matters, and follows the principles upon which the Ecclesiastical Courts acted.

Channel Islands.—There appears to be no right to proceed to obtain judicially a divorce *a vinculo*, and there have been no legislative proposals with that object.

(II.) BRITISH DOMINIONS

India.—The dissolution of marriage among the Christian communities in India, whether European, domiciled or country-born (save that in the native states the Act applies to British subjects only), is regulated by the provisions of Act IV. of 1869, usually called the Indian Divorce Act, under which decrees of divorce may be granted on grounds similar to those which exist at the present time in England, and where, since the marriage, a Christian husband has abandoned Christianity. Jurisdiction to grant any relief under the Act is confined to cases where (a) the petitioner professes the Christian religion; (b) resides and is domiciled in India at the time of presenting the petition; and (c) the marriage was solemnized in India. The two latter restrictions have inflicted in numerous cases great hardship, and the Commission made some suggestions thereon, which it is now proposed to incorporate in a special Act. The decision of Sir H. Duke in *Keyes v. Keyes* (1921) only emphasized the above which was good law before. It may be noted in passing that, by section 495 of the Indian Penal Code, adultery is made a criminal offence in the case of a man who, without the consent or connivance of the husband, has illicit intercourse with a woman who is known to be the wife of another man.

Canada.—The British North America Act, 1867, by section 91, conferred upon the Parliament of Canada exclusive legislative authority in relation to marriage and divorce, but by section 129 all laws in force in the provinces of Canada, Nova Scotia and New Brunswick were continued in such provinces respectively, and, by section 146, the provisions of the Act were extended to other provinces admitted to the Union. In the provinces of Nova Scotia, New Brunswick, Prince Edward I. and British Columbia, there existed at the time of the Union courts of divorce, and they still continue to exercise their functions. The grounds in those provinces are as

follows: in Prince Edward I. and New Brunswick, adultery, impotence, or consanguinity, and, in Nova Scotia, cruelty as well.

The Privy Council, the highest court of appeal, decided in 1919 (*Walker v. Walker*) that the English Act of 1857 applies to and is part of the substantive law in all the provinces of Canada except Ontario and Quebec. There being no divorce courts in Ontario and Quebec, recourse for relief must be had to the Parliament of Canada by private Act.

Union of South Africa.—(a) Cape Province.—According to Roman Dutch law, which is in force in that province, the grounds upon which divorce may be granted are adultery, malicious desertion, unnatural crime, perpetual imprisonment, long absence, and refusal of marital privileges, though it would appear that recourse is seldom, if ever, had to the latter four grounds. (b) Province of Natal.—Divorce is granted on the ground of adultery or malicious desertion for not less than 18 months before the suit. These provisions, however, do not apply to the native tribes, which are governed under their own system of laws.

Newfoundland.—There is no law relating to divorce.

New South Wales.—By the Matrimonial Causes Act, 1899 (Act No. 14, 1899), Part IV., ss. 12–6, divorce is granted, on the petition of a husband, for the adultery of the wife, and, on the petition of a wife, for the adultery of the husband, if the husband is domiciled in New South Wales when the suit is instituted, or such adultery is incestuous, or is coupled with (1) bigamy, or (2) cruelty, or (3) desertion, without reasonable cause or excuse, for three years or upwards. In addition to the above, on the petition of either party, if domiciled in New South Wales for three years or upwards, divorce is granted for malicious desertion during three years or upwards; on the ground that the husband has, during three years, been a habitual drunkard, and has left his wife without means of support, or has been guilty of cruelty; on the ground that the wife has, during three years, been a habitual drunkard, and has neglected her domestic duties, or been unfit to discharge them; on the ground of imprisonment for three years under commuted sentence for a capital crime, or under sentence of seven years or upwards; on the ground of conviction for attempt to murder or inflicting grievous bodily harm; on the ground of the respondent repeatedly assaulting and cruelly beating the petitioner; on the ground that the husband has been in the last five years frequently convicted, has had sentences of three years in the aggregate, and has habitually left his wife without support.

New Zealand.—By the Divorce and Matrimonial Act 1908, No. 50, as amended by the Acts 1912, No. 22; 1913, No. 69; 1919, No. 53, and 1920, No. 70, either husband or wife can obtain a divorce for adultery or wilful desertion for three years. If the wife is living separated and the husband leaves her without reasonable maintenance for three years he is deemed to have wilfully deserted her (Act of 1913). If either husband or wife fails to comply with a decree for restitution of conjugal rights the other can obtain a divorce forthwith, and the Court may in its discretion dissolve any marriage on the petition of husband or wife where the parties have been living separate for three years under decree of judicial separation or magistrate's order or deed or merely by mutual consent (Act of 1920). Where the husband has been an alien enemy the wife, if a natural-born British subject, can divorce him if he has left New Zealand for more than 12 months (Act of 1919). Habitual drunkenness for four years coupled with cruelty or with leaving the wife without means of support, or, in the case of the wife, coupled with neglect of domestic duties, is also a ground for divorce. Other grounds are conviction and sentence of seven years or upwards for attempting to take the life of the petitioner or any child of the petitioner or respondent or the conviction of the murder of such a child or the fact of being a lunatic confined in New Zealand for an aggregate period of seven years within 10 years of the filing of the petition.

Queensland.—By the statutes of Queensland, Matrimonial Causes Jurisdiction Act of 1864 (28 Vict. c. 29) and Matrimonial Causes Act of 1877 (39 Vict. c. 13), the provisions of the imperial statutes (20 and 21 Vict. c. 85, 21 and 22 Vict. c. 93, 21 and 22 Vict. c. 108, and 22 and 23 Vict. c. 61) are reenacted, so that the law is substantially the same as in England.

South Australia.—In South Australia divorce is granted on the same grounds as in England, except that in the case of adultery coupled with desertion in a wife's suit one year's desertion is substituted for two years.

Tasmania.—The provisions of the imperial statutes (20 and 21 Vict. c. 85, 21 and 22 Vict. c. 108, 22 and 23 Vict. c. 61) have been made applicable by statute in Tasmania, so that the law is substantially the same as in England.

Victoria.—In Victoria the petition may be presented and decree granted on the same grounds as those at present existing in England. In addition to the above, on the petition of a petitioner domiciled for two years in Victoria, a decree may be granted on the ground of desertion for three years; on the ground that the respondent husband has been a habitual drunkard for three years, and has left his wife without means of support, or has been guilty of cruelty; on the ground that the respondent wife has been a habitual drunkard for three years, and has neglected her domestic duties, or rendered herself unfit to discharge them; on the ground of imprisonment for three years, under commuted sentence for a capital crime, or under sentence of penal servitude for seven years or upwards; on the ground

of a conviction within one year previously for attempt to murder the petitioner, or of having assaulted him or her with intent to inflict grievous bodily harm, or on the ground that the respondent has repeatedly during that period assaulted and cruelly beaten the petitioner; on the ground that the respondent husband has been, in the preceding five years, frequently convicted of crimes, and has been sentenced in the aggregate to imprisonment for three years, and has habitually left his wife without means of support; on the ground that the respondent husband has been guilty of adultery in the conjugal residence, or coupled with circumstances or conduct of aggravation or of repeated acts of adultery.

Western Australia.—Until 1912 the divorce laws of this state, which were regulated by an ordinance (27 Vict. No. 19), were similar in all respects to the laws of England, but Act No. 7 of 1912 contains material alterations in the law.

The causes upon which the divorce may be granted, as enumerated in that Act, are: adultery; malicious desertion for five years; on the ground that the respondent (husband) has been a habitual drunkard for four years, and has either habitually left his wife without means of support or has been guilty of cruelty towards her; or, the husband being the petitioner, that his wife for a like period has been a habitual drunkard, and has habitually neglected her domestic duties or rendered herself unfit to discharge them; on the ground of imprisonment for three years under commuted sentence for a capital crime or under sentence for seven years or upwards, or, the wife being the petitioner, that the husband has been in the last five years frequently convicted, has had sentences of three years in the aggregate, and has habitually left his wife without means of support; on the ground of conviction for attempt to murder the petitioner or inflicting grievous bodily harm on him or her; further, on the ground that the respondent is a lunatic or a person of unsound mind, has been confined in an asylum or other institution in accordance with the provisions of the Lunacy Act of 1903 for a period or periods not less in the aggregate than five years within six years immediately preceding the suit and is unlikely to recover.

(III.) EUROPEAN COUNTRIES

It should be kept in mind that in all countries the Roman Catholic Church absolutely forbids its adherents to apply to the civil courts for a divorce *a vinculo*, and in modern European states there is frequently a conflict between the law of the State and the law of the Church on this subject. In certain cases the Church permits the spouses to separate and will sometimes annul a marriage if properly approached.

Austria.—In Austria, among Protestants, divorce may be granted on the ground of adultery, namely, the adultery of the wife, condemnation for crime, immoral habits, infectious diseases, ill-treatment, threats or serious vexations, unconquerable aversion; and among the Jews by mutual consent, or on the adultery of the wife.

Belgium.—In Belgium, divorce is granted on the following grounds, namely, the adultery of the wife, the adultery of the husband if he shall have kept his mistress in the common residence, violence endangering life (*excès*), cruelty (*sévérités*), grave indignities (*injures graves*), sentence of one of the parties to an infamous punishment involving loss of civil rights, mutual and unwavering consent of the parties expressed in manner prescribed by law.

Bulgaria.—By the law of the orthodox Greek Church, and therefore of Bulgaria, divorce *a vinculo* only is recognized. It may be granted on the grounds of adultery, cruelty, threat or designs against the life of the other party to the marriage, absence of the husband for four years if his whereabouts are unknown, or, if his whereabouts are known, without sending his wife means of support; impotence; insanity; epilepsy; idiocy, or syphilis supervening after marriage and incurable; sentence to severe or degrading punishment for theft, fraud, embezzlement or homicide; unsubstantiated charge of adultery made by one party to the marriage against the other; unnatural crime of the husband upon his wife; restraint on religious liberty; drunkenness, when accompanied by squandering property or destroying the home, or an otherwise disorderly or dissolute manner of life; abandonment of the husband by the wife, driving him from his home without sufficient grounds followed by refusal for three years to live with him again.

Denmark.—In Denmark judicial divorces are obtainable on the grounds of adultery, bigamy, desertion (if malicious, after three years; if simple, i.e. absence without known or apparent cause, after seven years), absence for five years where the presumption is that the absentee is dead, imprisonment for life. Administrative divorces may also be obtained on the grounds of insanity, separation for three years, sentence of three years' penal servitude.

France.—In France, divorce, which had been introduced for the first time in 1792, but had been abolished at the Restoration in 1816, resumed its place in the Civil Code in 1884. The grounds upon which it is now permitted are adultery, violence endangering life (*excès*), cruelty (*sévérités*), grave indignities (*injures graves*), condemnation of either spouse to an afflictive punishment.

Germany.—By the German Civil Code of 1900 all the previous laws of the federal states have been abolished, and the absolute

grounds upon which decrees for divorce are now granted throughout the German Reich are adultery, bigamy, crime against nature, attempt on the life of the other party to the marriage, malicious desertion for one year, insanity of three years' duration after the marriage, destroying intellectual communion between parties, and holding out no hope of recovery. The Court has a discretion to grant divorce on the ground of serious breach of conjugal duties, and dishonourable or immoral conduct, under which all vices and bad habits may furnish a sufficient ground.

Greece.—Divorce in Greece is regulated by the Roman and Byzantine laws, in accordance with the provisions contained in the collection of Harmenopoulos. The grounds for divorce are established in No. 117 of the Novellae Constitutiones of Justinian (with some important amendments) and are, on the petition of the husband, adultery; that the wife attempted the life of her husband, or, being aware of plots against it, has not disclosed them to him; non-disclosure to her husband of knowledge of a conspiracy against the sovereign; without her husband's consent staying the night at another house, except the house of her parents; without her husband's consent attending races, theatres or sports; against her husband's wish attending dinners or bathing in the company of men; procuring abortion. On a wife's petition, the grounds are, that the husband entertained schemes against the sovereign, or, being aware of such, has not denounced them to the authorities; that the husband has attempted the life of his wife, or, being aware of plots against it, has not disclosed them to her, or undertaken to prosecute the authors of them; that he has endeavoured to procure her to commit adultery; that he has brought a false accusation of adultery against her; adultery in the conjugal home; adultery in the same town, if persisted in; impotence of husband, existing before marriage and continuing at least three years after it.

Hungary.—Prior to 1894, each religious denomination was governed by separate regulations, but in that year marriage and divorce in Hungary and Transylvania were regulated by the Civil Marriage bill of that year which came into force in 1895; and the absolute grounds upon which divorce is permitted by the State (*see note above*), without distinction of creeds, are: adultery; unnatural crimes; bigamy; desertion; attempt upon life or serious maltreatment endangering safety or health; sentence of death or penal servitude or imprisonment for five years. The discretionary grounds are violation of marital obligations, other than above; inducing or attempting to induce a child of the family to a criminal act or immoral life; the respondent persisting in leading an immoral life.

Italy.—No divorce is permitted.

The Netherlands.—Adultery and malicious desertion under Roman Dutch law; and, by more recent addition, imprisonment for four years; grave injuries or ill-treatment endangering life; a lapse of five years after a judicial separation (by consent or otherwise) without reconciliation, are now grounds for divorce.

Norway.—The Norwegian Act of Aug. 20 1909 has effected radical changes in the law. Either party to the marriage is now entitled to a divorce, where, at the time of marriage, the other spouse, without the knowledge of the former, has suffered from a physical defect making him or her unsuited for marriage, or from epilepsy, or leprosy, or from venereal disease in an infectious form, or from insanity; or (the husband being petitioner) where the wife has been made pregnant by someone other than the husband; where either party has been guilty of certain crimes dealt with in the General Criminal Code, such as the contracting and transmitting, or exposing any others to, an infectious sexual disease, which has been contracted in consequence of immoral conduct, a serious offence against decency, or against a child under 16 or anyone being a ward of the party, incest, unnatural offences, etc.; adultery, bigamy, or such crimes as are dealt with in the Criminal Code, e.g. abduction of children and minors from the care of their parents and guardians, or a crime involving bodily injury of the other spouse, or of any deliberate crime by which the other spouse suffers injury in body or in health; or cruelty to children; or exposing them to conditions which are clearly dangerous to their morals; sentence of loss of liberty for three years or upwards; sentence to hard labour or confinement in an inebriate home for repeated acts of vagrancy or drunkenness; refusal of conjugal rights for two years; insanity for three years with no reasonable prospect of recovery; where a separation has been in existence for two years after formal decree, or for one year after such decree, if both parties assent to its becoming a decree of divorce; where there has been a separation for three years without decree, and no conjugal relations during that time (*see also Report of Divorce Commission, Appendix V., pp. 43-5*).

Portugal.—Prior to 1910, there was no law of divorce in Portugal. By Article 4 of a law passed on Nov. 4 of that year (copy set out in Appendix XXII., Report of Divorce Commission, pp. 152-3), the causes for divorce are:—(1) adultery; (2) conviction of one of the major crimes specified in Articles 55 and 57 of the Penal Code; (3) ill-treatment; (4) abandonment of home for not less than three years; (5) absence for not less than four years, during which the absentee gives no tidings of himself or herself; (6) incurable lunacy, three years after the date on which insanity has been declared by the competent authorities; (7) separation *de facto* by mutual consent for 10 years; (8) inveterate gambling habits; (9) incurable contagious disease or any disease which induces sexual aberration.

Further, by Article 34, the non-success of a suit for divorce instituted for causes 1, 2, 3, 4, 8, 9 aforesaid affords sufficient cause for the respondent in such previous actions petitioning for a divorce.

Sections 35-40 permit divorce by mutual consent, subject to the provisions laid down in those sections.

Rumania.—In accordance with the laws of the orthodox Greek Church, only divorce *a vinculo* is recognized, the grounds for which it may be granted being adultery; injuries or ill-treatment; sentence to imprisonment; attempt on the life of the other party to the marriage, or failure to warn such party of such attempt when made by a third party. Divorce may also be obtained by mutual consent, subject to various formalities.

Russia.—In Russia, before the revolution, the ordinances of each church embodied in the General Code of Laws laid down the grounds upon which divorce was to be granted.

For the members of the Russian Church, and for "the Old Believers," the grounds upon which decrees of divorce could be made were adultery; bigamy; impotence existing at marriage; the absence of the respondent for five years without news; sentence of a court of law, under which one of the parties to a marriage was condemned to loss of civil rights involving deportation; the entrance of both parties into a religious order, in cases where there are no children needing parental care; the conversion of a non-Christian spouse to the Russian Church, provided such a party or the other party to the marriage desires the dissolution. Members of the Lutheran Church (other than those resident in Finland for whom the grounds of divorce appear to be adultery, illicit intercourse with a third party after betrothal, and malicious desertion for at least one year) may seek divorce in their consistorial courts on the grounds of adultery; concealed loss of virginity of the wife before marriage; attempt to poison; five years' desertion; impotence and repugnance to marital intercourse; refusal to fulfil conjugal duties; incurable infectious disease; madness; depravity of life; cruelty and offensive treatment; attempts by one party to bring dishonour on the other or deprive him (or her) of his (or her) freedom, office, or occupation; unnatural propensities; grave crimes involving sentence of death or a punishment in substitution; penal exile. Among the Jews, divorces were granted by the rabbi. The marriage might be dissolved by mutual consent, or on grounds based on Mosaic law.

The law of Poland was, before the war, regulated by a decree of the Russian emperor of 1836, under which there were separate regulations for the members of the Roman Catholic, the Greek Orthodox, the Greek Unified and Protestant Churches, for members of denominations other than the above, and for cases where the religions of the parties to the marriage are different.

Spain.—No divorce is permitted.

Sweden.—The grounds for judicial divorces are adultery; illicit intercourse of either party with a third party after betrothal, or the intercourse of the wife with a third party before betrothal; malicious desertion for one year, provided the absentee has left the kingdom; absence without news for six years; or attempt by one party to the marriage on the life of the other; or the grounds that either party is suffering from bodily incapacity, or has concealed the fact of being affected with an incurable contagious disease; sentence of life imprisonment; insanity of three years' duration which is pronounced incurable. Divorces may also be obtained by direct appeal to the king's royal prerogative, where one party has been condemned to death or civil death; or condemned for a gross offence, or one involving temporary loss of civil rights; where one party has been imprisoned for at least two years; on the ground of prodigality; drunkenness, or violent disposition, or incurable aversion and hate, which has lasted after one year's separation *a mensa et thoro*.

Switzerland.—Prior to Jan. 1 1876, the different cantons of Switzerland had individual laws regulating divorce, but after that date the matter was regulated by a federal law throughout the country, and is now regulated by the Code Civil of Dec. 10 1907 which made but little change in the law then existing. The grounds laid down by that code are adultery; attempt by one party on the life of the other; cruelty (*services*); grave indignities (*injuries graves*); the commission of an infamous crime by one party, or base conduct by one party rendering married life intolerable; malicious desertion for two years; insanity rendering married life unbearable, and which after three years' duration is pronounced incurable; conduct rendering married life unbearable.

(R. TH.)

(IV.) UNITED STATES

Statistics concerning marriage and divorce are not compiled annually in the United States. The period 1867-1906 was thoroughly covered by two Federal reports, and in 1917 a government appropriation became available for continuing the investigation to the end of 1916. Because of the World War, however, it was decided to postpone the gathering of statistics for the whole decade and to make a special report for the year 1916 alone. This report was issued in 1919, by the Census Bureau. Figures for a single year may register abnormal fluctuations,

but it is apparent that divorce was rapidly increasing from the following figures for the years 1896, 1906 and 1916:—

	1916	1906	1896
Marriages	1,040,778	853,290	613,873
Divorces	112,036	72,062	42,937

From 1867 to 1906 the number of divorces granted totalled 1,274,341, each period of five years showing a constant increase averaging about 30%, while population was increasing at the rate of about 10%. The number of divorces per 100,000 pop. in 1916 was 112 as compared with 84 in 1906. It is noteworthy, however, that four states—Colorado, Maine, South Dakota, West Virginia—and the District of Columbia reported fewer divorces in 1916 than in 1906. The following table indicates causes of divorces in 1916, excluding 3,334 cases for which statistics were not given:—

All causes 108,702			Granted to Husband 33,809	Granted to Wife 74,893
Adultery	12,486	11.5%	6,850	5,636
Cruelty	30,754	28.3	5,895	24,857
Desertion	39,990	36.8	16,908	23,082
Drunkenness	3,652	3.4	271	3,381
Neglect to provide	5,146	4.7	—	5,146
Combination of preceding	9,332	8.6	1,440	7,892
Other causes	7,343	6.8	2,445	4,899

It appears that 31.1% of the divorces were awarded in 1916 to the husband and 68.9% to the wife; for 1906 the percentages were 32.5 and 67.5 respectively. It is probable that the wife more frequently has legal ground for divorce. Of the total number in 1916 desertion was the most frequent ground, and cruelty next, these two causes accounting for 65.1% of all. Of the 108,702 divorces noted in the table above, 69,936, or 63.5%, were granted in the state where the marriage had taken place, as compared with 76.3% for the period 1887-1906. It is not possible to determine the extent to which persons migrate to another state for the purpose of obtaining a divorce, as population is constantly shifting, but many changes of residence are made for this purpose and the tendency appears to be growing. The question of uniform state divorce laws was discussed in 1913 at the conference of governors, but the conflicting views held in different sections of the country do not point to early action. There is a growing demand, especially on the part of church authorities, for an amendment to the Federal Constitution to empower Congress through legislation to regulate marriage and divorce.

DIXMUDE, or in Flemish **DIXMUYNS**, a town in the province of West Flanders, Belgium, on the right bank of the Yser, with a pop. which had risen from 3,278 in 1900 to 3,460 in 1914. It is the centre of an agricultural district noted for cattle-rearing and for its dairy produce. The 15th-century church of St. Nicolas had a remarkably fine rood-loft erected in the 16th century by Jean Bertet and an Adoration of the Magi by Jordaens (1644).

As a result of the World War the town was almost totally destroyed. Dixmude constituted in effect one of the principal points of passage of the Yser and, at the end of Oct. 1914, a force of 5,600 Belgians and a brigade of French marines under Admiral Ronarch successfully resisted the desperate efforts of the Germans to seize the town. The town held out until Nov. 10, by which date, by damming the lower reaches of the Yser and opening the sluices between Dixmude and Nieupoort, a large flooded area was placed between the two armies. The town was retaken by the Belgians on Sept. 20 1918. The pop., which after the Armistice had been slowly returning, numbered in 1921 about 1,000 persons, housed for the most part in temporary huts, and the rebuilding of the town had begun.

DJEMAL PASHA (**AHMAD DJEMAL**) (1875-), Turkish politician and soldier, was born at Bagdad about 1875. His father, a person of some distinction, gave him a careful French education, and placed him in the army, where his energy and activity speedily brought him to the rank of lieutenant-colonel. As such he went to Salonika, where he spent five years, and not only gained an intimate understanding of the Young Turk ideas, but became their most able supporter. In 1909, when Djemal went as governor to Adana in Cilicia, he was charged with the task of strengthening the Young Turk ideas and the elimination of contrary currents. It was in administrative matters that Djemal's talents were most conspicuous. In 1911

he was made governor of his native town, Bagdad, but a year later he was sent to the Balkan War in command of a division, and subsequently contrived to become Vali of Constantinople.

After once more filling a military rôle for a short time as commander of the I. Corps at Constantinople, he handed over the command to the German general, Liman von Sanders, and devoted himself to politics. At that time Djemal, Talaat and Enver constituted a triumvirate which was the only effective Turkish Government, and already a certain antagonism, which had its roots in personal ambition, had sprung up between Djemal and Enver. Djemal obtained the Ministry of Public Works and immediately afterwards the Ministry of Marine. Djemal gave Adml. Limpus and the English naval mission a free hand, as Enver did the German military mission. In the spring of 1914 Djemal attended the French fleet manoeuvres, and on Aug. 9 1914, after the outbreak of the World War, he wished the home-going Frenchmen glory and victory. He was unwilling that Turkey should attach herself to Germany at once, even though the victory of the Central Powers might be certain. Enver, fearing Djemal's influence in Constantinople, banished the Minister of Marine, at the end of 1914, to Syria, as commander-in-chief of the IV. Army. There his military achievements were insignificant, but he fought the plagues of locusts and the epidemics, exerted himself over the cultivation of the land, the draining of the marshes, the building of new and the improvement of old streets, even began the work of afforestation, and made efforts to raise the level of public education. In Oct. 1917 he was removed by order of Enver from the command of the IV. Army and made commander-in-chief of all the troops in Syria, Palestine and the Hejaz, with the exception of the army operating on the Sinai front. This edict led to disorder and friction. Djemal's power was not lessened south of the Taurus, but he took no more interest in the conduct of the military operations. In Dec. 1917 he betook himself to Constantinople, and, greatly to the wrath of Enver, resumed his activities as Minister of Marine. However, he was given no more opportunities, either political or military. When, in the autumn of 1918, Turkey, and with her the Young Turk Government, was broken in pieces, Djemal Paasha was forced to flee, and he repaired to Germany where he wandered about under an assumed name. Later he obtained refuge in Switzerland, and subsequently he made his way to the East. In 1921 he was reported to have found employment as military adviser to the Amir of Afghanistan.

DOBSON, HENRY AUSTIN (1840-1921), English poet and man of letters (see 8.352), died at Ealing Sept. 2 1921. His later work consisted of prose essays, notably *At Prior Park* (1912), *Rosalba's Journal* (1915) and *Later Essays* (1921), all studies of the 18th century, and *A Bookman's Budget* (1917).

DOGGER BANK, BATTLE OF.—One of the most important naval engagements in the World War was fought near the Dogger Bank on Jan. 24 1915 between the British and German battle cruiser squadrons.

Movements of the British fleet had led the Germans to suspect some scheme for blocking their harbours was afoot, and Rear-Adml. Hipper was despatched at nightfall on Jan. 23 to reconnoitre off the Dogger Bank. His force consisted of the four battle cruisers of the First Scouting Group, the "Seydlitz" (flag), "Derfflinger," "Moltke" and "Blücher," four light cruisers of the Second Scouting Group, and 22 destroyers of the 5th Flotilla and the 15th and 18th Half Flotillas. Intelligence of the departure of the German force had been intercepted at the British Admiralty, and Vice-Adml. Sir David Beatty (later Earl) put to sea from the Forth at 6 P.M. on the evening of the 23rd. With him were the five battle cruisers of the 1st and 2nd Battle Cruiser Squadrons, the "Lion" (flag), "Tiger," "Princess Royal," "New Zealand" and "Indomitable," and the four light cruisers of the 1st L.C.S. under Commodore W. E. Goodenough in the "Southampton." His orders were to proceed to a rendezvous in $55^{\circ} 13' N$ $3^{\circ} 12' E$, 180 m. from Heligoland, where he was to meet Commodore Tyrwhitt in the "Arethusa" (flag) with the 1st, 3rd and 10th Flotillas, mustering three light cruisers and 30 destroyers. Behind him to the northward was the Grand

Fleet. The 3rd Battle Squadron (seven King Edward VII. class) had left Rosyth two and a half hours after him and the commander-in-chief had put to sea from Scapa with the battle-fleet. In the hope of intercepting the enemy on his way back Commodore (S)¹ had been ordered to proceed towards Borkum with the "Lurcher," "Firedrake" and four submarines. In heavy guns the British force was decidedly superior. The British battle cruisers mounted 24 13.5-in. and 16 12-in. against the German 8 12-in., 20 11-in. and 16 8.2-in.

Beatty reached the rendezvous at 7 A.M. It was a winter morning with a calm sea and good visibility. His battle cruisers were in a single line ahead with Goodenough's light cruisers a couple of miles on the port bow. Course was altered to S. by W. at 18 knots. Ten minutes later the "Arethusa" was sighted to the south-eastward about 7 m. on the port bow. The "Aurora" and "Undaunted," the two other Harwich light cruisers, were still some 15 m. to southward of her out of sight. Hardly had the "Arethusa" been identified by the "Lion" when flashes of gunfire were seen to the S.S.E. This was the "Aurora" engaging the "Kolberg" coming up from the S.E. on the port bow of Hipper's squadron. The "Kolberg" was hit twice and withdrew at 7:25 A.M.

At the sound of the guns Admiral Beatty ordered his light cruisers to chase to the southward. The "Southampton" had hardly gone a couple of miles when the "Aurora" was seen on the starboard bow, and soon afterwards enemy battle cruisers were sighted on the port bow to the south-east. Dense clouds of smoke were pouring from their funnels and they were evidently getting up steam for full speed. It was now ten minutes to eight. Beatty's unexpected appearance had come on Hipper as an unpleasant surprise, and he turned to the S.E. and made off at full speed with Beatty some 13 to 14 m. behind. Beatty's position at 8:30 A.M. was about Lat. $54^{\circ} 50' N$. Long. $3^{\circ} 40' E$, and the two forces had settled down to the long rush to Heligoland 140 m. away (see fig. 1). When the chase commenced the British

FIG. 1.

battle cruisers were in single line ahead on a S.E. by S. course working up to full speed. The "Arethusa," "Undaunted" and "Aurora" now took station about 5 m. on the "Lion's" port bow in a ragged line abreast some 2 m. apart. Goodenough with his squadron was further off on the port bow steaming hard after the enemy. Hipper was 11 m. sharp on the "Lion's" port bow on a S.S.E. course in full flight for Heligoland with his light cruisers and destroyers ahead of him sharp on his starboard bow. The action about to commence took the form of a long chase in which speed was the principal consideration. Here Beatty's squadron had a considerable margin of superiority. It maintained an average speed of probably 26 knots; while Hipper's may have done just over 23 till the "Blücher" fell out, and something over 24 afterwards. By 8:42 A.M. the range of the "Blücher" had come down to 22,000 yd., and at five minutes past nine the Vice-Admiral hoisted the signal to engage. At 9:09, some 17 minutes after the first shot, the "Lion" obtained her first hit on the "Blücher." About ten minutes later, at 9:20 A.M., a movement of some sort was observed among the enemy destroyers, and in

¹ Commodore (S) = Commodore (Submarines). Commodore Roger Keyes.

expectation of an attack British destroyers were ordered to take station ahead, but none of them except the "M" class had the speed to do so and the remainder accordingly dropped back to clear the range. At 9:35 the "Lion" made the signal to engage corresponding ships in the enemy's line, not intending it to refer to the "Indomitable," which had dropped some way astern, but the "Tiger" took it to include the "Indomitable," and instead of firing at the "Derfflinger," the second ship, concentrated on the "Seydlitz," leaving the "Derfflinger" unfired at. It was not till 9:45 that the Germans scored their first hit on the "Lion," sending an 11-in. through her armour-plate. Five minutes later a 13.5-in. crashed into the after turret of the "Seydlitz," wrecking a portion of the stern and igniting a charge in the working chamber under the turret. The flames roared up through the turret and passed through a connecting door into the adjoining one, setting the charges alight there and turning both turrets into furnaces where all the guns' crews perished. The "Blücher" was now having trouble with her engines, and at ten o'clock drew out of the line going heavily. The range increased for a time partly due to the "Lion" slowing down to 24 knots at 9:53 to allow the line to close up, partly to the enemy turning away for a time. The "Blücher" was on fire by this time and had dropped behind to a position 3 or 4 m. on the "Seydlitz's" port quarter. At 10:22 Adml. Beatty, to bring the rear of his line into action, ordered his battle cruisers to form on a line of bearing N.N.W. and to proceed at utmost speed. But repeated hits were telling on the "Lion," and at 10:45 she was dropping back. As it was clear that she could no longer maintain her place at the head of the line, Beatty at 10:47 made a signal "to close the enemy as rapidly as possible consistent with keeping all guns bearing," but the "Tiger" was the only one to receive it and then only the words "close the enemy." About 10:50 A.M. the "Lion" received a bad hit on the port side aft, which holed the feed tank and did serious damage in the engine room. This was the crisis of the action; at this moment the wash of a periscope was seen on the starboard bow (in a position Lat. 54° 9' N. 5° 15' E.), and Beatty immediately made a signal to alter course eight points to port. This was hauled down at 11:03 A.M. and the squadron turned to N.N.E. (see fig. 2).

FIG. 2.

But the "Lion" was no longer able to perform the duties of a flagship. Her wireless and her searchlights were out of action, she had fallen out of line and the rest of the squadron was drawing every moment farther and farther away to the northward. The "New Zealand" was some way behind, and Rear-Adml. Sir Archibald Moore, the second in command, whose flag was flying in her, had not grasped the intention or nature of the turn.

It was urgently necessary to resume the chase. Beatty therefore ordered two signals to be made—compass B (course N.E.) and A.F. (attack the rear of the enemy); and then a third: "Keep nearer to the enemy. Repeat the signal the Admiral is now making." These all went up practically at the same time, and had they been understood in the sense in which they were made would have redeemed the situation. Unfortunately Rear-Adml. Moore only received the first two at 11:21 A.M. and then read them as meaning "attack the rear of the enemy bearing N.E." The "Blücher" was then bearing roughly N.E., and taking them as an order to attack the "Blücher" he steered

towards her. Hipper altered for a few minutes to the S., bringing a heavy fire to bear on the "Tiger," which received seven hits at this time, then resumed his course E.S.E. and drew rapidly out of range. The "Lion" in a crippled state steamed slowly to the north-westward, while the remainder of the squadron some 6 or 7 m. off began to circle round the "Blücher," whose fate was now sealed. The destroyers "Meteor" and "Miranda" attacked her, but she was still in action and sent four shots into the "Meteor," wrecking her boiler room. At 11:38 A.M. the "Arethusa" came up and fired two torpedoes into her. She ceased firing, listing heavily with fires raging fore and aft. Hipper was now some 15 m. off, only 70 m. from Heligoland, and Rear-Adml. Moore apparently did not think it worth while to continue the chase. It was not till 11:52 A.M. that he assumed active command and made his first signal to form single line ahead and steer west. Beatty meanwhile had transferred his flag to the destroyer "Attack" and was racing after his squadron. About half-past twelve he reached the "Princess Royal," hoisted his flag in her and was about to resume the chase. But pursuit was now hopeless, and the situation not too favourable. The "Lion" could only go 10 knots and the High Sea Fleet was supposed to be coming up. Accordingly at 12:45 P.M. the squadron turned back. Hipper meanwhile made for home and got in touch with the German battle-fleet about 2:30 P.M. The "Blücher" had been lost, the "Seydlitz" seriously damaged and the "Derfflinger" hit three or four times. When Beatty turned home Jellicoe was hastening down to him with the battle-fleet. They met at 4:30 P.M. and it remained only to get the "Lion" home. In tow of the "Indomitable" and screened by the 1st and 2nd Light Cruiser Squadrons and two flotillas she reached Rosyth safely the next morning.

The loss of the "Blücher" was quickly reflected in German naval policy. Adml. von Pohl took Adml. von Ingenohl's place as commander-in-chief of the High Seas Fleet with definite instructions to revert to a more cautious policy.

On the British side the results were generally regarded as disappointing. It was believed that, had the pursuit been pressed, the "Seydlitz" and "Derfflinger" might have shared the "Blücher's" fate, but it must not be forgotten that the range was still over 18,000 yd. and the enemy's speed not seriously diminished. The battle, however, had a very real result. It fettered the initiative of the German commander-in-chief, and put an end to raids on the English coast for over a year.

See also Filson Young, *With the Battle Cruisers* (1921).

The following is a list of the forces engaged:—

BRITISH

1st Battle Cruiser Squadron.

"Lion" (flag), Vice-Adml. Sir David Beatty, Capt. Alfred Chatfield, 28 knots (designed).
"Princess Royal," Capt. Osmond de B. Brock, 28 knots.
"Tiger," Capt. Henry B. Pelly, 30 knots.
Armament 8 13.5-in., 16 4-in. ("Tiger" 16 6-in.).

2nd Battle Cruiser Squadron.

"New Zealand" (flag), Rear-Adml. Sir Archibald Moore, Capt. Lionel Halsey, 26 knots.
"Indomitable," Capt. Francis W. Kennedy, 25 knots.
Armament 8 12-in., 16 4-in.

1st Light Cruiser Squadron.

"Southampton," Commodore W. E. Goodenough, Comm. E. A. Rushton.
"Birmingham," Capt. Arthur A. Duff.
"Nottingham," Capt. Charles B. Miller.
"Lowestoft," Capt. Theobald W. Kennedy.
Armament 9 6-in., "Southampton" 8 6-in., 25 knots.

Harwich Flotillas.

"Arethusa," Commodore Reginald Tyrwhitt, Comm. E. K. Arbuthnot. 10th Flotilla: "Meteor" (Comm. Hon. Herbert Mead), "Miranda," "Milne Mentor," "Mastiff," "Minos," "Morris," speed 34 knots.

3rd Flotilla: "Undaunted," Capt. Francis St. John, "Lookout," "Lysander," "Landrail," "Laurel," "Liberty," "Laertes," "Lucifer," "Lawford," "Lydia," "Louis," "Legion," "Lark," speed 29 knots.

1st Flotilla: "Aurora," Capt. Wilmot S. Nicholson, "Acheron," "Attack," "Hydra," "Ariel," "Forester," "Defender," "Druid," "Hornet," "Tigress," "Sandfly," "Jackal," "Goshawk," "Phoenix," "Lapwing," speed 27 knots.

GERMAN

1st Scouting Group.

- "Seydlitz," Rear-Adml. Hipper, 10 11-in., 12 5-9-in., 26 knots.
 "Derfflinger," 18 12-in., 12 5-9-in., 27 knots.
 "Moltke," 10 11-in., 12 5-9-in., 25 knots.
 "Blücher," 12 8-2-in., 8 5-9-in., 24 knots.

2nd Scouting Group.

- "Graudenz," "Stralsund," "Kolberg," "Rostock."

(A. C. D.)

DOGS (WAR).—That dogs could be usefully employed as auxiliaries in the prosecution of war, as was the case in the World War of 1914-8, is not a modern discovery. Both Greeks and Romans used them for offensive and defensive purposes and for maintaining communication on the field of battle. War-dogs are mentioned by Plutarch and Pliny, and Strabo describes how, in Gaul, dogs were armed with coats of mail. In the Middle Ages and in early modern history there are many stories, some of them no doubt legendary, of the participation of dogs in war. In the Crimean War, dogs were employed on sentry duty; in the American Civil War they were used both as sentries and guards.

An ancient writer, Camerarius, noted that guard-dogs could discriminate Christians from Turks; and a modern authority has stated that dogs employed during the war of 1914-8 could even detect men of unfamiliar regiments. Instinctive fidelity and keen scenting power make the proper sort of dog peculiarly suitable for training as an auxiliary in war. Further, a dog very readily acquires a sense of danger; and it was noted, during the World War, that dogs, if unable to reach or uncertain of a particular destination, would make their way back to their kennels. They would never cross the zone to the enemy. The same instinct for hurrying to the rear was, it may be added, observed in stray horses and mules.

Despite his acknowledged suitability, however, no modern systematic training of the dog for use in war began until the latter part of the last century. About that time the movement made considerable headway in Germany, mainly because of the energetic championship of the animal-painter, Jean Bungartz. In France, too, some progress was made and some official encouragement extended; but in England, apart from the private efforts of Lt.-Col. E. H. Richardson, no action was taken, and it was not until 1917 that a British war-dog training school was established at Shoeburyness.

In Germany there was, at first, a great difference of opinion on the question of the most suitable breed for training. Poodles were originally decided upon, because of their high degree of intelligence, but poodles suffer considerably when exposed to the heat of the sun and, though they have sharp scent, they are extremely short-sighted. The St. Bernard was then experimented with. The record of its ancestors at the Hospice was distinguished enough; but it seemed to have been forgotten that the Hospice dog, besides being short-haired, was also of lighter build than the modern St. Bernard. The pointer was next tried; but though it has unquestionably the necessary intelligence and physical strength, the hunting instinct is so deep-rooted in this breed as to be ineradicable except after years of labour. One principle the German authorities had insisted upon from the outset—that "a military dog cannot be produced from cross-breeds." The Scotch collie, pure-bred for centuries, was, therefore, some 20 or 30 years ago regarded with great favour in Germany as a potential war-dog. J. Bungartz, indeed, in his book on the subject of the war-dog, dated 1892, pays eloquent tribute to the collie's qualities. Later, however, the collies fell into disrepute; and during the World War the great bulk of the dogs employed with the German army (it has been stated that, almost immediately after the outbreak of war, the Germans placed some 6,000 war-dogs in the field) were German shepherd-dogs. Indeed, according to the returns of the German Society for Ambulance Dogs (Oldenburg) of 1,678 dogs sent to the front up to the end of May 1915, 1,274 were German shepherd-dogs, 142 Airedale terriers, 239 Dobermanns and 13 Rottweilers. The figures remained in a like proportion throughout the war. The ambulance dogs were able to distinguish between the dead and the apparently dead; the former they left untouched, even passed

with signs of disgust, the latter they succoured. The English and French armies found it impossible to employ ambulance dogs on the western front during the late war; but the German army seems to have employed them; especially during the Russian retreat on the eastern front, with conspicuous success. It is indeed officially recorded that thousands of German soldiers owed their lives to ambulance dogs. Messenger-dogs also constituted an acknowledged part of the organisation of the German army. An infantry regiment was allotted a maximum of 12 dogs, while a battalion might have six, the allotments being made by the Messenger Dog Section (*Meldhundstaffel*) at the Army Headquarters. The breeds chiefly employed for message-carrying work were German sheep-dogs, Dobermanns, Airedale terriers, and Rottweilers. The Germans, unlike the British, employed the dogs on the double-journey—"liaison" principle—that is, with two keepers, and the dog travelling backwards and forwards between both. In the British army the messenger-dog was trained to make the return journey only to the one keeper.

British war-dogs, which were placed under the signal section of the Royal Engineers, were employed principally in maintaining communication, though sentry-dogs did valuable work, especially in Salonika; but a British war-dog school was not established until 1917. Many types of dogs were used. Thus, of a total of 340 dogs sent to France from the school within a certain period, 74 were collies, 70 lurchers, 66 Airedales, 36 sheep-dogs, and 33 retrievers, the remainder being made up of 13 different breeds. A central kennel was established in France at Etaples. The training course at the school lasted about five or six weeks and the dogs and their keepers were then sent overseas. From Etaples the dogs were posted to sectional kennels behind the front line, each sectional kennel consisting of about 48 dogs and 16 men. From these kennels the dogs and their keepers in the proportion of one man to three dogs were sent up for duty in the trenches.

The war-dog training school of the French army was established at Satory about the same time as the English school was set up at Shoeburyness. Shepherd-dogs of various kinds, Airedale terriers and Scotch collies were mainly employed. Each French infantry battalion was allotted six dogs, the allotments being made from the Army Headquarters kennels. The U.S. army did not use dogs.

In determining a particular dog's suitability for war training, his physical condition should first be considered. Strength and agility combined, of course, with intelligence are in fact indispensable qualities. The chest should be broad, the legs sinewy and the paws of firm construction. Colour must also be taken into account. White dogs and those of "check" colouring are obviously unsuitable for war purposes. They would constitute too conspicuous a target. Sex, again, plays a part. A bitch in heat will, at any time, throw a pack into excited confusion and therefore, though trials have proved that bitches are apter at learning and are more trustworthy, they are not suitable for use in war. Castrated dogs, on the other hand, lack courage and temperament and are useless for work in the field. With regard to age it has been said that the dogs chosen for war training should not be less than one year and not more than four years old. (C. E. W. B.; E. S. H. *)

DOHERTY, CHARLES JOSEPH (1855-), Canadian statesman, was born at Montreal, Quebec, May 11 1855. He was called to the Quebec bar in 1877, and became a Q.C. in 1887. He was elected to the House of Commons for the St. Ann's Division of Montreal 1908, being re-elected Sept. 1911 and in the by-election consequent upon his taking office as Minister of Justice in Nov. 1911. He was professor of civil and international law in McGill University for several years before entering the Government. He became a member of the Unionist Government in Dec. 1917. In 1920 he was made an Imperial Privy Councillor and the same year was a member of the Canadian delegation to the first assembly of the League of Nations at Geneva.

DOLLAR SECURITIES MOBILIZATION.—In the British system of war finance, 1915-7, an important part was played by the mobilization of securities. During the World War enormous supplies of war materials of all descriptions had to be purchased by England from abroad, and in addition, owing to the withdrawal of labour from production in the Allied countries, abnormal quantities of goods had to be obtained from the same sources.

The exchange facilities available were entirely inadequate for the purpose of making the payments necessitated by these purchases, and artificial methods had to be adopted to provide in suitable foreign currencies the funds required. The natural procedure was by borrowing, and by the realization of such assets as were marketable in the creditor countries.

Though in some instances, and more particularly in the early days of the war, it was possible to effect loans abroad on the credit of the borrowing countries, it was found necessary to a large extent to provide collateral security in addition. The various securities quoted on the Stock Exchange and others of similar nature held in the Allied countries formed the natural and most fruitful field for obtaining suitable collateral and for providing the assets most readily marketable abroad.

Before the introduction of any official control a considerable amount of securities of the United States of America and other foreign countries was sold abroad, on account of the relatively high prices obtaining and the favourable terms on which the proceeds could be remitted home, owing to the fall in exchange rates which had already taken place. Even after the introduction of official action these natural sales continued, though necessarily in decreased volume. The funds provided by means of these sales and from loans effected abroad without collateral security supplied in the main the necessary sums to pay for the purchases made, but as the demand for goods and raw material became more insistent the British Treasury found it necessary to take official action. In July 1915 instructions were given to the Bank of England to purchase American dollar securities by private treaty or through the London Stock Exchange and forward them to New York for sale. By this means securities of the nominal value of \$233,000,000 were obtained before the end of the year and the pressing requirements of the Treasury were satisfied.

By Dec. 1915, however, it had become apparent that this somewhat haphazard method of purchasing available securities was not altogether satisfactory nor likely to achieve the desired results, and it was therefore decided to adopt a more comprehensive scheme. Accordingly, the Treasury appointed a committee, known as the American Dollar Securities Committee, with a permanent secretary of the Treasury as chairman, the deputy governor of the Bank of England as deputy chairman, and four members, two of whom were nominated by the Bankers' Clearing House and two by the Committee of the London Stock Exchange. The management was placed in the hands of Mr. (afterwards Sir) George May, the secretary of the Prudential Assurance Company.

In order to obtain some idea as to the volume and class of securities available a circular letter was sent to all the larger investors, such as insurance companies, banks and trust companies, asking them to submit lists of American dollar securities held by them, with a view to a possible sale or loan to the Treasury. Active operations were begun in Jan. 1916, at the National Debt Office in Old Jewry, by the issue of a list of 54 selected American dollar bonds which the Treasury was prepared to purchase. The prices offered were based on the current New York closing quotations of the previous evening, the New York percentage price being converted into the London sterling price at the existing rate of exchange with accrued interest.

In illustration of the procedure adopted it may be mentioned that the official prices were not only posted up at the London Stock Exchange but by a special arrangement were telephoned by the General Post-Office to all the provincial stock exchanges at about 10 A.M. This enabled the country stockbrokers to deal promptly with the committee by means of a short telegram stating the amount they wished to sell and quoting the official number assigned to the particular security. Such bargains held good provided that the telegram was handed in at the provincial post-office not later than 2 o'clock (later extended to 4 o'clock) on the day of the quotation. As regards London dealings, the bargains were booked over the counter at the National Debt Office. To facilitate delivery of securities a branch of the Bank of England was installed in Old Jewry and on the Bank's officers devolved the duty of accepting the securities in good order and paying the purchase money. It is interesting to note that brokerage was paid by the Treasury and not by the seller, while unstamped bonds were accepted on the same terms as those bearing the English stamp. In the early

days of the scheme payment was made at the seller's option in British Government Exchequer bonds then being issued. In this way the double purpose was served of obtaining the means of securing a credit in New York and increasing subscriptions for British Government securities. Additional lists of bonds and shares for which daily prices were quoted were published from time to time, while special prices were made for suitable securities not appearing in a published list. Since it was essential for the Treasury to obtain the largest possible credits in New York at the earliest possible date negotiations were entered into with large holders of securities, and bulk prices were quoted for large and comprehensive blocks.

The scheme was successful from the outset, as will be seen from the fact that securities to the value of over £40,000,000 sterling were obtained in the first ten weeks of its operation.

During the first months of the Committee's existence no securities had been taken on loan, but towards the end of March 1916 a deposit scheme, subsequently known as scheme A, was introduced. Briefly the scheme was as follows:—

Securities were to be deposited for a period of two years from the date of deposit, the lender to receive all interest and dividends on the securities deposited by him, plus an additional $\frac{1}{2}$ of 1% per annum on the nominal amount. During the currency of the loan the lender was entitled (1) to have his securities sold in New York free of expense, the proceeds being paid to him in London at the current sterling rate of exchange, or (2) to obtain the release of his securities in New York against payment to the Treasury agent there of a sum in dollars equivalent to their American value, a similar sum in sterling being paid to the depositor in London.

The Treasury was also prepared in most instances to purchase for sterling the deposit certificates in London at the current American prices of the securities deposited. Though there was no intention to realize the deposited securities except in an emergency, the right to do so was reserved to the Treasury as otherwise the securities would have been useless as collateral for loans in New York.

In Aug. 1916 a further loan scheme, B, was brought into force. It differed from the previous scheme in that (1) deposit was for a period of five years from a fixed date, instead of two years from the date of deposit; (2) under it were included many colonial and foreign stocks and bonds in addition to the purely American securities; and (3) the right to realize securities as given under scheme A was limited to American securities having a market value in New York. Power was given to depositors under scheme A to transfer to scheme B, and this option was in most cases exercised.

The securities purchased were sold immediately a suitable opportunity offered, and those remaining unsold, together with deposited American dollar securities, were used for short borrowing as required. The main use, however, to which the deposited securities were put is illustrated by the particulars of a typical loan floated in the United States of America prior to the entry of that country into the war:—

UNITED KINGDOM		3-5 year 5½% Notes Dated Nov. 1 1916.
Amount of loan		\$300,000,000
Collateral		360,000,000
Composed of \$		
59,500,000	Australasian.	
25,500,000	South African.	
20,000,000	Argentine and Chilean.	
30,000,000	Japanese.	
15,000,000	Egyptian.	
5,000,000	Cuban.	
25,000,000	British Railway Debentures.	
180,000,000	U.S.A. dollar securities and Canadian.	

Up to May 27 1916, rather less than five months after the formation of the Committee, the amount paid for securities purchased exceeded £51,000,000 sterling, while the nominal amount of securities deposited on loan was about £8,000,000. Since these figures, however, were not sufficient to provide the funds required, the Chancellor of the Exchequer stated in Parliament that powers would be taken to impose a special tax of 2s. in the £1 on the income of all securities that the Treasury, by means of special lists, declared its willingness to purchase. The necessary authority of Parliament was granted. Relief from the additional tax was only obtainable by selling or loaning the specified securities to the Treasury. The effect was immediate. In the first two weeks following the announcement the purchases exceeded £23,000,000 sterling and the deposits £15,000,000 sterling. In course of time the purchases greatly decreased but the deposits, mainly owing to the introduction of scheme B, assumed very large proportions. For example, during the month of Sept. 1916, the securities taken in on loan amounted to about £100,000,000. The enormous requirements of the Treasury are

emphasized by the fact that in spite of the large amounts of securities purchased and deposited a still more drastic step had to be taken.

On Jan. 24 1917, a regulation issued under the Defence of the Realm Act came into force, by which the Treasury was given power to requisition securities. The first order under this regulation was issued on Feb. 17 1917, and required owners or custodians of specified securities to deliver them up in return for an amount of compensation based on the current market values. Holders of securities not ordinarily resident in the United Kingdom and certain other holders were exempted from the terms of the order. The compensation was payable within seven days of the transfer, and power was given to reduce its amount in case of late delivery. Altogether four such orders were issued, the number of securities included being 1,076. On March 1 1918 deposit scheme B was closed to new deposits, except in regard to securities subject to the extra 2s. tax and which had not previously been included in the list of requisitioned securities. A little later, when the securities under scheme A began to fall due for return, depositors were given the option to extend the term to five years. Nearly all such depositors availed themselves of this offer.

In addition to the purchase and loan schemes which have been described above, the American Dollar Securities Committee undertook various operations for the purpose of placing dollars at the disposal of the Treasury in America. In this connexion may be instanced arrangements with various Canadian provincial and municipal authorities for the purchase of their sterling securities in London for cancellation and the issue, in place thereof, of Canadian dollar securities for sale in America. Similar plans were adopted in the case of certain American industrial companies. Further, arrangements were made with certain British corporations to issue their own loans in America and place the dollars obtained at the disposal of the Treasury, the latter looking after the American loan and providing the English company with sterling in London. As an instance, reference may be made to the issue by the Central Argentine railway of a \$15,000,000 loan in America.

The labour involved in connexion with the operations and more particularly with the loan scheme, was of considerable magnitude, and it was necessary to adopt every device in order to lessen the work, which in the main had to be carried out by a staff collected in a time of emergency. In the early days an agreement was entered into with the agents of over £100,000,000 bearer securities, the coupons of which had to be encashed in London, to pay the coupons on deposited securities, plus the additional $\frac{1}{2}$ % per annum, and for this purpose they were supplied with schedules giving such information as would permit of the calculations and payments being made. In Sept. 1917 this procedure was discontinued, and thereafter the work was taken over by the National Debt Office.

With regard to the registered stocks on deposit, much duplication of work was avoided by the railway companies and other paying agents undertaking to keep the Treasury register and pay the increased interest as it fell due. By this means it is estimated that the authorities were relieved from the preparation, etc., of about 350,000 dividend warrants each year. Further, certain approved agents were appointed to accept deposits of amounts of less than \$5,000 each, the securities being handed over in bulk to the Committee; payment of interest on the aggregate amounts was made to such agents, who in turn distributed the sums received amongst the individual depositors.

The United States of America was naturally the chief source of supply, both for munitions of war and for goods, and therefore the financial arrangements already referred to were mainly directed to the provision of dollars in order to effect the necessary payments. In a smaller degree, however, payments had to be made to other countries, and certain of the securities obtained by the Committee were used to meet these obligations.

The United Kingdom was, of course, preëminent as the holder of foreign securities, and she therefore played by far the greater part in the efforts made towards mobilization in the Allied interests. But France also held a considerable amount and had a deposit scheme of her own, though on nothing like the same scale as that of the United Kingdom. In her scheme no purchases of securities were made, but a considerable volume of private sales to the United

States of America was effected, both direct and through London, and to a certain extent purchases of French holdings were made by the American Dollar Securities Committee through the medium of the banks of France and England.

The total amount of securities dealt with under the British mobilization scheme, including those bought by the Bank of England prior to the appointment of the American Dollar Securities Committee, was as follows:—

Purchases	£216,000,000
Deposits	£406,000,000
Total	£622,000,000

These particulars may be to some extent amplified. Thus, the purchases consisted of:—

\$680,000,000	Dollar bonds
\$241,300,000	Dollar shares
£ 27,800,000	Sterling bonds and shares
£ 4,100,000	Registered stocks
Fl. 5,400,000	Florin bonds and shares

Similarly the deposited securities were made up of:—

\$197,800,000	Dollar bonds
\$303,600,000	Dollar shares
£115,100,000	Sterling bonds
£172,000,000	Registered stocks
£ 17,500,000	Home Railway debentures
Fr. 8,500,000	Franc bonds
Kr. 8,100,000	Kroner bonds
Fl. 4,400,000	Florin bonds

The total number of different securities dealt with was 2,027.

The total amount of American dollar securities which passed through the hands of the Committee was thus approximately £285,000,000. In addition securities to the value of probably £100,000,000 were sold direct to America through the ordinary channels, making in all, say, about £400,000,000. Various estimates have been made from time to time of the amount of American securities held in Great Britain before the war. The data available on which to base any such estimate are very vague and uncertain in their nature, and the present writer is inclined to believe that any such estimates can only be regarded as more or less intelligent guessing. In his opinion the total amount of American securities held in Great Britain before the commencement of hostilities was certainly not greater than £600,000,000 and probably nearer £500,000,000.

The operations of the Committee undoubtedly achieved the purpose for which it was formed, as during its existence the rate of exchange practically remained constant at about 4.764 dollars to the £1. Although securities were purchased and taken on loan after the Americans came into the war the amounts obtained were not great, and it is believed that practically all available American securities suitable for sale or collateral for loans had been dealt with.

It is difficult to see what course could have been taken in order to obtain the necessary credits abroad in sufficient amount when these securities had been exhausted, but speculation on this point would be idle since the necessary credits became available after and on account of the entry of the Americans into the war. (G. E. M.)

DOLLAR STABILIZATION.—Under the existing currency system, the so-called "level of prices" is largely at the mercy of monetary and credit conditions. The tide of prices will rise or fall with the flood or ebb of gold or of paper money or of bank credit. Evidently a rise in the level of prices is a fall in the purchasing power of the dollar or other monetary unit, and *vice versa*. The purchasing power of money has always been unstable because a unit of money, as at present determined, is not a unit of purchasing power, but only a unit of weight. It is the one inconstant unit of measurement left in civilization. Other units—the yard, pound, bushel, etc.—were once as unstable and crude as the dollar, sovereign or franc still are; but, one after another, the other units have all been stabilized or standardized. Short weights and measures cheat the buyer; long weights, the seller. So a unit of money which changes in value or purchasing power is always playing havoc between contracting parties. When prices are rising—in other words, when the purchasing power of the dollar is falling—the creditor and the creditor-like classes suffer injustice. The sufferers include savings-bank depositors, bondholders, salaried classes and wage-earners. In the great upheaval of prices—i.e. in the United States, depreciation of the dollar—which took place between 1896 and 1921 such injustice amounted to over a hundred billion dollars. On the other hand, when prices fall, as they did between 1873 and 1896, it is other classes—debtors, stockholders, farmers and independent business men generally—which suffer the injustice. The indirect effects of falling or rising prices—i.e. of a rising or falling dollar—are equally bad. These indirect effects include industrial discontent

(either over the "high cost of living" or unemployment) and economic crises and depressions.

Hitherto there was ample excuse for the unstable monetary units of various countries. No instrument for measuring their aberrations had been devised. Likewise, until weighing scales were devised, weights could not be standardized, and until instruments for measuring electrical magnitudes were invented, electrical units could not be standardized. But for many years the "index number" of prices has provided an accurate instrument for measuring the value of the dollar in terms of its power to purchase goods. An "index number" of prices is a figure which shows for a specific period of time the average percentage increase or decrease of prices. One of the most suggestive signs of the times is that this instrument for measuring changes in the purchasing power of money has recently been utilized in adjusting wages and salaries to the high cost of living, i.e. to the depreciated dollar. A number of industrial concerns and banks, and some official agencies, have amended wages by the use of an index number of the prices of commodities.

It has been contended by some economists that this principle may be utilized in the future more generally to safeguard agreements made at one date to pay money at another date. Such corrections of the dollar would gradually break down the popular superstition that "a dollar is a dollar"; for every time we correct the dollar, we convict it of *heating* corrections; and ultimately the correction might be applied, not, as at present, as a patch on the dollar from the outside, but by incorporating it in the dollar itself. Various methods for accomplishing this have been proposed. The one perhaps best known is Prof. Irving Fisher's proposal to vary the weight of the gold dollar so as to keep its purchasing power invariable. Instead of a gold dollar of constant weight and varying purchasing power, what is needed, he contends, is a dollar of constant purchasing power, and, therefore, of varying weight. It is not proposed, of course, to remint gold coins, but simply to count an ounce of gold bullion as being the equivalent not always of \$20.67 (as at present) but of as much more or less than that sum as is required from time to time in order to keep the purchasing power of the dollar constant. In other words, the proposal is to vary the price of gold according to its worth relative to other commodities, instead of, as at present, keeping it artificially constant at \$20.67 an oz. pure or £3 17s. 10½d. an oz. 11/12 fine. In this way, Professor Fisher contends, we can control the price level, lowering it, raising it, or keeping it from fluctuating much, if at all. Thus, if Mexico should adopt the dollar of the U.S. (instead of its present dollar of half the weight of gold), the price level in Mexico would be disastrously cut in two. Again, if the U.S. should adopt the Mexican dollar, the price level in the U.S. would be disastrously doubled. That is, the more gold in the dollar, the greater its buying-power; and the less, the less. If, Professor Fisher contends, this principle be admitted, it follows that we hold, in the hollow of our hand, what the dollar's buying-power shall be—that is, what the level of prices shall be. It can be kept from changing greatly just as easily as it could be made to change, simply by periodical adjustments of the price of gold, each adjustment being made in accordance with the index number of prices. By this method, in conjunction with any of the sound systems of banking, Professor Fisher contends, variations of more than one or two per cent could easily be prevented except under the most extraordinary conditions. (I. F.)

DONALDSON, SIR JAMES (1831–1915), British scholar (see 8.406), died at St. Andrews, March 9 1915.

DONNAY, CHARLES MAURICE (1859–), French dramatist (see 8.417), wrote several fresh plays after 1910: *Le Ménage de Molière* (1912); *Les Éclaircuses* (1913); *L'Impromptu de Paquetage* (1916); *Le Théâtre aux armées* (1916). He also published some war-time essays and addresses: *La Parisienne et la Guerre* (1916); *Premières Impressions après* (1917); *Lettres à la Dame Blanche* (1917); *Pendant qu'ils sont à Noyon* (1917); *La Chasse à l'Homme* (1919).

DOUGHTY, CHARLES MONTAGU (1843–), British explorer and writer, was born in 1843, the youngest son of the

Rev. C. M. Doughty of Theberton Hall, Suffolk. In 1875 he made an adventurous journey through northern Arabia, remaining nearly two years in the country, and, after many hazards and hardships, finally emerging at Jidda (see 2.257). He published the results of his observations in a work since recognized as a classic worthy to rank with the records of the Elizabethan voyagers. *Travels in Arabia Deserta*, issued by the Cambridge University Press in 1888, received at first little recognition and brought its author no material reward. But gradually its fame spread amongst travellers and lovers of literature until the rare copies of the first edition were scarcely procurable at any price, and in 1921 a facsimile reprint of the two volumes was issued at £0.95. The value of Doughty's work as a traveller had by that time secured universal recognition; nothing was left for any future explorer to study between Damascus and Mecca which Doughty had not already closely studied, and in 1912 the Royal Geographical Society bestowed on him its Founder's gold medal. He had done other work previously, and he published several volumes; but he remains, in the estimation of the literary world, the author of one book. It should, however, be noted that in 1866 he brought out *On the Jostedal-Brae Glaciers in Norway*, and a collection of inscriptions copied by him in Arabia was published by the Académie des Inscriptions et Belles-Lettres in 1884. His later years were devoted to poetry and poetic drama. In 1906 he published an epic in six volumes *The Dawn in Britain*, followed by *Adam Cast Forth* (1908), *The Cliffs* (1909), *The Clouds* (1912), *The Titans* (1916) and *Mansoul, or the Riddle of the World* (1920).

DOVER, England (see 8.453).—Pop. (1911), inclusive of the garrison, 43,645; estimated civil pop. (1920) 41,408. The municipal boundaries were extended in Nov. 1921 so as to include an area of about 70 ac. in the River Ward destined for housing purposes; at the same date the various piers and jetties of the harbour were brought within the municipal area. A new general post-office was completed in Biggin St. in 1914. Two new churches have been erected—Charlton church, a large building in the early English style which takes the place of a small church dating back to the Middle Ages since demolished, and St. Barnabas church, built between 1890 and 1912. The Duke of York's Royal Military School was transferred from London to Dover in 1907, an extensive series of buildings of the bungalow type having been erected on the Eastern Heights near Fort Burgoyne. The Connaught barracks near the castle with accommodation for an infantry battalion were completed in 1913. The Dover Patrol memorial obelisk on the cliffs E. of the town was unveiled by H.R.H. the Prince of Wales on July 27 1921.

The Dover harbour scheme—in addition to the construction of piers and a breakwater to enclose the Admiralty harbour with a perimeter of about 4½ m., completed in 1909—included the reclamation of about 11½ ac. upon the harbour (eastern) side of the Admiralty pier, to provide for a new marine station and berths for the continental mail packet steamers and other vessels. Both these projects were sufficiently completed in time to be of service during the World War.

The reclamation wall is 2,260 ft. long, and the landing-stage upon the Admiralty pier extension, 792 ft. long and 20 ft. wide. Altogether six berths are provided. The stage is built on open pile work and double docks to suit levels for the passenger steamers—spring tides rise 18 ft. 9 in., neap tides 15 ft., and range 11 feet. Reinforced concrete piles support the foundations of the passage to an inset landing-stage, and also the foundations of the marine station. At the outer end is a lighthouse 85 ft. above high-water level, the light visible for 14 miles. As at Chatham, large colliers drawing four fathoms can berth alongside the pier to unload into railway trucks.

To provide railway communication to the Prince of Wales' pier, and to the harbour quays, the Harbour Board, in 1904, constructed a new swing bridge to carry passenger trains as well as ordinary vehicular traffic; during the war this bridge proved indispensable in the transport of material.

The Harbour Board acquired parliamentary powers, in 1920, to construct, by arrangement with the Government, an enclosed wet-dock upon the Admiralty harbour side of the Prince of Wales' pier, having an area of 21 ac. and depth of 34 ft. at high-water of spring tides. The entrance lock is to be 100 ft. wide, and additional quays, transit sheds, coal-tips, and connexions to the inner dock basins will be provided.

On its completion, the Admiralty harbour became the base of the battleships and armoured cruisers of the Atlantic Fleet. In 1911 the defence of the Straits was handed over to the destroyers and submarines and a camber in the northern corner of the harbour was completed for them just before war broke out. In Aug. 1914 the Sixth Flotilla of destroyers and submarines formed the naval force guarding the Straits, with their base at Dover.

During the war Dover was entrenched, the perimeter being nearly 6 m., and a division of troops manned the defences. The Swingate aerodrome was an instructional school for the final training of officers before leaving for France, and the Guston aerodrome the H.Q. of the R.N.A.S., afterwards the R.A.F. Dover was subjected to repeated air raids, the first raid on England taking place at Dover on Dec. 24 1914. There were several Zeppelin raids in 1915-7, but the defence prevented any serious damage. In all, 184 bombs were dropped on the borough and 370 in the immediate vicinity, and the total death toll was 25. The castle was hit several times by bombs but beyond a few chips in the walls of the keep no trace of damage remains. Over 100 men lost their lives in the blowing up of the monitor "Glatton" in Dover harbour on Sept. 16 1918, and 155 were drowned in the mining of the "Maloja" off Dover on Feb. 24 1916.

At the close of the war Dover harbour was abandoned as a naval base, the camber was leased to a private company for the breaking up of old battleships, and the Admiralty in 1921 were offering to lease the naval harbour for commercial purposes.

Dover castle has been placed in the care of the Office of Works as an ancient historical building and a considerable amount of restoration and preservative work has been carried out on the Roman pharos and the late Norman towers and walls. In recent years many tiles bearing the letters Cl Br have been found in the area between the Western Heights and the Dour, indicating that Roman Dover occupied this site. The tiles show from their stamp that they were made by artisans belonging to the Roman British fleet. As they have not been found elsewhere except at Boulogne, they appear to indicate that Dover was the chief Roman port to the continent.

The chief feature of the industrial development in the district was the opening up and working of the Kent coal-field. The H.Q. of the chief colliery company is at Dover.

AUTHORITIES.—"The Port of Dover," *Jour. of the Royal Society of Arts* (April 15 1910); *Engineering Supplement of the Times* (April 24 1914); J. Bavington Jones, *The Annals of Dover* (1916).

DOWDEN, EDWARD (1843-1913), English writer (see 8.456), died at Dublin April 4 1913.

See his *Letters*, edited by E. D. and H. M. Dowden (1914).

DOYLE, SIR ARTHUR CONAN (1859-), English novelist (see 8.461), was one of the originators of the Volunteer Corps during the World War, the first corps being formed by him at Crowborough, Sus., in Aug. 1914. In this, the 6th Sussex Batt., he served for four years as a private. He also did much propaganda work, and issued various pamphlets on war subjects, also a six-volume history of the war which was extensively read in America. He visited the war zones twice, and published *The British Campaign in France and Flanders, 1914* (1916) and *A Visit to Three Fronts* (1916), as well as a volume of verse, *The Guards Came Through, and other Poems* (1919). His other writings since 1910 include *The Case of Oscar Slater* (1912); *The Poison Belt* (1913); *Danger* (1918) and *His Last Bow* (1918). He became an ardent spiritualist and published *A New Revelation* (1918) and *The Vital Message* (1919), following these up by an active campaign of lecturing and controversy on the possibility of proving by spiritualism the continued existence and conditions of human life after death. A public debate between him and Joseph McCabe on the subject took place in 1920.

DRAMA (see 8.502).—The decade 1910-20 was one of paramount importance in the history of English drama and the English theatre. Apart from the temporary, but substantial, effect of the World War, which lasted for nearly half of the decade, other causes of wide influence profoundly affected both

the drama as a part of literature and the theatre as a commercial organization during that period. In the United Kingdom great changes in the constitution of theatrical enterprises were brought about abruptly and almost catastrophically. The government of the theatre by actor-managers ceased with dramatic suddenness and was replaced by the government of syndicates composed, for the most part, of persons innocent of all knowledge of acting or drama and concerned primarily, if not exclusively, with the production of large profits quickly returned. In those theatres where the actor-manager was not replaced by a commercially minded syndicate, his place was taken by what may be called the producer-manager.

The three great actor-managers of the English theatre, Sir Herbert Beerbohm Tree, Sir George Alexander and Sir Charles Wyndham, did not outlive their reign; the era of the actor-manager ended simultaneously with their decease. Tree died July 2 1917; Alexander March 16 1918; and Wyndham Jan. 12 1919. The normal process of nature, whereby one generation of tradition is slowly merged in another, was in their case mercifully suspended. In 18 months the actor-managerial system, which had been immensely powerful, was in ruins, and its chief protagonists, men of ability and taste, were dead, spared from the humiliation of neglect and supersession. It was a system undeniably disadvantageous to the drama as an art, since it tended to make the play subordinate to the player and restricted many dramatists to the production of plays with good parts for particular persons, but there is no doubt that the actor-managers, especially the three named, were possessed of ambition and much taste and that they worked successfully to restore dignity to the theatre. They were directly associated with many of the most interesting plays that were written during their reign, and Tree, Alexander and Wyndham could claim exemption from the charge so frequently and justly brought against Sir Henry Irving, of doing nothing whatever to encourage the work of meritable modern English dramatists. Sir Herbert Tree's annual Shakespearean festival, held often at grave financial disadvantage to himself, was a real tribute to taste and culture, despite the serious complaints fairly made about his methods of production. Sir George Alexander, more than anyone else, made the way to the stage easy for the writer of distinguished comedy and was chiefly responsible for the career as a dramatist of Oscar Wilde. Sir Charles Wyndham, less consistently ambitious than his colleagues, followed an honourable tradition and was responsible for the redemption of farce from buffoonery.

The decline and fall of the actor-managerial system coincided with the disappearance from the centre of London of the music-hall in which a succession of "turns," sparsely produced but highly individualized and having no relationship with each other, formed the programme. Three well-known music-halls ceased between 1910 and 1920 to be music-halls. These three, the Oxford, the Tivoli and the London Pavilion, were the centre from which radiated an elaborate ganglion of music-halls throughout Great Britain and Ireland. The Tivoli was demolished and its site remains, in 1921, unoccupied. The Oxford became, during the war, a theatre and in 1920, under the management of C. B. Cochran, was re-named the New Oxford, where an elaborately produced but less highly individualized form of music-hall entertainment, roughly connected in shape, was provided. At the London Pavilion, also controlled by Mr. Cochran, a skilfully contrived form of what is called "revue" became the standing entertainment. Specific reference to "revues" will be made later, but here it may be said that they are not "revues" in the French sense, a commentary on contemporary affairs, but a mingling of musical comedy and music-hall entertainment in which individual ability is made subordinate to general impression. The chief characteristics of this new entertainment, seen perhaps at its best in the roof-garden productions in New York, are expensive dresses, handsome scenery, fine and even beautiful effects both in grouping and lighting, and a particular insistence on feminine beauty.

This change in the character of the London West End music-hall coincided with the great growth in popularity of the cinema.

or picture-palace, or "movies." During the decade, almost all of the London suburban theatres became picture-palaces. Many of the provincial theatres, especially in small towns, also became picture-palaces. A variety of reasons caused this change to take place, some of which were financial and others connected with altered taste. The kinemas were at once cheaper and more comfortable than the theatres and they offered a more consistently attractive programme. The inhabitants of a London suburb or a small provincial town were able to see as good a film at the local kinema as could be seen in a kinema in the centre of London, but they could not hope to see a play performed at the local theatre by a company as capable as that acting in the same play in the West End. On the contrary, they might expect with certainty to witness a very inferior exhibition of acting. Precisely the same process was observable in America, where, owing to the competition of the "movies" and the inferior quality of travelling companies, what were known as "one-night stands" ceased to be profitable enterprises and were almost entirely abandoned.

Those were the three main changes in the nature of theatrical entertainment during the decade 1910-20; the disappearance of the actor-manager and the substitution for him of the commercial syndicate; the disappearance from the centre of London of the music-hall of marked personality and the substitution for it of the music-hall with elaborate effects and mechanical skill; and the collapse of the suburban and provincial theatre before the advancing kinema. These changes, although they hardly cause satisfaction, are of the nature of constructive changes, and they probably possess permanent characteristics. The commercial syndicate may result in more efficient administration in the theatre and a greater likelihood of continuous employment for the actor. It has not yet shown a desire to produce drama equal in merit to that produced by the actor-manager, but the system is still young and it was considerably handicapped by its inauguration during the war and remains handicapped by the high cost of production. The great virtue of these syndicates is likely to be of an administrative character. Many theatres, in London and the provinces, are coming under the control of a single syndicate, and this trustification of theatres will enable a particular firm to arrange its tours on a more economical and comfortable system than has hitherto been the case. The old individual system, unavoidably, resulted in touring companies sometimes spending a week in Edinburgh, the next week in Bristol and the third week in Newcastle-upon-Tyne. In a properly organized theatrical system, such tours will no longer take place, but will be arranged so that the journey from town to town will be short and easily accomplished by motor-car or lorry.

The change in the music-hall has brought about a great development of the mechanical and pictorial side of that entertainment, and if some of the spirited personality of the superseded form can be captured for the new form, the change will be of considerable value. The danger of it is that human qualities are subordinated to machinery and spectacular effects. In the case of the kinema development has been progressive and is likely to continue so. Film-manufacturers are constantly engaged in experiment, and they will in time invent a machine which will enable them to exhibit pictures in three dimensions, in natural colours and with some effect of the human voice. This will be done by means of an instrument which is a combination of gramophone and stereoscope, aided by some process of colour-photography. The film-firms, particularly in America, are endeavouring to improve the quality of the film-play and, since they offer very handsome monetary rewards to authors, are likely to succeed in their attempt. Many of the most distinguished dramatists of the world are engaged in writing scenarios for the "movies," and several of them have announced that they will in future write only for them.

Repertory Theatres.—The survey in the earlier article (see 8475) ended at a period when, in spite of many undesirable things, the drama was in a healthy condition. Plays of merit were being written and produced, not only in London, but also in the provinces where the activities of the repertory theatres were stimulating the imagination of young authors. Conservative managers were receiving original work with less hesitation or hostility than had been accorded

to it for several generations. The long and, in many respects, valuable domination of the theatre by dramatists such as Sir Arthur Pinero and Henry Arthur Jones, was declining before the rising authority of such dramatists as Bernard Shaw and John Galsworthy. The repertory theatres were increasing in number. In 1910, there were three repertory theatres in the British Isles, one in England (the Gaiety theatre, Manchester, owned by Miss A. E. F. Horniman), one in Scotland (the Royalty, directed by Alfred Wareing) and one in Ireland (the Abbey, directed by Lady Gregory and W. B. Yeats). The last was the oldest as it has proved to be the most durable of the three. In addition to these three repertory theatres, there was a most ambitious attempt to establish one in London, at the Duke of York's theatre, where the late Charles Frohman (who was drowned in the "Lusitania" when it was torpedoed by the Germans May 7 1915) enlisted the services of Harley Granville-Barker and Dion Boucicault. The scheme was to establish a repertory theatre more nearly corresponding to the strict definition of one than any of those operating in the provinces, which were identical with what used to be called "stock" companies. Mr. Frohman's gallant enterprise failed. It lasted for 17 weeks, from Feb. 21 to June 17 1910, and during that period eight new plays and two old ones were produced. The names of the plays and their authors are as follows:—*Justice* by John Galsworthy; *Misalliance* by Bernard Shaw; *Old Friends* by J. M. Barrie; *The Sentimentalists* by George Meredith; *The Tenth Muse* by J. M. Barrie; *The Madras House* by H. Granville-Barker; *Helena's Path* by Anthony Hope and Cosmo Gordon-Lennox; *Chains* by Elizabeth Baker; *Trelawney of the Wells* by A. W. Pinero and *Prunella* by H. Granville-Barker and Laurence Housman. Three of these plays were in one act (the third, fourth and fifth in the list).

The original scheme, of a strictly repertory theatre similar to the Comédie Française, was not maintained, nor does the history of the repertory theatres in Great Britain and Ireland indicate that such a scheme is ever likely to succeed in a country where the people are disinclined to make the research through newspaper advertisements which a programme of irregular performances involves. For good or ill, the system of continuous performances has obtained a hold on the British theatre which will not easily be shaken off and may never be shaken off. *Trelawney of the Wells*, the most popular of the plays produced during the season, was performed 42 times in a season of 17 weeks, which clearly signifies that the promoters of the scheme had to revise their plan, partly to satisfy the public demand and partly to recoup themselves for the losses sustained on the unpopular pieces. A similar history has attended the establishment of other repertory theatres on Comédie Française lines in England, for example the Everyman theatre at Hampstead, established in 1920 by Norman MacDermott. The repertory theatres steadily increased in number until, at the outbreak of the World War, there were seven of them operating regularly and a number of others operating for short periods during each year. None of these theatres earned large sums of money. Some of them, indeed, were constantly embarrassed by insufficient funds. But they performed a most valuable service to young actors and young dramatists: to the first, by giving them continuous and varied employment which, although not highly remunerated, enabled them to become accomplished in their craft; to the second, by giving them the greatest of all instruction to a dramatist, the public performance of his work, and by bringing before them the work of established dramatists, British and foreign, which otherwise they would not have known except in book form. Ibsen, Strindberg, Hauptmann, Schnitzler, Maeterlinck, Rostand, Verhaeren, Södermann, Tolstoi, Chekhov, Shaw, Galsworthy, St. John Hankin, Granville-Barker, Arnold Bennett and John Masefield among the moderns; and Euripides, Shakespeare, Ben Jonson, Congreve, Beaumont and Fletcher, Goldsmith and Sheridan among the classics—the work, in quantity, of all these writers was brought to the knowledge and even to the intimacy of provincial playgoers who, but for the repertory theatres, would have had to subsist in the theatre on the more popular of the pieces produced in London and sent on tour. A similar service is performed in America by what are called "little" or "community" theatres.

Out of these repertory theatres came a number of young dramatists, many of them resident in the city in which their plays were first performed, of whom at least one man was a genius, John Millington Synge (d. 1909) and three men of distinction, Stanley Houghton (d. 1913), John Drinkwater (b. 1882) and Lennox Robinson (b. Oct. 4 1886). Synge has been the subject of several biographies of which the principal and most authoritative one is *John Millington Synge and the Irish Theatre* by Maurice Bourgeois. He wrote six plays, a book of poems and translations and some impressionist articles of a newspaper character. Two of the plays are in one act. In *The Shadow of the Glen* and *Riders to the Sea*. The latter is commonly regarded as the best of his work. One of the plays, *Deirdre of the Sorrows*, is unfinished. Of the remaining three, *The Tinker's Wedding* (in 2 acts), *The Well of the Saints* (in 3 acts) and *The Playboy of the Western World* (in 3 acts), the last-named is the most widely known, partly because of its merits, but chiefly because of the anger which it aroused among the more sentimental of the Irish people who, accustomed to the romantic delusions in which subject or oppressed peoples live, could not endure the romantic realism of this play. A long succession of poets had insisted on one aspect of the Celtic

character, its idealism and generosity and romance, with the result that people disbelieved in the other aspect of it, the cruelty and greed and treacherous materialism. Synge, a man without prepossessions or creed, set down what he saw in words of acrid beauty, and the Irish people, horribly shocked, pronounced him to be a liar, a degenerate and even a traitor. The violence of their anger against *The Playboy of the Western World* died down in time, but Synge remains a man of genius of whom his countrymen, when they take pride in him at all, remain reluctantly proud. He and Lennox Robinson are the principal products of the Abbey theatre, Dublin, which includes among its minor dramatists Lady Gregory, William Boyle, T. C. Murray, Padraic Colum, the late Seumas O'Kelly and St. John Ervine. W. B. Yeats has written plays for the Abbey theatre, but the dramatic form is intractable in his hands.

Lennox Robinson, who was appointed manager of the Abbey theatre in 1910, at the age of 23 and, except for a break of two or three years, has managed it ever since, has written nine plays, of which two, *The Lost Leader* and *The White-headed Boy*, have been successfully performed in London. The first was produced at the Court theatre June 10 1919, where it was acted 68 times. The second was produced at the Ambassadors' theatre Sept. 27 1920, and was acted for more than 300 times. His plays conform more closely to the conventional shape than do those of John Drinkwater, and they are more skilfully contrived than those of Stanley Houghton. He puts realistic, rather than romantic, speech into the mouths of his people, thus separating himself very distinctly from the Synge drama. His principal merits are great technical skill, veracity of character and speech, and natural exploitation of natural emotions. His defects are a lack of staying power and vagueness of thought, which causes his last act to drop considerably below the level of his first. But of all the Irish dramatists, he has the greatest comprehension of the theatre.

Stanley Houghton, after writing a number of meritable pieces of uninspired realism, presented the Gaiety theatre, Manchester, with a comedy in three acts, entitled *Hindle Wakes*, which, to fill an emergency, was first performed before the Stage Society June 16 1912. It made an immediate impression and was put into the evening bill at the Playhouse and afterwards at the Court, receiving in all more than 100 performances in London. It had greater success in the provinces, where at least one company has performed it ever since, but it failed to be popular in America. *Hindle Wakes* is not a profound play, nor has it conspicuous literary qualities; but it is fresh and forceful and it deals with a question of sex in a direct, natural and sincere, but unusual, manner. Whether or not Houghton would have grown into a dramatist of distinction (he was 32 when he died) is not a matter which can profitably be discussed. The plays which came after *Hindle Wakes*—*The Perfect Cure* and *Trust the People*—did not sustain the reputation it had made for him, but as they seemed to be written deliberately for commercial purposes and failed to realize them—*The Perfect Cure* was performed for four nights only—it is probable that Houghton would have returned to the milieu in which he was happiest and that, although he was unlikely ever to become a first-rate dramatist, he would have become a very competent and meritable one. The Gaiety theatre, Manchester, gave opportunity to a number of other dramatists, of whom the principal are Harold Brighouse and Allan N. Monkhouse, the first-named being the author of *Hobson's Choice*, which had great popularity in America and London, and the second-named the author of *Mary Broome* and *The Education of Mr. Surragé*.

John Drinkwater is the product of the Birmingham Repertory theatre (founded in 1913 by Barry V. Jackson) of which for several years he was both manager and play-producer. He had already earned reputation as a poet, critic and dramatist when his historical play in five scenes, *Abraham Lincoln*, was first produced. This play, influenced by the form of Thomas Hardy's *The Dynasts*, is written in prose, but the scenes are separated by a Chorus who speaks in verse. It was produced for the first time at Birmingham Oct. 12 1918, and afterwards at the Lyric opera house, Hammermith, Feb. 19 1919, where it was performed for exactly one year. Much doubt was felt about the reception the play was likely to receive in America, but this doubt was dispelled when, Dec. 15 1919, it was produced at the Cort theatre, New York, where it was continuously performed for nine months. *Abraham Lincoln* will probably be performed throughout the United States for many years and has given a great impetus to the production of serious historical plays in America. Percy Mackaye, an American poet, wrote a pageant play on George Washington, at the request of President Wilson, but this piece was not a success when produced in New York. Other plays on Lincoln have been written since the production of Drinkwater's play, but the latter, which was derived, so far as its main facts are concerned, from Lord Charnwood's biography of the great President, is indisputably the best of them. The play is simply and directly written, in spite of its remarkably long cast, and its emotional quality is very high. Part of its appeal to the British people is probably due to the fact that Drinkwater with extraordinary skill has unobtrusively drawn a parallel between the circumstances of the Civil War and the World War, and many of the great crowds who saw it performed in London must have been more conscious of the war from which the world had just emerged than they were of

the war which had been so fiercely fought in America, 60 years earlier. This was the first of a series of historical plays planned by Drinkwater, of which two others, *Oliver Cromwell* and *Mary, Queen of Scots*, have already been written. The latter was produced for the first time at the New Ritz theatre in New York March 21 1921, with Clara Eames in the title part. It is interesting to observe that Lennox Robinson and John Drinkwater have followed faithfully in the footsteps of such dramatists as Shakespeare, Molière and Ibsen by being practical theatre managers and producers and even, as in Drinkwater's case, an actor.

The "Intellectual" Drama.—The record of the English repertory theatres up to the time the World War began was honourable and promising. We have now to consider the record of the ordinary commercial theatre, and here we discover that the standard of plays produced had been greatly raised. The authority of Sir Arthur Pinero and Henry Arthur Jones, already diminished by the work of Oscar Wilde, was now yielding to that of Shaw and Sir James Matthew Barrie and John Galsworthy. A number of young dramatists of varying quality were appearing, whose allegiance was more definitely given to the school led by Shaw than to the school led by Sir Arthur Pinero, and these included Granville Barker, the late St. John Hankin (d. 1909), Charles McKivoy, Arnold Bennett, John Masefield, Cicely Hamilton, Githa Sowerby and Elizabeth Baker. What was called the "intellectual" drama seemed to be established not on a broad basis, but on a basis sufficiently wide to make it steady. Shaw and Bennett were even able to obtain long "runs" for their plays, and Cicely Hamilton made a popular success with *Diana of Dobson's*. It is true that the "intellectual" drama did not make fortunes for its producers, but it is true also that it did not cause any bankruptcies, and probably, if an accurate statement of accounts could be prepared, the "intellectual" drama would be found to have caused less loss of money, relatively and absolutely, than the commercial drama. It might even be found to have paid its way. Following on the heels of the "intellectual" dramatists cited above came still younger dramatists, also of the school led by Shaw, whose intellectuality was perhaps less arid or severe, and these young dramatists contrived to write plays definitely of the "intellectual" school which made much profit for those who produced them. They have already been named in connexion with the repertory theatres. Their lack of aridity is due, possibly, to the fact that the stage is their first concern, whereas most of the generation between them and Shaw came to the theatre from the novel and the sociological survey.

Outside the "intellectual" or "highbrow" school, in what is called the commercial theatre, there was observable a great increase in the quality of the plays produced. The younger dramatists who were without any intellectual pretensions were indirectly affected by the work of Shaw, even when it was repudiated by them. Plays by Hubert Henry Davies, Rudolf Besier, Alfred Sutro, Bernard Fagan, Somerset Maugham and J. E. Harold Terry were notably better in quality than plays written by their predecessors at any time during the century immediately preceding their appearance in the theatre. The work of Besier in *Don* and *Lady Patricia* had a flavour of letters and a technical excellence which made it appear almost equal to the best work of Sir Arthur Pinero and Henry Arthur Jones and superior to the best work of Sydney Grundy. Somerset Maugham, who began his career with a sombre play, *The Man of Honour*, changed his *métier* completely and very soon reached a high and profitable position as a writer of light comedy. He is the most skilful writer of the comedy of manners now working for the English theatre and his plays, *Home and Beauty* (re-named *Too Many Husbands* in America) and *The Circle*, put him in direct line of succession to Congreve. J. E. Harold Terry may be said to have been produced by the war. His plays are notable chiefly for their tropical quality, but they are well-done and are not without universal appeal. His first play, written in collaboration with Lechmere Worrall, was entitled *The Man Who Stayed At Home*. It was produced at the Royalty theatre Dec. 10 1914, when the condition of theatrical enterprise was still sore from the effects of the war's beginning, and it was an immediate success. Terry wrote a second play with a war motive, entitled *General Post*, produced at the Haymarket theatre March 14 1917. This play, slightly similar in theme to Meredith's *Evan Harrington*, was also a great popular success. In 1921 he produced a play entitled *The Fulfilling of the Law*, in which special appeal was less direct.

The situation at the outbreak of the war, therefore, was one of great hope and of considerable achievement. A finer type of play was being written in every department of the theatre. The influence of Shaw, strong among the intellectuals and distinctly felt among the commercial dramatists, was even discoverable in the work of the melodramatists, whose plays began to show signs of sociological interest. A more enterprising form of management was obtaining a hold on some theatres, and even in minor matters, such as stage décor, a newer and better spirit was informing productions. The vicious principle of subordinating the play to the actor-manager was fading away. Demand was made for a high level of acting throughout the cast, for better team-work, and actors were busy forcing the Actors' Association into a trade union for the purpose of improving their conditions of employment.

Stage Production.—Simultaneously with this improvement in the kind of play and of the quality of the acting there was also an improvement in the mechanics of the theatre. The whole business of stage decoration, both from the point of view of scenery and of lighting, was undergoing a profound change, due chiefly to the work of E. Gordon Craig, the son of Ellen Terry. The elaborate "sets" used by Sir Henry Irving and, later, by Sir Herbert Tree involved a serious waste of time in changing scenes, to such an extent that Shakespeare's plays were mercilessly "cut" and even re-shaped to make them fit the requirements of the stage-carpenter. The reaction from this sort of thing brought a demand for more manageable scenery. Craig had been experimenting with stage settings for many years and had produced "sets," particularly suited to poetical plays, which were undeniably beautiful. They had the supreme merit of enabling a manager to perform a Shakespearean play as it was written by its author and with no other "cuts" than were made necessary by a different code of manners or by the obscurity caused through the lapse of time. Craig founded a school of decorative artists in Florence and printed his theories in various books of which the principal one is *The Art of the Theatre*. His influence on stage décor has been immense. The famous Moscow Art theatre admittedly derives from him, and it is indisputable that Herr Reinhardt, the great German producer, owes much to him (see *Reinhardt und seine Bühne*, by Ernst Stern and Heinz Herald, Berlin, Eysler & Co.). In England Craig's influence is wide and admitted. Decorative artists, such as Norman Wilkinson, Claude Lovat Fraser, (d. June 18 1921), Hugo Rumbold, Charles Ricketts and Albert Rutherston, derive from him, as do producers such as Granville-Barker, Nigel Playfair, Bernard Fagan and Basil Dean. In America Lee Simonson, Robert Edmond Jones and Rollo Peters acknowledge Craig's authority.

Simplicity was the key-note of Craig's demand. He achieved impressions of height and depth by the use of long curtains and the manipulation of light, and it became plain that in future production would be less a matter of complex machinery and more a matter of manipulated light. Drury Lane theatre, on its mechanical side, has the appearance of a large engineering works, and its very complicated machinery requires the attention of a large staff of skilled mechanics. There is not likely to be any growth in the extent of engineering-production, although engineering will not entirely disappear from the theatre. We are likely to achieve a revolving stage in every theatre, with deep cellars into which whole "sets" can, if necessary, be dropped. Scenes will often be a matter, not of substantial things, but of actual light. It will then be possible to produce a Shakespeare play in a great variety of scenes, without elaborate "cuts," in a very short time. In America, where electricity is much cheaper than it is in England, experiments with light have been made for many years, with the result that production is in a more advanced state than it is in England. Some of the more modern English producers, such as Basil Dean, had to import electrical apparatus from America.

The movement for greater simplicity in stage décor received some impetus in England from the employment of Craig by Sir Herbert Tree to make the scenery for *Macbeth*. A quarrel, followed by litigation, prevented the experiment from being completely made, but Tree used enough of Craig's designs to show their austere beauty and value. It was not, however, until Granville-Barker began his remarkable season at the Savoy theatre with the production of *The Winter's Tale* in Sept. 1912, followed by *Twelfth Night* in Nov. of that year and *A Midsummer Night's Dream* in 1914, that the new methods of production received extensive consideration. Barker, who had been associated with J. E. Vedrenne at the Court theatre where Shaw's plays first received popular support and Galsworthy became known to the public as a dramatist, and was later associated with Frohman and Dion Boucicault in the Duke of York's season already described, entered into management with Lillah McCarthy, both at the Savoy and at the Kingsway, where he conducted seasons of remarkable value and courage, dramatically and decoratively. A number of plays, old and modern, English and foreign, were produced by him in a highly brilliant and, in several instances, exceedingly beautiful manner. Some of his innovations were not successful in obtaining the degree of beauty at which he aimed—the use of golden-faced fairies in *A Midsummer Night's Dream*, for example, introduced a metallic and heavy element, unattractive in itself, into a world where insubstantiality was the primary requirement, and took, moreover, the English quality out of the play—but it is impossible to deny high tribute to him for the quality of his work and the great distinction he achieved for the theatre. The plays produced at the Savoy, in addition to the three Shakespearean plays already named, were *The Tragedy of Man* by John Masefield; *The Witch*, translated from the Norwegian of H. Wiers-Jønsen by Masefield; *The Silver Box* by Galsworthy; *The Wild Duck* by Ibsen; *The Doctor's Dilemma* by Bernard Shaw; a translation of Molière's *Le Mariage Forcé* and Alfred Sutro's translation of Maeterlinck's *The Death of Tintagiles*. Prior to the season at the Savoy, Barker had conducted a short season at the St. James's where he produced *Androcles and the Lion* by Shaw, followed by a *Harlequinade* composed by Dion Clayton Calthrop and himself. Simultaneously with his season at the Savoy he conducted a season of modern English plays at the Kingsway, producing *The Eldest Son* by Gals-

worthy, followed by revivals of his own play, *The Voysey Inheritance*, Shaw's very popular piece, *Fanny's First Play*, and Arnold Bennett's *The Great Adventure* in which Henry Ainley and Wish Wynne especially distinguished themselves. Bennett's play was a great popular success, almost as popular as *Milestones* which he wrote in collaboration with Edward Knoblock. Mr. Shaw seemed to be on the crest of a high wave of popularity, for not only had *Fanny's First Play* been performed for more than 600 times, but his five-act comedy, *Pygmalion*, with Sir Herbert Tree and Mrs. Patrick Campbell in the principal parts, which was produced at His Majesty's April 11 1914, ran for 118 nights, a long run for any play in so large a theatre. Two plays by Galsworthy, *The Mob* and *The Fugitive*, were not popular successes and were hardly on the general high level of his work. Sir James Barrie's activities during the five years preceding the war, apart from the production of *The Adored One*, were confined to one-act plays, of which *The Twelve-Pound Look* is likely to be a classic example of the short play at its best. Others of these plays, notably *The Will* and *Rosalind* were very near the level of *The Twelve-Pound Look*.

Effects of the World War.—The situation, then, at the outbreak of the World War was one of extraordinary interest in the English theatre. The theatrical season 1913-4 had closed with considerable brilliance. Plays of merit had been extensively performed in London and in the provinces, and the repertory theatres were in a fairly healthy condition. A rich level of acting had been discovered. Production was on a genuinely artistic scale. The season of 1914-5 seemed likely to open still more brilliantly than the season just concluded. There was even talk of a national theatre at which the plays of Shakespeare would be permanently performed. On Aug. 4 1914 Great Britain declared war against Germany and immediately the great revival of the English theatre languished and seemed at first in danger of total collapse. Many of the repertory theatres soon ceased to exist. In 1921 the Gaiety theatre, Manchester, passed from the hands of Miss Horniman to a cinema syndicate. A gallant effort to maintain a decent standard of plays was made by some managers; Sir Herbert Tree revived L. N. Parker's pageant piece, *Drake*, and Mr. (now Sir) Frank R. Benson revived *Henry the Fifth* in the laudable desire to satisfy patriotic cravings with something of value. Granville-Barker produced a number of scenes from Thomas Hardy's *The Dynasts* at the Kingsway. But these attempts to keep the theatre on a high level were not successful, and very soon began the process of degeneration which was maintained for the whole period of the war. Some of the managers gave up their efforts to save the tradition they had established: Sir Herbert Tree and Cyril Maude went to America. Others such as Gerald du Maurier remained in London and, with great courage, made a fight for decent drama. Among the plays produced by Gerald du Maurier during the war was a strange piece, very popular, entitled *Dear Brutus* by Sir James Barrie, and a revival of the same author's *A Kiss for Cinderella*. Du Maurier, more than anyone else during the war, kept faith with fine things finely done.

For the first two years of the war, a form of entertainment inaptly described as "revue" was very popular. The chief features of these entertainments were light and colour and jingling music and pretty girls and broadly comic effects. They were a medley of music-hall and musical comedy and pantomime performances, reduced to a low level. Some of the individual performers in these entertainments, notably Ethel Levey and Violet Loraine, Harry Tate and George Robey, were of indisputable talent, but generally speaking, personalities were submerged in spectacles. Mr. C. B. Cochran, more wise than some of his competitors, exploited personalities in his "revues," which were handsomely and even wittily done, and in Mlle. Delysia and Nelson Keys he discovered two artists of very great merit. Farces of a bold and even indecent character were next to the revues in popular esteem. Oddly enough, certain plays commonly called "highbrow" became popular during the war for reasons which were not concerned with literature. Brieux' banned play, *Les Atarés*, known in England as *Damaged Goods*, was licensed by the censor for public performance on the representations mainly of medical men and sociologists, and it was widely patronized in London and the provinces. The artistic value of *Damaged Goods* is slight, but its sociological value is indisputably great, and it brought a degree of publicity to the discussion of evils which would have been impossible in England prior to 1914. The success of this play led to the public performance of Brieux' play, *The Three Daughters of M. Dupont*, and of Ibsen's *Ghosts*, from which also the ban was removed by the censor. The latter play, however, is not, like *Damaged Goods*, a propaganda play and it received little support in spite of its being labelled "A Play for Adults only." The rule of the censor was considerably relaxed during the war and his ban was removed from Shaw's one-act play, *The Shewing-up of Blanco Posnet*, but attempts to obtain a licence for Mrs. Warren's *Profession* were unsuccessful. Since the conclusion of the war the censor's rule has been tightened again, but, as a result of the changes made on the recommendations of the Joint Select Committee on Stage Plays (censorship) 1909, the rule bears rather less arbitrarily on meritable work than it formerly did.

The end of the war found the stage in a chaotic condition. The demand for entertainment during the hostilities had been so great

that theatre rents rose rapidly to absurd figures: a common rent at any time between 1915 and 1921 for a theatre in the centre of London was £400 to £500 per week. All other expenses, owing to the high cost of living, increased proportionately, but the price of admission, apart from the entertainment tax imposed during the war (which did not benefit, but rather harmed, the theatre manager) remained at the pre-war figure. Slight increases, after the Armistice, were made in one or two cases, but in 1921 the economic situation in the theatre was that the revenue remained at the pre-war figure while the expenditure was on the post-war scale. Such a situation as that is only endurable when the theatre is filled with an audience, each member of which has paid for his seat. In pre-war times a play could be profitably performed before an audience occupying three-fourths of the seats. A manager could even make ends meet although half his seats were unsold. He could afford to lose money on a production for four or five weeks if he had a reasonable hope that thereafter profitable audiences would assemble for the performances. In 1921 a manager could not hope to make money out of a production unless his theatre was fully occupied at each performance. If a play failed to draw enough people to fill all or nearly all his seats, that play could not be continued in his programme. The financial burden was too heavy to be borne; and for this reason many meritable pieces which might have been "nursed" into popularity were withdrawn almost immediately after production because they had not at once taken hold of popular fancy. The plays which suffer from this economic situation are undoubtedly the better kind of plays. Those which profit from it are the plays without merit other than that of a spectacular character. The best illustration of the effect of this situation on the drama is to be found in the remarkable popularity of *Chu Chin Chow*, an eastern spectacle written by Oscar Asche. This banal piece, a variant of the theme of *Ali Baba and the Forty Thieves*, was produced at His Majesty's theatre—a theatre with an honourable tradition—on Aug. 31 1916. It ran for nearly five years, creating a record of over 2,200 consecutive representations. Every device of colour and light and costume was used in this production. The appeal made was almost exclusively to the eye, very little to the ear and not at all to the mind. *Chu Chin Chow* broke all records for consecutive performances at one theatre and earned large fortunes for those who were concerned in its production.

In spite, however, of the difficult economic situation, of the change in tradition and government of the theatre, there was a remarkable recovery of quality on the English stage after the signing of the Armistice, and plays of quality began to appear, not timidly, but almost arrogantly. A play by Galsworthy, *The Skin Game*, dealing with the conflict between aristocracy and plutocracy (in which both sides are badly besmirched) and susceptible of allegorical application to the war and the treaty of peace, was performed with great success at the St. Martin's; and a political comedy, entitled *The Grain of Mustard Seed*, by H. M. Harwood, produced at the Ambassadors' had a singularly successful "run," singular because of the fact that political plays are rarely acceptable to English audiences. Sir James Barrie's *Mary Rose* was performed at the Haymarket with enormous success. In this play he treated the problem of life after death in a fashion which divided playgoers sharply into complete devotees or complete sceptics. *The Skin Game* was successfully produced in America, but *Mary Rose* hardly won the favour in New York that it had won in London. The most interesting post-war success was the popularity with which Gay's *The Beggar's Opera* was revived at the Lyric opera house, Hammer-smith. It was not, however, a success in America. Rostand's *Cyrano de Bergerac* was revived with notable success by Robert Loraine, and Bernard Shaw's *Arms and the Man*, also revived by Loraine, had astonishing success with ex-soldiers on account of its anti-romantic treatment of war. Shakespeare's plays are extensively produced. A working-class theatre in the Waterloo Road, London (popularly known as "the Old Vic."), had maintained the standard of good drama throughout the war, and this theatre, handicapped by lack of funds and rather amateurish acting, steadily built up an audience for good plays. After the Armistice its work was amply rewarded. The "Old Vic." became the one theatre in London where playgoers could depend on seeing great drama, and as the quality of the acting was much improved, they could also depend on seeing competent performances. Bernard Fagan in 1920 reconstructed the Court theatre and announced that it would henceforth be a Shakespearean theatre, where four of Shakespeare's plays would be produced annually. But the economic situation made gallant enterprises difficult, and it remains to be seen how far good intentions will survive high prices. The era is one of transition, and the period of transition nearly always causes more pessimism than good hope.

UNITED STATES

In America, the theatre, after the end of the war, was in a healthier state than in England. This is more true of New York perhaps, than of the rest of the country. Playgoers in that city seem more willing to patronize good things and to support new enterprises than playgoers anywhere else. A remarkable organization entitled The Theatre Guild of New York has, in three

years, raised itself from an obscure, impoverished and unknown position into that of the only first-class theatrical enterprise in the world which is a great financial success. The Theatre Guild grew out of the activities of a small group of enthusiasts who were known as the Provincetown Players and the Washington Square Players. These players gave performances, usually of one-act plays, in small theatres near Washington Square. They were akin to the movement, very widespread in America, known as the Little Theatre or Community Theatre movement—societies of amateurs producing plays primarily for their own entertainment rather than for profit. The Theatre Guild, when established, secured a long lease on an old theatre, the Garrick, in West 35th St., and began operations with the production of *Bonds of Interest*, translated from the Spanish of Jacinto Benavente. This play (*Los Intereses Creados*) has been done in England both under the American title and under that of *The Bias of the World*. It was not a financial success, and the capital of the Guild, about \$500, was almost exhausted when the directors decided to produce *John Ferguson*, a four-act tragic Irish play by St. John Ervine. This play was not expected to be financially successful, but it falsified anticipation. It was performed in New York for nine months, and enabled the Guild to establish itself more securely. Subsequent productions, including Masfield's *The Faithful*, were not quite so profitable, but the season ended with greater hope than it had begun. In the following season Tolstoy's *The Power of Darkness*, St. John Ervine's *Jane Clegg*, Strindberg's *The Dance of Death*, and other plays were performed, of which *Jane Clegg*, which ran for five months, was the most financially successful. The third season included the first production in English of Bernard Shaw's *Heartbreak House*, as well as of A. A. Milne's *Mr. Pim Passes By*. Both these plays made much profit for the Guild, the first-named running for 150 performances. The success of the Theatre Guild and of *John Ferguson* caused an immediate effect on theatrical entertainments in New York, and one interesting result of it was that a young American dramatist of Irish descent, Eugene O'Neill, was given an opportunity of producing his plays at a first-class theatre. He had already become known as the author of one-act plays when his six-act tragedy, *Beyond the Horizon*, was produced at the Morosco theatre in New York. This play, most skilfully acted, had a great success, and those who are desirous of seeing a fine native drama grow up in America felt encouraged to maintain their hope when they contemplated O'Neill's work. In 1920 he produced a strange play in eight scenes, entitled *The Emperor Jones*, which is what may be called a one-part play, dealing with the journey of a negro into a West Indian forest where he lapses into primal terror. This play was produced by the Provincetown Players and the principal part was acted by a remarkable negro actor, Charles Gilpin. O'Neill is perhaps the most significant figure that the American theatre has produced since the death of William Vaughn Moody, and the quality of his work justifies hopes of raising the standard of American drama to a considerable height.

American dramatists display great technical excellence in their work, together with a tendency towards sentimentalism of a curiously crude character. There is probably more mechanical ability among American dramatists to-day than among any other dramatists in the world, but this ability is seldom related to artistic power and it is frequently used to falsify life. There are signs, however, of discontent with slick sentimentality, and young writers throughout the country are endeavouring to relate technical excellence to plays in which life is truly treated. Dramatic craftsmanship is more closely studied in America than in England, and in many of the colleges and universities students take a course in dramaturgy. The most interesting experiment of this kind is that conducted by Prof. George P. Baker, professor of dramatic literature at Harvard University, who, in what is popularly known as "the 47 workshop," instructs his pupils in the writing and production of plays from the point of view of author, producer, actor and critic. Many of his pupils have written competent one-act plays and several of them have successfully produced more ambitious pieces. One of the ablest of American dramatists and, at the same time, the least prolific, is James Forbes, the author, among other plays, of *The Chorus Lady*, *The Show Shop* and *The Famous Mrs. Fair*. Forbes produces mainly satirical comedies of stage-life, but the last-named piece deals with ordinary life and is a very able bit of work. Other

notable dramatists are Edward Shillon, whose *Romance*, with Doris Keane in the principal part, was extraordinarily successful in England; George Broadhurst—his *Bought and Paid For* was described by Arnold Bennett as one of the best commercial plays he had ever seen; David Belasco; the late Clyde Fitch; Langdon Mitchell, the author of a brilliant comedy, *The New York Idea*; Augustus Thomas, whose *The Wyching Hour*, *The Harvest Moon*, *As a Man Thinks* and *The Other Girl* are plays of uncommon quality; the late Charles Klein; Eugene Walter, author of two particularly able realistic plays, *Paul in Full* and *The Easiest Way*; Channing Pollock; A. E. Thomas; Booth Tarkington, who, more popularly known as a novelist, achieved remarkable success in 1920 with a light comedy called *Clarence*; Zoë Akins; and Susan Glaspell. The condition of the theatre in America at the end of the decade 1910-20 was more hopeful than that in England because of the greater general interest in meritable plays and of the noticeable desire, especially in New York, to support original enterprises.

The standard of acting in America so far as actresses are concerned, is higher than in England, but there is more all-round efficiency among English actors than there is among American actors. The latter excel in character-parts—a very admirable instance of this is the case of Frank Bacon in his own play *Lightnin'*—but are less capable in what are known as "straight" parts. With the exception of John Drew there are few American actors who can interpret characters such as were acted by Sir George Alexander. It is very difficult to discover either actors or actresses in America who can speak verse. These flaws in technique are remediable, however, and are slowly being rectified. One result of the war was to cause a distinct decline in the quality of acting among young players in England, and it is probably true to say that there was less acting ability among the younger members of the English theatrical profession at the end of 1920 than at any other period in the history of the English theatre. In America, on the contrary, there was a marked growth in technical skill among young actors and actresses.

GERMANY

In 1910, the condition of the drama in Germany was very curious—declining in Berlin, but flourishing in the provinces. Metropolitan taste was fickle and vulgar; provincial taste was steadfast and of high quality. The result of this odd reversal of customary positions was that the German provinces absorbed almost the whole of the interest of dramatic students. More experiments were made outside Berlin than were made inside it, not only in the quality of the plays performed, but also in the methods of production and in the interior economy of the theatre. Volksbühnen (people's theatres) were organized in many places, at which performances of classical and modern pieces were given at very moderate prices. The two Freien Volksbühnen of Berlin, which were typical in most respects of all the other people's theatres, had between them a membership of 60,000 persons, of whom a considerable number were working-men. These Freien Volksbühnen contracted with various theatre-managers for the performance of specified plays for their members, and the larger of the two, Die Neue Freie Volksbühne, was spending £25,000 per annum in 1910 on plays produced at 11 different theatres. This society even started a building fund, which in that year had reached £5,000, for the purpose of establishing a theatre of its own, to hold 2,000 persons. The members of this society paid one shilling for each performance witnessed, and seats were allotted by ballot. A similar society, with a membership of 9,000 persons, existed in Vienna; under the direction of Stefan Grossmann, a dramatist. The Cologne Stadt-theater organized performances on lines similar to those of the Volksbühnen, on Sunday afternoons before audiences drawn from workmen's societies which were allowed to nominate the play to be produced. In 1909, the trade unions of Cologne chose Galsworthy's *Strife* for performance, and this play was received with enormous enthusiasm. A Deutsches Volkstheater was in process of erection in 1909. Each subscriber to this society was to be admitted to one performance per week in a season of 40 weeks and to receive a theatrical paper, delivered free of charge, together with free admission to a number of lectures, for an annual subscription of 20 shillings! The number of Stadthund theatres was increasing remarkably, and certain towns either subsidized or completely owned the local theatre. The following is a record of sums paid by German cities and towns for their own theatres:—Cologne, £25,000; Frankfurt, £13,000; Barmen, £6,000; Dortmund, £6,000; Essen, £4,000; Elberfeld, £4,000; Aachen, £3,500; Breslau, £3,000; Düsseldorf, £2,900; Magdeburg, £2,500; Kattowitz, £1,000; Thorn, £1,000.

The two great German dramatists, Gerhart Hauptmann and Hermann Sudermann, had reached the apex of their powers in 1910 and were beginning to yield place to new men, of whom the chief were Frank Wedekind, Arthur Schnitzler (an Austrian and, like Somerset Maugham and H. M. Harwood in England, a doctor of medicine) and Hermann Bahr. Problem and "tendency" plays were prolifically produced, and the drama of intellectual concepts rather than the drama of human emotions seemed to predominate. Just before the outbreak of the World War, a number of allegorical plays were being performed; such as *Hans am Meer* by Stefan Zweig and *Mutter und Geheimes Leben* by W. von Molo. But, apart from the extraordinarily experimental character of much of German drama

and stage production during this time, the general range of theatrical entertainments was very catholic, extending from harshly realistic plays of the soil, such as Sudermann's *Strandbinder*, to purely poetic plays, such as *Medusa*, by a young dramatist of promise, Hans Kyser. In addition to the very diverse quality of native drama, the German theatre produced many foreign plays, equally diverse in character, ranging from Shaw's plays to plays by Jerome K. Jerome, Ibsen, Björnson and Strindberg (who died in 1912) had much popularity in Germany, and so had many French dramatists, but none of them had greater popularity than Shaw, Oscar Wilde and Galsworthy. Other English writers, Maugham, Sir James Barrie, Sutro, Arnold Bennett and Edward Knoblock, Monckton Hoffe, H. H. Davies, Sir Arthur Pinero, W. J. Locke and L. N. Parker, were freely and extensively admitted to the German theatre. Shakespeare, of course, had long been a popular author in Germany and this popularity did not decline during the war.

Hauptmann, who received the Nobel prize on his fiftieth birthday in 1912, was fairly prolific during the five years preceding the war; *Griselda*, founded on Boccaccio's legend, was produced in 1909, and was followed in 1911 by *Die Ratten* (*The Rats*). *Gabriel Schillings Frucht* (*The Escape of Gabriel Schilling*) was produced in 1912, and in 1913 came the famous Festival Play commissioned by the city of Breslau to celebrate the war against Napoleon for freedom. This play was produced by Reinhardt in the new rotunda of the Breslau Centenary Exhibition, and its democratic sentiments were so displeasing to the Junkers that it provoked a great uproar. The then Crown Prince threatened to cancel his patronage of the exhibition unless the play were withdrawn—which was done. Another play, entitled *Der Bogenspanner Odysseus* (*Odysseus the Archer*), was written in 1913.

Hermann Sudermann was less prolific than Hauptmann. His *Strandbinder*, a play about people living on the shores of the Baltic Sea, was produced in 1909. This play had considerable affinity with the work of a dramatist who died in 1909, Ernst von Wildenbruch, two of whose plays, *Lieder des Euripides* and *Der Deutsche König*, were performed, after his death, in that year. *Strandbinder* was followed by an historical piece, entitled *Der Blinde von Syracus* in 1911 and *Der Gute Ruf* in 1913.

The ascending dramatists, Bahr, Wedekind and Schnitzler, produced many plays in the first half of the decade, as did another well-known, but peculiar and unsuccessful dramatist, Herbert Eulenberg. Bahr, whose gift is for human comedy, is known abroad by *Das Konzert* (*The Concert*) which was not notably successful in London, but was very popular in America as well as in Germany. Another play, *Kinder*, was produced simultaneously in 20 different German theatres in 1910. It was followed by *Das Prinzip* and *Das Tänzchen* in 1912 and by *Phantom* in 1913. Frank Wedekind, a dramatist of queer, undisciplined genius, was by far the most prolific of all the dramatists in Germany during the period under review and probably of all the dramatists in Europe. He produced nine plays in five years, four of which, indeed, were in one act. The plays were *Die Junge Welt*, *Die Zensur* (one act), *Der Liebeswahn*, *Die Büchse der Pandora*, and three one-act plays, *In Allen Saiteln Gerech*, *Mit Allen Hunden Gehezt* and *In Allen Wassern Gewaschen*, which were combined in 1911 under the general title of *Schloss Wetterstein* and issued with the statement that they contained his views "on the inner necessity on which Marriage and the Family rest." These plays were followed by *Der Stein der Weisen* and *Frantisko*, the latter, prohibited by the censor in Vienna, being produced in Munich. Arthur Schnitzler, a Viennese, known in England through the *Anatol* plays, translated by Granville Barker, and *Der grüne Kakadu* (*The Green Cockatoo*), had four plays performed in the first five years of the decade, *Komtesse Mimi*, *Der junge Medardus* (which took five hours to perform), *Das Weisse Land* and *Professor Bernhardt*, the latter of which was forbidden in Vienna. Herbert Eulenberg was responsible for six plays, *Der natürliche Vater*, *Anna Walewska*, *Samson* (his most popular piece), *Alles um Geld*, *Alles um Liebe*, *Belinde* (which won the Volkschiller prize), *Zeitwinde* and a one-act play, *Paul und Paula*. Hans Kyser, in addition to the play already named, produced *Titus und die Jüdin* and *Erziehung zur Liebe*.

The list of meritable German dramatists is a very long one. It includes men such as Paul Ernst, Hans Franck, Otto Harnack, Carl Schönherr, whose *Volksstück* ("people's play") *Glaube und Heimat* was performed in more than a thousand theatres in six months, Edward Stucken, Max Halbe, Ludwig Fulda, Ludwig Thoma, Franz Dulberg, Leo Birinski, Reinhard Sorge and Arno Holz. The records of the German theatre during the war indicate that a better standard of play was maintained there than elsewhere. Since the signing of the Armistice a new group of dramatists has arisen, of whom Georg Kaiser is known in England, because of the performance of his play *Von Morgens bis Mitternacht* (*From Morn to Midnight*) before the Stage Society in 1919. He experiments with new dramatic forms, but his work hardly merits the extravagant claims made for it. In addition to the play named, he has written others, of which the most meritable are *Die Bürger von Calais* (*Burgers of Calais*) and *Die Koralle* (*The Coral*). A violence of sex-interest has been manifested in much of the post-war German drama, and this was most plainly to be detected in Schnitzler's *Reigen* (*The Chain*).

Perhaps the most interesting figure in the German theatre since the signing of the Armistice has been Max Reinhardt, who derives,

with more practicability, from Gordon Craig. Prior to the war he was known in England as the producer of *The Miracle*, *Oedipus Rex* (with Sir John Martin Harvey and Lillah McCarthy in the principal parts) and *Sumurun*. His taste is for spectacular pieces of an ambitious nature. He was in 1921 in charge of Das Grosse Schauspielhaus (the Great Arena theatre), which was opened in 1919 and has seating capacity for 3,000 persons.

FRANCE

In 1910, the theatre in France gave less occasion for satisfaction than the theatre either in England or in Germany. The traditions of decent drama were, of course, maintained at the Comédie Française, the Antoine and the Odéon, but, broadly speaking, plays of quality were few in number and "revues" of a very vulgar character were growing in popularity. That bad state of affairs could not last, and after 1910 until the outbreak of the World War, when the French theatre for obvious reasons completely collapsed, there was a revival of quality in French drama. The French theatre, too, which had not previously offered much hospitality to foreign plays, began to open its doors, not widely, indeed, but slightly to plays written by foreigners. Shakespeare suddenly came into fashion. *Hamlet* was produced at the Comédie Française, *King Lear* at the Antoine, *Julius Caesar* at the Orange Fêtes, and *Romeo and Juliet* at the Odéon. Camille de Saint-Croix organized single performances of many Shakespearean plays which were highly praised. One of Shaw's plays was performed in Paris, but without much favour. English musical comedy, produced on a more extravagant scale than is customary in France, became popular, and George Grossmith set the Parisians to singing "Ipi-addy-i-ay-i-ay."

The most interesting play produced in Paris during the first five years of the decade was undoubtedly Edmond Rostand's *Chantecler*, which had been anticipated for seven years before it was performed for the first time at the Porte-Saint-Martin in 1910. It had not the great success of *Cyrano de Bergerac*, but it caused much discussion. Lucien Guitry played the part originally intended for the late Constant Coquelin, which part was played in New York by Maude Adams. Rostand, who was born in 1868, died in 1918. Another death of great importance to the French theatre was that of Jules Claretie, who, after controlling the Comédie Française for 28 years, died in 1913. Claretie conducted the difficult affairs of the national theatre with very great skill and diplomacy, and showed clearly that while a national theatre is not a forcing-house for genius, it is certainly a place in which the level of honourable drama is highly maintained. He was succeeded by Albert Carré, who remained in charge of the theatre until he was called up for military service during the war, when he was succeeded by Emile Fabre, a dramatist. Paul Hervieu, the dramatist, died Oct. 25 1915, and Mme. Réjane, the famous actress, June 14 1920.

Much useful, if not particularly significant, work was done by French dramatists from 1910 to 1915, but none of the disintegrating and insurgent influences detectable both in the English and the German theatres appeared to affect the French theatre. Stage décor, for example, is singularly poor in France, where, on the other hand, the standard of acting is very high. In addition to Rostand's play, notable pieces were produced by Henry Bataille (*Le Songe d'un Soir d'Amour* and *La Vierge Folle*—the first of which, done at the Comédie Française, was hardly so successful as the second, done at the Gymnase), by Pierre Wolff (*Ruisseau* and *Marionnettes*), Henri Bernstein (*L'Assaut* and *Le Secret*), George Duhamel (*La Lumière*), Brieux (*La Femme Seule*, done in England under the title of *Woman on Her Own*), Maurice Donnay (*Les Eclaircies*), Sacha Guitry (*Le Beau Mariage* and *La Prise de Berg-op-Zoom*), De Flers and de Caillavet (*Habit Vert*) and Tristan Bernard (*Jeanne Dore*—with Sarah Bernhardt in the cast).

After the outbreak of war, the French theatre for a considerable period practically ceased to exist. Conscription and war regulations, together with enemy air-raids and proximity to the front, made theatrical enterprise in Paris either impossible or exceedingly difficult. Some companies of French players came to London. There were only two new plays produced in Paris in 1915—*Les Deux Vestals*, a farce of an old-fashioned broad character, done at the Gymnase, and a translation, made by W. B. Perier, of the English play, *The Man Who Stayed at Home* by J. E. Harold Terry and Lechmere Worrall, which was done at the Théâtre des Bouffes Parisiens under the title of *Kit*, with Max Dearly in the cast. Several war plays, not particularly meritable, were done in Paris towards the end of the war or immediately after the signing of the Armistice, and Sacha Guitry's play *Deburau* was also produced. A translation of this play, done into rhymed couplets, has been made by H. Granville-Barker and was produced in New York in 1921 with great success. Edmond Scé's *Saison d'Amour* was produced in 1919, and Sacha Guitry, rapidly acquiring a high place in France as a dramatist and an actor, was responsible for *Pasteur*, a farce entitled *Le Mari, La Femme et L'Amant* (a title which sufficiently indicates the character of the piece), and a comedy called *Mon Père avait Raison*. The Guitrys, father, son and daughter-in-law, gave a season of their plays in London in 1920 which was exceedingly successful. (St. J. E.)

DRESDEN, Saxony (see 8.574).—The pop. of Dresden, according to the census of 1919, was 529,326; in 1910, without some suburbs

since incorporated, it was 548,308. Dresden was perhaps harder hit by the World War than most other towns in Germany. The whole structure of its economic life had been dependent upon visitors, especially foreigners, and the outbreak of the war brought this to a sudden stop. In addition, the shortage of food, serious everywhere, was more especially felt in Saxony and her capital, which were dependent mainly upon industry. Lastly, the revolution swept away the life of the Court, which meant a great deal for Dresden. With the revolution came the development of extreme political tendencies among the working classes of Dresden, which led to constant disturbances, strikes, etc., although the violent and sanguinary encounters associated with the insurrectionary movement in western Saxony, were less widespread in Dresden. But the assassination of Neuring, the majority Socialist Minister of War, on April 12 1919, and the sanguinary street fighting of Jan. 9 and 10 of the same year, are sufficient proof that the capital of Saxony was not immune from scenes of violence. After 1914 the expansion of the city came to a complete standstill, and in 1921 Dresden, like other towns, was suffering severely from lack of housing accommodation. After the revolution there was a majority of extremists in the Municipal Council, and the financial position of the city had become very precarious.

The collections and museums will doubtless maintain the reputation of Dresden as a centre of art. The Royal Opera, which enjoyed a world-wide reputation before the World War, has not been able as a State Opera to maintain its high artistic level. Industry came to a complete standstill during the war—the manufacture of cigarettes, for instance, which was very flourishing, had to be cut down owing to lack of raw material—but by 1921, some recovery had taken place and Dresden showed signs of returning prosperity as a resort for visitors. (C. K.)

DRINKWATER, JOHN (1882–), English poet, playwright and critic, was born at Leytonstone, Essex, June 1 1882 and educated at the Oxford high school. After twelve years' work as an insurance clerk he began to devote himself to theatrical enterprise, and became manager and producer to the Pilgrim Players, who developed into the Birmingham Repertory Theatre Company. His first volume of poems appeared in 1908 and his first play *Cophetua* (in verse) in 1911. He subsequently published several volumes of verse, critical studies on *William Morris* (1912), *Swinburne* (1913) and others, and several plays, of which *Abraham Lincoln* (1918) was produced with great success both in London and in America.

DRIVER, SAMUEL ROLLES (1846–1914), English divine and Hebrew scholar (see 8.585), died at Oxford Feb. 26 1914. His later works include *Four Papers on the Higher Criticism* (with F. Kirkpatrick, 1912).

DROYSEN, GUSTAV (1838–1908), German historian (see 8.506), died at Halle in 1908.

DUBAIL, AUGUSTIN YVON EDMOND (1851–), French general, was born at Belfort April 1851. At the age of 17 he entered the military academy at St. Cyr, and on July 15 1870 was appointed a sub-lieutenant of infantry, having passed seventh out of 310 candidates. He took part in the Franco-German War and was captured at Metz in Oct. 1870. Released in April 1871 he rejoined his regiment, and served with the army of Versailles in the operations against the Commune. He was appointed captain and transferred to the 81st Inf. Regt. in Nov. 1878. From Oct. 1880 to Feb. 1883, and again from Nov. 1883 to Jan. 1886, he had an appointment as professor at the École Spéciale Militaire St. Cyr. In June 1886 he was made a chevalier of the Legion of Honour. In Nov., while serving in Algeria, he was promoted lieutenant-colonel; and in Oct. 1901, while still in Algeria, was made a colonel and given command of the 1st Regt. of Zouaves. On returning to France he took over the Alpine Brigade at Grenoble. In 1906 he became commandant of St. Cyr—an appointment which he held for three years. He was made a divisional commander on Dec. 25 1908, being appointed to the 14th Div. at Belfort. He later commanded the IX. Army Corps. In 1911 he was made chief of the general staff and a member of the Superior War Council. On the

outbreak of the World War Gen. Dubail took over the I. Army, which (with the II. Army under Gen. de Castelnau on the left) was responsible for the offensive into Lorraine, and later for the defence of the eastern fortress line against the armies of Prince Rupprecht of Bavaria. The stubborn resistance of Dubail and Castelnau not only nullified the threat of invasion but insured a pivot for future French manoeuvres; it prepared the way indeed for the Marne victory. Gen. Dubail was given the Grand Cross of the Legion of Honour (Sept. 18 1914). On the withdrawal of the II. Army to the Somme, Dubail took charge of the whole line between Verdun and the Vosges, and when in Jan. 1915 the armies along the front were grouped under three headquarters of groups of armies, Dubail was placed in charge of that of the east, comprising the III. of Verdun, his old I., and the Vosges force. In Oct. of the same year he was awarded the médaille militaire. On April 6 1916 he was made military governor of Paris. He was placed in the "Second Section"—on reaching the age limit—in April 1916, but retained his appointment as military governor of Paris. After his final retirement he was appointed Grand Chancellor of the Legion of Honour.

DUCLAUX, AGNES MARY P. (1856—), Anglo-French poet and critic (see 8.632), published after 1910 a volume of essays, *The French Ideal* (1911); a study of *Madame de Sévigné* (1914); *A Short History of France* (1918); *Twentieth Century French Writers* (1920) and a life of *Victor Hugo* (1921).

DU CROS, WILLIAM HARVEY (1846–1918), British manufacturer, of Huguenot descent, was born in co. Kildare, Ireland, June 19 1846. He was educated at the King's hospital, Dublin, and became founder of the pneumatic tire industry and a pioneer in automobile construction. From 1906–8 he represented Hastings in the House of Commons. He died at Dalkey, co. Dublin, Dec. 21 1918.

DUCTLESS GLANDS (see 8.633).—Much new work on the physiology, pathology and medicine of the ductless glands has been done since 1910.

There are two ways in which the *consensus partium* in the animal economy is brought about. The best known of these is that which occurs through the nervous system. But it has been recognized during recent years that other agents take part in this process of coördination. These are called the *ductless glands* through their products the *internal secretions*, which have also been called *hormones*. The latter have, however, been renamed *autocoid* substances by Schafer, and these again divided into two groups: those which excite metabolic processes and those which depress them. The former autocoids are called by him *hormones*, the latter *chalones*.

In the glands of internal secretion, or as they are sometimes called the *endocrine* organs, the material secreted is passed away not through a duct but by means of the veins leaving the organ. This material when it reaches the general blood stream acts in the manner of a chemical messenger, or of a drug, producing effects upon various organs and tissues of the body. The ductless glands which we shall have to consider are (1) the *adrenal gland*; (2) the *thyroid gland*; (3) the *parathyroid glandules*; (4) the *pituitary body*; (5) the *pineal gland*. It is probable that the thymus is not an organ of internal secretion. In addition to these certain other glands furnished with a duct and providing an ordinary or external secretion are supposed to supply the body with internal secretions also. This applies to the pancreas. Further, the *gonads* (reproductive organs) have an endocrine function.

The Adrenal Gland.—For many years it has been customary to refer to the *cortex* and the *medulla* of the adrenal body as the suprarenal capsule. But comparative anatomical studies have shown us that this is an inaccurate view of the problem. It is only in mammals that the terms *cortex* and *medulla* as applied to the two parts of the organ are strictly appropriate. In elasmobranch fishes we have to deal with a series of paired *chromaphil* bodies in connexion with the sympathetic ganglia, and with an interrenal body placed in the middle line between the two halves of the kidney. The first of these is the homologue of the mammalian medulla while the interrenal body corresponds to the

mammalian cortex. Even in mammals a trace of the original arrangement still persists, e.g. the sympathetic ganglia contain groups of chromaphil cells and there are other outlying masses of chromaphil tissue. The cortex also is not the sole representative in mammals of the original interrenal body. So that the problem before us is by no means to discover the function of a single organ but to ascertain the significance of the chromaphil tissues (of which the adrenal medulla is only a part) and of the cortical tissues (of which the adrenal cortex is only a part, albeit the principal one).

The chromaphil tissues everywhere contain adrenin, the formula for which is:

This substance is generally supposed to constitute the internal secretion of these tissues. When injected into the circulation of a living animal it produces effects similar to those brought about by stimulation of the sympathetic nervous system. That is to say, its action is sympathomimetic. Other substances having a similar chemical constitution will produce similar physiological effects. The most striking of such effects are constriction of arterioles and an enormous rise of blood pressure, dilatation of the pupil and inhibition of the muscular coats of the alimentary canal. Small doses often produce results qualitatively different from medium or large doses.

The secretion of the chromaphil tissues does not appear to be essential to life. It is tolerably certain that it does not help to maintain the normal blood pressure. It is possible that it is important for the activity of muscular structures under circumstances of physiological and especially of emotional emergency.

Of the functions of the cortex we know practically nothing, and yet we are justified in regarding this portion as the adrenal body in the true sense of the word. Experimental and clinical evidence has taught us that it is the part which is essential to life. It seems probable that it has to do with the development of the organs of reproduction. Tumors of the adrenal cortex are frequently associated with sexual precocity in young children.

The only disease definitely traceable to a lesion of the adrenal body is that known since 1855 as Addison's disease. The most striking symptoms are a peculiar bronzing of the skin, extreme muscular weakness, low blood pressure, vomiting and other symptoms probably referable to the sympathetic nervous system. The pathogenesis of the skin pigmentation cannot be correlated with anything we know of the physiology of the gland. The muscular weakness is supposed to be pathognomic and attributable to the absence of circulating adrenin. The cases are always fatal, and treatment with adrenal substance seems to be of no use.

The Thyroid Gland.—The thyroid is developed as an outgrowth of the embryonic pharynx between the first and second branchial clefts. It is at first single and solid, but later becomes bilateral and divided up into closed vesicles. It is doubtful how far the lateral rudiments or post-branchial bodies take part in the formation of the mature thyroid in mammals. The vesicles hold a peculiar "colloid" material which contains iodine. The blood supply is very rich and nerves are provided from both vagus and the sympathetic.

Extirpation of the thyroid produces varying results according to the kind of animal employed and according to its age. The symptoms are not always very clearly defined, but they consist in general terms of the manifestations of sluggish metabolism. In young animals there may be almost complete cessation of growth though there is a tendency to adiposity. The symptoms differ from those of myxoedema in the human subject.

DISEASES OF THE THYROID.—**Myxoedema.**—This condition is found in middle-aged or elderly subjects, usually women. The skin becomes altered, hands and feet swollen, lips and tongue enlarged. The oedema does not put on pressure, and there is mental dullness. The symptoms are in fact those of pronouncedly slowed metabolism. The disease is clearly due to deficient thyroid secretion, and may be kept in abeyance or permanently cured by treatment with thyroid substance.

Cretinism.—This is usually due to atrophy of the gland at the time of birth. The growth of the skeleton is arrested and the nutrition of the muscles and skin is seriously affected, so that the children are deformed, and, as a result of lack of mental development, idiotic. Treatment with thyroid substance is often beneficial.

Simple Goitre.—The precise pathological condition varies in different cases. The commonest form is now very generally considered to be due to an infection from drinking-water. Many cases can be cured by treatment with intestinal antiseptics and sterilization of the water. Small doses of iodides have been found useful as a prophylactic when administered to children in goitrous districts.

Exophthalmic Goitre.—This disease is characterized by the three cardinal symptoms, enlargement of the thyroid, protrusion of the eye-balls and a rapid heart beat. It is usually ascribed to an over-secretion of the thyroid gland, though many authors prefer to attribute it to a disturbed function of the organ. Complete rest often suffices to cure the condition, though many surgeons recommend removal of a large part of the gland.

Kendall believes that he has isolated the active principle of the thyroid gland, and to this he gives the name of *thyroxin*. It is alleged that this substance may be used instead of thyroid substance in cases of thyroid insufficiency and that the results are as satisfactory as when the gland substance is employed.

The Parathyroids.—In the great majority of mammals there are four parathyroids, two in relation with each lobe of the thyroid. The glandules do not contain vesicles but consist of solid masses of cells. They are developed from the epithelium of the third and fourth branchial clefts. Most observers do not believe that they are functionally related to the thyroid.

Extirpation of all four parathyroids is rapidly fatal in the case of many animals. Where death does not occur it is usually assumed that accessory parathyroids are present. It is certainly true that in many of the herbivora such accessory glandules are frequently present. The symptoms which occur after extirpation are those of *tetany*—muscular spasms, rapid respiration, salivation, etc. The condition is now usually called *tetania parathyreopriva*, and Koch and Noël Paton ascribe it to intoxication by guanidin. They believe that the parathyroids control the metabolism of guanidin and in this way exercise a regulative action upon the tone of the skeletal muscles.

Idiopathic Tetany.—Since the symptoms of this disease strikingly resemble those of tetania parathyreopriva, it is now very generally believed that they are due to disease of the parathyroid. It is sometimes alleged also that paralysis agitans, chorea, epilepsy, and eclampsia are due to disturbance of the functions of these bodies.

The Pituitary Body.—The pituitary body consists of two principal portions, the *anterior or glandular*, and the *posterior or nervous*. The former is developed as an evagination from the ectoderm in the buccal region. The posterior portion is an outgrowth from the base of the brain. Covering the latter is a second glandular portion called the *pars intermedia*.

The glandular portion seems to give rise to substances which are essential for the proper development of the skeleton and other tissues of the growing animal, and Robertson states that he has succeeded in isolating from this lobe a substance called *lethelin*, which hastens growth in young animals. Pituitary feeding is stated to increase the output of eggs in laying hens.

Extirpation experiments seem to point to the anterior lobe as the part which is essential to life. But from the posterior lobe certain active extracts can be obtained. These extracts when injected into the circulation of a living animal produce a rise of blood pressure which is more prolonged than that produced by adrenin, but a second injection may produce a fall. The extract produces a sthenic effect upon uterine contractions and upon those of the intestine and bladder. It also causes dilatation of the pupil and constriction of the bronchioles. Pituitrin also causes a marked increase in the flow from the kidney and the mammary gland. A striking effect on metabolism produced by the administration of pituitary substance is a lowering in the tolerance for sugar.

DISEASES OF THE PITUITARY.—**Hyperpituitarism.**—Overgrowth of the anterior lobe usually of an adenomatous nature gives rise to increased growth of the bones of the extremities and of the face, and, if it occurs in young subjects, to gigantism, when, as in older subjects, it chiefly affects the face and the ends of the long bones, the condition is called *acromegaly*. Diminished sugar tolerance usually supervenes as the other parts of the organ become affected. There may be actual glycosuria and frequently polyuria.

Hypopituitarism.—In this condition the body does not grow, although there may be an extensive deposition of fat. There is marked failure in sexual development. Sugar tolerance is very pronounced and there is arrested mental development. In cases which do not arise until adult age has been reached obesity and increased sugar tolerance are the most striking symptoms.

A functional relationship between the pituitary and the other ductless glands (especially the thyroid) is more than probable.

The Pineal Gland.—This tiny structure has usually been considered as belonging to the group of "vestigial remains,"

and its chief interest to morphologists centres round its homology with the median eye of reptiles. It is developed as an outgrowth from the third ventricle of the brain. But even in lower vertebrates there is some evidence that a glandular constituent has to be reckoned with. Within the last few years numerous writers have urged that in mammals, including man, the organ is of considerable importance, and that it belongs to the group of glands furnishing an internal secretion.

Extirpation experiments have been carried out in some animals, and it is stated that removal of the organ accelerates growth of the body and especially of the reproductive apparatus, or at any rate a hastening of the development of the reproductive functions.

Tumors of the pineal gland are associated with abnormal growth of the skeleton in children, and with early and precocious development of the secondary sexual characters. In order to correlate these findings with the results of extirpation experiments it is assumed that the tumour gives rise to a condition of hypopinealism. It will be remembered that the common tumours of the pituitary body are considered to be adenomata and to give rise to a hypersecretion.

Injection of extracts made from the pineal gland give rise to no special effects upon the blood pressure, respiration, secretion of glands, or other functions which can be investigated by ordinary kymographic methods. But it is alleged that administration of extracts over a long period to growing animals hastens the growth and development of the reproductive organs. If these statements are correct they only tend in the present stage to complicate the problem, for it is certainly contrary to expectation to learn that removal of an organ from an animal and its administration to the animal as food or drug will produce similar results. The whole subject is obscure, and here, as in the case of some other of the ductless glands, it is probable that our experimental technique is too faulty or too limited to enable us yet to draw any just conclusions.

The Testes.—The effects of castration in man have been known for a very long time. The absence of hair from the face, the undeveloped larynx and the persistent soprano voice resulting, and the tendency to gigantism and obesity are among the more striking of the characters of a eunuch. In male stags the antlers do not grow, and in the cock the comb fails to develop. These results do not occur when the vas is tied. In some animals and under favourable conditions these secondary sexual characters may be induced if a testis is transplanted from another animal. So that they must be attributed to an absence of a specific internal secretion.

The elements of the testis which are usually supposed to furnish the internal secretion are the *interstitial cells* of Leydig. These are of an epithelioid character and contain lipid granules. These structures are not always very striking in sections through the testis, but they are more marked in some animals than in others.

Injection of extracts of the testis was observed many years ago by Brown-Séquard to have a rejuvenating or stimulating effect upon the subject so treated, but it is doubtful whether the effect is specific or more marked than with other extracts.

The Ovaries.—It is well known that if both ovaries are removed from a young animal the uterus does not develop, menstruation does not occur, and the mammary glands fail to grow.

Extracts made from the ovary produce certain effects upon smooth muscle, but it is not certain that these effects are specific.

The *corpus luteum* appears to be concerned with the fixation of the embryo *in utero* and also with the growth of the mammary gland and the secretion of milk. As in the case of the testis there is a tendency to attribute the internal secretions of the ovary to certain *interstitial cells*. These, however, are not present in all animals or at any rate are not present during all periods of the sexual cycle.

Extracts of ovary have been employed in the same manner as those of testis, and the same criticism applies.

The Carotid Body.—Situated at the bifurcation of the carotid artery and consisting, in many animals, of only a few cells, it is not known that the carotid body, or carotid gland, carries out any important functions. Among the constituent cells are a few of the chromaphil variety, and these are capable, presumably, of furnishing a small amount of adrenin to the general circulation.

The Coccyeal Body.—This structure is included in our list because it has been alleged that it contains chromaphil cells. This, however, does not appear to be the case. The body is apparently an arterio-venous anastomosis. (S. V.)

DU MAURIER, GERALD (1873—), English actor, was born at Hampstead March 26 1873, the son of George Du Mau-

rier (see 8.658). He was educated at Harrow and first appeared on the stage at the age of twenty at the Garrick theatre, London, then under the management of John Hare. Two years later he joined Herbert Tree at the Haymarket and played with him in Shakespearean plays and his father's play of *Trilby*, as well as in various melodramas. Amongst many later successes may be mentioned his acting in Barrie's *Peter Pan*, *The Admirable Crichton*, *Little Mary*, *What Every Woman Knows* and *Dear Brutus*, and his performances as the hero of Conan Doyle's *Raffles* and of McCutcheon's *Brewster's Millions*. He wrote the play *A Royal Rival*, produced by Lewis Waller, and with his brother, Guy Louis Busson Du Maurier (1865-1915), author of *An Englishman's Home* (1900), wrote *Charles I. and II.*

DUNAJEC-SAN, BATTLES OF THE.—The line of the river Dunajec and that of the San, both in West Galicia, marked the two successive stages in the break-through battle which initiated the Austro-German offensive of 1915 on the eastern front.

After the severe fighting on the Carpathian front (see *CARPATHIANS, BATTLES OF THE*) there ensued a pause in the second half of April 1915, both on the side of the Central Powers and on that of the Russians, whose attempts at a break-through had failed. Fighting continued only in the sector of the German Southern Army up to the end of the month, the crowning day being April 24, when Hofmann's Austro-Hungarian corps stormed the Ostry heights.

The general situation on the eastern front was at this time somewhat unsatisfactory. The Austro-Hungarian armies in the Carpathians were exhausted; the IV. and I. Armies, Woyrsch's Army, and the German forces on the eastern front were certainly holding their ground, but were continually being weakened by having to detach troops to the Carpathian front. The Russians were in similar case; the combats in the mountains had absorbed not only great masses of men but also quantities of material, which could not so readily be replaced. Thus, although the danger in the Carpathians was not yet over, Russian offensive movements on a large scale were hardly to be expected.

The position was far more favourable on the German western front, where the Germans awaited the French attacks with calm confidence, while behind the lines the organization of 14 new divisions was nearing completion. The opportunity for improving the situation in the E. appeared, therefore, to have arrived. The desirability of relieving the pressure on the Carpathian front seemed self-evident, and the only question was as to the direction and method of execution of the offensive. The choice appeared to lie between an offensive on a large scale against the whole Russian front, combined with enveloping movements against its northern and southern flanks, and a direct break-through at some part of the line. For the latter operation the area Gorlice-Tarnów appeared to offer advantages; it had been largely denuded of troops by the Russians during the course of their Carpathian offensive, and a drive on Sanok, via the Jaszlo and Krośno basins, would get into the rear of the Russian forces in the Carpathians and roll them up. The length of time that would be necessary for the preparation of an attacking group in the Carpathians, where the railway communications were very bad, would be bound to militate against the success of the first plan, while an enveloping movement in the N. would be too far distant to have any lasting influence in improving the situation in the Carpathians. West Galicia, on the other hand, was well suited as an area of assembly for an offensive group, and the possibilities of success were highly promising.

The High Commands of both the Central Powers had early in April decided, independently of each other, for the second solution of the problem; indeed, the Austrians had, in the middle of March, undertaken an offensive towards Gorlice with weak forces, which resulted only in a tactical success. When the Austrians early in April renewed their request for German divisions to be dispatched to the Carpathians the whole matter came up for discussion; the preliminary conditions for the offensive were arranged by telegraph, and the final decision was arrived at on April 14, at a conference between the two chiefs of the general staffs in Berlin.

The XI. Army, under Gen. von Mackensen, was organized as a shock group, consisting of eight German divisions from the western front, the two divisions of the Austrian VI. Corps, and the 11th Honved Cav. Div.; and it assembled behind the right wing of the Austrian IV. Army. This latter was also placed under Mackensen, who was himself subordinated to the Austrian High Command. These two armies were to carry out the main attack in West Galicia, while the armies of Dankl N. of the Vistula and those of Borojevič, Böhm, Linsingen and Pflanzer were to display all possible activity and engage the enemy in their front so as to prevent him from detaching troops to the main attack. Simultaneously two demonstrations in the Praszynsz and Novgorod areas, and a raid on Memel, were planned.

After the completion of the assembly of the XI. Army, the distribution of the Austro-German forces in West Galicia and the Carpathians was as follows: In West Galicia, on the Lower Dunajec, the heights of Wal, and the Biala as far as Cieczkowice, was the Austrian IV. Army under Archduke Joseph Ferdinand (7 inf. divs.). To the right of this, the XI. German Army, under Gen. von Mackensen (10 inf. and 1 cav. divs.), lay by Luzna and Gorlice as far as Malastów. The Austrian III. Army, under Gen. von Borojevič (14 inf. and 2 cav. divs.), stretched from Malastów in a salient curve S. of the Carpathian crest by Zboro to Virava. Thence the Austrian II. Army, under Gen. von Böhm-Ermolli (14 inf. divs.), held its position as far as the heights W. of the Uzsok pass. From here by Zawadzka, on both sides of the Orawa and the Oportales, by the Wyszokow saddle to the sources of the Moloda, lay the Southern German Army, under Gen. von Linsingen (9 inf. divs.). Next came the Austrian VII. Army, under Gen. Baron von Pflanzer-Baltin (8 inf. and 5 cav. divs.), curving on the line Solotwina, Ottynia, Horodenka, Zaleszski, and along the Dniester and the frontier.

On the Russian side there stood in the area S. of the Vistula, and on the Carpathian front, the III. Army (Gen. Radko Dimitriev), the VIII. Army (Gen. Brussilov), the Stry detachment and the IX. Army (Gen. Lechitski)—in all some 40 inf. and 16 cav. divs. with at least 10 Militia Opolchevie brigades.

The Break-through of Gorlice-Tarnów (May 2-5).—By the end of April all the preparatory measures for the offensive were complete, and on May 1 the preliminary bombardment on the front of Mackensen's Army Group began; this was followed at 6 A.M. on the 2nd by four hours' intensive fire by some 1,500 guns of all calibres, on a scale far surpassing anything yet known. The Russian trenches, on which many months' labour had been expended, and which were sited with great skill, were soon so shattered that the infantry, who had advanced to assaulting distance, were able to storm them.

During the night of the 2nd the left-wing group of the IV. Army, the combined division under Field-Marshal-Lt. Stöger-Steiner, forced the line of the Lower Dunajec by a surprise attack, and during the day established itself at Ościnów on the eastern bank.

The vigorous offensive of the XI. Army, in which the Austrian VI. Corps specially distinguished itself, met with little resistance from the Russians, who had been completely overwhelmed by the bombardment. Between Cieczkowice and the heights S. of Gorlice their lines were completely broken through. The Austrian X. Corps, fighting on the left wing of the III. Army, had a large share in this success. By 3 P.M. it had stormed the Russian positions on the heights S.E. of Ropica Ruska, and E. of Malastów, and continued its advance up till a late hour of the night.

The Austro-Hungarian IV. Army, which had to carry the very strong and defensible ridges of Dobrotyn and hills 419 and 402, was also in the end successful, after severe fighting, assisted in some measure by the effect of the XI. Army's break-through. Meanwhile the remaining Austro-German armies kept the Russians on their respective fronts constantly on the alert, and thus prevented any transference of troops; the Russian III. Army alone succeeded in concentrating strong reserves (III. Caucasian Corps and 63rd Res. Div.) in the vicinity of Jaszlo.

The offensive was continued on the 3rd with the utmost energy; the XIV. Corps stormed hills 419 and 402, while the IX. Corps on the right wing of the army captured the heights E. of Gromnik. Up to mid-day the XI. Army met with little resistance; in the afternoon, however, it came up against a series of strong positions, which were not captured till the evening, and its right wing reached Wapienne, the centre Biecz, while the left wing occupied the Lipie heights and the ridge N.E. of Olpiny. The left corps of the III. Army stormed Ostra Góra, the Russians in front of it establishing themselves on the E. edge of Magura.

By the 4th such rapid progress had been made that it was possible to extend the attack on the whole front of the III. Army.

The Army High Command ordered the XI. Army to continue its advance, with its reinforced southern wing moving in the direction of Dukla-Krosno-Strzyżów, the III. Army's left moving on Tylawa, its centre and right continuing to hold fast the enemy in their front. The time for the assumption of the offensive was to be at the discretion of the army commander himself. The neighbouring army under Böhm was already assigned as a reinforcement of the left wing, to operate in harmony with Borojević's right wing.

The left wing of the IV. Army was heavily attacked on the night of the 4th-5th, and little progress was made by it or by the German 47th Res. Div. in the course of the following day. On the other hand, the Russians opposed to the XIV. Corps, in the centre of the IV. Army, fell back before dawn; both divisions of the corps followed them up closely, and by nightfall had reached the line of the Biala. The right corps captured the heights N.E. of Tuchów and Dobrotyn hill. The XI. Army made very rapid progress on this day, driving the enemy back step by step as far as the Wisłoka, and establishing itself at Pilgrzymka Osobnica and Olpiny in close touch with the IV. Army.

On the left wing of the III. Army the 21st Landwehr Inf. Div. occupied the heights of Watkowa after heavy fighting.

On the 5th, however, the resistance of the Russian III. Army was still unbroken. The IX. Corps, indeed, captured the heights of Obzar and Wiszown, thus securing possession of the whole of the Dobrotyn ridge, while Szende's brigade and the 106th Inf. Div., in the face of stubborn resistance, cleared all the area E. of Tuchów as far as Zalasowa and the heights of Trzemesna W. of it, while the 3rd Div. succeeded in crossing the Biala; but the 8th Div., which finally followed the 3rd over the river, and the whole of the northern wing of the IV. Army, were unable to gain any success.

On the right wing of the XI. Army, however, Gen. von Emmich's corps, which had pressed far forward, again met with great success, throwing the Russians back behind the Jasiolka in the direction of Dukla, while the left wing of the army advanced to Jodłowa.

This rapid advance naturally facilitated the task of Borojević's army. As early as the morning of the 5th the front of the XXIV. and XII. Russian Corps, before the centre and left of that army, began to yield. Pursued by the Austro-Hungarian X., XVII. and VII. Corps in the direction of Jaslika and the upper valley of the Laborca, they were driven into the area W. of Tylawa behind the valley of the Ondava and onto the heights N.E. of Nagybakoc. Only the XXI. Russian Corps held its ground at great cost against the German Beskiden Corps, fighting on Borojević's right wing.

On the N. wing of the IV. Army the enemy's resistance was at length broken on the night of the 6th by the repeated assaults of Stöger-Steiner's Div. and the German 47th Res. Div. While the Russians evacuated their positions below Tarnów as far as the Vistula, the Austro-German troops occupied Tarnów and initiated a pursuit in the area W. of Pilzno.

The right wing of the IV. and the left and centre of the XI. Army had meanwhile reached the Wisłoka. Emmich penetrated as far as Wietrzno with his corps, and in the Dukla area blocked all the lines of retreat leading N. and N.E., along which Radko Dimitriev's defeated columns were now retiring in wild disorder. At Tylawa the Austro-Hungarian X. Corps, advancing from the W., encountered the 48th Inf. Div. of the Russian XXIV. Corps under Gen. Kornilov, and, in conjunction with Field-Marshal-Lt. Berndt's Cavalry Div., forced the greater part of it to surrender and scattered the rest, who were captured some days later by Emmich's troops.

By the evening the Austrian XVII. and VII. Corps had reached the Dukla pass and the Laborca valley, driving before them Radko Dimitriev's broken right wing, which took refuge behind the Jasiolka and the Carpathian ridge, leaving behind many prisoners and vast quantities of war material.

In view of these successes, it was to be expected that the Russian XXI. Corps would shortly be compelled to evacuate the Lupków pass which would shake the whole Russian front along the Carpathians to the E. of it. The rolling-up of this line seemed to ensure the complete strategic success of the five days' "break-through" battle of Gorlice-Tarnów in which Radko Dimitriev's army had been driven back more than 20 m. on a front of 100 m., with a loss of 50,000 prisoners, 50 guns and much other material.

The Pursuit and Battles at Sanok and Rzeszów (May 6-11).—After his severe defeat, Radko Dimitriev's plan was to hold the Lupków pass with his left wing, and, supported upon this, to bring the pursuit to a stand on the line Nowotaniec-Besko-right bank of the Wisłoka, where there were positions favoured by the lay of the ground, and then, between the Vistula and the Wisłoka, on the line Wielopole-Zassow-Malec. Here he proposed to reconstitute his units, which had fallen into great disorder, and to strengthen them by bringing up reserves. Troops were sent to him from other fronts, and by the 8th he could again dispose of 18 inf. divs., 5 cav. divs. and 5 Reichswehr bdes. The orders were that the offensive was to be continued with all possible vigour. Mackensen's army was to push forward over the stretch of the Wisłoka between Besko and Frystak on Mrzyglód and Tyczyn, and the Archduke Joseph Ferdinand on Rzeszów, while Borojević was to roll up Brussilov's VIII. Russian Army in the direction of Sanok. Böhm's II. Austrian Army was to join up corps by corps from the left wing in proportion to the progress of the attack.

In the course of the 8th the Russian positions were once more attacked along the whole front, and in the sector of Mackensen's army were stormed along the whole E. bank of the Wisłoka. Both here and in the front of the centre and right of the IV. Army the fighting was heavy; the Russians were driven by the latter from Pilzno and Brzostek and pursued beyond Delica and the hill of Chelm. In front of the newly formed group under Gen. von Kirchbach, composed of Stöger-Steiner's Div., the German 47th Res. Div. and certain Landsturm formations, on the left wing of the IV. Army, the Russian IX. Corps fell back in the afternoon to the new line prescribed.

Meanwhile, Borojević had also pressed the Russians hard and by 3 A.M. forced them to abandon the Lupków pass as well as the strong Bokuwica ridge, and to retire to the line Zarszyn-Bukowsko-Szczawne, where they once more took up strong positions. As a natural result of the retreat of the III. Russian Army, the whole of Brussilov's VIII. Army began to give ground, and Böhm's army, with the W. wing of Linsingen's, at once took up the pursuit.

On the 9th, however, violent resistance was once more encountered, particularly on the fronts of the German Southern Army and the Austro-Hungarian II. and III. Armies, from the Ostry hill to Besko. The Russian *point d'appui* at the latter place was much endangered by the withdrawal of the Russian front fighting against Mackensen to the left bank of the Stobnica; but it was urgently necessary to hold it, as also the strong front Bukowsko-Szczawne, in order to secure Brussilov's undisturbed retreat. Despite a violent counter-attack delivered by three newly arrived divisions astride the Sanok road between Besko and the left flank of the Russian line on the Stobnica, the Russians were forced to abandon Besko on the evening of the 9th.

When on the 10th Böhm's left wing, pressing forward by Baliogrod and the San, captured Szczawne, and the gallant X. Corps on Borojević's left took Zarszyn, the strong position of Bukowsko became untenable; and by the evening of the 11th the Russians had fallen back behind the San. The III. Army followed them up to the area Sanok-Zagorcz. Meanwhile the XI. Army had stormed the Stobnica position and advanced its front. Of the Archduke Joseph Ferdinand's army Kirchbach's corps on the evening of the 11th reached the Lower Wisłoka while the centre took Sedziszow. During the night of the 12th the IX. Corps secured Rzeszów.

The Russians, after some minor rear-guard actions, had also fallen back along the whole front before the II. Army, so that on the 11th the Austrian left wing had reached the Lisko area, while the right had passed the Upper San, where the Southern Army was.

At this point may be said to have ended the battle of Rzeszów-Sanok, the effects of which were quickly seen in the retirement of the enemy line N. of the Vistula. The Russians now prepared to make a fresh stand on the strong defensive line of the San below Przemyśl, where they had constructed strong lines of defences, with their flanks resting on the Dniester marshes at Wielki Błoto, and the angle made by the Vistula and the San. Up to this point they had lost 130,000 prisoners, 100 guns and 300 machine-guns.

Events up to the Battle of Przemyśl (May 12-23).—The Russians, foreseeing the possibility of a further retreat, had chosen as their next position the line of the San below the fortress of Przemyśl, which had again been placed in a state of defence, as far as Nisko, and they had strengthened this line by the construction of bridge-heads at Radymno and Jarosław. Below Nisko the line enclosed the angle formed by the Vistula and the San, whence a particularly strong line of defence led to Tarnobrzeg and was continued on the far side of the Vistula to Klimontów and Opatów. The southern front was connected by an equally strong fortified line through Husaków and Krukienice with the Dniester, which served as the next natural line of defence for the Russians. At first, however, they did not make full use of this river as an obstacle, since they advanced their IX. Army against Pflanzner-Baltin to the Pruth.

The immediate object of the Austrian and German High Commands was to force the San below Przemyśl, and to attack that fortress. The following objectives were assigned to the armies. The IV. Army was to force the Lower San, and the XI. to pass that river on either side of Jarosław. The N. wing of the III. Army was to push forward S. of the San against the W. and S. fronts of Przemyśl, and secure that place by a *coup de main*, while its S. wing advanced by Dobromil on Mosciska. To the II. Army was assigned the direction Chyrów-Sambor, while the Southern Army's objectives were Drohołyca and Stryj. The VII. Army was to maintain its positions, while on the N. of the Vistula the armies of Dankl and Woyrsch were to follow up the enemy, with their inner flanks moving by Daleszyce on Słupia.

After breaking off the battle the Russians had rapidly fallen back to the San, and were as rapidly pursued. The pursuers encountered in the main only a few small rear-guards during the next few days; the II. Army, however, had violent fighting at the San crossings; and on the III. Army front, the 27th Div., in conjunction with the German Beskiden Corps, dispersed a hostile rear-guard on the heights of Magiera, S. of Przemyśl.

On the 14th the German Guard Corps found itself face to face with the strong fortifications of the bridge-head at Jarosław. After a short but intense preliminary bombardment the Guard infantry, assisted by those of Field-Marshal Arz's Corps advancing from the

S.W., stormed the works on the 15th, and on the 16th entered Jarosław and crossed to the E. bank of the San.

The IV. Army reached the Russian lines on the Vistula-San angle on the same date, and took up a position on the W. bank of the San as far as the Wisłok. S. of the Wisłok the XI. Army had established itself on the left bank of the San, in face of the fortress girdle of Przemyśl and extending to the San S. of Mackowice; the III. Army aligned itself as far as Husaków before the S.W. and S. fronts of Przemyśl, while the II. Army had worked its way forward to the entrenched line extending over Krukienice to the Wielki Błoto. S. of this marshy area the Southern Army had driven Cherbachev's XI. Russian Army back on Stryj and Dolina, which had been formed out of the Stryj detachment early in May. Pflanzer's Army was compelled to withdraw before the Russian IX. Army (Lechitski) to the Pruth between Czernowitz and Kołomea, and there made preparations to hold this line, while cooperating with its reinforced left wing in the offensive of the Southern Army.

N. of the Vistula the Russian IV. Army was forced back by the armies of Dankl and Woyrsch to the line Nowe Miasto-Mniszek-Ilza-Opatów-Klimontów, after heavy fighting in the Czarna and Lysa Góra areas, and small rear-guard actions elsewhere. Before the IX. German Army the Russians held their ground.

In 14 days of fierce battle the Central Powers had gained a great victory, and had pushed back the Russian "steam-roller" some 110 m. eastwards, besides securing 170,000 prisoners, 128 guns, 368 machine-guns and immense quantities of war material.

A pause in the operations now ensued, which was devoted to the preparations for a further offensive, to comprise the forcing of the San line, the capture of the fortress of Przemyśl, and the storming of the heights S.E. of the fortress.

The San itself at this season was not a serious obstacle, and its passage presented no difficulties in itself; but on the far bank there existed strong and well-prepared positions, while the Russians had received considerable reinforcements; their front E. of the Vistula having been strengthened by some 9 divs. at the beginning of May. The fortress of Przemyśl had been reconstructed by the Russians and was now too strong to capture by a *coup de main*. The bringing-up of heavy artillery would therefore be necessary, and the strong positions S.E. of the Vistula also demanded a carefully planned attack. It appeared, moreover, that the Russians had recovered their breath in this new position, and that they intended to oppose an energetic resistance to the pursuit. Fresh and thorough preparations had, therefore, to be made for the continuance of the attack. The transport of supplies could not keep pace with the troops during their rapid advance, for the Russians in their retreat had carried out a thorough work of destruction. The roads and railways could not be used, and the bridges had been blown up. Only after hasty restoration had been carried out could the necessary heavy artillery and ammunition be sent forward.

As the front became shortened during the advance, the Austrian VIII. Corps was on May 10 taken out of the line on the III. Army front, transferred by rail to the IV. Army, and attached to Kirchbach's group where it was to be assigned the part of storming Sandomierz. The 41st Honved Inf. Div. was also transferred from the III. to the I. Army, coming into line on the 19th at Staszów.

The imminent entry of Italy into the war had no influence on the continuance of the offensive, apart from the fact that the VII. Corps (17th Inf. Div. and 20th Honved Inf. Div.) were entrained on the 21st at Mező Laborcz for the S.W. front. There was, however, a spontaneous pause during which both sides made their preparations for the forthcoming great battle. The Austro-German troops were engaged on their front in securing favourable conditions for their impending attack, while the Russians endeavoured, in a series of powerful counter-blows, to check the progress of their pursuers and even to prepare the ground for a possible offensive.

The occupation of Jarosław early on the 16th, and the construction within the next few days of a regularly fortified bridge-head, in which was included the village of Sieniawa, captured on the 18th by the Austro-Hungarian 10th Inf. Div., afforded a favourable sallyport for the next advance. Despite the gallant counter-attacks of the III. Caucasian and XXIV. Corps, the German X. and Guard Corps and Arz's Austrian Corps were able to consolidate their positions in this sector. The 12th Div. of the last-named corps on the 20th carried out a successful advance towards Radymno. The XI. Army Command, in order to assist the II. and III. Armies, which were making little headway, projected an attack on the 24th with the left flank along the Szkoło on the E. bank of the San. If the part played by the Russians opposed to the XI. Army was mainly passive, they showed a more aggressive spirit opposite the IV. Army on the Lower San. Units of their IX. Corps near Misko, and of their X. Corps near Stare Miasto, delivered violent attacks on the 18th, which were defeated. On the 19th, after being reinforced, they again crossed the San between Rudnik and Stare Miasto but had to return hurriedly to the E. bank as the result of a counter-attack by the 3rd Inf. Div. Heavy fighting also occurred near Rudnik, where the 8th Inf. Div. defeated with the utmost gallantry the repeated Russian efforts to effect a break-through.

During the pause in the fighting here, violent fighting took place in the bend of the Vistula on the front of Dankl's and Woyrsch's

armies. The pursuit, which had been begun on the 12th by the former army, had been successively taken up by Woyrsch's armies and by Kövess's army group. The right wing of Dankl's army encountered strong resistance on the 16th on the line Koprzywnica-Klimontów, advanced to the attack but failed to break through; the same fate befell the II. Corps on his left wing, which had to relinquish its initial gains in face of a violent Russian counter-attack. Woyrsch's right wing, which was in touch, was also held up; on his left wing, however, the 16th Inf. Div. took Ruski Brod near the source of the Radomka and drove the enemy back in flight.

During the 17th indications of a Russian counter-offensive between the inner wings of Dankl's and Woyrsch's armies increased in number, and Bredow's div. (Woyrsch's right wing) and the II. Corps actually had to resist a series of violent assaults which, in the case of Dankl's army, even suggested the necessity of a retreat behind the Czarna. On the 18th, however, the expected counter-offensive failed to materialize against Dankl's left wing; the Russians devoted all their efforts on this and the following day to the capture of Bredow's positions, and they also exercised considerable pressure against Dankl's southern wing; all their attacks, however, were beaten off.

On the 20th the main body of the Austro-Hungarian 7th Cav. Div. came into action on Bredow's right, and the 41st Honved Inf. Div. from the III. Army, on the II. Corps' left; and the Russians in this part of the front thereupon fell back before this corps and Bredow's div. to an entrenched position on the line Brody (on the Kamienna)-Wasniów-Kobylany. The pursuers worked forward to this on the 24th. Nothing of moment occurred in the centre and on the northern wing of Woyrsch's army, or on the fronts of Kövess's army group and the German IX. Army.

The Russian attempt to break through in the mountain area N. of Kielce, to relieve the pressure on their retiring troops N. of the Vistula, had thus failed; 6,300 prisoners had been lost.

S. of the Vistula there now began the violent struggle prepared for since the 12th, which in the battle of Przemyśl, was to introduce the second phase of the great spring campaign in Galicia.

The Battle of Przemyśl (May 24-June 6).—On May 24 the attack by Mackensen's army, which had been planned four days earlier, began along the Skło in an E. and S.E. direction. At the same time the II. and III. Armies were to advance in a N.E. direction along the Mosiska-Przemyśl road, with the object of driving the Russian field army away from the fortress from the S. The IV. Army, securing the San crossing at Sieniawa, was to direct its main effort against the strong Russian positions in the angle between the San and the Vistula about Rudnik and Machów, while the Southern Army was to continue its attacks in the Drohobycz-Stryj area. As early as the 24th the XI. Army forced back the enemy along all the front of attack. The German XLI. and Austro-Hungarian Corps, on this and the following days, accomplished the brilliant feat of storming Radymno, which the Russians had erected into a powerful bridge-head by means of three exceptionally strong lines connected with the northern defences of Przemyśl.

A violent and extremely effective artillery preparation begun early in the morning made it possible to take Ostrów and Radymno on the 25th, and finally for the VI. Corps to capture the bridge-head of Zagrody. The Russians fled over the San in complete disorder. By the premature destruction of the bridge over the river, 21,000 of them were cut off, and fell into the hands of the victors, who also captured 39 guns and 40 machine-guns.

By the evening of the 25th Mackensen's attacking wedge had been driven forward on the E. bank of the San to the line Radwa-Zapalów (on the Lubaczówka)-Laski-Lazy. On the W. bank the Bavarian 11th and German 119th Divs. had already on the 24th reached the heights S.W. of Zablotce. On the 26th the XLI. Corps succeeded in gaining possession of the S. end of Święte on the W. bank of the San, while the VI. Corps took the villages of Nienowice and Chotyńiec. The Guard established itself on the line Zaleska Wola-Zapalów.

The Russians had made every effort to check Mackensen's advance, particularly by means of violent counter-attacks at night, but in vain. Mackensen's advance had progressed so far to the E. that Przemyśl was now encircled from the north. He proceeded to consolidate his positions in this area, partly in order to counter a Russian offensive which was just beginning, partly in order to await the moment when the II. and III. Armies should be able to deliver a direct assault on Przemyśl from the south.

The right wing of the II. Army and the whole of the III. continued their attacks on the 24th with the utmost energy. On the previous night a Russian counter-attack had pressed the XVIII. Corps back a little, but on the morning of the 25th the position was restored, largely owing to the arrival of the 13th Landwehr Inf. Div.

Field-Marshal-Lt. Schmidt's group (7th Inf. Div. of the IV. Corps and the XVIII. Corps) attacking on the left wing against Mosiska, gained some small successes, but the German Beskiden Corps farther to the left made no advance on this day. On the 26th it was able to storm two hills near Husaków, but as against this all the efforts of Schmidt's group broke down before the strong Russian positions, which were in part concreted and consisted in places of seven successive lines of trenches. Owing to the lack of heavy artillery the attack here could progress only by systematic

sapping, and in this manner it had, by the 28th, worked its way up to the Russian wire entanglements.

Meanwhile the Russians had resolved on a counter-offensive with superior forces against the S. wing of the IV. Army. Their plan was to advance from the N. and N.E. over the San at Sieniawa and to the N.W. of it, and thus to put a term to Mackensen's progress.

On the 27th the strongly reinforced III. Caucasian Corps (Gen. Irmanov) delivered a surprise attack upon the Sieniawa bridge-head. The Austro-Hungarian 10th Div., consisting in part of untrustworthy Czech troops, gave way, and was thrown back to the W. bank of the San and the Lower Lubaczówka, losing 9,000 prisoners, 9 guns and 4 machine-guns. Strong reinforcements hurried forward from other divisions succeeded in stiffening the badly weakened right wing of the army on the W. bank of the San, and in averting the menace to Mackensen's left flank. On his front also the Russians on the 27th delivered unexpected but unsuccessful attacks against the Lubaczówka and the positions of the VI. and XLI. Corps at Chotyniec and Starzawa.

On the 28th the Russians renewed their attacks in this area and on the San. On the Lubaczówka they succeeded in penetrating the lines held by the German X. Corps, but were driven out by a flanking movement. On the next day they again delivered strong assaults in the Sieniawa area and made vain attempts to pass the San.

The N. wing of the IV. Army, in conjunction with the I. Army on its left (now under Kirchbach, in place of Dankl, who had been appointed to the command in Tirol), moved forward on the 24th to attack the fortified line Machów-Rudnik, and by the 26th had forced the Russians back to the S. of Grębów. The Russian attack at Sieniawa, however, necessitated the immediate withdrawal of forces to strengthen the right wing of the IV. Army and the cessation of the N. wing's offensive. On the 30th, therefore, there was a temporary cessation of activity; at the same time indications were observed of a renewed Russian blow against the inner flanks of the IV. and XI. Armies. The Supreme Army Command gave expression to this fear in instructions to these armies to devote special care to the strengthening of their positions and to hold reserves in readiness on their threatened wings. The III. and II. Armies were meantime to pursue their attacks.

During the following days, from May 30 to June 3, Przemyśl was stormed (see PRZEMYŚL). Throughout this period hard fighting was also taking place immediately S.E. of the fortress and on the San between Przemyśl and Rudnik. In the latter area it was the Russians who took the initiative. Since the capture of the Sieniawa bridge-head by the III. Caucasian Corps, it became clear that strong forces were being concentrated against the XI. Army, and that the Russian IX. Corps in the Ulanów-Rudnik area was being reinforced. The XIV. and XV. Corps of the Russian IV. Army had been brought over the Vistula to the area Sandomierz-Nisko.

In front of the Austro-Hungarian IV. Army and the northern wing of the German XI. Army (in all, 11½ inf. and 2 cav. divs.) stood the whole of the Russian III. Army (some 20 inf. and 4 cav. divs., with 6 militia brigades). The Russians appeared to be planning an energetic counter-attack; on June 2 the Austro-Hungarian IX. and XIV. Corps had had to repulse heavy attacks and to prevent attempts to cross the San.

On the evening of June 1 the 8th Inf. Div. on the left wing of the XIV. Corps W. of Rudnik had been hard pressed and forced to fall back to its next line of defence; all attacks on the 2nd were beaten off, but there was danger of a Russian break-through just W. of Rudnik, as the whole XIV. Corps in conjunction with the IX. Corps had been pressed back to the line running from the heights W. of Tarnagóra, by Jezowa to Jata, where it came into touch with the right wing of the VIII. Corps which was bent back on the line Stany-Przysów. In the case of this latter corps nothing worth mentioning occurred. All attacks on the Lubaczówka were repulsed by the German X. and Guard Corps, on the northern wing of Mackensen's army.

On the following day the IV. Army front continued quiet, the troops fortifying their new defensive line, which was not attacked. The fall of Przemyśl having freed troops of the III. Army for use elsewhere, the Austrian X. Corps (24th and 25th Divs.) was hastily dispatched to Lancut and Rzeszów, to reinforce the IV. Army. Troops were also dispatched to the XI. Army, the German 22nd Div. to Lancut, the 8th Bavarian Div. to Radymno, the German XXVI. Corps to Jarosław, and the 107th Div. to Przemyśl.

On the 4th the Russians renewed their massed attacks against the IV. Army, but these were all repelled with heavy loss. The 59th Regt. near Tarnagóra repulsed an attack by the four regiments of the Russian 61st Inf. Div. The northern wing of the XI. Army also dealt successfully with a series of Russian attacks delivered as late as the night of the 4th. On this day the Russians' power of attack seemed to have exhausted itself. They had suffered enormous losses and the driving-back of the Austro-Hungarian XIV. Corps was the only success they had to show. Only on the 6th did strong forces from the Russian VIII. Army once more attempt a counter-attack on Mackensen's eastern front; but this did not succeed in preventing the establishment of the XLI. Corps on the line Starzawa-Czerniawa. On the front of the IV. Army all was quiet on June 4. The Russian plan of holding the San line, and relieving

their hard-pressed VIII. Army by a powerful counter-offensive in the Rudnik area, had thus failed.

While Przemyśl was being invested and captured Puhalló's and Böhm's armies were engaged with Brusilov's left wing S.E. of the fortress. The former had taken over the III. Army from Boroevič, who on May 24 was put in command of the V. Army against Italy. Early on June 2 Böhm made an energetic attack in conjunction with the German Beskiden Corps on the right wing of the III. Army, but on this day met with no success. Only by slow degrees and step by step could the divisions of the II. Army work their way forward up to the strong hostile positions. On the 3rd the Beskiden Corps succeeded in breaking through the Russian lines at Husaków and in establishing itself on the heights W. of Mysłatycze, while the divisions of the XVII. Corps in touch with it to the W. gained a firm footing on the crest N.W. of Husaków. The success of the attack was greater next day. In conjunction with the XI. Army the XVII. Corps pushed forward to the heights E. of Wola Łocka, and there met with strong resistance. The Beskiden Corps was engaged by the evening against the hostile positions W. of Czyski and N. of Rakosć (S.W. of Mosciaka), where it connected with the left-wing corps of the II. Army, which had itself done excellent work in the area to the S. of the Beskiden Corps and in conjunction with it.

Battle of Stryj, and Fighting on the Pruth and Dniester (May 24-June 15).—Simultaneously with the attacks of the IV., XI., III. and II. Armies, there began on May 24 on the German Southern Army front a 48 hours' intense artillery preparation, which was followed by the actual attack on the morning of the 26th. The front of Linsingen's army extended from Husaków on the Bystrzyca E. of Drohobycz, S.W. of Stryj, and E. of Bolechów to the Dolina area. The 5 inf. divs. of Stcherbachew's XI. Russian Army were opposed by 8 inf. divs. and 3 independent brigades.

The results of the first day's operations were brilliant. Field-Marshal Szumay's corps on the left stormed the hostile positions at Gaje, while the 38th Honved Inf. Div. and the left wing of Gen. Count Bothmer's German Corps in touch with it pressed forward successfully before Stryj. Hofmann's Austro-Hungarian corps also made progress N. of Dolina. Gen. Gerok's XXIV. German Reserve Corps fighting on the right wing to the S.W. of Dolina, on the other hand, beat off all attacks. As on the second day, however, the Russians everywhere maintained their strong positions with the utmost stubbornness, the attack was brought to a standstill, and recourse had to be made to sapping, as on the II. Army front.

During the next few days the Russians endeavoured to clear their front by a series of strong counter-attacks mostly delivered by night against Hofmann's Austro-Hungarian corps; and they succeeded by the morning of the 30th in forcing it back behind the Swica to the line Lisowice-Hoszów. Here, however, their progress was checked by Hofmann and the 24th Reserve Corps.

On the 31st Bothmer's energetic attack on Stryj turned the scale of victory in favour of the Southern Army. Advancing in conjunction with Szumay's S. wing from the Holobutów area, he defeated the enemy, taking 9,050 prisoners, 8 guns and 15 machine-guns—and, pushing on through Stryj, established himself on the line Lisowice-E. of Stryj-S. of Brigidau.

The effect of this was immediately felt on the Southern Army front. Szumay's left wing, on June 1, stormed the Russian line N.E. of Drohobycz, and pursuing by Kolodrubly and Mikolajów, drove the enemy back on Medenice. The 1st Cav. Div. and 5 battalions of the II. Army, which had joined in the attack, were placed under the Southern Army. On June 2 Bothmer's corps took Lisiatycze, but its 1st Div., fighting E. of Stryj, made no progress. The 38th Honved Inf. Div. and Szumay's right wing during the night drove the Russians back to the Dniester.

The Supreme Army Command now proposed, while securing its flank on the Dniester, to push Bothmer's corps and the main body of Szumay's corps eastwards towards Zurawno against the flank of the Russian IX. Army, thus relieving the pressure on Pflanzer-Baltin. The execution of this scheme produced excellent results. Yielding to Bothmer's pressure, the whole Russian line was in retreat early on the 4th. While Szumay on the line of the bridge-heads of Mikolajów and Kolodrubly undertook to guard the flank facing the Dniester, Bothmer advanced on Zurawno with the 38th Honved and German 1st and Guard Divs. By the evening Hofmann and Gerok, taking up the pursuit towards Kalisz, had reached the line Zawadka-Holyn. Here on the 5th the right-wing corps of the Russian IX. Army stood stubbornly at bay, while Bothmer was already preparing to force the Dniester at Zurawno, which he had taken by a *coup de main*. Meanwhile the 1st Cav. Div. had advanced by Tejsarow on Zydaczów, and on the W. flank Szumay repulsed powerful counter-attacks by the Russian XXII. Corps.

On the 6th Gerok and Hofmann broke the resistance of Lechitski's right wing at Holyn and Zawadka, and pursued the XI. Corps, which had been in action there, by Kalisz on towards Wojnilów. Bothmer, with the 38th Honved Inf. Div. and the Guard Div., stormed the heights N. of the Dniester, and on the 7th, after violent fighting with parts of the Russian XVIII. Corps, forced the Russians to retire from Nowoszyń. The 38th Honved Div. reached Bukaczowce that evening. On the 8th Hofmann's troops forced

the passage of the Lomnica, and pressed on towards Halicz and Jezupol, while Gerok entered Stanislaw.

The task of the Southern Army, to roll up the hostile line in front of Pflanzer's army by an attack eastwards, was more than fulfilled when it had reached the line Halicz-Stanislaw. The right wing of the Russian IX. Army had indeed been in retreat since June 9.

Pflanzer-Baltin's army had been forced back behind the Pruth by the Russian counter-offensive in the middle of May, and only at Kolomea did it continue to hold a position somewhat in the nature of a bridge-head on the N. bank. Its line ran from Delatyn, which it enclosed N.E. of Pasieczna to the Perehinsko area, where it touched Linsingen's right. On May 21 the Russians had stopped their advance and entrenched themselves along their whole front: they had some 11 inf. and 8 cav. divs. as against 8 Austro-Hungarian inf. and 5 cav. divs., with 5 independent brigades. On June 1 they delivered an unsuccessful attack against Pflanzer's left-wing corps under Field-Marshal-Lt. Count Schönburg; and next day they turned against the neighbouring corps, the XIII., S. of Nadworna, which also held its ground. On the 3rd, however, the Russian 2nd Rifle Div. managed to force a passage to the S. bank of the Pruth at Sadzawka, but was thrown back to the Pruth next day, after heavy fighting, by the hastily reinforced Eastern Group under Field-Marshal-Lt. von Czibulka.

In view of the change which had meantime taken place in the situation on the German Southern Army front, the Russians seemed determined to press forward in the direction of Delatyn, in order to secure a fresh success against the VII. Army and to put a stop to the Southern Army's progress. During the whole of the 5th they assailed the 5th Inf. Div. and Czibulka's group with the utmost violence, and forced the latter back to the line Mlodiatyn-Peczeniczyn. By the evening, however, the Austro-Hungarian troops, reinforced by some battalions from the neighbouring groups and by the 8th and 10th Cav. Divs., succeeded in driving them back to the line Kniadzow-Mlodiatyn, and in holding this line until the 6th.

At noon on the 4th Pflanzer-Baltin, hearing that the Russian XI. Army was withdrawing on its whole front, issued orders to Count Schönburg, in command of his left-wing group, and to Gen. Baron von Rhemen, commanding the XIII. Corps, to assume the offensive, which would also relieve Czibulka's hard-pressed troops. Schönburg was to advance eastwards with his main body on Bohorodczany, and with his right wing on Solotwina, while Rhemen was directed on Nadworna and Krasna. By the evening Schönburg had succeeded in getting forward to the heights S.E. of Maniawa, and to the line Kryczka-Jablunka-Majdan-Krasna. His advance came to a standstill on the 5th, but by then the flank attack of the Southern Army had begun to make itself felt. During the 6th the Russian attacks on Rhemen's and Czibulka's front entirely ceased, and in front of Schönburg's group rearward movements suggested that the Russian front was about to be withdrawn.

On the 7th Pflanzer-Baltin assumed the offensive all along the line. The Russians were thrown back again over the Pruth at Sadzawka, and the 36th Div. pursued them on to the far bank. The XIII. Corps got well beyond Nadworna, while Schönburg continued his attack in an easterly direction, and by nightfall stood on the Bystryca Nadwornianska at Grabowice. Marschall's corps took Zablotów, and Korda's XI. Corps and the 5th and 6th Cav. Divs. crossed the Pruth below the confluence of the Czeremosz. On the 8th Schönburg reached the Ottynia area, while Rhemen, Czibulka and Krautwald (III. Corps) reached the line Chlebiczyn-Koraszów-Kamionka Wk.-Gwoździec and the area E. of Wolczkowce. The right wing was advancing victoriously beyond the Pruth between Czernowitza and Sniatyn.

The 9th saw further successes; the centre and left wing forced the Russians back from the line of heights N.E. of Ottynia and Obertyn and S.W. of Horodenka. At this date Field-Marshal Lt. von Kaiser assumed command in place of Gen. von Marschall, who had been appointed to a command in the Southern Army.

Meantime, however, events on the Southern Army's front had taken an unfavourable turn, which had its repercussion on the operations of the VII. Army. Gerok's corps and the German 5th Cav. Div. had to be detached from the right of the Southern Army to its left, which was in a perilous position. This transfer, together with the fact that Schönburg and Rhemen were pushing eastwards, could not fail to create a gap in the area of Stanislaw which would involve considerable danger to the inner wings of the Southern and VII. Armies if the Russians became aware of it in time. The direction of the VII. Army's advance, therefore, had to be changed from E. to N. Schönburg and Rhemen were to move to the Mariampol-Nizniow area, Czibulka to Potok Zloty, Krautwald to Czernelka, Kaiser to the adjoining Zaleszczycki area, while Korda was to attack in the direction of Toporoutz.

The Russians had meantime resolved on a counter-offensive against the Southern Army. Bothmer's advance in the Zurawno area, the possible loss of the Mikolajow bridge-head, and an advance by the Southern Army in the direction of Lemberg, would have a serious influence on the Russian situation, both in the battle of Przemyśl and on the Lower Dniester.

On the 7th the right of the XI. Russian Army reinforced by 2 divisions delivered a series of fierce attacks against Szumay's group, which were driven back by the 8th to the line Derzów-

Bilcze-Medenice. At the same time a similar counter-blow was delivered against Bothmer in the Zurawno area; he held his ground successfully on the 8th, but on the morrow the superiority of the enemy on his front was so overwhelming that he withdrew to his old positions behind the Dniester. Szumay's group also, attacked on both wings, had again to retire, and was withdrawn to the line Ruda-Tejsarów-Wolica-Letnia-Dobrowlany-Hruszów.

Faced with the urgent necessity of assisting his hard-pressed left wing, Gen. Linsingen left on his right wing before Stanislaw and Halicz only Marschall's group and Hofmann's Corps. Gerok's corps (19th Inf. Div. and 38th Honved Inf. Div.) was entrusted with the defence of the Dniester between Ostrów and Zurawno, while Bothmer, with 1st Inf. Div., the 3rd Guards Div., the 48th Reserve Div., and the 40th Honved Inf. Div., counter-attacked from the Salatyce-Zurawno area in the direction of Ruda and Zydaczów. Meanwhile Szumay's group, covered on its left by the 4th Cav. Div., had, without any assistance from other troops, forced back the enemy to Litynia, and assumed the offensive all along its front.

On the 11th the 1st Inf. Div. stormed Zurawno, and the 3rd Guard and 40th Honved Inf. Div. approached Zydaczów, while Marschall's group repulsed all attacks on Stanislaw, and Hofmann's Corps prepared to carry Halicz.

The Russians, however, who had observed all their preparations, were ready with the necessary counter-measures. Reinforced by contingents from the VI. Corps, they made an attempt to break through Szumay's front along the road to Stryj, but all their attacks failed. On the 4th, reinforced by two new divisions (33rd and 44th) of the XXI. Corps, they again attacked all along the front, and Szumay's troops had once more to be withdrawn.

Meanwhile, the VII. Army's offensive northwards had met with great success. On the right wing Korda's corps threw the Russians back over the heights of Brdo Horodyszczce on to the Bessarabian frontier, while Kaiser's group, despite fierce resistance, took the village of Zaleszczyki and reached the N. bank of the Dniester at Zezawa; the centre stormed the heights S. of Czernelka, while Rhemen and Schönburg on the left wing occupied Jezierzany and the area S. of Tysmienica.

On the 12th these two corps crossed the line Tysmienica-Tlumacz, and then moved against the fortifications of Nizniow, which were stormed after a short artillery preparation on the 15th. On this date the S. bank of the Dniester was in German-Austrian possession from Mariampol to Kosmierzyn, where units of the 15th Inf. Div. (XIII. Corps) crossed to the N. bank. After a short but violent resistance the Russians were driven back, and the advance was resumed on Potok Zloty.

Korda's corps on the 12th drove the Russians over the frontier, and pursued them by way of Chotin and Wladczna to beyond Nowosieltica. During the pursuit the 6th Cav. Div. encountered hostile resistance at Raszków, which was quickly overcome. As any further penetration over the frontier, however, involved the danger, not only of being as an isolated advance, unsuccessful, but of opening too wide a gap in the line near Zaleszczyki, the Austro-German front was withdrawn over the frontier on the 15th.

A favourable influence on the situation on the right wing had been exercised by the break-through achieved by Mackensen's Army Group, after the battle of Przemyśl, at Mosciska and Lubaczów.

*The Break-through at Mosciska and Lubaczów (June 12-15).—*After the fall of Przemyśl, the armies of Mackensen, Puhall and Böhm pursued Brussilov's army with rapidly succeeding attacks until June 5. On the heights W. and S.W. of Mosciska, as far as Wielki Bloto on the one hand and on the Middle and Lower Lubaczówka on the other, Brussilov hoped again to hold up the Austro-German advance. After Mackensen's capture of Starzawa on the 5th the attack came to a standstill before the strong Russian positions. Here, as before Przemyśl, the II. Army had recourse to sapping, which by the 12th brought it sufficiently far forward for the assault of the enemy lines.

Mackensen had now assumed command of the IV., XI. and II. Armies; the III. Army had been broken up, its X. and XVII. Corps going to the IV. Army after the fall of Przemyśl, and the Beskiden Corps to the II. Army. He determined to make use of the breathing-space for a thorough preparation of the attack. Reserves had to be brought up to strengthen the armies, which in the matter of material also had to be made again fit to take the field by bringing up a sufficient store of munitions and by establishing a new base of supplies. Mackensen's Army Group was organized on June 10 as follows: The IV. Army (Archduke Joseph Ferdinand) stood on the front held by it during the Russian counter-offensive; the VIII. and XIV. Corps on the left wing to S. of Tarnagóra; the X. Corps, brought up from the III. Army, extended thence to Stare Miasto, and the IX. Corps from Stare Miasto to the Wisłok. S. of that river as far as the heights at the confluence of the Lubaczówka, stood the XVII. Corps, also from the III. Army. The total strength of the Army amounted to 14 inf. and 13 cav. divs. From the Lower Lubaczówka to S. of Czerniawa by way of Zapalów, E. of Chotyńiec and Starzawa, the XI. Army held the line. It was composed from N.W. to S.E. of the combined corps, the German X., XXII. and Guard Corps, the Austro-Hungarian VI. and the German XLI. Corps—in all 14 inf. divs. The positions of Böhm's II. Army, which adjoined it, extended from S. of Czerniawa in a circle W. of and S.W.

of Mosciska to the S. edge of the Wielki Bloto. This army comprised the Beskiden Corps, the Austro-Hungarian IV., XIX., XVIII. and V. Corps—14 divs. and 1 Landsturm Hussar brigade.

The Russian front was held by the III. Army from the Vistula to the upper Lubaczówka S. of Zapolów, and by the VII. Army thence to the Wielki Bloto. In all there were 41 inf. and 6 cav. divs. and 9 Reichwehr brigades of which, however, on June 14 two divisions of the XXI. Corps had been transferred to the W. flank of their XI. Army for the counter-offensive against Szurmey.

The general attack by all three armies began on the 13th. That of the IV. Army opened at 5:40 A.M. on the 12th with a powerful artillery preparation against the Russian positions at Sieniawa. In the course of the day Lt.-Gen. Behr's combined corps on the N. wing of the XI. Army succeeded in passing the Lubaczówka, and the Austrian 26th Landwehr Inf. Div. crossed the San at Ubieszyn and Lezachów, S. of Sieniawa, and finally got possession of the last-named place, which was held despite Russian counter-attacks.

At dawn on the 13th the XVII. Corps stormed the strong points of the hostile line at Sieniawa and Jukowa Gora, E. of it. These strong points were technically strengthened. Units of the IX. Corps had meanwhile passed to the E. bank of the San, including the whole of the 10th Div., which came into action in support of the XVII. Corps. On the same day Mackensen and Böhm opened the main attack. The Austro-Hungarian VI. Corps succeeded in pressing forward to Malastów, and to the N. of this the Guard advanced victoriously on Krakowiec. On the other hand, the II. Army at first made little headway until in the night of the 14th the successes of the XI. Army on the previous day began to have an effect. As early as the evening of the 13th the Russians began their retreat, which on the morning of the 14th became general. On this day the XVII. Corps of the IV. Army pushed forward on Cewków and the IX. on Tarnograd, the northerly advance of the latter being intended to facilitate the advance of the adjoining X. Corps over the San. The objectives of the XI. Army were, to the E., the line Sakny-Krakowiec, and to the N., in conjunction with the IV. Army, the area S. of Lubaczów. The II. Army was to advance beyond Mosciska. By the evening of the 14th the Russians had fallen back behind that town to a new defensive line which they had prepared on the heights W. of Sadowa Wisznia, at Krakowiec and Oleszyce. This line, however, also fell on the 15th. On the previous day the VI. Corps had for the second time succeeded in breaking through the Russian front at Krakowiec, and on the following day the German XXII. Corps did the same in the Niemirow direction, and the German X. Corps in that of Oleszyce and Lubaczów. On the IV. Army front the IX. Corps captured the *point d'appui* of Pioskorowice, while the XVII. Corps exploited its success at Sieniawa. The Russian resistance also gave way in front of Böhm's army, which on the 15th had stormed the Russian stronghold W. of Sadowa Wisznia.

On the evening of the 15th and on the 16th, the Russians were in retreat along the whole front. They had once more been beaten decisively in the battles of Przemyśl, Mosciska, and the Lubaczówka, and were now in full flight towards Lemberg. There existed now between the victorious Austro-Germans and the capital of Galicia only a single line of defence on the Grodek and Janow marshes of the Wereszyca, on which the 1914 battles of Lemberg and Rawa Ruska had been fought, and on this line the Russians once more attempted to make a stand.

Their losses since the commencement of the spring campaign in Galicia had already amounted to no less than 971 officers and 391,000 men captured, with 304 guns, 763 machine-guns, and vast quantities of other material. (E. J.)

DUNCAN, SARA JEANNETTE, MRS. EVERARD COTES (1861—), British-Canadian author, was born at Brantford, Can., in 1861, the daughter of Charles Duncan, merchant, and married Everard Cotes, Anglo-Indian journalist, late managing-director of the Eastern News Agency, in 1890. She began her literary work as a journalist in connexion with the *Washington Post* and afterwards the *Toronto Globe* and *Montreal Star*, contributing to the latter letters from Japan and the East, afterwards republished as *A Social Departure* (1890). During her long residence with her husband in India she made a considerable reputation as a novelist of Anglo-Indian life, notably in *His Honour and a Lady* (1896); *Set in Authority* (1906); *The Burnt Offering* (1909) and *The Pool in the Desert*, a volume of short stories (1903). Her lighter work includes *A Voyage of Consolation* (1898); *Those Delightful Americans* (1902) and *His Royal Happiness* (1915), dramatized and produced in London March 1919. She also wrote *The Imperialist* (1904), a Canadian novel.

DUNSANY, EDWARD JOHN MORETON DRAX PLUNKETT, 18TH BARON (1878—), Irish author, was born in London July 24 1878 and educated at Eton and Sandhurst. He entered the army, holding a commission in the 1st batt. Coldstream Guards, and served in the South African War. He was transferred

to the Reserve Royal Inniskilling Fusiliers and was wounded in the World War, April 25 1916. He unsuccessfully contested W. Wilts. in the Conservative interest in 1906.

Amongst his prose works may be mentioned *The Gods of Pegana* (1905); *Time and the Gods* (1906); *The Sword of Welleran* (1908); *A Dreamer's Tales* (1910); *Tales of War* (1918); *Unhappy Far-off Things* (1919); *Tales of Three Hemispheres* (1920). His plays include *The Glittering Gale* (1909); *King Argimenes* (1911); *The Gods of the Mountain* (1911); *The Golden Doom* (1912); *A Night at an Inn* (1916) and *If* (1921).

DUPUIS, JEAN (1828–1912), French traveller, was born at Saint-Just-la-Pendue, near Raonnc, France, Dec. 7 1828, and was educated at Tarare (dept. Rhone). In 1858 he went to Egypt as a trader, and from thence to China. His trading journeys took him into many previously unexplored parts of southern China, and in 1871–2 his efforts opened up the Song-koi or Red river to commerce. The foundations of the French possessions in Tongking were thereby laid and Dupuis did much to assist in the conquest of the country (see 27.6 seq.). His explorations are described in the following works: *L'ouverture du fleuve Rouge au commerce* (1879); *Les origines de la question du Tong-kin* (1896); *Le Tong-kin et l'intervention française* (1898) and *Le Tong-kin de 1872 à 1886* (1910). Dupuis was in 1881 awarded the Delalande Guérineau prize by the Academy of Sciences in Paris. He died at Monaco Nov. 28 1912.

DURBAN, Natal, S. Africa (see 8.606).—Pop. (1911) 34,880 whites and 53,118 natives, Asiatic and coloured. In 1918 the whites numbered 41,865 (with suburbs 48,413), natives (estimated) 26,000 Asiatics; and other coloured persons, 23,750; total 91,615. Durban's importance and prosperity depends upon its port (Port Natal), but since 1910 it has become a manufacturing place of some note. It is the most compact of the larger S. African towns, the borough covering only 12 square miles.

Chief among modern buildings are the new Town Hall (opened 1910) and the Law Courts. The latter face the Victoria Embankment, a fine thoroughfare along Bay Beach, i.e. the Bay of Natal. At the Point, overlooking the eastern entrance to the harbour, an equestrian statue of Dick King, commemorative of his great ride to seek help for the infant settlement, was erected in 1915. From Ocean Beach a semi-circular pier, over 900 ft. long, encloses a bathing place free from sharks. Ocean Beach, with its esplanade and park and fine hotels, forms the chief attraction during the Durban winter season (May to Sept.) when the mean maximum temperature is 76° F. For horse-racing fixtures Durban ranks only second to Johannesburg among the cities of South Africa.

Vessels are constantly engaged in dredging the bar at the entrance to the harbour; the lowest depth of water at the entrance is 36 ft., the minimum depth at the quayside varies from 22 to 30 ft. The harbour is equipped with every facility for the rapid loading and unloading of ships. At Congella, at the N.E. end of the harbour, some 220 ac. of land had been reclaimed and 3,460 ft. of wharfage provided by 1920. Here timber and bulky goods are handled. Congella is also the centre for manufactures; it has cold-storage accommodation and does a large export trade. It was, however, the development of coaling facilities, made practicable by the nearness of the Natal coalfields, that placed Durban in 1913–4 above Cape Town as premier port of the Union. The coal bunkered at Durban, 1,196,000 tons in 1913, rose greatly during the war, but fell to 608,000 tons in 1918–9. In the same year, however, the export of coal rose to 704,000 tons compared with 261,000 in 1917–8. The rival to Durban for coal exports in South Africa is not Cape Town but Delagoa Bay, which exports the coal from the Transvaal mines. In 1918, in which year there was a great falling off in the number of ships visiting the port, the total tonnage of cargo landed, shipped and transhipped at Durban was 2,373,000—it had been 2,801,000 in 1916. In 1919 shipping increased, the total net tonnage entering the port being 2,959,000, of which 2,562,000 tons were British.

In 1910 a wireless station was opened at Durban; the first in South Africa. It has a normal range of 300 m. by day and 1,000 m. by night. In 1918—year ending July 31—the rateable valuation of Durban was £12,378,000, the revenue £1,095,000 and indebtedness £3,135,000. In that year the net profit on municipal trading was £110,000; in 1920 the municipal valuation was £13,546,000.

DUVENECK, FRANK (1848–1919), American painter (see 8.737), died in Cincinnati Jan. 3 1919. He was awarded a special gold medal at the San Francisco Exposition in 1915, and the same year he presented to the Cincinnati museum a large collection of his own works.

DYEING (see 8.744).—The changes which occurred in the practice of dyeing during the years 1009–21 were not numerous

or important, any real progress having been checked by the World War, while in the rush to make up for loss of time post-war developments have also been few and far between.

As far as cotton-dyeing is concerned the most striking feature was the continued demand for the fast colours produced by means of vat dyes (indanthrene dyes, thioindigo red, etc.) which were introduced prior to 1914. These colouring matters, of which a wide range is now available, are being extensively used, in spite of their high price, for dyeing casement cloths, warp or weft threads to form the pattern in "grey" or unbleached piece goods which are subsequently bleached in the piece, and for the production of the fastest class of work in calico printing. Effects are thus obtained, even in bright colours and tints, in a degree of fastness formerly unknown, and this circumstance should go far to strengthen public confidence in the permanence of high-class coloured cotton goods.

Of colouring matters produced on the fibre, aniline black¹ is by far the most important, and is used in increasing quantity. This black may be produced on the fibre by different methods, but the one almost universally employed to-day is a modification of Lightfoot's original process patented as long ago as 1863. Commercially known as a "copper black," it is obtained by impregnating the material with a liquor containing aniline salt, copper sulphate and chlorate of soda, and, after ageing at a moderate temperature, running the goods through a hot dilute solution of bichromate of soda. This latter treatment constitutes the improvement on Lightfoot's process.

The production of insoluble azo dyes on the fibre, which was originated by Holliday in 1880 and has since been improved upon, is largely employed especially for the brilliant para-nitraniline red, a colour which also lends itself to the production of cheap but very striking resist effects in calico printing. The substitution of the anilide of beta-oxynaphthoic acid (naphthol A.S.) for beta-naphthol in the "prepare" may be regarded as a distinct recent advance in this class of dyeing, for the resulting colours are not only fuller and more level but the new colouring matters are tinctorially about twice as strong as those obtained with beta-naphthol. A still further improvement has recently come about by which the number of operations required to produce the colour is reduced to padding and steaming. To this end the fabric is padded with a mixture of naphthol A.S. and a nitrosamine (the nitrosamine obtained from diazotized ortho nitro para-toluidine) and the colour developed by steaming in a rapid ager. It appears likely that this class of colour will have considerable application in the future.

Among the direct cotton colours a complete range is now available (of the benzo fast red and other types) which yield shades of remarkable fastness to light, a property which was rarely shown by earlier representatives of this class of dye. For goods such as casement cloths this property is naturally an advantage, for the colours are not only easier to apply than the vat colours but are considerably cheaper. It should, however, be borne in mind that although they possess fastness to light they are liable to bleed in washing as badly as their predecessors.

Other improvements in cotton-dyeing relate mainly to labour-saving devices in the dyeing of yarn. Dyeing in the cop, "cheese" or on the beam (for warps) is more largely practised than formerly and various appliances are employed for the purpose. The principle in all of these is, however, the same, i.e. instead of the yarn being moved about in or passed through the dye liquor, the material to be dyed is held *in situ* and the dye liquor is caused to percolate evenly by pumping or other suitable contrivance. It is easy to understand that only such colouring matters as can be obtained in perfect solution can be employed for this kind of dyeing. The process requires skilful management to get good results, but if such can be achieved with certainty it not only saves much labour but the yarn remains in a better condition. In hank dyeing and washing the turning of the hanks to ensure uniformity of treatment requires much hand labour. This is now largely dispensed with by the use of suitable machinery for the purpose.

As regards wool-dyeing no great changes have taken place in the ordinary run of bright and most fancy colours, which are mainly got with acid dyes. For blacks and browns and other sombre colours which were formerly dyed almost exclusively with mordant colours (and are still so dyed for the best class of work), two classes of azo dyes have come into prominence which are rendered faster by means of chromate or bichromate of soda.

Diamond black may be taken as a type of the first class. The wool is dyed with this colour in the ordinary way in an acid (acetic) bath, and at the end of the operation bichromate of soda is added to the

bath and the boiling continued for some time, this additional treatment resulting in a considerable improvement in fastness and at the same time darkening the shade. Colouring matters of this type are known in the trade as "after-chrome" colours. The other class comprises the "meta-chrome" colours, and of these meta-chrome brown may be taken as typical. The dye-bath is made up with colouring matter, chromate of soda and ammonium sulphate. When the temperature of the bath approaches the boil ammonia is given off and the bath gradually becomes acid, causing both colouring matter and some of the chromium to be taken up by the fibre.

As in the case of cotton, machine-dyeing is now largely practised in dealing with wool in the loose state, in slubbing and in yarn. Here also a considerable saving in labour is effected and the valuable qualities of the fibre are much better preserved.

As far as silk-dyeing is concerned what changes have occurred are not of sufficient importance to merit special mention here. Artificial silk, especially that obtained from viscose which comes into the market in ever-increasing quantity, is dyed like cotton, but requires more care in manipulation since in the wet condition its tensile strength is considerably diminished.

Effects of the War.—During the years preceding 1914 Great Britain had been drawing roughly nine-tenths of its requirements in coal-tar dyestuffs (about 18,000 tons valued at £2,000,000 annually) from abroad—mainly from Germany. It was therefore clear at the outbreak of war that, unless the deficiency could be made up the British trade in coloured textiles would be severely handicapped as soon as the stocks in hand were exhausted. As early as Sept. 1914 a strong committee of British chemical manufacturers, colour manufacturers and colour users, styled "The Dyewares Supply Enquiry Committee," was inaugurated in Manchester under the auspices of the Society of Dyers and Colourists to discuss ways and means to meet the situation. This committee held numerous meetings at which various recommendations were made, some of which were ultimately taken up by the Board of Trade. The cardinal point which it was sought to elucidate from the start was the wants of the colour users, and to this end it was sought to make a classification of the imports before suggesting any definite course of action. The users were therefore appealed to, but although the majority readily responded several large users, including two of the large combines, refused to coöperate and the whole scheme fell through. The list, which would have been of great use and would not have taken long to compile, was completed and published at the instance of the Board of Trade five years later. In the meantime, stocks had long since become exhausted, and in spite of the enormously increased activity of the English colour makers and of the timely assistance of the Swiss colour works,² the supply was nothing like equal to the demand. The enormous profits realized by makers were largely devoted to extending and improving their works, but the prices of dyestuffs—both artificial and natural—nevertheless soared to unheard-of figures. The shortage of dyestuffs was brought home to the public by the miserable quality of the colours in wearing apparel offered for sale. Khaki for the army was dyed on wool mainly with a colouring matter of the meta-chrome series, whereas for cotton the old method (in which chromium and iron salts supply the colour without the use of any dyestuff) was available, but khaki shades were also dyed largely with sulphide colours. Indigo for navy clothing was not available in sufficient amount to go round, and its place was taken on wool by an azo dye known as coomassie blue. For indigo-blue shades on cotton sulphide blues were mainly employed.

The principal makers of coal-tar colours in England in 1914 included the following firms: Ivan Levinstein & Co., Blackley, Manchester; Read Holliday & Co., Huddersfield; Claus & Co., Dröysden; The Clayton Aniline Co., Manchester (owned by a Basle firm and mainly concerned with intermediates); The British Alizarine Co. of Silvertown; a works at Bromborough owned by a combine of three German colour works, and a works at Ellesmere Port owned by another German combine. The two latter were sequestered by the Board of Trade and subsequently disposed of

² Seeing that the Swiss colour makers were likely to help the British textile industry out of their dilemma, the German Government stopped supplies of raw materials to Switzerland, and these were sent from England on the understanding that an equivalent supply of dyestuffs should be delivered.

¹ Through an oversight the copper sulphate (10 parts) was omitted in the recipe given in 8.751. The total volume of the liquor (200 parts) should also have been stated.

to British manufacturers. In 1915 a company was formed with Government assistance to take over and extend the works of Read Holliday & Co. of Huddersfield under the style of British Dyes, Ltd. The amount of capital was £3,000,000, half of which was taken up by the Government and the other half largely by dye users, and it was decided at the time that the principal new works of the company should be established at Huddersfield, where a large tract of land for the buildings and yards had been purchased. Although at the time no efforts were spared to accelerate building and equipment the demand for colours still largely exceeded supply. Encouraged by the huge profits which were being made other works soon came into existence in various parts of the country, and each of these supplied its quota for users and for export. It may be said that in 1921 the development of the industry in England had proceeded so far that makers were in a position to supply a fair proportion of the colouring matters which were formerly imported—at a price. Considering the difficulties with which the makers had to contend in the way of having first of all to put up plant for the manufacture of the necessary intermediate products and then for the colouring matters themselves, in face of all the engineering and building restrictions which were accentuated by war conditions, great credit is due to the organizers and workers alike for this great achievement. Many processes were of course known to the chemists in pre-war works, and these offered little difficulty in the larger output. The intermediate products required for the manufacture of the azo dyes alone (the largest and most important class of the coal-tar colours) had to be first worked out in the laboratory before being put into operation on the large scale, for they had previously all (with the exception of aniline and toluidine) been obtained from Germany. In 1897 a plant was working in Manchester for the manufacture of two of the most important of these intermediates—beta-naphthol and alpha-naphthylamine, and German colour makers at that time actually drew their supplies of the latter product from England. But it was not many years before they were offering their own products for sale in England at prices lower than they could be produced at, with the result that the British manufacture was given up and imports were made from abroad. What was necessary in the way of preliminary work in the case of intermediates was naturally also required for the new colouring matters introduced, and this of course also required not only time but the undivided attention of a large number of skilled chemists. Another difficulty which the British colour makers were up against was the shortage of acids, especially oil of vitriol and fuming sulphuric acid or “oleum.” This meant the huge additional burden of having to erect new chambers and contact plant without which progress would have ceased.

After 1918, the British Government, recognizing the importance of dye manufacture as a “key” industry to the most important of the manufacturing industries—the textile industry, and in view of the fact that the colour industry and the manufacture of high explosives had something in common, decided to extend their support of dye-making as a national industry, and a new concern was launched under the style of “The British Dyestuffs Corporation, Ltd.” The new firm included British Dyes and Levinstein, Ltd. (which had previously bought up Claus & Co.), and started off with a capital of £10,000,000. Lord Moulton, who during the whole period of the war had undertaken the arduous and difficult duty of supervising the explosives branch of the Ministry of Munitions, was elected the first chairman of the new company. He possessed an intimate knowledge of some branches of the colour industry, and had from the outset taken a keen interest in their war-time development. The vast new works which have been erected by the company at Huddersfield are well planned and substantially built. Once in proper working order they should go far towards meeting the whole of the requirements of the British textile industries.

After the signing of peace at Versailles it was not unnatural that the German colour makers should have desired to re-open their trade in coal-tar colours with England, and as the British

consumers had been so long accustomed to the excellent products which they had supplied, German colours again began to be imported. The legality of this procedure was challenged by the British Government, who caused a consignment of pyrogallie acid to be impounded under a Proclamation dated June 25 1919. But in the test case against Mr. John Brown, trading as Brown & Fourth, Mr. Justice Sankey held that the Proclamation was illegal and invalid. Subsequently some thousands of tons of German-made dyestuffs were imported, and it soon became clear that the regenerated British industry would receive a severe check through foreign competition. To obviate this the Dyestuffs bill, which it had been intended to bring in immediately following the Sankey judgment, was prepared and passed somewhat hurriedly (but not without opposition) through both Houses of Parliament and came into force on Jan. 15 1921. The Act offers protection to the colour-manufacturing industry for a period of ten years, and is worked on the basis that no dyestuff may be imported which can be satisfactorily made in Great Britain. All imports in dyestuffs must pass through the hands of a licensing committee appointed by the Board of Trade. It was difficult to conjecture how this arrangement would work in the long run, but unless the prices of the British-made products were to be very materially reduced from their existing standard they were likely to constitute a drain on the textile industries which would not be justified. As long as the Act remains in force internal competition could operate as the only check. The colour users in England were quite prepared to pay a reasonable price for the possession of a colour industry of their own, and are large shareholders in the Dyestuffs Corporation. In this respect there is a precedent which, though well known in some circles, is not very common knowledge. About the year 1879 the manufacture of alizarine was almost entirely in the hands of the German works. They formed a combine and demanded an extortionate price for their products, whereupon the United Turkey-red Co. and other large British users of alizarine founded in 1882 the British Alizarine Co., which in spite of all foreign competition was a flourishing concern from its inception and has remained so ever since. Had it not been for the existence of these works (the only alizarine works in the world outside Germany) the English calico-printing trade would have almost gone out of existence during the war.

The difficulties which the British textile industry had to face owing to the shortage of dyestuffs was the lot of all other countries with a textile industry which were at war with Germany. In Belgium and France the industry was located almost entirely in the war zone. Nevertheless the French were not slow to resuscitate their old-established colour-making industry. Italy never had one and was supplied for war purposes either with dyed material or with dyestuffs largely from England. In Russia a works was started previous to the revolution under the management of Swiss technical chemists with a capital of £1,000,000. Japan appears to have had a fairly large stock of German dyes, but before these gave out colour works were started in that country which are reported to have been worked successfully. In India the position was very bad, and recourse was had largely to the indigenous natural dyestuffs, which were, after all, not very long since, the only dyes used there. The position in the United States and in Canada was very much the same as in England. The United States had, however, the advantage of having come into the war much later, although in 1917 their stocks of foreign-made dyes must have been at a very low ebb. Several American colour works of considerable capacity had existed prior to 1914 and had been protected by a 30% ad valorem import duty, plus a fixed duty of 7 cents per pound, on foreign dyestuffs. Without having to appeal to the State for further assistance, new and important works were started under the supervision of Swiss or German scientifically and technically trained chemists, private capital being abundantly supplied for the purpose.

It has been computed that, taking the world's production of artificial dyestuffs as 100, the distribution in 1913 was as follows: Germany 74.1, Switzerland 7, Great Britain 6.5, France 5.4,

United States 3.3, Austria 1.6, Russia 1.1. In view of the great changes which have taken place these figures are now of course no longer valid. What the figures were in 1921 was not even approximately known, but it is certain that the world's producing capacity, as distinct from actual production, was far in excess of any likely demand.

A good deal has been said and written about the correlation of dyestuff manufacture and the manufacture of high explosives, poison gases and other products required for chemical warfare. As far as the manufacture of high explosives is concerned, two main products, namely picric acid and trinitro toluole (T.N.T.), come into consideration. It is not very generally known that the former was made in England in large quantities as a dyestuff long before the French introduced it as an explosive. As a dyestuff it has long since been discarded, having been replaced by other coal-tar yellows of greater fastness which are not subject to any official restrictions. Both of these substances are nitro compounds of the aromatic series, and, like those manufactured as intermediates for dye-making, require, besides the coal tar common to both, large quantities of sulphuric acid, oleum and nitric acid (all products of the so-called "heavy chemical" industry) as raw materials. The nitrating operations are similar in both cases and similar plant is used, but there is always a limit to the size of the nitrating vessels which it is neither safe nor economical to exceed. Once the process is standardized on a unit of plant any increased production is obtained by increasing the number of units. Naturally any plant producing such nitro compounds in a colour works could in an emergency be turned to account to produce such a substance as T.N.T., but the amounts required for any serious military or naval operations would be vastly in excess of what could be turned out with the nitration plants of even large colour works. Nitrating is only one of a large number of important operations required in colour manufacture, and some dyestuffs are manufactured entirely without the help of this operation. The idea which seems to have become prevalent that the plant in a colour works is capable of turning out anything from a finished dyestuff to mustard gas or any new product that may come along is untenable. What is really wanted in this respect is a body of alert, scientifically and technically trained chemists. The best guarantee for the requirements of "chemical warfare" in the future is the possession of a successful colour industry, for the chemist best suited by training and habit of mind to cope with an emergency problem is the colour chemist.

United States.—The dyeing industry of the United States during 1910-21 grew commensurately with the textile industries. An important advance was made in the production of fast colours on cotton goods. This was in keeping with the rapidly extended use of cotton in high-grade wearing apparel and the increase of steam laundries, displacing household washing. Modern laundry methods of rapidly cleansing and whitening fabrics necessitated the use of strong chemicals, destructive of the colours formerly employed in dyeing cotton. The demand for laundry-fast colours was met by the introduction of the so-called "vat" dyes of which indigo was long the only representative. The extended use of the dye known as sulphur black to take the place of aniline black for cotton hosiery and piece-goods was also worthy of note. The silk industry in America also grew largely, consuming more raw silk in manufactures than any other country. This led to the great extension of silk-dyeing, chiefly in the industrial centres of South Manchester, Conn., Paterson, N.J., and Lancaster, Pa.

The World War at first threw the dyeing industry in the United States into confusion, owing to the uncertainty of trade relations with Germany, the more so when the Allied blockade put a complete embargo on Germany's exports. It was then seen how dependent America had been on Germany for dye-

stuffs, and it was estimated that manufacturing industries with products valued at about \$4,000,000,000 might soon be thrown completely out of gear by a lack of dyestuffs. In the confusion which resulted all manner of expedients were adopted in the production of colours with a consequent reduction in the fastness and quality of dyeing. Dyestuffs became so scarce that exorbitant prices stimulated the erection of many dyestuff factories in various parts of the United States. Large amounts of capital were freely invested in the new industry, and many chemists became engaged in dyestuff research and manufacturing.

Previous to the war the United States had a small dyestuff industry distributed among about five plants. The manufacturing operations, however, were limited chiefly to the assembling of the coal-tar intermediates imported from Germany for the production of the finished dyes, so that the new industry had to be built from the ground up. To the great credit of the American chemist and chemical manufacturer it may be said that in a very short time the more important dyes were successfully made in the United States in such quantity that practically no dye-consuming industry was forced to shut down by reason of a lack of dyes. Indigo and sulphur black were soon produced on a large scale, as well as the required acid dyes for wool and silk, most of the basic dyes, and a complete line of the direct cotton dyes. In 1920 there were 213 firms manufacturing dyestuffs and related coal-tar chemicals. These employed about 2,600 chemists and nearly 20,000 workmen and the total value of the finished products amounted to over \$112,000,000. There were 236 different intermediates manufactured, and 360 different dyes. The total production of dyes amounted to over 88,000,000 lb. as against a pre-war importation of about 70,000,000 pounds. The total value of the finished dyes was given as \$95,600,000, so that the average price per pound was about \$1.07. Over 18,000,000 lb. of synthetic indigo was made, about twice the pre-war importation, indicating great extension in the use of indigo. Associated with the making of dyestuffs there also grew up the many related branches of the coal-tar chemical industry, such as colour lakes for paints, lithographic and printing inks; coal-tar pharmaceuticals; flavouring and perfume materials; photographic chemicals and synthetic tannins and resins. The great growth of the industry created a constant demand for increasing quantities of coal-tar distillates, which form the raw materials of the dyestuff industry, and this led to a rapid increase in the number of by-products coke ovens. In 1920 the production of coke in by-product ovens amounted to about 60% of the total.

The great production of dyes in the United States during the period 1917-21 led to the building up of a considerable export trade, particularly to South America and the Orient. The total dyestuffs exported from the United States in 1920 amounted in value to nearly \$30,000,000, of which \$22,450,000 was for coal-tar dyes. This export trade, however, showed a rapid falling off from the beginning of 1921, due both to the general business depression throughout the world and to the fact that the German dyestuff manufacturers were again active in foreign trade.

At the close of the war the American dyestuff manufacturers quickly realized that unless they had suitable Government protection they could not meet aggressive competition from European dyestuff factories. In 1916 they petitioned for, and obtained the passage of, a bill placing a tariff of 30% ad valorem and a specific duty of 5 cents per pound on most dyes. When hostilities ended certain Government regulations were also applied to the importation of dyestuffs and related products from Germany so that such importations were licensed to bona fide consumers and were limited to dyes that could not be satisfactorily obtained from the American manufacturers. In the meantime Congress was petitioned for an embargo on importation of dyes from foreign sources except under adequate licence regulations which would restrict the imports to dyes not manufactured in the United States. This was in line with similar action by Great Britain, France, Italy and Japan, all these countries deeming it highly expedient to foster and build up a self-contained dyestuff and coal-tar chemical industry as a measure of national defence.

In the matter of natural dyestuffs America has always occupied a leading position. Many of the principal natural dyes are of American origin. Logwood, fustic, cochineal and the red-woods are all American products, discovered in, and still obtained from, Mexico, Central America and South America, as well as the West Indies. During the war a product very closely resembling fustic and known as osage orange was also developed in the United States and in 1921 was being produced in considerable quantities. As the dyer usually employs the colouring matters of the dyewoods in the form of suitable extracts, there has long been developed in the United States a considerable industry in the manufacture of these extracts, generally produced in connexion with the manufacture of tannin extracts. This industry is in no way associated with the coal-tar dyestuff business. The great scarcity of dyes during the early part of the war resulted in an abnormal expansion of the dyewood extract industry, which rapidly declined as the manufacture of synthetic or coal-tar dyes increased. In former years natural indigo was extensively used in dyeing, and in early colonial days large quantities of this dye were cultivated in the south. As the growing of cotton increased, that of indigo was neglected, so that most of the indigo used in the United States was imported, chiefly from the Far East. A certain amount, however, had long been obtained from Central American provinces and the West Indies. The advent of synthetic indigo soon displaced the natural product, so that little of this vegetable dye was used in America, although the United States in 1921 manufactured all it needed of this most important dye. After the war, owing to the shifting of the centres of trade, the United States became an important market for the sale and manufacture of furs. This resulted in the building up of an extensive industry in the dyeing and finishing of furs which will without doubt become firmly established as an important adjunct to the general dyeing industry of America. (J. M. M.)

DYSENTERY (see 8.785*).—This term is now employed to designate a clinical syndrome characterized by the passage of blood and mucus consequent upon the pathogenic activities—primarily upon the large bowel, leading to ulceration—of certain animal or vegetable forms of life. The advances in our knowledge of dysentery made during 1910–20 were considerable, and were in great measure due to the combined interdependent efforts of protozoologists, bacteriologists and entomologists in their unremitting investigations and laboratory researches, to their fruitful collaboration with the physician, also to the extensive experience gleaned through the World War. Dysentery as a disease is widespread throughout the world and workers in all continents and many countries have shared in the progress of knowledge of it. This was, moreover, essential, as certain causal organisms amongst the helminths can only complete their life-cycle in the particular regions where their primary host, a lower animal, exists in nature.

Again, climatic factors play a rôle in the incidence of certain types of dysentery; and the organisms, their rôle and specific lines of treatment and prevention, can be best studied where the disease prevails. Thus American workers in Manila firmly established by experiments on condemned prisoners that there is but one, *Entamoeba histolytica*, of the five amoebae found in man which is pathogenic to him, and finally cleared up the confusion by determining its life-cycle and differentiating it from the *E. coli*, an amoeba living also in the large bowel of man.

From Hong-Kong we learned the specific action of emetine, an alkaloid extracted from ipecacuanha, on amoebae; and its application with such beneficial results to man was first made in India. Though amoebic dysentery was until recently considered a disease of the tropics, and rare in temperate countries, relative researches on inhabitants of several temperate countries show a small percentage to harbour the *E. histolytica*, some without complaint of dysenteric symptoms. The conditions of climate, sanitation, food and living may favourize individual resistance as well as susceptibility to acute symptoms. Recently a few workers in England have concluded that there are two or more strains of the *E. histolytica*, distinguishable by the size of the cyst each

forms. French physicians in Indo-China have observed that in one region the *E. histolytica* gives rise to more severe dysentery and is less amenable to treatment than in another, thus raising the question of a difference in virulence amongst strains.

In Rumania in 1916 a new and distinct species of *Bacillus dysenteriae*—*Bacillus dys. Schmitz*—was first found.

In England and France the presence of bacteriophage has been determined. If a few drops of the filtrate from a culture of the dysentery bacillus Shiga be placed in a new growth of this bacillus, the micro-organisms are dissolved. The action is considered due to the development of an ultra-microscopic micro-organism which destroys the bacillus and appears to be specific.

As dysentery may be due to diverse organisms, the causal one or its family or generic name is employed to specify the origin, thus—amoebic, bacillary, spirochaetic, ciliar and helminthic dysentery. When there are evacuations of blood and mucus associated with inflammation and ulceration, not due to an organism which acts primarily and specifically on the lower bowel, but which may primarily attack another part of the body (e.g. tubercle, syphilis), or to carcinoma, or due to an impacted foreign body or mechanical irritation, the condition is termed, to distinguish it, pseudo-dysentery. When an ulcer is low down it can be seen and its character determined by the sigmoidoscope.

It is important to determine the causal organism in a sporadic dysentery case or in an epidemic, not only because of the specific treatment necessary but to assure adequate prevention of its extension; and laboratory collaboration for this is essential.

It has been amply exemplified that dysentery cannot be diagnosed on the presence of blood and mucus in the stools with accompanying abdominal pain and tenesmus. One or more of these symptoms may be absent, for they depend on the extent or site of the ulceration. In the contact or healthy carrier of the *E. histolytica* there may be no signs past or present, the *E. histolytica* to all appearances living as a harmless commensal within its human host, and the first sign of the presence of the disease may be a liver abscess, a very rare condition outside tropical regions. It is only by investigating these contact carriers in the laboratory that the disease can be detected from cysts in the faeces.

Dysentery has always been the most dire disease accompanying war. During the World War, despite our greater knowledge of its causes and of prophylactic measures to counteract it, its invaliding rôle was considerable in all armies, especially those fighting in tropical countries where the conditions favour it, and in parts of eastern Europe where sanitary control was not scrupulously exercised. The number of admissions to military hospitals which follow testify to its ravages amongst British troops, and many others there were who did not seek hospital treatment. The comparatively small death-roll was no doubt due to the application of the advances in our knowledge that dysentery may be due to diverse organisms, each having a specific line of treatment to be directed against it. Most deaths were due to *Bacillus dys. Shiga*.

In France there were 11 cases in 1914; 1915, 26 cases; 1916, 5,754; 1917, 6,031; 1918, 12,211 cases—figures which are relatively small considering the number of troops there. In East Africa 1917, 9,369 cases, 317 deaths; 1918, 1,646 with 38 deaths. In Mesopotamia 1916 (6 months), 1,939 cases with 126 deaths; 1917, 4,860 with 151 deaths; 1918, 5,455 with 109 deaths. In Egypt 1916, 5,577 cases with 81 deaths. In Italy 1918, Forward Area, 897 cases with 17 deaths; Lines of Communication (Toranto), 146 cases. In Salonika 1916, 5,987 cases with 132 deaths; 1917, 5,842 with 124 deaths; 1918, 9,318 with 158 deaths. On the Gallipoli Peninsula figures were not obtainable, but it is estimated that nearly every soldier who landed on the peninsula suffered from dysentery or diarrhoea and few escaped the former disease. Severe climate, difficulties of obtaining adequate food and sterilized water, fly pests, fatigue, hastily improvised resting places and sanitary arrangements, prolonged periods in trenches—all were important factors conducive to susceptibility in man and to the spread of infection.

Bacillary and amoebic dysenteries greatly predominated. There were exceptional and sporadic cases of spirochaetic and, amongst coloured troops especially, of ciliar and helminthic dysentery. In all countries bacillary greatly predominated. In France other than bacillary infections were rare and the amoebic type was found more frequently amongst those associated with troops from tropical countries or who took over camps or trenches used by them. In tropical and sub-tropical regions the percentage of amoebic to

* These figures indicate the volume and page number of the previous article.

other dysentery cases was approximately 12. More particularly in Gallipoli combined infections were not uncommon and there were cases suffering from dysentery and enterica at the same time.

During 1920, of 6,193 returned troops claiming State aid for disability from war dysenteries, 446 were still harbouring the *E. histolytica* and over 80% of these were intermittently or constantly passing blood or mucus; two acquired a liver abscess when in England as a complication; eight were still infected with the *B. dys. Shiga* and four with *B. dys. Flexner-Hiss*; one case had mixed amoebic and bacillary (*Shiga*) infection, and three mixed amoebic and spirochaetic, and six spirochaetic dysentery.

By reason of the variety of the causal organisms, the clinical symptoms and pathological characters to which each gives rise and the specific treatment directed against it, each type of dysentery had best be considered separately, and the commoner types, amoebic and bacillary, discussed in greater detail.

Amoebic Dysentery (also called Amoebiasis, Loeschiasis or Tropical Dysentery, the latter because of its early endemicity and greater incidence there).—The causal organism, *E. histolytica* (Loesch 1871), a species of the genus *Entamoeba*, affects man alone in nature, though the dog and cat and recently the guinea-pig have been infected experimentally. The *E. histolytica* in its life-cycle in man passes through three stages—a large vegetative stage when living within the tissues, giving rise to ulceration and passage of blood and mucus; a pre-cystic or *minuta* stage found in convalescents and in carriers when the amoebae are much smaller, live on the mucous membrane within the bowel, but which may pass through the membrane and assume the larger vegetative form, with ulceration and its symptoms following; and a cystic stage. The amoebae increase in numbers by division of the parent into two, but it is only the pre-cystic or *minuta* stage in which many of the amoebae contract into a smaller rounded or ovoid form, develop a firm outer wall and are transformed into cysts with the characteristic one to four nuclei and containing chromatoid rods which possibly act as food stores. Since it is only by swallowing these cysts that man is infected, the continuance of the entamoeba in nature is thus provided for. These cysts do not resist drying, but retain their vitality for two weeks if kept moist in the faeces or in water. They can therefore be transmitted by direct contamination with faeces through handling soiled linen, by flies carrying them on to food, by soil or by drinking contaminated water; and prophylaxis must be directed accordingly.

Clinically the disease is characterized, as are all protozoal infections, by its chronicity with tendency to recrudescence of symptoms. The onset is insidious, the sufferer first noticing a feeling of debility and lassitude with an increase of stools, soft in character, for several days. These may clear up and be the only signs noticed or may light up again and assume true dysenteric characters months later. Most often the initial stage is followed on by an acute exacerbation of symptoms, dependent in their degree upon the extent of the ulceration in the large bowel, the most markedly affected sites being the caecum and flexures. Stools become still more frequent, up to 40 or 50 in 24 hours, and the ulceration gives rise to abdominal pain and, if at the rectum, to severe tenesmus. The patient takes to his bed exhausted. In uncomplicated cases there is but slight rise of temperature or other symptoms of toxæmia as the entamoeba produces no toxin. The entamoeba gains entrance to the body by the swallowing of its cysts, which pass through the stomach unchanged. In the small intestines they germinate and young amoebulae are set free in the lumen of the intestine. They increase in size, multiply by a process of division, and by means of their lytic or dissolving power penetrate through the mucous membrane lining the large bowel, rarely the appendix save at its base, into the sub-mucous layer, where they continue to proliferate, destroy the tissue, including the blood-vessels, thus leading to the haemorrhage that accompanies the mucus produced by the irritation of the membrane, and impede the circulation of blood and lymph at the site. A typical flask-shaped ulcer is formed, with roughened undermined edges at the orifice. When ulcers are situated approximately they are frequently joined by submucous tunnels, and, the ulcers being mechanically produced, there is little accompanying inflammatory reaction. Occasionally super-added infection with other bowel organisms supervenes and gangrene may follow, or the amoebae may penetrate through the outer muscular walls of the large bowel, giving rise to perforation and accompanying peritonitis, or, by penetrating a blood-vessel, they may be carried off in the blood stream and give rise to an abscess in the liver, to which the blood first takes them, or, as most exceptionally happens, an abscess in the brain or elsewhere. Healing is brought about by the development of fibrous tissue at the sites of the ulcers, and this contracts and leads to a thickening of the walls and constriction of the lumen which, if extensive, produces subsequent chronic constipation; or, what is rare, to stenosis and blockage. Diagnosis is quickly made by examination of the stools. In the acute condition they may consist entirely of blood and mucus or contain also a little faecal matter. The mucus is stained a brownish colour by degenerated blood cells and the blood is usually in the form of clots, not evenly mixed through it. Microscopically the *E. histolytica* is readily found and is distinguished by its rapid movement, ill-defined nucleus and greenish-

tinted ectoplasm and ingested red cells. White blood cells apart from a relative increase of eosinophils are not seen in great numbers. Charcot-leyden crystals, as yet only seen in dysentery of the amoebic type, may be found.

The acute symptoms readily subside under appropriate treatment. The patient should be put to bed. The specific treatment is ipecacuanha or an alkaloid extracted from it, emetine. Combined hypodermic injections of emetine hydrochloride with oral administration of ipecacuanha (Brazilian), to attack the amoebae from within and without, have given striking results in allaying symptoms. More recently emetine alone or in combination as bismuth-emetine-iodine in a salol capuled pill has been widely employed and good results are claimed, especially in the treatment of chronic cases. The toxic action of emetine on the heart must be watched. Added to the specific treatment in acute cases there is the general and symptomatic, which should include a free flushing of the bowel by a dose of castor oil with tinct. opii. added; later followed by magnesium (or sodium) sulphate in hourly or two-hourly half or drachm doses for 12 or 24 hours. Morphia may be necessary to relieve the abdominal pain and straining. The diet must be light and easily assimilated. Milk and raw foods should be withheld.

The symptoms subside in one to three weeks and no further trouble may supervene. However, the patient not infrequently is left with symptoms, generally slight, from cicatrization of the bowel; or, from persistence of the entamoeba, becomes a *convalescent* carrier as distinguished from a *contact* carrier, one who has never developed acute symptoms. The treatment of these carriers is one of considerable importance not only for the individual, who may re-develop acute symptoms or a liver abscess, but for the community, since these carriers pass in their stools the cysts of the entamoeba which can infect others. Treatment apart from symptomatic is directed to eliminate the amoeba in chronic cases and consists in giving orally ipecacuanha or emetine alone or combined with other drugs as a pill, capsule or paste in courses over a number of days. Emetine hydrochloride subcutaneously, or neosalvarsan intravenously, have been employed to supplement oral treatment. At the same time the large bowel is washed out by enemata per rectum, the use of appendicostomy wounds not having given sufficiently encouraging results, with solutions of quinine, tannin or, as recommended by the French, of neosalvarsan. Indiscretions in diet should at all times be avoided and it appears advisable for the carrier to reside in a temperate region. Amoebic hepatitis and a small abscess of the liver are cured by injections of emetine hydrochloride or neosalvarsan, but a large abscess needs surgical intervention.

Bacillary Dysentery.—While sharing with the amoebic the clinical dysenteric syndrome above described, it differs therefrom in the shortness of the incubation period, generally 24 to 72 hours, by its sudden acute onset with elevation of temperature, which may persist several days or more, and other symptoms of toxæmia; extreme contagiousness; seasonal incidence (midsummer and autumn); epidemic character and predilection for temperate regions; higher death-rate and in the complications that may follow infection with *Bacillus dys. Shiga*, namely:—arthritis, conjunctivitis, muscular paralysis and myocarditis. Clinically it may assume forms varying in symptomatology from mild to severe, and occasionally be hypertoxic, typhoid or ulcero-gangrenous in character. Outbreaks of dysentery in asylums, prisons, concentration camps and ships are generally bacillary in type. In tropical regions the amoebic type also occurs, but in temperate regions this latter form is practically limited to sporadic cases.

The bacillary dysentery group comprises species of bacilli genetically related: 1. The *B. dys. Shiga* (Chantemesse and Widal 1888, Shiga 1898, Kruse 1900), a well-defined homogeneous species, known as the true dysentery bacillus since it alone contains endotoxins which are pathogenic to man and experimental animals. 2. *B. dys. Schmitz* (Schmitz 1916, Andrewes 1918, Broughton-Alcock 1918), another homologous species and one which contains endotoxins acting severely on rabbits but less pathogenic to man. 3. *B. dys. Flexner-Hiss*, a very mildly toxic group of bacilli characterized by their power to ferment mannite, produce indol from peptone and containing many species as recently distinguished by the agglutination and absorption reactions. 4. A further group which embraces bacilli characterized by specific agglutination and absorption properties and power to ferment certain sugars, e.g. *Bacillus of Strong*, *Castellani*, *Gay*, *d'Herelle* and others, each capable of producing a mild clinically dysenteric syndrome in man.

Clinical symptoms vary, as does the degree of the intestinal lesions and the toxicity of the causal bacillus. Infections with *B. dys. Shiga* are characteristically the most severe. The ulcerative lesions are not confined to the large bowel but extend one to two feet into the small intestine. Recent researches have proved that the bacilli pass through the stomach, multiply in the small intestine and produce at least two toxins which are absorbed into the blood, one acting on the nervous system and the other excreted into the large bowel, causing inflammation with coagulation of lymph, thrombosis of vessels and necrosis of the submucous layer and superimposed mucous membrane. An exudative fibrinous diphtheritic-like membrane forms on the bowel wall and separates off, leaving superficial ulcers with raised red oedematous edges. These may

deepen by continued microbic action and even penetrate through into the peritoneum, leading to peritonitis, or gangrene may set in in the damaged necrosed tissue, and in either case death follows unless surgical intervention is early. Repair proceeds along the same lines as in amoebic cases, but, the ulcers being generally more superficial, the permanent damage is not so great.

The stools have a characteristic microscopic appearance, as numerous pus epithelial cells and large macrophage cells are present in the mucus. Macroscopically the stool most often consists of mucus, like cloudy-grey jelly streaked or stained by bright red blood, or the mucus may be bile-stained in a diarrhoea-like stool or, in very severe cases, there are shreds of necrosed mucosa.

The causal bacillus is readily isolated by culture within the first days, but afterwards it becomes difficult as the microbic life in the necrotic tissue becomes a flora of proliferating organisms. The bacillus of Shiga, which has been the only species isolated from the blood stream, has been found therein in only four or five cases. The bacilli dysenteriae, as judged by post-mortem findings, pass to the mesenteric glands along the lymphatics, but are arrested there. After the cessation of the symptoms the percentage of cases retaining the causal organism in the bowel is very small, as testified in the figures given above. If the patient becomes a carrier of *B. dys. Shiga* the stools will continue to be in part muco-purulent, even up to three or more years. The property of agglutinating the causal organism and other strains of the same race is present in the blood after the first week and may last for only eight or ten days in mild cases, but when the infection is prolonged this property of agglutination persists for a longer period. *B. dys. Shiga* infected cases generally agglutinate also the *B. dys. Flexner-Hiss* in a lesser degree, but the converse does not hold. *B. dys. Flexner-Hiss* cases agglutinate several species of the group, rarely only the strain isolated from them. *B. dys. Schmitz* cases do not appear to develop agglutinins even for their own organism.

The general and symptomatic treatment given above for amoebic dysentery is similar, but the specific treatment widely variant, and this is directed towards neutralizing the toxins which further the clinical symptoms. It is the anti-Shiga serum, prepared by inoculating the bacilli with their contained endotoxins into the horse, which is the most efficacious; and as it is the infection with *B. dys. Shiga* which is most severe, its utility is considerable. It has been employed also in cases due to *B. dys. Flexner-Hiss* with apparently satisfactory results. A polyvalent horse anti-serum made by inoculating strains of both these groups has also been extensively given in cases of either infection and, with this, amelioration of symptoms has followed. The injection of anti-serum should be as early in the illness as possible and in large doses dependent upon the severity of the cases, e.g. 60 c.c., 40 c.c., 20 c.c., on successive days in a severe case; and with this treatment free saline purgation is combined until the stools become faecal. Thereby rapid amelioration follows, complications are rare, and the bacillus quickly eliminated from the body. In the early complications of bacillary dysentery anti-serum therapy again gives good results.

The general prophylactic measures to be taken are comparable to those against infections with *E. histolytica*, but it should be remembered that bacilli are lower vegetable organisms and can

proliferate in suitable environment outside the body. Dependent on several factors, bacillary is more contagious than amoebic dysentery. Encouraged by successful results following inoculations of typhoid and paratyphoid vaccines, some series of inoculations with a vaccine of *B. dys. Shiga* were made in epidemic areas during the war, as this was the bacillary organism so prevalent and so toxic in epidemics during war conditions. Its contained toxins give rise to acute local reactions unless modified prior to inoculation by special methods, as by laving the heat-killed bacilli with normal serum (serum-treated) or with specific horse anti-serum (sensitized), or by inoculating both specific anti-serum and bacillary emulsions on approximating days, or by giving an absorbed specific anti-serum and bacillary emulsion simultaneously, or by emulsifying the bacilli in oil. The series of inoculations made by various workers gave encouraging results. Vaccine-therapy employed to rid the convalescent carrier of *B. dys. Shiga* has not been successful. In striking contrast with *B. dys. Shiga* the killed and untreated emulsions of the *B. dys. Flexner-Hiss* group give rise to no reaction, even in high doses.

Spirochaetic Dysentery, due to *Spirochaeta eurygyrate* (Le Dantec 1900, Werner 1910, Fantham 1916).—Investigation of this type of dysentery is in continued progress, and evidence is increasing that this spirochaeta is capable of living upon the mucous membrane of the large bowel and maintaining a chronic form of dysentery. It is seen in considerable numbers in the mucus and occasionally also within the lining cells of the glands. Occasionally there is also blood present with the mucus which is being continually passed with faeces. An acute condition with passage of blood and mucus only has been observed. This spirochaeta is resistant to intravenous injections of neosalvarsan or tartar emetic alone; and treatment by an arsenic-containing compound at the same time as a local washing of the bowel with irrigations containing eucalyptus has given the most encouraging results.

Helminthic Dysentery.—The chief helminths which give rise to dysentery are the bilharzia worms, *Schistosoma mansoni*, in Africa, South America, West Indies, and *Schistosoma japonicum* in the Far East. Bilharzia dysentery is characterized by the passage of mucus and clots of blood due to the presence of the ova which the adult female worm lays in the capillaries of the wall of the rectum. This form of dysentery is extremely common in Egypt. The discovery of the intermediate snail host and the specific action of sodium or potassium tartrate in killing these worms in man is an advance of considerable value.

Other trematodes which may cause dysenteric symptoms are *Fasciolopsis buski*, *Heterophyes heterophyes* and *Paragonimus westermani*. Normally the last is a lung fluke, but it occasionally occurs in cysts of the intestinal wall, when it gives rise to the passage of blood and mucus in the stools.

In heavy infections with hook-worm (*Ancylostoma duodenale*, present in England in the mines of Cornwall, and *Necator americanus*) blood and mucus are sometimes passed in large quantities, and these cases may be mistaken for true dysentery. Thymol given orally rapidly kills off these worms.

Ciliar Dysentery, due to *Balantidium coli* and known to occur in Japan and the Philippine Is., is rare elsewhere and needs but mention. A specific remedy has not yet been found. (W. B. A.)

EAKINS, THOMAS (1844-1916), American painter (see 8.791), died at Philadelphia June 25 1916.

EAST, SIR ALFRED (1849-1913), English painter (see 8.827), was knighted in 1910, and died in London Sept. 28 1913.

EAST AFRICA: MILITARY OPERATIONS, 1914-8.—The outbreak of war found all the combatants in East Africa unprepared for offensive operations. But the advantage inclined to the Germans, for they had forces on the spot sufficient for defence, which was not the case in respect to the British protectorates bordering German East Africa. The Belgian Congo was also without adequate means of defence.

Hostilities were entirely unexpected. So little was the Government of British East Africa anticipating war with its German neighbours that the bulk of the Protectorate Force, a battalion and a-half of the King's African Rifles—negro troops officered by Europeans, together with the Uganda battalion of the same force, was, in Aug. 1914, engaged against recalcitrant tribesmen in Jubaland, on the borders of Italian Somaliland, 500 m. away. In short, all the British protectorate lay open to invasion. But Lt.-Col. von Lettow-Vorbeck, commander of the forces in German East Africa—the one German soldier who earned a high reputation in the colonial campaign—knew that his opponents would be reinforced from overseas, and contemplated nothing more than an offensive-defensive. His total force, when the war began, was just under 5,000, including 260 Europeans.

The British had the advantage of the command of the sea, and the ports of German East Africa lay open to attack. So keenly did the governor of the protectorate, Dr. Heinrich Schnee, realize their helplessness that one of his first orders was to forbid any action to be taken which would lay the ports open to bombardment. As in the case of the governors of British Dominions and Colonies the governor of German East Africa was also commander-in-chief of the forces, and Dr. Schnee asserted his authority in that respect despite the protests by von Lettow. Indeed, Dr. Schnee and many of the Government officials at Dar-es-Salaam, the capital and chief port, had "little stomach for a fight," and when on Aug. 8 two old British cruisers, the "Astraea" and "Pegasus," steamed across from Zanzibar to Dar-es-Salaam, by the governor's orders and without the knowledge of von Lettow, negotiations for surrender of the port took place. The ships had no force to garrison the town, but the Germans signed an agreement "which forbade us to undertake any hostile act in Dar-es-Salaam, while the enemy was not so bound" (von Lettow). The same day Dr. Schnee left Dar-es-Salaam for Morogoro, a pleasant hill station with European amenities, 140 m. inland by train. The high-power wireless station at Dar-es-Salaam which communicated with Berlin was destroyed.

Despite the attitude of the governor, von Lettow determined to carry on the fight to the utmost possible limit. He had taken up his command in East Africa in Jan. 1914 convinced that "the universal war," as he calls it, might be imminent, and that if it broke out it was his duty to combat as many of the enemy as he could and for as long as he could.

The country was highly favourable to protracted defence by a resolute and ruthless commander, such as von Lettow proved.

A very large proportion of the country is covered by "bush," that is an undergrowth sometimes more or less open, but usually dense, from which rise trees to a height of some 30 feet. This bush covers hills and valleys and even dry desert, and in the coast region develops into luxuriant jungle. Much of it is infested by the tsetse fly. Some areas are covered with dense forests, others with elephant grass growing 6 to 10 or more feet high. The valleys of almost all the rivers are swampy and fever stricken; during the rains vast areas become inundated; in the dry season, away from the rivers, water is often lacking; wild animals constitute a real danger, especially to the wounded. The climate is tropical and very unhealthy save

on a few high plateaus, and in certain hill districts malaria is endemic. These conditions existed throughout German East Africa, a country nearly double the size of Germany. The "bush" was the greatest asset of the defence. As Gen. Smuts wrote (in 1918), "in the African bush, with its limited visibility, it is practically impossible to enclose an enemy determined to escape." The method is simple—when a force is so hard pushed that destruction is inevitable if resistance continues the order is given to "line for bush," whereupon the force splits up into parties of threes and fours and vanishes into the bush. Pursuit is hopeless, and the scattered enemy, if well trained, reassembles at an appointed rendezvous. Moreover, so dense is the bush over many thousands of square miles that considerable forces may be on the march within a mile of one another, without being aware of each other's existence. These factors explain why, given sufficient armament and food, von Lettow was still in the field when the Armistice was signed in Europe, in spite of his isolation and the superior forces that after 1916 were brought against him.

Von Lettow had drawn up his plan of campaign before hostilities began, and as the best means of defence had determined to take the offensive against the enemy's most sensitive spot.¹ This he rightly conceived to be the line of the Uganda railway (which runs from Mombasa to Victoria Nyanza). The line is parallel to and about 50 m. distant from the (then) Anglo-German frontier. It passes through the Highlands, where the British European population is concentrated with Nairobi as chief town. On the "German" side of the frontier are the Usambara hills and the Pare mountains, presenting a wall-like face to British East Africa, with few passes. But between the northern end of the Pare mountains and the towering slopes by Kilimanjaro, which rise farther north, was a distinct "gap" forming the usual passage-way between the German and British protectorates. A railway from Tanga, the port of Usambara, ran to Moshi, on the slopes of Kilimanjaro, and at the western end of the "gap." At its eastern end, in British East Africa, is Taveta. This place was seized by the Germans on Aug. 15 and was used by them as a jumping-off ground for raids on the Uganda railway, raids which included the design of occupying Nairobi.

At the outset, or shortly afterwards, a design was also entertained by the Germans of capturing Mombasa and holding it long enough to wreck the harbours and destroy the great railway bridge from the island to the mainland. This was rendered possible by the return to Dar-es-Salaam in Sept. of the cruiser "Königsberg" (it had sailed from that port shortly before the declaration of war). It was then arranged that a force should march along the coast from Tanga on Mombasa, while the "Königsberg" attacked it from the sea. On Sept. 20 the "Königsberg" appeared off Zanzibar and destroyed the "Pegasus," which was in the roadstead undergoing repairs. Mombasa, was to be attacked on Sept. 29. But the "Königsberg" did not keep its engagement, ships of the Cape Squadron under Vice-Adml. King Hall intervening. Harried by the British, but not overtaken, the commander of the "Königsberg," Capt. Looff, in Oct. ran his ship aground in the shallow waters of the Rufiji river, south of Dar-es-Salaam. The land force which was to coöperate with the "Königsberg" was already at Vanga, just within the British border, and it began its march of 50 m. along the coast on Sept. 20. It attacked Gazi, 25 m. from Mombasa, on Sept. 23, was repulsed and forced to retire to the frontier on Oct. 8.

Apart from raids along the coast and on the Uganda railway the Germans made a series of incursions into the frontier districts of Uganda, the Belgian Congo, Rhodesia and Nyasaland. For

¹ Von Lettow records that at first many officers were loth to obey his orders, because, apart from the governor's attitude, they believed that "under the Congo Act" they were obliged to be neutral. In fact the German Government made neutrality proposals on Aug. 23 1914. These were rejected by the Allies (see AFRICA: § History).

these minor operations the Germans had the advantage of a central position, interior lines and better means of communication. The railway from Dar-es-Salaam to Kigoma on Lake Tanganyika had been completed about six months before the war began, and during Aug. the small steamer "Hedwig von Wissmann," manned and armed by German sailors from Dar-es-Salaam, sank the only hostile boat on the lake, a small Belgian vessel. Thus the Germans had command of the 400 m. of waterway on Tanganyika. On the two other lakes, Nyasa and Victoria, the British, however, early obtained command.

The operations in all theatres other than on the British East Africa frontier were regarded by both sides as subsidiary. At first the British had to consider purely defensive measures. At the outset the East Africa Protectorate Force was under the command of Lt.-Col. L. E. S. Ward. Volunteers were called for, and two regiments, one mounted, were at once formed by the white settlers in British East Africa. The King's African Rifles were recalled from Jubaland and were in action by September. An Arab detachment was raised on the coast by Lt. (subsequently Maj.) A. J. B. Wavell (an adventurous soldier who had made the pilgrimage to Mecca), and it rendered good service until its gallant commander was killed in action Jan. 6 1916. But outside help was needed, and the Government of India consented to send a force, officially known as "Indian Expeditionary Force B." The first regiment, the 29th Punjabis, arrived at Mombasa at the end of Aug., and with them Brig.-Gen. J. M. Stewart, who took over the command.

Plans for an offensive were now formed. It was decided that the bulk of the force from India should land at Tanga and occupy the Usambara Highlands, the most healthy and most developed region of German East Africa, and in which

The Tanga Episode.

lived the majority of the German settlers. The landing finished, it was intended to advance along the railway from Tanga to Moshi. At the time Tanga was attacked Gen. Stewart was to demonstrate against Taveta, and to sweep round by Longido (N. of Kilimanjaro) to Moshi. Brig.-Gen. A. E. Aitken was selected to command the Tanga expedition. India was then being heavily drained of troops for service in France, and for East Africa troops that were not all of first-class quality had to be employed. The strength of the force was about 7,000, including one British unit, the 2nd Batt. Loyal North Lancashire Regiment. The force sailed from Bombay towards the end of Oct. and the transports arrived off Tanga harbour early on Nov. 2. The attack had been expected, news of the expedition having reached the Germans through captured Indian mails, and at the end of Oct. von Lettow had arranged with the district commissioner, Auracher, that Tanga should be defended, whatever were the instructions of Dr. Schnee. On receiving a summons from the commander of H.M.S. "Fox" for unconditional surrender Herr Auracher went on board, stated that Tanga was an open and undefended place and said that he must obtain special instructions. The British, therefore, refrained from bombarding the town, and meanwhile von Lettow was hurrying down reinforcements by rail. On the evening of Nov. 2 Gen. Aitken landed one and a-half battalions at Ras Kasone, two m. east of the port. It advanced through dense jungle to the outskirts of the town, became heavily engaged and had to fall back. The British were reinforced and the fight was renewed on Nov. 3. It was indecisive, but in the evening the officer in command, Capt. Baumstark, believing that Tanga could not be held against another attack, had collected his force four m. W. of Tanga, leaving patrols only in the town. That evening von Lettow arrived, passed through deserted Tanga, and reconnoitred the British camp at Ras Kasone. Von Lettow's plans for the morrow were, while defending Tanga itself, which he reoccupied with two companies of Europeans, to place most of his troops in the bush along the Ras Kasone-Tanga road and attack the enemy in flank. The fight was renewed on the fourth. The British and Indian troops advanced through coconut and rubber plantations and entered Tanga town. By this time fighting was severe and general, and soon after 3 P.M. von Lettow delivered his counter-attack on the British left, which, he states, he was able

to outflank by means of his two reserve companies. Supported by machine-gun fire, this outflanking force was able to push its attack home, and soon the British were in full retreat to Ras Kasone. The fight continued in the dense bush till after night-fall, the Indian and British troops eventually getting back to their camp. The next day, Nov. 5, they were reembarked, and taken to Mombasa. The attack on Tanga had been a complete failure. The casualties in Aitken's force were, according to an India Office statement, 795, including 141 British officers and men. Sixteen machine-guns were lost. Von Lettow gives the German force engaged as "little more than 1,000." Fifteen Germans and 54 askaris were killed. The number of wounded was not stated. After this action Aitken was removed from his command, but in Dec. 1920, after a fresh investigation by the War Office, he was declared "not guilty of culpable negligence . . . and should not be held responsible for the failure."

The simultaneous attack on Longido, N. of Kilimanjaro, also failed. The Germans—about 800 strong—were strongly posted, and covered the only permanent water supply available. Stewart's attacking force numbered about 1,500. After a night march of 15 m. across a waterless region, the action began on the morning of Nov. 4 and continued till 7:30 P.M. The whole movement—typical of many operations in this theatre of war—was tersely summed up by an officer who wrote, "We marched all night, attacked at dawn, fought all day, and then having failed to turn the Germans out, came back here as we had no water."

Following the failure at Tanga no new general offensive was undertaken by the British until the early months of 1916. The intervening period was one of preparation on both sides, with, on the part of the Germans, frequent and sometimes successful attempts to raid the Uganda railway, and on that of the British, defensive and retaliating raids of the same kind. Of the engagements of this period that at Jassin was the most notable. Following the failure of the German march on Mombasa, the British force on the coast advanced S., crossed the German frontier and occupied (Jan. 2 1915) the buildings of Jassin plantation, which was garrisoned by some 300 Indian troops. Von Lettow thinking that a land attack on Tanga was intended got together a force of 1,500-1,600 men, and attacked Jassin on Jan. 17. After 48 hours' fighting, the Indian troops, having expended all their ammunition and being without water, surrendered. Attempts by the King's African Rifles (in camp 10 m. distant) to relieve them failed. But the German losses, especially in European officers, were serious, and the expenditure of ammunition made a heavy inroad on von Lettow's small stock.

Period of Preparation.

The period of preparation was spent on the British side largely in raising new troops and in the organization of transport. In April 1915 Col. M. I. Tighe, Indian army, with the local rank of Major-General, was appointed to command the troops in East Africa and to prepare for the new offensive. His force was increased by two newly raised white regiments, the 2nd Rhodesian and "Driscoll's Scouts" (25th Batt. R. Fusiliers). While parrying the raids on the Uganda railway—which were numerous and daring, but taken as a whole, ineffective—Gen. Tighe organized occasional offensives, such as the successful attack (June 1915) on Bukoba, the German base on Victoria Nyanza for operations against western Uganda. This raid was made by Gen. J. M. Stewart, and it affords an illustration of the great distances to be covered in the East African operations. Nairobi, headquarters, was 327 m. by rail from Mombasa, the base, and 237 m. from Kisumu, railhead on Victoria Nyanza. Thence Stewart's force had to go by steamer 240 m. before reaching Bukoba. To aid his operations Gen. Tighe began the building of a railway and pipe line across the 70 m. of desert between Voi, on the Uganda railway, and his advanced posts near Taveta.

The other theatres of operation in East Africa were much worse off for means of communication. To reach the German frontier bordering Nyasaland, Rhodesia and the Belgian Congo was a journey of from 2,000 to 3,000 m., including hundreds of miles to be covered on foot or by animal and mechanical transport. This involved the employment of vast numbers of carriers

in regions where local supplies of food were often non-existent. Thus in northern Rhodesia a road 400 m. long had to be cut through trackless bush, in which the areas of cultivation were infinitesimal. The Germans were better off in that, besides their two railways,¹ they had constructed several main roads before the war, and during the war other roads and some light railways were laid down. And the German troops had not such long distances as had their opponents to cover on foot. Nor were they troubled by lack of food (at least not before 1917). The natives had been compelled to establish large food depôts at all military stations, while Usambara, in or near which the bulk of von Lettow's force was quartered for 22 months, was a land of plenty. But the necessity that they were under of guarding the coast and to a lesser extent the N.W. and S.W. frontiers, while keeping their main forces in the principal theatre about Moshi, imposed upon them a great deal of movement in a more or less N. and S. direction for which—apart from the command of Lake Tanganyika—few facilities existed. For instance, movement of supplies or stores by carrier from the Central railway to the Usambara railway took 12 days, and from the Central railway to Lindi in the S. not less than three weeks.

Throughout 1915 von Lettow's chief concern was the increase and training of his forces. At the outbreak of war he had, as has been stated, just under 5,000 men (a figure which included the police as well as the troops proper). This number had been increased by Feb. 1916, when the German force was at its maximum strength, probably over 20,000. Exact figures cannot be given as the number of carriers and batmen who acted as combatants is unknown, but the rule was to arm 15% of them. Von Lettow himself says that the total numbers enrolled during the war were "about" 3,000 Europeans and 11,000 askaris (natives); the figures of casualties and captives show that the number of whites on the German side was nearer 4,000, and an official German return gave 2,217 Europeans as under arms in Aug. 1915.² The Europeans included most of the German settlers in Usambara and other districts, almost all of whom were ex-soldiers and many ex-officers; a few Boer settlers; German residents at Zanzibar who had been allowed by the British to cross to the mainland; some 500 sailors from ships in harbour, including over 400 men of the Imperial navy, and a few visitors to Dar-es-Salaam. These last had come to attend fêtes to mark the formal opening of the Dar-es-Salaam-Tanganyika railway, and among them was a retired Prussian officer, Maj.-Gen. Wahle, who rendered von Lettow good service. The German forces were organized in companies normally consisting of 200 askaris and 16 Europeans; a few of the companies were composed almost entirely of whites, two companies were mounted. The askaris were drawn from the most warlike tribes of the country, and were very well treated. Von Lettow himself was ever careful of their needs and shared their hardships on campaign. He won and retained throughout their respect and devotion. Besides his regular force von Lettow had in the earlier stages the help of various levies; and the anti-Moslem policy of Dr. Schnee having been reversed he also obtained the support of a number of Arabs (support which proved of little value). His movements were not, for a considerable time, hampered by disaffection among the natives; some tribes near the border of British East Africa were deported because of doubt as to their sympathies, and the converts of the British missionary societies were in general regarded as enemies and were very badly treated, many being executed. Fear of a native rising was felt among the Germans when the war broke out, but the fear proved groundless. "It was not" (writes von Lettow) "till the enemy had

penetrated the country that the natives became a real danger to us; and then it was indeed very great. The native has a fine sense of the transfer of real power from one hand to the other." Even then, with the natives hostile, the askaris (who had with them their women and children and carriers) were faithful to their leader, and more resolute than many of the Germans.

That they obviously had the advantage inspired the German native troops with confidence, and the hard training they had between Nov. 1914 and March 1916 made them, as the event proved, very formidable opponents in their own country of white and Indian troops. And months before the onslaught of Gen. Smuts they had also been rearmed with modern weapons.

On Feb. 28 1915 a blockade of the whole coast of German East Africa was proclaimed, and the British Government stated that "ample steps had been taken to make the blockade thoroughly effective." The task of the reinforced **Blockade Runners.** Cape squadron under Vice-Adml. King Hall in watching 600 m. of coast line provided with many excellent natural harbours was difficult, and in fact several vessels got through. In Dec. 1914, before the blockade was proclaimed, Dar-es-Salaam was visited and the German ships which had taken refuge there sunk. In April 1915, when the Germans were in greatest need of more ammunition, the blockade was broken in a remarkable manner. The "Rubens," an English ship of 3,000 tons seized at Hamburg, had been loaded with arms and ammunition, had eluded the blockade of the North Sea, and on April 4 (its arrival was expected) was sighted by H.M.S. "Hyacinth" four m. off Mansa Bay, N. of Tanga. The "Rubens" got into the bay, severely damaged and on fire. The crew fled ashore; the ship was boarded by bluejackets, who found her timbered up and battened down; the party was recalled and more rounds having been fired into the vessel "the admiral . . . steamed away under the impression that she would burn herself out" (Brig.-Gen. J. H. V. Crowe). Subsequently the Germans salvaged at leisure nearly the whole of her cargo, though a great part of the cartridges had been damaged by sea water. But there were enough Mauser '98 rifles to rearm the force, which previously, for the most part, used the M 71 rifle. (A year later, at another critical period of the war, the Germans were again rearmed, by another blockade runner.)

The operations against the "Königsberg" also resulted in a valuable addition to von Lettow's armament. The cruiser had remained shut up in the shallow waters of the Rufiji, but in July 1915 the light-draught monitors "Severn" and "Mersey," sent specially from England, succeeded in setting it on fire. The cruiser was then blown up by Capt. Looff, who with his officers and crew joined von Lettow. The "Königsberg's" armament, which included 10 4.7-in. guns, was all salvaged, and these 4.7-in. guns formed von Lettow's heaviest ordnance.³ The Germans also recaptured with its guns the 300-ton steamer "Adjutant" (originally taken by the British at Dar-es-Salaam), which had run aground off the Rufiji in Feb. 1915. The "Adjutant" was transferred by rail to Lake Tanganyika.

Plans for the conquest of German East Africa took shape in the summer of 1915, but their execution had to be delayed until Britain could put a sufficient force in the field. This force was not forthcoming until the close of 1915, when Gen. Botha, Prime Minister of South Africa, having conquered German South-West Africa, agreed to provide a force for service in East Africa. At the time Gen. Tighe had under him 10 regular infantry regiments supplied by India, including the 40th Pathans and the 120th Baluchis brought from France, a squadron of the 17th Lancers (Indians), Imperial Service troops, the 27th and 28th (Indian) Mountain Batteries, and the Calcutta Volunteer battery. Of white troops there were, besides the two regiments

Plans for British and Belgian Offensive.

¹ The Usambara line (Tanga-Moshi) and the Central railway (Dar-es-Salaam-Tabora-Tanganyika).

² Dr. Ludwig Deppe, a surgeon with von Lettow's force, who appears to have kept careful records, states that there were 3,629 casualties among the whites up to the end of Nov. 1917. He puts the highest total of the German force in the field at any one time at 3,300 whites and 15,000 askaris. These included the non-combatant services.

³ In like manner the 4-in. guns of the disabled "Pegasus" were removed and added to Gen. Tighe's artillery. It is noteworthy that the captain of the "Königsberg" had the breech-blocks of his guns thrown overboard, but they were salvaged by the officer commanding the land detachment at the Rufiji delta.

raised by the settlers in East Africa, the 2nd Rhodesian Regiment, the 25th Batt. Royal Fusiliers and the 2nd North Lancashires (the only regular British infantry unit in East Africa). There were also the battalions of the King's African Rifles, but at that time the value of negro troops was not sufficiently appreciated. Though they were best adapted for warfare in equatorial Africa—and ultimately bore the brunt of the fighting—and though von Lettow had shown the way, the raising of new native regiments was neglected at first by the British.

The plan adopted by the British in conjunction with the Belgians was for a concerted attack on three sides. The object was not only to defeat the enemy, but effectively to occupy the country, so as to render impossible the splitting up of the German forces "into guerrilla bands doubling back in all directions" (Gen. Smuts). This aim was achieved with one remarkable exception, the Wintgens-Naumann raid (see p. 883, note). But when von Lettow was driven eventually into Portuguese territory the whole remaining German force became a guerrilla band, with an unlimited field for doubling and redoubling. The scheme evolved in 1915 was to strike the main blow with the force in British East Africa, whilst the Belgians were to operate in the north-west and a second British force in the south-west of the German protectorate. This second force was gathered on the Nyasa-Rhodesia borders, and Brig.-Gen. Edward Northey assumed command of it in Jan. 1916. When, in March 1916, the Portuguese entered the war, they undertook to guard the southern frontier of German East Africa. Thus the Germans had enemies on every side, and had no opportunity (which the Germans in Cameroon took) of escaping capture by retirement into neutral territory.

When Gen. Botha's Government undertook to send forces to East Africa it had to rely upon volunteers to redeem its promise.

But a force already organized and originally destined for service in Europe—the 2nd South African Infantry Brigade (under Brig.-Gen. P. S. Beves) was diverted to East Africa. A mounted brigade under Brig.-Gen. J. L. Van Deventer, and a brigade consisting of five batteries of S.A. Field Artillery, with all necessary administrative and other units, were also formed so that the South African contingent was complete and self contained. Later this contingent was increased by another infantry brigade, a second mounted brigade and the Cape Boys Battalion¹ (under Col. Morris). All these troops except the 2nd mounted brigade had reached East Africa by Feb. 1916, before the offensive began.

When South Africa furnished this contingent—the largest body of white troops which had taken the field in tropical Africa—the Home Government offered the command to a South African, Gen. Smuts. Smuts was Minister of Defence in the Union Cabinet; the political situation in South Africa was uncertain and he declined the offer. Gen. Sir Horace Smith-Dorrien was then selected for the post, but while at the Cape on his way out, in consequence of ill health, he resigned his appointment. Again appealed to, Gen. Smuts accepted the command and reached Mombasa on Feb. 19. He adopted, with some modifications, the plan of campaign which Gen. Tighe had originated.

Gen. Tighe had had a very difficult task, and the *moral* of his force, predominantly Indian, had suffered through being so long on the defensive. It altered completely with the opening of the offensive. Before the arrival of Gen. Smuts the railway across the waterless waste between Voi and Taveta had been taken to Serengati, within five m. of the German post on El Oldorobo (otherwise Salaita hill), which blocked the main approach to the Taveta gap. Skirmishing had been going on around Salaita since March 1915. The hill was without water, which was taken to the garrison from Taveta in donkey carts. "Strangely enough," wrote von Lettow, "it did not occur to the enemy to interfere with it [the transport] and thus render the mountain untenable." The first action in which the South Africans took part was an attack on Feb. 12 1916, on Salaita. Brig.-Gen. Malleeson with the 1st East African and 2nd South African In-

fantry Brigades, supported by artillery, assaulted the strongly entrenched German positions, approached through thorn bush. Little progress was made and the Germans, reinforced from Taveta, counter-attacked and compelled Gen. Malleeson to retreat. The British casualties were 172, of which number 130 were among the South Africans. They suffered through ignorance of the new conditions. "The South African Infantry," wrote Gen. Smuts, "had learned some invaluable lessons in bush warfare, and also had opportunity to estimate the fighting quality of the enemy."

Gen. Tighe intended to force the enemy from the Taveta gap by a double movement. One force, under Gen. J. M. Stewart, was to sweep round Kilimanjaro from the north; another, under Gen. Malleeson was to attack Taveta. The forces were to join hands at Kahe, a place on the Tanga railway S. of Moshi. Gen. Stewart, who had the 1st East African Division (infantry) and Van Deventer's mounted brigade, was at Longido, some 50 m. from Kaijado, the terminus of the Magadi branch of the Uganda railway and Stewart's base for supplies. The chief alteration in Gen. Tighe's plans made by Gen. Smuts was to bring back Van Deventer's mounted brigade to the Taveta side and to use it for a turning movement which would render a frontal attack on Salaita hill unnecessary. The infantry which were to follow up Van Deventer's movement consisted of the 2nd East African Division, of which Gen. Tighe was placed in command.

Four days after reaching Mombasa Gen. Smuts telegraphed to Lord Kitchener that he was prepared to carry out the occupation of the Kilimanjaro area at once; two days later (Feb. 25) Kitchener's sanction for the operation was received. There was good reason for haste as the rainy season was approaching, and during the rains operations might be (and in fact proved to be) impossible. Von Lettow was well aware of the enemy's movements, and as early as Aug. 1915 had made preparations in view of having to abandon the Kilimanjaro and Usambara regions. These preparations included the removal of all military stores. For this purpose a light railway was built south from Mombo station on the Tanga railway to Handeni (40 m.), whence a wagon road went to Kimamba on the Central (or Tanganyika) railway. Up to nearly the end of 1915 von Lettow had thought that the new British offensive might be a landing at Dar-es-Salaam or Bagamoyo; afterwards there was no doubt that it would be in the Kilimanjaro region. To meet the attack he had, he states, a force of "about 4,000 rifles" under Maj. Kraut (the British estimated that Kraut had 6,000 rifles, 16 naval and field guns and 37 machine-guns). About 1,000 rifles were concentrated to dispute any advance from Longido.

The Germans were apparently unprepared for the turning movement executed by Van Deventer's mounted men, who got behind Taveta, and forced the enemy to evacuate Salaita hill, though on this point von Lettow asserts "our want of artillery obliged us to look on quietly while the enemy executed unskillful movements at no great distance from our front."³ Van Deventer's movement began on March 8, and on the next day his men were astride the Moshi road behind Taveta. Salaita hill was evacuated by the Germans on that day and new positions were taken up by them covering the gap between the North Pare mountains and Kilimanjaro. Von Lettow himself, with the bulk of his force, was at Himo, five m. from his front, and he was aware that behind him Gen. Stewart's column was advancing. That column, in Gen. Smuts's plan, was to cut off von Lettow's retreat, and in view of the greater distance it had to cover had started from Longido on March 5. Stewart's column met with many difficulties, and though it had no serious encounter with the Germans its progress was much slower than had been anticipated. Meanwhile the attack on the position west of Taveta was delivered on March 11. The road to Himo and Kahe passed between two hills, Raeta and Latema. Maj. Kraut held both

¹ The "Cape Boys" are coloured men, all with a strain of white blood, from the Cape Province.

³ It is to be observed that von Lettow's record of the campaign appears not to have been written till after the close of the war, and there are indications that knowledge subsequently gained colours his record of events.

Kilimanjaro Operations.

South African Reinforcements.

hills and the pass or nek between them; no turning movement was possible and the order was given to Gen. Malleon, commanding the 1st Brigade of the 2nd East African Division, "to clear up the position and, if possible, make good the nek." The whole region was densely bushed. The advance began at 11:45, and the 130th Baluchis and the 3rd King's African Rifles were sent forward to seize a spur of Latema. The defence was very strong and by 4 P.M. little progress had been made. At this hour, writes Gen. Smuts, "Gen. Malleon, who was seriously indisposed, asked to be relieved of his command." Gen. Tighe then assumed personal direction of the operations. The 2nd Rhodesians, the 3rd King's African Rifles, and the 130th Baluchis now attempted to gain the Latema ridge. The enemy, well hidden in the bush, and supported by accurate machine-gun fire, kept, however, possession of the ridge. Finally, the 5th and 7th South African Infantry Battalions, brought up as reinforcements and led by Lt.-Col. Byron, were sent in to make a night charge with the bayonet. Here and there small parties, which became isolated, gained the crest. Col. Byron got within 30 yds. of the main enemy position, but with 20 men only, and was forced to retire. Tighe thereupon dug in astride the road to await daylight. At 4:30 A.M. March 12 Smuts ordered Tighe to draw back his force. This operation was in progress when news came that the enemy was in full retreat. Von Lettow states that about 11 P.M. on the 11th a telephonic message from the Raeta position informed him that the enemy had penetrated into the position in great force and that to avoid the risk of having his communications cut he ordered the troops with him, forming his left wing, to fall back towards Kahe. When he discovered the mistake made it was too late to alter his dispositions. Maj. Krut then evacuated the Latema-Raeta position, and the whole force retired to the Kahe position, abandoning Moshi and Kilimanjaro. Gen. Stewart's division had not played the part expected; it was not until March 13 that it reached Bomba Jangombe, 25 m. N.W. of Kahe. Here Gen. Stewart was informed by telegram that the enemy had already avoided encirclement, and his force was brought into New Moshi on the 14th. On the 10th Gen. Stewart left for India. Later experience showed that the difficulties of encirclement were greater than then supposed.

Von Lettow's new position—known as the Kahe-Ruwa—stretched, S. of the Moshi-Taveta road, from Kahe railway station, near which the Ruwa (Pangani) crossed the railway, eastward along the northern end of the Pare mountains, through a region of forest, bush, swamps and rivers. On March 18 he was attacked from the Latema Nek direction by a force under Brig.-Gen. S. H. Sheppard (who had commanded the 2nd East African Brigade under Gen. Stewart) and on March 20 Gen. Van Deventer was sent westward from Moshi to turn the enemy's rear at Kahe. He reached and—after some sharp fighting—seized Kahe station on the 21st, but owing to the difficulty in getting his force across the Pangani could not cut off the enemy. On the same day Sheppard fought a very determined and apparently indecisive action on the northern front—a South African Brigade which was to have aided him "was so impeded in the dense bush that it was unable to exercise any influence on the fight" (Gen. Smuts). But under cover of night the German force was withdrawn to Lembeni station, 20 m. S. of Kahe. Von Lettow retired in perfect order with practically all his stores and guns, except one of the "Königsberg's" 4.1-in. guns, which was blown up.

The fight of March 21 marked the conclusion of the Kilimanjaro operations. They had opened the door into German East Africa and had greatly inspired the British. They had done more, for though von Lettow's force was intact and its *moral* still high, its supply of ammunition had been greatly depleted. But at this critical moment another ship ran the blockade and brought the Germans most welcome supplies, including four 4.1-in. field howitzers, ammunition for the "Königsberg's" big guns, 5,000,000 rounds of '08 small-arms ammunition, 12 machine-guns, medical stores, provisions and clothing (for women as well as men). The ship, the "Maria," which had come *via* South America, the East Indies and Madagascar, entered Sudi Bay, near Lindi, in the far south of German East Africa, in the middle

of March unobserved by the British patrolling vessels. She was discovered early in April, fired into and damaged. But she completed the discharge of her cargo, and got clear away. The value of this reinforcement to von Lettow is difficult to over-estimate.¹

The military problem as it presented itself to Gen. Smuts and to Col. von Lettow respectively was very different. Smuts knew that the Belgians were ready to strike from the N.W. and the Nyasa-Rhodesia force from the S.W. and von Lettow was also aware of the fact. But in so large a country as German East Africa those operations were not likely for some time to affect the main forces. Von Lettow's position was comparatively simple; he could not prevent the enemy from developing his offensive in the manner he chose, but with his superior mobility he could adapt his movements to meet his foe's tactics.

Gen. Smuts had four possible alternatives: (1) to advance from Victoria Nyanza on Tabora, the chief town in the interior (this was ruled out as it was thought, and proved to be the case, that the Belgians could deal with Tabora); (2) follow the enemy down the Tanga railway through Pare and Usambara (this was rejected as it was the enemy's chosen ground, and where he was strongest); (3) advance direct inland from Kilimanjaro; (4) land a force at Dar-es-Salaam and advance along the Central railway. Gen. Smuts chose the third alternative; whether it was better than the fourth is questionable. An advance along the line of the Central railway had obvious advantages. The railway traversed the protectorate in an east-west direction from end to end; its occupation would have cut the German forces in two and materially helped the operations of the Belgians and Gen. Northey. Dar-es-Salaam, the ocean terminus of the railway, lay at the mercy of the British navy; it was the capital of the protectorate; its occupation would have much political as well as military importance, and would have given the British a sea base 200 m. nearer South Africa than Mombasa and reduced land communications to a much greater extent. And the shortening of the lines of communication was a vital matter. Smuts, however, decided against Dar-es-Salaam "partly because the prevalence of the S.E. monsoon at that period (April) made a landing of a large force on that coast an operation of great difficulty, and even danger, partly because a prolonged campaign on the coast immediately after the rainy season would mean the disappearance of a very large percentage of my army from malaria and other tropical ailments."

Moreover, von Lettow by retiring along the Tanga railway had left the road into the interior "wide open and unguarded." At that time, April 1916, it was not realized that the climate of the interior was little less deadly than that of the coast, and that whatever course was adopted a large proportion of the army—especially among the white troops—would be affected by malaria and other tropical ailments. Also Gen. Smuts was misinformed as to the extent and severity of the forthcoming rainy season. Of the difficulties of communication he was well aware, and slightly to lessen them the railway from Voi to Taveta was carried through the Latema gap and joined to the Tanga railway at Kahe. This railway was completed on April 25 1916. It was cut through swamps and virgin forest and thousands of men had to be employed to keep the rails from sinking in the mud. Kahe, by rail, was 210 m. from Mombasa; from Kahe the advance into the interior had to be made by other means of transport. Smuts made large use of motor lorries.

Smuts's plan for his new campaign was, briefly, as follows: A mounted force under Van Deventer was to make a rapid advance

Alternative Plans of Campaign: Smuts's Choice.

¹ A remarkable attempt to carry medical and other comforts to von Lettow in 1917 by air failed. Zeppelin L59 (known as "The Balkan Terror") under von Butlar, carrying supplies, left Yambol, Bulgaria, on Nov. 21 1917, crossed the Mediterranean, and keeping along the edge of the Libyan Desert, reached the latitude of Khartum on Nov. 23. Then von Butlar received a wireless message "Return, East Africa occupied." He got back to Yambol on Nov. 25, after a non-stop flight of 4,500 m. By the Egyptian authorities it was thought that the L59, which was observed passing over the oases in the Libyan Desert, intended to bomb the Assuan Dam.

S. from Arusha (a place 40 m. W. by S. of Moshi) to Kondoa Iringa—the chief strategic point in the interior of the northern part of the country—thence advance to the Tanganyika railway and turn E. along that line to Morogoro. Smuts himself, with the rest of his force, after clearing as much of the Pare and Usambara regions as was necessary for his purpose, was to turn S., parallel to the coast and E. of Van Deventer's line of advance, also converging on Morogoro. It was hoped thus to corral von Lettow and bring him to a decisive engagement. Smuts had reorganized his forces since the March operations, and no longer had the aid of Gen. Tighe, who was given a command elsewhere and created a K.C.M.G. Smuts formed his army into three divisions, the first under Maj.-Gen. A. R. Hoskins (Inspector-General King's African Rifles), the second under Van Deventer, the third under Maj.-Gen. Coen Brits. The first division was made up of the two East African Brigades; the two other divisions were composed of South African troops, supplemented by batteries of Indian and other artillery. On April 3 Van Deventer

Van Deventer's March to Kondoa.

took the road across the Masai Steppe to Kondoa, which place he occupied after a smart engagement on April 19. *En route* the garrison of Lol Kissale, 17 Germans and 404 askaris with two machine-guns, had been surrounded and forced to surrender. It had been a brilliant march of some 200 m., but Van Deventer had lost hundreds of animals through horse-sickness, and though only some 80 m. from the Central railway he could advance no further. Then the rainy season set in and cut off Van Deventer for several weeks. Meanwhile von Lettow made rapid preparations to meet Van Deventer's thrust. Three companies were brought from near Lake Kivu in the N.W. and by steamer on Lake Tanganyika to Kigoma, whence they took train to Saranda (the nearest point on the railway to Kondoa), while von Lettow himself with 15 field and two mounted companies marched from Korogwe on the Tanga railway to Kimamba on the Central railway—a distance of 125 miles. Maj. Kraut remained in charge of the force left in Usambara. The rains began while the troops were on the march, but by the beginning of May von Lettow and his force had occupied a strong position a little S. of Kondoa. A good deal of minor fighting followed but neither side made a general attack. (In May, owing chiefly to the privations caused by the rains, Van Deventer could barely muster 3,000 rifles—a number inferior to that of von Lettow.) And in June, during the period of waiting, the Belgian advance towards Tabora began to have effect on von Lettow's own position. Gen. Smuts was also moving. His advance could not begin until May 18, the rains having turned much of the country into a lake. It took an armoured-car detachment under Lt.-Comm. Whittall, R.N., sent to reinforce Van Deventer, 35 days to cover 75 m. (in the dry season the journey took three days).

When Smuts advanced Maj. Kraut retired, skilfully, by the railway to Handeni. Equally skilful was Smuts's advance. The main column under Gens. Sheppard and Beves marched, through the densest bush, down the left bank of the Pangani. W. of the Tanga railway; a smaller force under Gen. Hannington followed the railway; a third column under Lt.-Col. T. O. Fitzgerald entered the Pare mountains through a gap (the Ngulu gap) on the east. Outflanked, Kraut had no option but to retire; he had strongly fortified the railway line, but had, apparently, not believed that an advance along the fever-haunted valley of the Pangani was possible. By June 15 the conquest of Usambara was completed by the occupation of Korogwe, whence the Tanga railway descends to the coast plain. Smuts put off the occupation

Gen. Smuts's Main Operations.

of the coast region, and had already with his main force turned S., and on June 19 Handeni was occupied. On June 24 a determined effort was made to round up Kraut's force, the Germans being attacked simultaneously on three sides. In this action the Kashmiris and the 25th Fusiliers (familiarily known as "the Old and Bold") earned special distinction. The Germans fought with great determination, and when the day was lost scattered in the bush and thus escaped. They reformed in strong positions in the Nguru hills.

After this fight Gen. Smuts was compelled to halt, forming a large standing camp on the Msiha river. The force had covered about 250 m. since May 22; water was short and the transport had reached the limit of its capacity. Malaria had greatly reduced the force—several units had no more than 30% of their original effectives—and the troops were on half rations. The interval of enforced idleness at Msiha camp was utilized in clearing Smuts's left flank; that is, the northern coast region. This was done by Indian and African troops under Brig.-Gen. W. F. S. Edwards (Inspector-General of Communications), with the help of the Cape squadron, now under Rear-Adml. E. F. Charlton. At this time Gen. Smuts had already reached the conclusion that white troops were not best suited for campaigning in tropical Africa (nor were the Indian troops particularly suited for the work), and that a much larger negro element was needed. By his direction the raising of new battalions of the King's African Rifles was undertaken, but the need was urgent for immediate reinforcements by trained black soldiers. These were found in West Africa. The Gold Coast Regiment had volunteered for service soon after its return from the Cameroon campaign; its offer was accepted and it sailed in June for East Africa and was in action in July. At the end of Aug. volunteers were called for a Nigerian overseas contingent and there was a ready response, but the Nigerian Brigade could not reach East Africa till Dec.-Jan. 1916-7. Meantime a battalion of the West India Regiment and the Gambia Company had joined Smuts. The coast operations, in which the navy played a great part, were successful; Tanga was occupied on July 7, Pangani on July 23, Sadani on Aug. 1 and Bagamoyo—the terminus of the old slave road from the great lakes—on Aug. 15. The British base was removed to Tanga, a saving of 75 m. sea voyage and over 200 m. rail transport. Dar-es-Salaam was occupied on Sept. 4, but it took three months before the port could be used as the new base.

While Smuts was still at the Msiha river von Lettow had brought most of his force from Kondoa to the Nguru hills. An attempt to surprise the British camp was unsuccessful owing to "the remarkably dense bush." When on June 24 Van Deventer, reinforced, resumed his offensive the German detachments left on his front gave way, nor was their retreat marked by the skill usually displayed by the Germans in their retirements. Van Deventer was delayed by the difficulties of transport, but by the end of July he was in possession of some 100 m. of the Central railway—from Kilimantinde to Kikombo,—and on Aug. 9 had concentrated his division for an advance E. on Morogoro. Farther W. the Belgians were beginning to close in on Tabora. Von Lettow was obliged to leave his forces in that region to their fate, but (at the end of June) he had sent reinforcements to the detachments opposing Gen. Northey's advance from the south. His own position now appeared critical. He withdrew Maj. Kraut and most of his force S. to Kilosa, on the railway, W. of Morogoro, leaving Capt. Schulz, with a few companies, to oppose Gen. Smuts, who resumed his advance on Aug. 5. Von Lettow's plan was to get away with as much of his stores as he could. Kraut's force did not remain at Kilosa, but crossing the railway struck S. in the direction of Mahenge, a military station in the middle of a healthy plateau, to which plateau the detachments which were opposing Northey were falling back.

Gen. Smuts's effort, to use his own words, "to bottle the enemy up in Morogoro" failed. Schulz, after fighting an action at Dakawa on the Wami river on Aug. 16, retired on Morogoro, leaving a broken bridge across the Wami. Smuts sent forces to outflank von Lettow, but in vain. When on Aug. 26 the British occupied Morogoro it was to find it abandoned, and partly destroyed, by the enemy. Von Lettow had gone with his force into the Uluguru mountains, which lie immediately S. of Morogoro, by a track the existence of which was unknown to the British. With von Lettow was Dr. Schnee, the governor.

Gen. Smuts had taken measures intended to prevent von Lettow getting away from Morogoro by roads leading E. and W. of the Uluguru hills; he had not anticipated a retreat into the hills themselves. Brig.-Gen. Enslin was sent with the 2nd Mounted

Von Lettow Avoids Encirclement.

Brigade to guard the western exit from the hills. This movement von Lettow had foreseen and had posted troops to meet an advance in this direction. Meanwhile the rest of his men, with as much of the stores as could be collected, were being moved through the mountains to Kissaki. To prevent von Lettow's escape E. of Morogoro Smuts's main force had crossed a waterless desert 25 m. long, a move which the enemy had not expected, and it was this march which caused the hurried evacuation of Morogoro. Exhausted as were his men Smuts determined to make another effort to corner von Lettow. For some three weeks very bitter fighting continued in the Uluguru hills, in which the Germans gained several successes, but on Sept. 15 Kissaki, with considerable stores, was captured by the British. Von Lettow could neither remain in the fertile and healthy hill region nor escape W., but he was able to retreat S.E. towards the Rufiji, where he formed an extensive camp on the further side of the Megeta river, which he continued to occupy for months. In short, the limit of endurance had been reached by Gen. Smuts's troops, further pursuit was impossible and the second rainy season was approaching. "Gen. Smuts," writes von Lettow, "realized that his blow had failed. He sent me a letter calling upon me to surrender, by which he showed that as far as force was concerned he had reached the end of his resources."

Von Lettow is entitled to his deduction, but by his energy and driving force Gen. Smuts had surmounted obstacles which appeared insuperable, and in conjunction with the Belgians and Northey had conquered fully two-thirds of the German protectorate, including the chief areas of European colonization and both the railway lines. This had been done in a period of seven months, and was a very considerable achievement. Civil administrations were set up in the conquered regions.

The operations of the Belgians had been carefully planned and were thoroughly successful. While such troops as were available were engaged in defending, as best they could, the Congo frontiers, a special force of a little over 10,000 men—all natives of the Congo—was raised and officered by Europeans. All supplies for this force, except food, had to be imported, a long and tedious process.

A railway completed in Sept. 1915 from the upper Congo to Lake Tanganyika gave some help as, for example, when two small, fast and comparatively heavily armed British motor boats were taken from Cape Town to Tanganyika in sections. These boats took nearly six months to complete the journey of some 3,000 m. from the Cape to Tanganyika. Launched on the lake in Dec. 1915¹ they soon obtained mastery of its waters, by capturing, sinking or bottling up the enemy steamers. This achievement was of much assistance to the Belgian operations.

The organization of the new Belgian force was confided to M. Tombeur, acting Vice-Governor-General of Katanga, and an ex-officer, who in Feb. 1915 was made commander-in-chief of the Belgian Congo troops with the rank of Colonel (subsequently Major-General). All the fighting men were infantry and gunners—there were, all told, 60 machine-guns and 12 field pieces. The force was divided into a Southern Brigade (under Lt.-Col. Olsen) and a Northern Brigade (under Col. Molitor). Olsen's brigade was stationed along the Rusizi river, between lakes Kivu and Tanganyika; Molitor's N. of Kivu along the Congo-Uganda border. Tombeur's headquarters were established at Kibate, just N. of Lake Kivu. Molitor's brigade was partly stationed in British (Uganda) territory. It had the help of the Congo Carrier Corps, consisting of natives of Buganda (of whom 8,429 served in the corps), while Gen. Smuts made himself responsible for supply arrangements to Molitor's headquarters, which were at Lutobo, 150 m. W. of Victoria Nyanza. This was a great advantage as from Mombasa to Lutobo is barely 1,000 miles.

The defence of the region had been entrusted to Maj.-Gen. Wahle, whose "western command" extended from Lake Nyasa to the Uganda frontier. Von Lettow had withdrawn part of the troops to strengthen his main force. Wahle, whose headquarters were at Tabora, was instructed not to risk a decisive action, but,

when compelled, to fall back on Mahenge. From about mid-July to the end of Oct. Wahle was cut off from his chief.

The terrain for the first part of the Belgian operations was extraordinary. North of Kivu rise the Mfumbiro mountains, a range of lofty, active volcanoes; farther N.E. extends a tangled mass of hills, for the most part heavily wooded, and numerous small lakes and rivers. On the German side was the mountainous, fertile, and thickly populated region of Ruanda—but newly conquered and still preserving its native government. A narrow passage between Lake Kivu and the Mfumbiro mountains afforded the only practicable route for the invasion of Ruanda from the N. side of the lake; from the S. side there was an easier approach. Col. Molitor's plan was to attack from both sides of Kivu and to make a third advance from Lutobo. The campaign began on April 4 with holding attacks by Maj. Rouling at the N. end of Kivu, where the Germans, under Capt. Wintgens, held very strong positions at Kissenzi along the little river Sebea. Then the two other columns were set in motion, and to avoid being trapped Wintgens had to evacuate the Sebea lines. By the middle of May the Belgians by their converging movements had "nipped off" Ruanda. They next repeated the manoeuvre on a larger scale. Olsen crossed the Rusizi at the N. end of Tanganyika and pressed E.; Molitor sent columns S.W. to join up with him and at the same time sent other columns S.E. to Victoria Nyanza, which was reached on June 27. Capt. Godovius, the German commander in Karagwe, who for nearly two years had conducted guerrilla warfare with the British Lake Detachment near the western Uganda frontier, falling back, tried to pierce the Belgian lines. His detachment sustained very heavy losses, and Godovius, severely wounded, was taken prisoner. The detachments under Wintgens, though badly mauled, escaped the Belgian cordon. By the middle of July the Belgian columns had secured the Tanganyika-Victoria Nyanza line and were ready for a further advance. Olsen's brigade marched S. parallel to Lake Tanganyika on Kigoma—the lake terminus of the railway from Dar-es-Salaam and the port of Ujiji.

In its harbour was the "Graf von Götzen"—launched in 1915 and the biggest boat ever seen on Tanganyika, the "Adjutant" (the vessel brought in sections from Dar-es-Salaam), and the tug "Wami." From June onwards they had been bombed by British seaplanes manned by Belgians. Olsen's brigade occupied Kigoma on July 28 and Ujiji on Aug. 2, the German garrison retiring by the railway to Tabora, 200 m. east. Other Belgian detachments now crossed Tanganyika S. of Ujiji; and these and Olsen's brigade advanced on Tabora.

Molitor's brigade, whose objective was also Tabora, had the co-operation of a British column under Brig.-Gen. Sir Charles Crewe, a South African soldier, who was on Gen. Smuts's staff. With a force of about 1,800 men Crewe captured Mwanza, the German port on the southern shores of Victoria Nyanza, on July 14. Thereafter the Molitor brigade marched W. and Crewe's column E. of the road leading from Mwanza to Tabora. Both forces suffered from transport difficulties, excessive heat and lack of water, and both had to fight several stiff actions. Tabora² was the most important and the largest place in the interior of German East Africa. The Arabs had a large colony; there were Greek, Genoese and Indian traders and representatives of many African tribes. To lose the place would be a severe blow to the

¹ The Germans had sent the enemy civilians they interned and also many of their soldier captives to Tabora. The British Europeans interned numbered over 200, a large proportion being missionaries, women as well as men. All the Europeans—there were Belgians, Italians, French and Russians as well as British—were harshly treated, but the British were subjected to calculated indignities, with the object of lowering British prestige in the eyes of the natives. The Indian and African prisoners of war were treated with open brutality. One Brandt, commandant of Tabora, was directly responsible, but his action appears to have been approved by Dr. Schnee, and it was not till the Belgians were approaching Tabora that Schnee ordered better treatment of the prisoners. Von Lettow seems to have had no responsibility for the ill-usage of the prisoners. There was, however, first-hand evidence that at the prisoners' camp at Chiwata he took no steps to put an end to the inhumanity with which the Indian prisoners were treated.

² The Belgians also launched a small vessel on Tanganyika.

Germans in Arab and African eyes, but though they fought strong delaying actions with Olsen's brigade W. and Molitor's brigade N. of Tabora they had no intention of holding out to the last, and in preparation for departure Gen. Wahle employed British, Indian and African prisoners in building a road towards Mahenge and established food dépôts along it. On Sept. 18 Wahle evacuated Tabora, leaving behind about 150 white (German) soldiers, some sick, some simply war-weary, a number of civilians (among them Frau Schnee), many prisoners of war and considerable military stores. The Belgians occupied the town the next day. Sir Charles Crewe's column, which, it was hoped, would have reached the railway line E. of Tabora before the Germans had time to get away, only struck the line a week later. Shortly afterwards the column was broken up and Sir Charles Crewe returned to South Africa. He had, said Gen. Smuts, "rendered very useful service." The Wintgens column in its retreat was engaged by a Belgian detachment at Sikonge, 40 m. S. of Tabora. Though Wintgens suffered serious loss he made good his escape. With this action the Belgian campaign of 1916 ended, just at the close of the dry season and at the same time that Smuts suspended his operations against von Lettow. Gen. Tombeur's organization had been thorough and methodical, and Cols. Olsen and Molitor had proved capable commanders. The Congo Carrier Corps was disbanded and returned to Uganda.

When the Germans evacuated Tabora the operations conducted by Gen. Northey from the Nyasaland-Rhodesian border had so far developed that some of Northey's columns were interposed between Tabora and Mahenge. Northey had taken the offensive on May 25 (1916). His fighting force was about 5,000 strong; it was made up of King's African Rifles (1st battalion), South African troops (infantry), Nyasa and Rhodesian volunteers, the Northern Rhodesian Police (natives under European officers), the British South African Police (Europeans), and, later, a battalion raised from the natives of northern Rhodesia. For the supplies of this small fighting force the administrations of northern Rhodesia and Nyasaland were responsible. Some idea of the effort required is seen from the fact that up to July 1917, out of a total native population of scarcely 2,000,000 in the two districts named, 395,000 were employed as carriers. Much of the supplies had to be carried, in canoe or on foot, fully 600 miles.

Northey's forces were in two main columns: a Nyasaland column under Maj. (temporary Lt.-Col.) G. M. P. Hawthorn, and a Rhodesian column under Lt.-Col. R. E. Murray. A third column under Lt.-Col. T. A. Rodgers coöperated with Col. Murray. The advance was along the 200 m. front between lakes Nyasa and Tanganyika; there was a great deal of detached fighting, some German commanders, in von Lettow's opinion, too easily surrendering. Bismarckburg, the German port at the S. end of Tanganyika, was occupied by Col. Murray on June 8. Northey's main thrust was along the highroad which led from the Nyasa frontier by Neu Langenburg and Iringa to Kilosa on the Central (Tanganyika) railway—the road crossing the Tabora-Mahenge route. In an action on July 24 at Malangali Northey defeated the German force which sought to bar his progress, and on Aug. 19 the British seized Lupembe, a place 100 m. W.S.W. of Mahenge. On Aug. 29 Iringa was occupied. Exactly a week earlier Van Deventer had taken Kilosa, 120 m. N.E. of Iringa. Northey could have reached Iringa much earlier, but on Gen. Smuts's advice he "slowed down."

When von Lettow had been forced to take to the lower Rufiji district, it was decided that a joint effort should be made by Van Deventer and Northey to deal with the enemy in the Mahenge district. But before that operation could be undertaken—Van Deventer's men were nearly spent after over six months' fighting, marching, privations and illness—Northey had to meet the troops of Gen. Wahle coming from Tabora. The Germans were in three columns, an eastern under Maj. von Langenn, a centre column under Wintgens, and a western under Lt. Huebener. Wahle was with the centre column. The western column lost touch with the others, which acted in close coöperation. Northey's columns near Iringa were much outnumbered. Al-

though Col. Rodgers with a small body of South Africans made an effort to hold up the enemy on the night of Oct. 21 1916 the larger portion of Gen. Wahle's troops broke through the British lines. An attack made by Maj. Kraut the same day on Mkapira, in the Lupembe region, was regarded by the British as evidence of his knowledge of Wahle's movements; von Lettow states that this was not the case. The attack on Mkapira ended in a severe reverse to the Germans, but sharp fighting with Wintgens' column continued in the Lupembe area till the middle of Nov., by which time the Germans had occupied a chain of posts covering Mahenge, extending over 200 m., and facing Van Deventer's and Northey's troops. Huebener's column was still W. of Northey's lines, in the neighbourhood of Lake Rukwa. This was a region where there were neither British nor Belgian troops, and for weeks the British had been doubtful even of the existence of this column. It was eventually tracked down at Ilembule by Col. Hawthorn and bluffed into surrendering. It numbered 54 Europeans and 240 askaris, and the booty included a 4.1-in. howitzer (one of the guns from the "Maria").

The combined attack by Van Deventer and Northey against the Mahenge force was at length begun, on Dec. 24. The operation failed, though one of Northey's columns compelled the surrender of Maj. von Grawert and his detachment of 280 fighting men, including 30 Europeans. The main engagement was fought by Van Deventer's force—South African infantry and mounted men. The fight was at Muhanga, 70 m. N.W. of Mahenge. It began on Christmas Day and continued till Dec. 28. The Germans were attacked front and rear, but, as Gen. Smuts wrote, "eventually escaped through the dense bush and forest under cover of darkness and eluded pursuit." The rains had begun and early in Jan. (1917) the operations had to be abandoned. Gen. Wahle had now under him in the Mahenge area 6,000 or more soldiers, of whom at least 1,000 were Europeans, with a large following of carriers, and he found some difficulty in feeding them all. To relieve the pressure he directed Kraut and Wintgens to take detachments S. towards the Portuguese frontier, and Kraut, crossing Northey's lines, reached the Rovuma, where supplies were found. Wintgens had separated from him and turned N.W. (see below). All this time communications between Wahle and von Lettow were slow and irregular.

Since the abandonment of the pursuit of von Lettow at the end of Sept. (1916) Gen. Smuts had been engaged in reorganizing his army and in shortening lines of communication by making Dar-es-Salaam his base. He evacuated 12,000 to 15,000 white troops (South Africans), their place being taken by the Nigerian Brigade (under Maj.-Gen. F. H. Cunliffe) and new battalions of the King's African Rifles. The German ports S. of Dar-es-Salaam had been occupied by the navy in preparation for a new offensive. Of these ports the chief were Kilwa and Lindi, Kilwa being the nearest to Dar-es-Salaam. A considerable force had been concentrated at Kilwa by mid-Nov., when Gen. Hoskins took over command in that area. On Jan. 1 1917, in conjunction with Van Deventer's and Northey's operations in the Mahenge region, Gen. Smuts opened a new offensive against von Lettow, Hoskins coöperating from Kilwa in the rear of the Germans. Smuts tried an enveloping movement on the Mgeta river, but again, after very stout fighting, the enemy got away; they were followed up towards the Rufiji and engaged on Jan. 4 at Beho-Beho, in which fight F. C. Selous was killed at the head of his company of 25th Fusiliers. Though severely handled the Germans "again slipped past" and crossed the Rufiji at Kibambwe. The operations continued and were proceeding favourably to the British until the rains turned much of the valley of the Rufiji into a vast lake; and in that region, uncomfortably enough, von Lettow was able to maintain himself.

In the middle of these Jan. operations Gen. Smuts gave up the command. At the request of Gen. Botha he went to England to become a member of the Imperial War Cabinet. Having handed over the command in East Africa to Gen. Hoskins Smuts sailed from Dar-es-Salaam on Jan. 20 for London. Gen. Van Deventer left East Africa at the same time, returning to South Africa.

British Forces re-organized; Changes in the Command.

In consequence of the heavy rains Gen. Hoskins had to abandon operations on a large scale, though by the end of Feb. the N. bank of the Rufiji was cleared of the Germans. Some idea of the difficulties caused by the rains may be gathered from the fact that in this area "patrol work had to be carried out for some time in canoes, and the men found themselves making fast to the roofs of houses which had lately formed their quarters" (Gen. Hoskins's despatch). Sickness among the European and South African units was so great as to necessitate their withdrawal. As many as possible were sent to South Africa to recuperate, being recalled in May, when the dry weather permitted the offensive to be resumed. Meantime Gen. Hoskins utilized the period of the rains to undertake a thorough reorganization of his forces. The training of new battalions of the King's African Rifles was pushed on rapidly, and special attention was devoted to the improvement of communications. The difficulties of transport were very great; owing to the tsetse fly animal transport was no longer possible; both carriers and light mechanical transport, essential for a forward movement, were deficient. Gen. Hoskins by energetic measures largely overcame these difficulties.

To an extent hard to realize, the operations—of the Germans equally with the British and Belgians—depended on the number,

*Depend-
ence upon
Native
Carriers.*

organization and distribution of native carriers. Complete statistics are lacking, but on the British side alone, first to last, well over 500,000 carriers were employed. Those with the main forces were recruited from British East Africa (Kenya Colony) and Uganda,

in both of which countries a Compulsory Service Act was put in force in March 1917. Uganda, which also found a large number of carriers for the Belgian troops, up to the end of 1917 had furnished a total of 178,000 porters (besides 10,000 men for the King's African Rifles). A still larger number was recruited in British East Africa; a fair number of carriers were also recruited in German East Africa itself. Gen. Northey, as already stated, obtained his carriers from Northern Rhodesia and Nyasaland. Many carriers were used in the first line, that is they took ammunition, water, etc., right up to the fighting men, and casualties in action amongst these carriers were numerous.

There was also serious wastage among the carriers from sickness and privations, especially among the men obtained from Uganda and British East Africa. This arose mainly from the difficulty in supplying them with their accustomed food. Tribes, like the majority of those in the Uganda Protectorate, whose staple food consists of bananas, sweet potatoes and beans, suffered from intestinal disease when placed on a grain diet. For example out of 3,576 carriers from Uganda employed in the coast region of British East Africa between Aug. 1914 and March 1915 only 2,050 returned. Sufficient care was not always taken by officers in charge to procure suitable rations. But these cases were exceptional, and the African Native Medical Corps, 1,000 strong, raised in 1917 (recruited mainly from the senior high-school boys in Buganda), did much to improve the health of the carriers. In 1918 the carriers in hospital numbered 7%. The West African troops had their own Carrier Corps, raised voluntarily in Nigeria, the Gold Coast and Sierra Leone. The South African troops also brought their own carriers and labour contingents, a total of 60,300 men being sent from the Cape.

Before the weather had improved sufficiently to permit the offensive to be renewed Gen. Hoskins was appointed to command

*Position
in May
1917.*

a division in Palestine. Gen. Van Deventer returned from South Africa and took over the command on May 29 1917. The position of the Germans at this time was briefly this: von Lettow with his main force

was at the Matunda river, with patrols and detachments pushed close to and S. of Kilwa. Maj.-Gen. Wahle had recently been transferred from Mahenge to command in the Lindi area, succeeding Capt. Looff. At Mahenge Capt. Tafel had taken over control. There were smaller German detachments between Kilwa and Lindi and near the Rovuma. There was indirect if not direct communication between all the German forces. Nowhere, as throughout the campaign, was there any continuous front. The columns under Northey contained the Mahenge force on the

S. and W., and Van Deventer had at Iringa another column watching Tafel from the N.W. The rest of Van Deventer's force was to be engaged against von Lettow. That von Lettow might in the last resort retire into Portuguese territory had been foreseen; he had in fact contemplated that course ever since in Sept. 1916 he had been forced out of the Uluguru mountains. And German columns had already raided deep into Portuguese East Africa, bringing back much loot and reports of a land flowing with milk and honey.¹

For his main operations Van Deventer had the choice of an advance either from Kilwa or Lindi. An advance from Lindi (which is situated on the estuary of the Lukuledi) appears to have had the prospect of the best results, as by pushing forces up the valley of the Lukuledi and joining hands with Northey's column E. of Nyasa the escape of von Lettow into Portuguese territory might have been prevented. But Lindi harbour was poor, that at Kilwa was good, and the main body of the Germans was concentrated near it. Van Deventer's formula was to "find the enemy and hit him hard," and he decided to attack on the Kilwa side. The Kilwa force had been under Gen. Hannington, but Hannington was then seriously ill and Gen. Beves was in temporary command. The advance began on July 5, in the direction of Liwale, it being hoped to force von Lettow to disclose his intended line of retreat. Three columns were formed, the forces engaged including South African infantry, King's African Rifles, the 23rd Punjab and two mountain batteries. After some sharp fighting the Germans fell back to Narungombe, where an engagement was fought on July 19. The fighting was very severe; the Germans delivered several well-sustained counter-attacks and the issue appeared doubtful. The fight showed that "the enemy's capacity for resistance had not in any way been weakened by the rainy season, and that the *moral* and training of his troops remained high" (Van Deventer).

After the fight at Narungombe the Germans, who were under Capt. von Liebermann, retreated south. Von Lettow regarded the action as an opportunity missed by von Liebermann and as further proof of the immense difficulty of carrying out successfully in the bush operations in which several columns are engaged. But Beves's offensive was spent, and his troops suffered heavily from sickness. It was not until mid-Sept. that a new Kilwa force was ready to take the field. In the meantime preparations had been made for the advance from Lindi. In Aug. Brig.-Gen. H. de C. O'Grady, a great fighting soldier, had driven the Germans from the estuary of the Lukuledi, and provided elbow room for a further advance. He also foiled an attempt made by von Lettow in person to surprise his force.

When in Sept. Van Deventer was at length in a position to begin the main advance Gen. Beves had been transferred to the Lindi command and Gen. Hannington had resumed command at Kilwa. The Nigerian Brigade had been at Kilwa since Aug., and Hannington had also three new battalions from India, including the 25th cavalry. It was planned that the Kilwa force should sweep S. and the Lindi force W. so as to enclose von Lettow and prevent his breaking W. and consolidating with the Mahenge force. This period of the main advance, up to the end of

*Van
Deventer's
Campaign
in the
South-
East.*

¹ Here may be mentioned the most remarkable raid of the whole campaign. When early in March 1917 Wintgens parted from Maj. Krauth he took his detachment N.W. to Lake Rukwa, where he was engaged by, but escaped from, one of Northey's columns. He then continued N. towards Tabora, but falling ill with typhus surrendered to the Belgians (May 23). A Lt. Naumann then took command of Wintgens' men. Constantly pursued, he reached almost to the borders of British East Africa, then doubled back, losing men in several encounters, redoubled N. and finally was compelled to surrender with the remnant of his command—146 soldiers out of 600—at the beginning of Oct. (1917). A regiment, the 10th South African Horse, had been specially raised to help in tracking him down. "Such a raid," wrote Van Deventer, "could perhaps only have been carried out in a country like German East Africa, where the bush is often so thick that two considerable forces may pass within a mile, unaware of each other's presence; and where a ruthless leader of a small force can nearly always live on the country."

Nov., witnessed the hardest fighting of the whole campaign in East Africa. Relentlessly pursued by Hannington's columns von Lettow was compelled to fall back to the Lukuledi valley, the chief line of retreat being towards Nyango, a place 40 m. S.W. of Lindi, towards which Beves was pressing back Wahle's detachments. Early in Oct. Hannington detached the Nigerian Brigade (with which was the Gambia Company) to march to Nyango and join the Lindi force. Meanwhile other columns of the Kilwa force, including cavalry, were marching S., but further W., towards the mission stations of Lukuledi and Massasi. At those places, and at Chitwa, S. of the Lukuledi river, were most of the German supplies.

The Nigerian Brigade, after a fine march of 80 m., reached its destination on Oct. 15. On that day two columns of Beves's force under Gen. O'Grady and Col. Tytler respectively had driven back Wahle's main body to Nyango and Mahiwa (the latter about two m. from Nyango).

The Nigerians were to coöperate in cutting off Wahle's retreat (preparatory to the pursuit of von Lettow), and were in action early on the 15th. This was the beginning of a four days' battle, the most stubborn and most costly of the whole campaign. Von Lettow with four companies had gone to the help of Wahle, and attacks were met by counter-attacks; the Nigerians at Mahiwa being driven back and very hard pressed. Nyango the Germans abandoned on the 16th, only to take up stronger positions on a ridge two m. S. on the farther side of a river bed. These positions the British in vain assailed; they were in turn counter-attacked on the 17th and again on the 18th and compelled to fall back to the river bed, the enemy pressure continuing until after dark. Gen. Beves gave orders that the attack was to be resumed on the 19th. This order was cancelled by Gen. Van Deventer, and on the same day the command of the Lindi force was transferred to Gen. Cunliffe. On that day the Germans retired to the positions they had taken up on the 16th. The battle was over. Out of a total strength of 4,000 infantry engaged the British had 2,700 casualties, of which 528 were in the Nigerian Brigade. The 25th Fusiliers, reduced to a remnant in previous fighting, had 70 casualties out of 120 men who went into action. Von Lettow says that the German force was "some 1,500 men" and their casualties 519. This did not include all Wahle's casualties in the retreat to Mahiwa, for on Oct. 15-8 the British captured in all 241 Europeans and 677 askaris. The total German force engaged was not fewer than 2,800. Von Lettow describes this fight as, next to Tanga, the most serious defeat suffered by the British, and says he adapted his tactics to those of Gen. Beves, who "threw his men into action regardless of loss of life and did not hesitate to try for a success . . . by repeated frontal attacks." He (von Lettow) abandoned the idea of "an annihilating pursuit" as he learned that the enemy columns in his rear were threatening the Lukuledi mission station. He hastened to its relief and began the process of concentrating his forces to the Chiwata region. The Mahiwa-Nyango battle gave him this advantage—it was 10 days before Gen. Cunliffe was able to resume the offensive. On Oct. 24 von Lettow had a conference with Dr. Schnee, who appears to have urged that the end had come, but, writes von Lettow, "I firmly stated my opinion that . . . the war could and must be carried on."

Meanwhile Tafel's force had been driven from the Mahenge plateau with the help of troops furnished by the Belgians, whose coöperation had been sought. While columns of Northey's force, under Cols. Hawthorn and Fair, pressed the enemy hard from the S. and S.W., the Belgians struck at Mahenge from the north. The main Belgian column, under Maj. Batille, left the Central railway on Aug. 15, and made good progress through very difficult country. The Germans put up the usual strong rear-guard delaying actions, but when the Belgians attacked (Oct. 8) the last defence of Mahenge, Tafel ordered a general retreat. His losses had been heavy and many of his askaris deserted. Both Hawthorn and Fair were drawing near, but Tafel succeeded in outdistancing his pursuers, whose long lines of transport had reached breaking point. Tafel chose the only route open to him—

that leading S.E. in the direction of von Lettow. On Nov. 16 he broke through two weak detachments of Northey's force which gallantly endeavoured to bar his progress. A Belgian column, which had been sent round *via* Kilwa to Liwale, arrived only in time to engage Tafel's rear-guard. This was the end of the Belgian effort, and their troops shortly afterwards returned to the Congo. The pursuit of Tafel was taken over by the Kilwa force and his attempt to join von Lettow was frustrated.

At this time, mid-Nov., von Lettow's position was critical. The Lindi force had resumed its offensive on Nov. 6 and had joined hands with the Kilwa force on Nov. 12. Von Lettow had concentrated all his men near Chiwata, but to remain there meant certain disaster. So leaving only a small body at Chiwata to put up a delaying action—the place was taken by Gen. O'Grady on Nov. 14—he retreated eastward, i.e. towards the coast, along the broken edge of the Mkondi Plateau. He was pursued without pause and constantly engaged, suffering losses every day, was in a foodless region and had lost nearly all his stores. On Nov. 17 von Lettow took what he calls a fateful decision. It was to abandon all idea of fixed bases; reduce his force—half-starved and very short of ammunition, break off fighting and get away to some district where food was to be found. At a place called Nambindinga he left some hundreds of Europeans (many of whom, he states, were not unwilling to lay down their arms) and 600 askaris, and with the rest again eluded his pursuers by turning S.E. "by an unsuspected path." While the British columns were re-forming to pick up his trail he marched rapidly S.W., having determined to cross the Rovuma near its confluence with the Lujenda, where was the Portuguese fort of Ngomano. At Nwali he shed more of his troops, and his force was now reduced to approximately 300 Europeans, 1,800 askaris and 3,000 bearers and other natives, including women and children. He marched along the Rovuma to the selected crossing place, and on the night of Nov. 25-6 he crossed the river into Portuguese territory. Gen. Wahle, Maj. Kraut and other tried leaders were with him and also Dr. Schnee. Two attempts to overtake him "failed by a few hours at both places, in spite of hard marching." So wrote Col. G. M. Orr, commander of one of the pursuing columns.

For a day or two Tafel and von Lettow had been near one another; Tafel had reached the Rovuma but not finding von Lettow turned back. Running into an Indian patrol Tafel again tried to turn south. But his force was foodless and hopeless. On Nov. 27 a party of 37 Germans, 178 askaris and 1,100 followers gave themselves up to the British, and the next day, Nov. 28 1917, Tafel himself surrendered unconditionally with 19 officers, 92 other Europeans, over 1,200 askaris and some 2,200 other natives.¹

Not a single German combatant was left in German East Africa, and the conquest of the Protectorate was complete. At the time of his flight into Portuguese territory von Lettow states that he received a second summons to surrender. But he was no more ready to surrender to Van Deventer than he had been to Smuts; moreover, he considered his position satisfactory inasmuch as he could still contain a large enemy force.

The failure of the Portuguese to prevent von Lettow from crossing the Rovuma, or in accounting for him when he had crossed that river, was not due to lack of effort on the part of the Lisbon Government. During 1914-5 they had sent over 2,000 white troops to Mozambique, and between May and July 1916 another force 4,600 strong was sent from Lisbon. Part of this force had occupied Nwali (Oct. 1916), but had been forced to evacuate it a month later.² In 1917 Portugal sent 8,776 more men from Lisbon, and had strengthened the posts along the Rovuma, including that at Ngomano. But the Portuguese white troops

¹ A party of six Europeans and 20 askaris under Capt. Otto broke away from Tafel the night before his surrender, and eventually joined von Lettow.

² Urgent instructions were sent by the Lisbon Cabinet to the Portuguese commander, Gen. Gil, to coöperate with Gen. Smuts. The original idea was that Gen. Gil should march on Lindi.

lacked experience; there were not sufficient trained native soldiers and the military posts were widely scattered. Nor was any one post equal to a successful defence against the 2,000 and more veterans von Lettow had with him. Ngomano was attacked, and it surrendered after a gallant resistance in which some 200 casualties were suffered, including the commanding officer, Maj. Pinto. Its loot gave the Germans just what they lacked—food, ammunition, rifles, machine-guns and clothing. The Nigerians and the 25th Cavalry being in pursuit von Lettow then marched up the Lujenda valley. He had no difficulty in keeping ahead of the enemy, and the rainy season having set in the Nigerians and 25th Cavalry were recalled in the third week in Jan. (1918) and the Germans had a short breathing space.

Gen. Van Deventer now sent home all his white and Indian troops, and the Nigerian Brigade also. Except for the Gold Coast Regiment (which was not sent back till Aug.) the 1918 operations were carried out almost entirely by natives—the King's African Rifles. There were, however, a considerable number of Europeans among the Portuguese forces, which were put under the supreme command of Van Deventer.

Given the character and extent of the country into which the Germans had entered, the known determination of von Lettow to continue the struggle and the proven difficulty of bringing him to a decisive action, "the 1918 campaign," said Van Deventer, "had perforce to be one of virtual extermination." Wide converging movements were undertaken. Gen. Northey sent columns from the E. and S. shores of Lake Nyasa, while the Gold Coast Regiment advanced W. from Port Amelia (a harbour midway between the Rovuma and Mozambique). This Port Amelia column was later strengthened and came under command of Brig.-Gen. Edwards. Between Feb. and the middle of May the Germans were engaged at several points from both sides, mainly in the central region between the Lujenda and Msalu rivers. Von Lettow then marched S. to the Lurio river, 200 m. from the point where he had left German territory, with no enemy in front of him except isolated Portuguese posts, from which he obtained more valuable supplies. He was pursued from the N., and an Anglo-Portuguese column started N.W. from Mozambique (to which port Gen. Edwards removed his base) to overtake him. But von Lettow, marching very quickly S., captured Ilie, and in June reached the coastal region near Quilimane (Kilimane), where he ravaged many rich *prazas*. In this month Gen. Northey left, having been appointed governor of British East Africa and Col. (Brig.-Gen.) Hawthorn took his place. On July 1 von Lettow attacked a mixed Portuguese and British force at Nhamacurra, 25 m. from Quilimane, and after three days' fighting captured the place and inflicted very severe loss on the defenders. The approach of strong British columns then compelled von Lettow to retire. He marched parallel to the coast, in the Mozambique direction. He established himself at a place called Chalaun, but when in mid-Aug. British columns closed in upon it, it was to find the camp evacuated. Von Lettow had turned N.W. again, one of his ideas at this time being to raid the Blantyre district of Nyasaland. On Aug. 30 and 31 he was engaged by part of Hawthorn's force at Lioma, E. of Lake Shirwa, and suffered severely. "It was hoped that the enemy might have been captured, but the rugged country and the thick bush made operations very difficult, and he finally broke away to the northward."

Save that he could not replace his casualties (except to some extent by turning bearers into askaris) von Lettow held the advantage in this campaign in northern Portuguese East Africa. It was nearly as large as France, most of it was fertile, and the natives, richly rewarded with booty from captured posts, were friendly and useful. If hustled from one area there were others to which he could move. He was tied to no base and was an ideal guerilla leader. He had now, end of Aug., to decide his future course; he came to the conclusion that an attempt to invade British Nyasaland was too risky, as there the British communications were good. It was easier to go north. To reënter German East Africa would be a complete surprise to the enemy, who would imagine he was making for the Tabora region (where

most of his askaris came from) and take precautions accordingly. This would give him an opportunity of turning in another direction, and keep his force in being. His casualties at Lioma had numbered 95, and he had lost stores, baggage and ammunition. By Sept. 1 his total strength had been reduced to 176 Europeans and 1,487 askaris. He suffered further loss in another encounter on Sept. 6, after which date he got clear of his pursuers. Gen. Hawthorn had sent troops by steamer up Lake Nyasa, which should have reached the N. end of the lake before von Lettow could get there; the steamers broke down, and when on Sept. 28 the Germans again reached the Rovuma they were able to overcome the weak posts stationed there. Avoiding places held in strength by the British, and keeping ahead of the columns now in hot pursuit, von Lettow passed round the N. corner of Lake Nyasa, losing many carriers by desertion but recruiting a few askaris. He stayed at Ubena some days and then (Oct. 17) set out for Rhodesia.

Von Lettow's Surrender.

(At Ubena Gen. Wahle and two other Europeans, sick or wounded, were left behind.) On Nov. 1 von Lettow attacked Fife, just within the Northern Rhodesian border, hoping to capture its stores, but it was too strongly held, so the Germans turned S.W., making for Kasama, von Lettow now having some idea of penetrating into Belgian Congo. Kasama was taken on Nov. 9, but British columns were in its immediate neighbourhood and there were several patrol encounters. Necessity urged von Lettow onward. On Nov. 13 he was reconnoitring a crossing of the Chambezi (the eastern head stream of the Congo) when an English motor-cyclist arrived with a message from Gen. Van Deventer announcing the conclusion of the Armistice. Von Lettow notified his acceptance of the Armistice on Nov. 14; the formal surrender was made to Gen. Edwards at Abercorn on Nov. 23. The force which surrendered numbered 30 officers and 125 other Europeans, 1,165 askaris, and 2,891 other natives, among them 819 women, with one small field gun, 24 machine-guns and 14 Lewis guns. Those who surrendered included Dr. Schnee and Maj. Kraut.

The troops employed by the Allies in East Africa included 52,339 sent from India (among them 5,403 British) and 43,477 South African whites. Other white troops employed (East African and Nyasaland settlers, Rhodesian volunteers and the 25th Fusiliers) numbered about 3,000, the African troops (King's African Rifles, Nigerians, Gold Coast Regiment, Gambia Company, Cape Corps—1,600 strong—and West Indians) about 15,000; an approximate total of 114,000, not reckoning Belgian native troops—about 12,000 in all—the Portuguese and the naval force engaged. The greatest number in the field at any one time, May to Sept. 1916, was about 55,000; the lowest number, in 1918, was some 10,000, all African, save the administrative services. The total British and Indian casualties was officially returned at 17,823; of these 2,762 were among the South African Forces. These figures are exclusive of casualties among carriers and of deaths and invaliding through sickness, which among the South Africans alone exceeded 12,000.

The cost of the campaign to Great Britain, inclusive of Indian and South African expenditure and that of the local protectorates to March 1919, was officially estimated at £72,000,000.

AUTHORITIES.—British.—The despatches of Generals Smuts, Hoskins, Van Deventer, Northey, of the High Commissioner for South Africa (Lord Buxton), the Governor of Nyasaland (Sir George Smith) and of Adml. Charlton, published in the *London Gazette*, cover the operations, except the period up to March 1916, on the British East Africa frontier and the early naval operations, concerning which no despatches were issued. "The Times" *History of the War*, chaps. 155, 183, 206 and 276, covers the whole campaign. Brig.-Gen. J. H. V. Crowe, *Gen. Smuts' Campaign in East Africa* (1918), has an introduction by Gen. Smuts and an account of the blockade runners. For the German treatment of prisoners, etc., see the White Paper, Cd. 8689 (1917); E. F. Spanton, *In German Gaois* (1917), and J. H. Briggs, *In the East Africa War Zone* (1918). For particular units see A. Buchanan, *Three Years of War in East Africa* (1919), chiefly about the 25th Fusiliers; Sir Hugh Clifford, *The Gold Coast Regt. in the East African Campaign* (1920); W. D. Downes, *With the Nigerians in East Africa* (1919); G. M. Orr, "The Indian Army in East Africa," *Ind. U.S. Inst. India* (1919).

EASTERN EUROPEAN FRONT CAMPAIGNS.—Under this heading comes the general story of the campaigns of the World War which were fought between 1914 and 1917 on the front between the Baltic and the Black Sea. Till the summer of 1916, Rumania was neutral, and the theatre of war was limited on the S. by the northern extremity of that country. Thereafter, till the conclusion of the peace of Brest, the Russian and Rumanian fronts became one.

The story falls into three main parts, of which the first is considerably the most important. These are:—the open-warfare, free-manceuvre campaigns from the outbreak of war till the establishment of a continuous trench line and the setting-in of trench-warfare conditions, along the whole front in Oct. 1915; the trench-warfare operations on the Russian front from that date to the peace of Brest; and the Rumanian campaigns of 1916 and 1917. The events of 1918 belong rather to the story of the Russian civil wars than to that of the World War, and may be summarized for the present purpose in two clauses—the occupation of the Ukraine, for its economic exploitation, by German and Austrian forces, and the maintenance of a cordon, requiring large numbers of troops, along the frontier of Bolshevik Russia to provide against the contingency of a new eastern front being built up by the Entente and the Soviet Government, or by either singly. As an active element in the operations of the World War, the eastern front closes its history with the battle of Riga in the autumn of 1917, and this event, therefore, is taken as the limit of the present article.

I. THE THEATRE OF WAR

The operative contrast between the eastern and the western theatres of war lies less in the greater distances and areas of the former than in the fact that there Nature's handiwork has not been greatly modified by man's, whereas in France and Belgium there is an intense network of main roads and railways, and in many parts a great industrial development that has covered the country with factories, mines, tramways and workmen's suburbs. Hence arises a peculiar distinction. Strategically, the western theatre is penetrable everywhere; tactically, it is in many parts so tangled that coherent operations are nearly impossible. In the east, on the contrary, it is strategy that is difficult and tactics that are simple.

The importance of area and distance must not of course be ignored. Without counting Rumanian territory the theatre measures 650 m. x 320 m.—a six weeks' march under peace conditions from flank to flank, and a three weeks' march from front to rear. This and the unfamiliar sound of the place and river names to western ears have tended to make the operations of the eastern front seem more difficult to understand than they really are. In fact, the course of operations was largely dictated by geography, and the map, rightly read, shows the lines of geography to be drawn in bold, strong strokes. And even in point of distance, the E.-W. depth of the theatre is not more than 1½ times the distance covered by the Germans in their 1914 sweep through Belgium and France, and only half that covered by the *Grande Armée* in its march from the Rhine to Austerlitz in 1805. The picture of the operations of 1914-17, therefore, is not too large for comprehension, and the meanings of its parts are usually clear.

The broadest characteristic of the eastern theatre is its division into four well-defined regions. (a) The great central salient of Poland on and W. of the middle Vistula. (b) The Pripyat or Rokitno marshes, an area of 240 x 160 m. which, though largely reclaimed in modern times and therefore penetrable to a certain extent for tactical purposes, constitutes an almost insurmountable barrier to strategic movements on a large scale. Lying behind the Polish salient, these marshes, as it were, hollow out its base, leaving on either hand two avenues or corridors:—

(c) the northern, connecting Petrograd and Moscow with north-western Poland, and (d) the southern, connecting Kiev and S. Russia with Galicia and S.W. Poland. To the right and left rear of the salient (a) the two corridors (c) and (d) lie exposed on their outer flanks to hostile attack from E. Prussia and Galicia respectively, except in the portions nearer to their eastern entrances where the hostile frontiers curve away to the sea and to Bessarabia. Across the base of both corridors and in rear of the central marshes runs a water barrier consisting of the western Dvina and the Dnieper lines, unbroken save for the narrow gap at the watershed traversed by Napoleon in 1812. This waterline marks the eastern limit of the theatre. Its western limits, which espouse the shape of the salient, lie inside the frontiers of Germany and Austria-Hungary and may be taken as the lake region of W. Prussia, the Oder and the Silesian and Carpathian mountains. This limiting line, in contrast to the eastern, has several gaps, of which the most important is that lying between the Silesian and the Carpathian mountains—which is the gate to Vienna, and, owing to the higher cultural development of Germany and Austria, is strategically more penetrable even where geographical obstacles exist.

Across the whole width of the theatre, cutting off the salient from the corridors and the marshes, runs an almost straight barrier of water, constituted by the Vistula and its tributary the San, from the Baltic to beyond Yaroslav, and by the Dniester from the lakes S.W. of Lemberg to the Black Sea. The only gap is between Yaroslav and the lakes of Grodek.

All railways connecting the salient with the interior of Russia, whether they approach by the northern corridor, the marsh or the southern corridor, converge on the Warsaw-Ivangorod portion of this waterline and thence make south-westward for Upper Silesia. Practically all railways from S. Russia to Austria-Hungary, on the contrary, traverse the gap of Grodek-Yaroslav. The only line from Russia to the German Baltic lands enters E. Prussia at Wirballen at the broad entrance of the northern corridor; and similarly, at the other end of the theatre, a line from Bessarabia comes into the Bukovina system at Czernowitz. Apart from these two, the whole length of the northern corridor is traversed by three lines from Dvinsk, Polotsk and Orsha respectively ending at Warsaw and Ivangorod; the central marshes by one from Gomel which at Brest-Litovsk merges with the third of the northern lines; and the southern corridor by two from Kiev and Berdichev respectively which at Kovel become one, ending at Ivangorod. The significance of the various lateral lines connecting these approach lines is best judged by studying the map, and here it is enough to draw attention to (1) the line along the eastern base itself; (2) the line Baltic-Shavli-Vilna-Minsk with its accessory Vilna-Baranovich-Rovno; (3) the line Kovel-Brest-Litovsk-Osowiec-Lyck-Memel (4) the line Ivangorod-Warsaw-Mlava-Danzig; (5) the line Skierniowice-Lowicz-Wloclawek-Danzig. It should also be noted that, in the salient, no lines exist W. of Lodz and N. of Czenstochowa, and that in the northern corridor about Grodno and Augustowo the Prussian and Russian railways carefully avoid contact. Of the road system, it may be said, broadly, that first-class roads are not numerous, and that they group themselves, in the main, on the same axes as the railways. In the area N.W. of Lodz-Czenstochowa, however, roads to some extent mitigate the absence of railways, and about Augustowo the connexion with E. Prussia, which the railways avoid, is, as regards roads, intimate.

Within each of these broad divisions—the salient and the two corridors—other natural features exercised a considerable influence. The chief characteristic of the northern corridor is the practically continuous waterline which defends its flank from attack from E. Prussia. Leaving the Vistula at Novogeorgievsk below Warsaw, this line is formed by the lower Bug, the lower Narew, the Bobr, the lakes of Augustowo and Suwalki, the middle Niemen to Sredniki, the Dubissa, the Vindavski canal which crosses the low Shavli watershed, and the Venta prolonged by the Vindava to the Baltic. From the Niemen section to Novogeorgievsk almost every important crossing—there are

not many—is protected by permanent fortification of some sort. Its most vulnerable section is that at which the E. Prussian frontier makes contact with Augustowo-Suwalki-Kovno-Grodno. South of this region, on the stretch Rozan-Lomsha, owing to the absence of railways and first-class roads, military operations were never principal, but always dependent upon either those of Suwalki and Augustowo or those astride the Warsaw-Mlava-Danzig line. North of Kovno, at the broad entrance to the corridor, it was safe against all but secondary attacks, so long as Kovno held out and kept the attack toward Shavli.

Frontally, of course, the corridor was protected by the Vistula and its fortresses Ivangorod, Warsaw and Modlin or Novogeorgievsk (this last at the origin of the flank barrier just described), and behind this frontal defence were other successive lines—the middle Bug, the middle and upper Narew, the upper Niemen and its feeders, the Vilia system—not to mention partial barriers such as the Wicprz. But most of these rear barriers, in particular the Bug, tend in their upper course to turn *southward*, thus opening to an invader who stands N. of the San a series of successive gates along the inner edge of the corridor, by which penetration is possible to Bialystok or even to Baranovichi. Hence the special importance attaching, in the operations of 1914-5, to the lower San sector and the fortress of Brest-Litovsk.

The southern corridor, unlike the northern, lies partly on one side of the political frontier and partly on the other. No important natural barrier prevents either an Austrian irruption from the S. as far (roughly) as the line Lublin-Kovel-Sarni, or a Russian irruption through and past Lemberg (Lvov) to the Dniester. As has just been mentioned, the left wing of such an Austrian irruption has the opportunity of seizing the gates of the northern corridor; no reciprocal advantage offers itself to the Russians since the Dniester line is doubled by that of the Carpathians. But, in particular, the fact that the whole Lemberg region is within the Austrian frontier narrowed the corridor normally open to the Russians to a mere strip of country. To protect this from being cut off from behind, the Russians had constructed a triangle of fortresses Rovno-Dubno-Lutsk. At its front end, where it joins the northern corridor and the salient, Ivangorod, Brest-Litovsk, and minor river courses and marshes were relied upon to seal the region of Chelm and Vladimir Volynsk; in effect, a drive by the Austrians into that region if pressed too deep laid open its flanks to counter-attack both from Ivangorod and from Lutsk (Luck).

The geography of the interior of the marsh area needs little description. As above mentioned, much of it is tactically penetrable, but owing to the extreme paucity of communications, as well as to its physical difficulties, it is on the strategic plane essentially an obstacle and not a field of manoeuvre. Its outstanding geographical feature is its river system; the Pripyat itself runs W.-E., but it has numerous N.-S. tributaries notably on the S. side, and these tributaries sometimes form, with tributaries of the Dniester (flowing in the opposite direction), N.-S. waterlines of defence only broken at the watershed (Brody, for example) along which run the communications between Rovno and Lemberg.

In the forefront of the central salient, too, it is the waterlines that are the most important features. The course of the upper Warta; that of the Pilitea; the position of Lodz (or rather Lenczyska) at the divide of the Warta and Bzura systems; the course of the Nida meeting at its mouth the mouth of the Dunajec, one of the several Galician rivers which double the San obstacle; lastly, the upper Vistula itself which forms the southern boundary of the salient—all these were important.

Practically the whole of this region belongs to the W. Russian plain, and has marshy valleys, feeble undulations, and great forests, some of these last still existing in primeval density, others already broken up by man's clearings and settlements. The only hilly mass is the Lysa Goza in the Kielce region of the salient. On the contrary, the Lemberg-Brody-Buczacz portion of the southern corridor, and all country between the San or Dniester and the Carpathians, is almost wholly a country of deep-cut valleys and high plateaux.

The German reëntrant opposed to the Polish salient is geographically similar to, but in point of human development very different from, that region. In Silesia, owing to its industrial character, the network of roads and railways is as dense as in western Europe. Without going west of Posen, no less than three complete lateral or circumferential railways join Upper Silesia to the trans-Vistula railways of E. Prussia. As, in face of these, no Russian lateral exists W. of Lodz it is easy to see how this region, in spite of its want of natural defences, was able to act as a curtain between the two bastions of E. Prussia and Galicia, facilitating quick transfers of the centre of gravity from flank to flank and itself (save at one critical moment) immune from attack because of the difficulty of approach.

Of these two "bastions," E. Prussia was the more important as menacing the whole length of the northern corridor, from front to rear. Whereas the Lemberg region only projects from the San-Dniester barrier, E. Prussia has its whole length at right angles to the Vistula. It is served by so many railways that either end of this length is utilizable for the offensive.

The principal directions which this offensive may take are—from the eastern end of the province towards Shavli, from the same towards Kovno and Grodno, and from Mlava towards the Narew and, if and when that obstacle is overcome, on Siedlce or Bialystok. We have seen that the first of these is inevitably a secondary or dependent operation. Between the other two the choice was always, for the German Command, difficult. Presuming the Narew forced, or Kovno taken, as the preliminary in either case, the one offensive leads close into the rear of the Warsaw-Ivangorod stronghold, while in the other the corridor is seized far back near its entrance; the choice therefore depended on how deeply the enemy was advanced in the Polish salient or how long the passive front of the "curtain" could be held, or what chance there was of coöperation from the lower San through the Bug "gate," and on other factors which had to be reckoned together on every occasion that an offensive was planned. But these two avenues (Kielce or Warsaw-Mlava, and Vilna-Kovno [or Grodno]-Insterburg) equally serve for Russian offensives, and the defensive characteristics of E. Prussia were nearly if not quite as important as its qualities as an offensive base.

The main feature of military geography in E. Prussia is the chain of the Masurian lakes which, in a sickle from N. to S. and then westward, protects the interior against attack from the E. or the S.E. The tongues of land which separate the lakes represent only a narrow frontage which has actually to be defended, and have the effect also of gathering communications, plentiful in the interior, at a few points of exit. To the S. of the lakes a number of tributaries of the Bobr-Narew system continue the water barrier, as against eastern attack, to the Narew; to the N. of them the river Angerapp presents a similar barrier as far as the Pregel, beyond which river smaller streams continue the line of defence with some gaps to the Niemen. Behind the lakes, the next important N.-S. barrier is the line of the Alle which, rising in the central Masurian lakes, runs to the Pregel at Wehlau, whence from Tapiau to the Kurische Haff runs the Deime. Other partial barriers to an invader's westward progress exist but are of less importance. Finally there is the German section of the lower Vistula which, intricate at Danzig and fortified at Thorn and Graudenz, still bars access to Germany proper when E. Prussia has been conquered or evacuated.

Thus on the E. this province is singularly well protected. But it is to be noted (1) that the frontier, especially in the northern part, lies well in advance of the barrier, and that a policy of passive defence on the lake line forfeits a not inconsiderable region at the outset; and (2) that both the Insterburg-Johannisburg line and the Alle are turned by attack from the S., by Mlava and Soldau, where the westernmost part of the lake system dies away. At the centre of the "sickle," on the other hand, the density of the lakes is highest and they not only afford local protection to this part of the region, but also enable the defending army to shift its weight from E. to S.W. and vice

versa without much fear of flank attack in doing so; while, on the Russian side, the paucity of communications in the foreground of these central lakes seriously impedes liaison between the northern or Gumbinnen and the south-western or Soldau groups of the invaders. Such shifts of the centre of gravity are, moreover, facilitated by the dense railway system lying behind the lakes. The frontier railway, which runs from Thorn, by Soldau, Johannisburg and Lyck (junction of the Russian Bialystok-Brest-Litovsk transversal), to Tilsit and Memel, lies outside all defensive barriers. But inside the barriers are some three other transversals, one being the Thorn-Insterburg-Wirballen section of the Berlin-Petrograd main line, and the others parts of a well-developed provincial system.

The military-geographical characteristics of the Lemberg region, the other potentially offensive base lying outside the Vistula-San-Dniester barrier, are less sharply marked and their influence is not so definite. Offensive possibilities lie in the direction of (a) Bessarabia, (b) Kiev, (c) Kovel, (d) the inner edge of the northern corridor, towards Brest-Litovsk. Of these, as in the case of E. Prussia, (a) is eccentric, except as a secondary element of (b); and (c) centres on a region which is ill-developed in communications, and therefore operations there are subsidiary to those on either flank. The important alternatives are therefore, speaking broadly, (b) and (d). In (b) Dubno and Rovno play the same rôle as Kovno in the N., and the results to be expected from a successful operation of this character are similar to, but smaller in scale than, the corresponding enterprise on the Niemen. (d) The operation, twice carried out and several times contemplated, offered many results and many risks, and its usefulness varied according to a number of factors like that of the corresponding operation from the N., with which, in fact, it was logically combined.

Defensively, the conditions of the Lemberg region were similar in some respects to those of E. Prussia. Waterlines opposed invasion from the E., while from the N. Lemberg was open. But the real obstacle value of the E. Galician watercourses,—Gnila Lipa, Zlota Lipa, Strypa, etc.,—whose names were to become historic, is small, and, though N. of the Stry system and the uppermost streams of the Bug (Stry) have wide marshy valleys and are serious barriers, the watershed itself (Dubno-Brody-Lemberg) is an open gate both for road and rail approach to the Galician capital.

The railway system of the Galicia theatre, though far inferior to that of Silesia and Prussia, included two complete laterals N. of the Carpathians, and at least one S. of them. From the interior of Hungary and Moravia, over the Carpathians, to the San-Dniester barrier there were eight approach railways between Teschen in the W. and Czernowitz in the E., and four of these pass the barrier at or near the Grodek gap, converging on Lemberg and Rava Ruska. In the latter region itself the railways lie chiefly radially from Lemberg. It is to be noted that on the whole front N. of Lemberg the Russian frontier region is destitute of approach railways.

Finally, the Carpathians (of which Galicia to the San, to Lemberg and to the Dniester, is simply a glacis) are not as the sea is to E. Prussia, a definitive barrier, but rather a wall with many gates for the passage of an invader into Hungary and Austria. The mountains themselves are rather Vosgian than Alpine, and their main passes are low enough to be practicable for railways. At the W. and E. ends, the mountains broaden out into the Tatra and massifs, but in the centre the mountain zone is at its narrowest, and it is exactly in front of this that the Grodek gap breaks the forward barrier and allows these railway approach lines to make for the Hungarian plain. West of the Tatra massif, the Troppau gap opens Moravia to an invader who has mastered Upper Silesia. (C. F. A.)

II. THE CAMPAIGNS OF 1914

The Russian Plan of Campaign.—Two characteristics of the Russian Army were admitted on both sides as axiomatic, the relative slowness with which its total forces could be brought to bear and the numerically overpowering superiority of those

forces when assembled and ready. Both these were summed up in the popular phrase of 1914, which likened the Russian Army to a steam roller. The axioms were not, however, independent. Only by waiting could the overpowering strength be realized, and by temporarily forgoing this numerical advantage, it was possible for the Russians to act with partial forces and provisional objectives, almost if not quite as promptly as the armies of the Central Powers. Instead, therefore, of the usual stages of *couverture* and full-power action there would be, or might be, three—*couverture*, rapid partial action, and delayed full-power action—and the application of the geographical factors to strategy varied accordingly.

In all alternatives, the inclusion of the central salient, either in the *couverture* system or in the deployment for the main action, was impossible. In other words, it was militarily evacuated from the outset. In the alternative of delayed full-power action, the *couverture* would guard the outer flanks of the two corridors and the Warsaw-Ivangorod-Lutsk front, while the main masses assembled further back. Flank-guard groups would prolong the defence of the corridors respectively in the Shavli region and to the S.E. of Dubno and Rovno. The line of detrainment for the main bodies would be, substantially, Kovno-Grodno-Bialystok-Brest, and (for the Southern armies) points behind Rovno. But the abandonment of so large a portion of Poland would only be necessary in the case of Germany's employing the major portion of her forces in the east. In that case, especially if it arose in winter, it was calculated that the Russian forces on the *couverture* line would have to retire fighting, giving up Warsaw and possibly Ivangorod, but holding firmly at all costs on the middle Niemen front and at Brest. If that case did not arise, then the *couverture* was strong enough to enable the main masses using the northern corridor to detrain further forward. In proportion as the arrangements for mobilization and concentration were improved in the years 1910-4, and in proportion also as it became more probable that Germany would elect to employ the bulk of her forces on her French front, not only this forward concentration but also preparatory offensives delivered from the *couverture* line came to be considered.

In all cases the main object which was to be sought when the forces were fully assembled was practically the same. It was the destruction of the Austrian armies in Galicia, the occupation of the Carpathian line, and eventually an advance into Moravia and Silesia by Troppau and the Oder head, turning Breslau. The exact form in which this ultimate offensive would be realized could not be foreseen until the Germans and Austrians had shown their hand; meantime, the problem before the Russian general staff was so to plan their *couverture* arrangements, their detrainments, and their now feasible preparatory offensives as to subserve this purpose.

Generally speaking, the *couverture* on the Narew-Bohr, that on the middle Niemen, and that in the Shavli region were disposed and directed to checking as long as possible any German attack on the flank of the northern corridor. It would be reinforced *in situ* to the strength of two armies and an independent group. If powerful German attacks developed it would offer an elastic defence, on one line after another, to protect at all costs the region of Bialystok-Grodno-Vilna during the troop movements in that area. If not, it was to take the offensive and, by conquering E. Prussia to the Vistula, definitely to secure the right rear of the future main effort. This conquest was to be carried out from the S. by Mlava, turning the lake barrier, by one army while the other pressed up against the front of the lakes and the Angorapp, so as to occupy the Germans and at any rate to prevent a rush upon Kovno and Grodno. The independent group about Shavli was to deal with minor enterprises of the enemy in its own area, and especially with landing threats on the Baltic coast as far as Riga. From that point inclusive, coast defence was entrusted to another army, with headquarters at Petrograd.

In the centre two armies, coming from the interior by the central and eastern railways of the corridor, were, if possible, to

**EASTERN EUROPEAN FRONT
CAMPAIGNS (POLAND)**

PLATE III.

concentrate about Lublin and Chelm respectively; otherwise they were to divide, one going to the right of the defensive wing about Shavli, the other continuing S. to Brest and Kobryn. Supposing that this proved unnecessary, the two armies, from Lublin and Chelm respectively, were to take the offensive against the left of the Austrian armies in Galicia. The right of these meantime would be attacked by two other armies, advancing from Dubno and from Proskurov. These armies were given special precedence in their equipment, so as to be ready to act early. At Odessa, a minor army of reserve divisions was to be assembled to watch Rumania.

Defensive or offensive as the case might be, these preparatory engagements were all assumed to be in progress before the full concentration had been effected. Including the Petrograd army, only 28 out of a total of 37 active corps were comprised in the dispositions, and the reserve divisions formed on mobilization were not counted upon for immediate service. The remainder, in so far as no new complications occurred to tie them to their peace regions (e.g. Caucasus), would become successively available and constitute a mass of manoeuvre or a pool of reinforcements, according to the course of events.

On mobilization, accordingly, the allocation of troops was as follows:—

I. Army (*Rennenkampf*). Niemen, including Shavli. II., III., IV., XX. Gd., I. Corps. (As soon as relieved by reserve divisions [XXVI. Corps] at Shavli, XX. Gd. was to proceed to IV. Army.)

First task: protection in front of Niemen line, on that line, or if necessary further back towards Vilna. Second task: advance to bind the German forces on the lakes and Angerapp.

II. Army (*Samsonov*). Narew. VI., XV., XXIII., XIII. Corps. First task: protection of Bobr-Narew-Bug line and reconnaissance into Mlava-Neidenburg region. In case of heavy German offensive, the region of Bialystok to be protected at all costs. Second task: invasion and conquest of E. Prussia via Mlava, turning the lakes. (These two armies had each several reserve divisions allotted.)

IV. Army (*Leert*). Concentration area Lublin. Grenadier, XIV., XVI., XVIII. Corps.

V. Army (*Plekve*). Concentration area Chelm. V., XVII., XIX., and XXV. Corps.

Both for attack of N. front of Austrian armies in Galicia.

III. Army (*Ruzsky*). Concentration Rovno-Dubno. IX., X., XI., XXI. Corps.

VIII. Army (*Brussilov*). Concentration S. and W. of Proskurov. VII., VIII., XII., XXIV., III. Caucasian Corps.

Both for attack of N.E. and E. front of Austrians in Galicia.

The I. and II. Armies formed the north-western front under Gen. Zhilinsky (succeeded after the first operations by Ruzsky), the IV., V., III., VIII. the south-western front under Gen. Ivanov, whose Chief of Staff was Alexeyev.

The VI. Army (*Grand Duke Nicholas*) was the title of the Petrograd force, the VII. (Nikitin) that of the Odessa troops.

(In the event of German offensives developing on a large scale, requiring the adoption of the rear line of rail-heads, the IV. Army was to be switched *en route* to the right of the I., and to it instead of to the VIII., the XXIV. Corps was to go. It would also become part of the north-western front.)

The peace-time scheme, as thus outlined, was at once modified in the early days of mobilization, not so much in intentions as in allocations of force. No commander-in-chief of the whole was appointed before the war, as the Tsar was undecided as to whether to take command himself. At the outbreak of war the Grand Duke Nicholas, Commander of the VI. Army, was appointed. He had taken no part in drawing up the scheme, and his own ideas differed somewhat from it. He therefore formed a new scheme, or rather a modification of the basic scheme, whereby the Guard and I. Corps were dispatched to Warsaw (instead of to the I. Army) to form the nucleus of a IX. Army, and the VI. or Petrograd Army was reduced first to one corps, and then to reserve divisions only. The first corps to leave was the XVIII., originally intended for the IV. Army but now assigned to the IX. (replaced in the IV. by the III. Caucasian Corps taken from the VIII. Army). The XXII. followed towards the end of August, joining the I. Army in lieu of the Guard and I. Corps. Further, a number of the reserve divisions accumulating behind the I. and II. Armies were constituted a little later as a X. Army with the mission of connecting the I. and II. Armies—but too late to avoid the catastrophe of Tannenberg.

Mobilization and concentration proceeded rapidly. The cavalry divisions allotted to the Prussian front were detained complete by the 7th day of mobilization, the infantry corps by the 13th day. On Aug. 14 the Grand Duke informed the French ambassador that the I. and II. Armies would open their offensive on the morrow, considerably sooner than was expected by the French, who only began their advance on that day.

The "preventive" offensive that was to lead to Tannenberg was thus launched on Aug. 14. Its objects were, partly, the accelerated fulfilment of the original plan of campaign (at the lowest, the active flank defence of the northern corridor, now being traversed by a IX. Army as well as the IV.); and partly, the desire to aid France by startling the German command into making detachments to the E.

Plans of Campaign—Central Powers.—The problem of war on two fronts had for many years been anxiously studied in Germany and it had been generally accepted in principle that a simultaneous offensive E. and W. was impossible. In the time of the elder Moltke, the difficulty of defending the long, open eastern frontier, as compared with the relative ease with which the short, strong line Thionville-Strassburg could be held, had decided the great general staff in favour of choosing the east as the offensive theatre; and this plan held the field, with few modifications, until Schlieffen came into office as Chief of the General Staff and reconsidered the military position. He decided that the first offensive must be directed against France, but in such a way as to insure the quick and complete destruction of the French army, i.e. by using Belgian avenues for the envelopment of its left. His solution of the two-front war problem, therefore, was to prevent its happening: neither he nor his successor, the younger Moltke, seems to have dealt exhaustively with the case that actually arose, i.e. that of a prolonged contest in which the centre of gravity constantly required to be shifted from E. to W. and vice versa. An important factor, perhaps the ruling factor, in the decision was the assumption that it would be impossible to bring the Russian army to decisive battle; owing to its slow assembly, the distances to be traversed in order to reach it required a time allowance which the western defensive, at grips with the highly trained and efficient French army, could not insure for it. Moreover, with unlimited space behind them the Russians were regarded as having every chance of avoiding a decision for as long as they wished to do so, and the re-distribution of the Russian peace garrisons after 1910 (which pointed to the choice of the rear line Kovno-Bialystok-Brest as the probable line of entrainment) confirmed the conclusion. Two possible offensive directions were considered, that from the Mlava region against the Narew line, and that from the lake front by Wirballen and by Augustowo and Suwalki against Kovno and Vilna. These alternatives and their meaning have been alluded to already. The choice was a difficult one, hardly to be settled except *ad hoc*; it was to be the chief bone of contention between Falkenhayn and Hindenburg in the 1915 campaign. But even the second, and more promising, line of operations would not lead to the enemy's rear if he abandoned all Poland at the outset, and concentrated between Kovno and Brest.

In fact such a course of action was provided for in the Russian concentration scheme. But the alternative preferred by the Russians was an offensive, or two offensives, carried out by the readiest portion of their forces, and their alternative naturally engaged the attention of the Central Powers in the years after 1910, when the war-readiness of the Russian army was evidently being improved with menacing rapidity. The defence against such an attack could not readily be combined by the two Central Powers because of the salient W. of the Vistula; on the defensive, therefore, Germany and Austria-Hungary formed two theatres, either or both of which might be the target of enemy offensives of uncertain power. Further, the entire peace forces of the Central Powers, taken together, were not equal numerically to the peace forces of Russia, and the adhesion of Turkey, and still more that of Rumania, to their side was problematical. If the bulk of the Russian forces concentrated on the forward line, then there were only two practical alternatives for the Central

Powers: either (a) to concentrate as much as possible of the German army in the E. (relying upon the short and well-fortified defensive line of Lorraine and Alsace, doubled by the Saar and the Rhine, to hold up the French), and to take the offensive with 90 or 95 divisions, German and Austro-Hungarian, as soon as possible so as to catch the enemy in the act of detrainment; or else (b) to stand on the defensive, each in his own theatre of war, resigned to give up territory in order to gain time for the annihilation of the French.

But that annihilation effort would require at least four-fifths of the German mobilizable forces, if it were to be carried out in the short time that the conditions of the E. allowed, and in the case of Germany the territory that would have to be resigned was E. Prussia, bound indissolubly to the Hohenzollerns and to the Prussian army by ties of sentiment and tradition. Its abandonment was "unthinkable." Yet the force that could be spared to defend it was small indeed. The Reichstag had declined to sanction the creation of the three new army corps which would have eased the problem; and, in the event, one to two corps allotted in principle to the E. were taken at the last moment for the W. In short, the German army allotted to the E. was a minimum force. But it was not on that account authorized to give up any German ground.

The case of Austria-Hungary was more favourable to this extent, that nearly the whole force of the Dual Monarchy could be employed in the defence of Galicia, unless (as actually happened) offensive action was simultaneously undertaken in the Serbian theatre. On the other hand, Galicia would clearly be the enemy's principal target, and were he to leave mere flank guards against E. Prussia, there was little doubt that even in an accelerated offensive he could employ superior forces. Many Austrian authorities therefore favoured a withdrawal of the line of defence to the Carpathians, and probably the majority considered that nothing could be held in advance of the San-Dniester barrier. The problem then was difficult and obscure, and differences of opinion both within each country and between the two countries themselves were certain. Austria's strategy even in respect of her local problems depended largely upon Germany's, and no definite, binding convention appears to have been negotiated, either for the case of the offensive or for that of the defence. More, the interchange of views which did take place led to completely disjointed action. When the inner wing of the Austro-Hungarians was driving forward the offensive on Lublin and Chelm, the Germans in E. Prussia were under orders to retreat to the Vistula.

Conrad von Hötendorf, the head of the Austrian general staff, was essentially active in temperament, and the wave of sentiment in favour of the undiluted offensive which swept through all European armies about 1912 strongly influenced him and his entourage. A scheme was prepared under which the left portion of the Austro-Hungarian army was to take the offensive from the lower San, northward on Lublin and Chelm, flank-guarded by an échelon directed on Vladimir Volynsk, while the right portion defended Lemberg against attack from the E. In coöperation with this left wing, a German army was to advance by Mlava on the Narew line, force this, and effect a junction with the Austrian advance about Siedlce. By this scheme it was hoped either to cut off a part of the Russian army and beat other parts in detail as they detrained—if the Russians were attempting to forward concentration—or to make good military occupation of almost the whole of Poland in the shortest time—if they were concentrating on the rear line Kovno-Brest. At the lowest, Conrad held, the protection of Galicia and of E. Prussia would be best assured by the offensive.

In how far Moltke agreed to this plan is doubtful. He had definitely committed himself to the Schlieffen scheme of putting France out of action before an eastern front came into existence, and though he had considerably altered its details, he had provided even less force for E. Prussia than Schlieffen had proposed. Such evidence as is available tends to show that Moltke agreed with the scheme as the operative idea of the eastern offensive that was to follow the decisive defeat of France (expected to

have been sufficiently achieved by about the 30th day of mobilization), but not as a preventive offensive to be launched while the issue in France was still undecided. Conrad, on the other hand, was determined to carry it out the moment he was ready, hoping, as he said, that Moltke would not "leave him sitting in the ink too long." The scale of the operation for him was only that of a preventive offensive, carried out substantially by about 27 Austro-Hungarian and 10 German divisions from the San and from the Mlava region respectively. This force, if it caught the Russians in the act of concentration, would create "favourable conditions for later operations" on a large scale.

Moltke, on the contrary, gave the E. Prussian Army (VIII., Gen.-Oberst von Prittwitz and Gaffron) nine active and reserve divisions (I., XVII., XX. Active Corps, I. Res. Corps, 3rd Res. Div.), for both the lake and the Mlava fronts. Apart from a number of Ersatz and Landwehr formations, most of which were intended for the defence of Thorn, Graudenz and Königsberg, this was all. In Posen province and in Silesia, there were only frontier guards of Landsturm, and the Landwehr and Ersatz garrisons of Breslau and Posen; as the salient facing these provinces was practically evacuated, no more was necessary, and indeed eight Landwehr regiments were grouped in Upper Silesia as a field force (the "Landwehr Corps," von Woyrsch) to accompany and guard the left of the Austrian offensive.

Thus, the first campaigns in the E. were distinct and without connexion of idea or of date. The battles of both being described elsewhere, it is sufficient here to outline the campaigns of Lemberg and Tannenberg in succession.

The Campaign in East Prussia; August-Sept. 1914.—The first requirement of the Russian scheme of operations being free use of the northern corridor for the assembly of forces against the Austrian left, the troops disposed on the dangerous flank of the corridor were ready for action about ten days before the date set for the completion of the Lublin-Chelm concentration. In the original scheme, their mission was primarily defensive and in the second place offensive, but as early as Aug. 9 the Grand Duke determined to push forward both the I. and II. Armies on their offensive missions, in the hope of at once compelling the Germans to hold back forces destined for the W. On the 14th, their concentration completed, these armies moved out of the detrainment areas, the I. (II., III., IV. and XX. Corps) under Rennenkampf on the axis Kovno-Gumbinnen and Suwalki-Marggrabova, the II. (VI., XV., XXIII., XIII. and later I. Corps) under Samsonov on the axis Prusznysz-Soldau. Seven to eight cavalry divisions accompanied and preceded them. At many points on the frontier from Memel to Bialla and round to Mlava there had already been local engagements, especially on the axis Kovno-Gumbinnen, where Rennenkampf on the one side and von François (commander of the German I. Corps) on the other had both strong motives for activity, the Russians to thrust back the enemy's forces as far from the "corridor" as possible, the Germans to preserve the region between the frontier and the lakes as long as possible from occupation or pillaging. On the Mlava axis these episodes were fewer, for the Russian main bodies were more distant. The Germans were unable to prevent the enemy's mounted troops from ranging up to Soldau, but their Zeppelins reconnoitred the line of advance of Samsonov's main bodies.

Gen. von Prittwitz, in spite of his small forces, was confident. He placed the I. Corps (François) facing E. on and in front of the Angerapp, the XX. Corps facing S. between Allenstein and Soldau, the XVII. and I. Res. Corps and the 3rd Res. Div. in the interior, waiting on events. To the left rear of the I. Corps, the Königsberg main reserve—an Ersatz and Landwehr force numerically, but only numerically, equivalent to a corps—moved out N. of the Pregel to Insterburg. To the right of the XX. Corps was a frontier guard, also composed of Ersatz and Landwehr belonging to the fortresses of Thorn and Graudenz. On Aug. 14 v. Prittwitz, satisfied that no important threat was impending on his S. front, turned over the defence of that front to the Landwehr and Ersatz formations of Gen. von Unger, drew the XX. Corps to Ortelsburg, in readiness for an offensive to-

wards Johannesburg, and brought the remainder of his forces to the E. front behind and on the flanks of the I. Corps, the 3rd Res. Div. (reinforced by one brigade and a screen of Landsturm posts) holding the lake barrier.

On the 17th took place the first serious encounter of large forces. Von François still maintained a forward position on the Kovno railway at Stallupönen, barely five miles inside the frontier; he was determined to defend offensively, and he inflicted a sharp blow on the central columns of the enemy before the others became effective. But his left was driven in, and Prittwitz, whose intention was by no means to fight so far forward, ordered the combat to be broken off and the troops to retire to the Gumbinnen position. There, on the 19th and 20th, the battle of Gumbinnen was fought. Claimed by both sides as a victory but in fact indecisive, since parts of each line gained successes or suffered failure, it ended in Prittwitz's ordering the battle to be broken off. To the astonishment of his corps commanders, he announced that he proposed to retreat over the Vistula. A grave crisis had arisen. The Russian II. Army, seemingly quiescent on the Narew, had in fact been cautiously advancing on the Mlava axis, which was now defended only by second-line troops and, partially, by the XX. Corps—everything else, even mobile Landwehr brigades, having been brought over to the E. front by the order of the 14th. Such was the situation of the defences when, some time after noon on the 20th, reports reached Prittwitz to the effect that four or more Russian corps were approaching Mlava and Ortelsburg. He had three alternatives—to disregard the threat, win an effective victory at Gumbinnen, and pursue the enemy in such a way as to impose caution on all Russian forces in advance of the sensitive point of the "corridor"; to leave a containing force about Gumbinnen, trust to the lake barrier, and bring back the bulk of the forces so as to strike the flank of the oncoming II. Army; or to fall back beyond the sweep of that army's manoeuvre. The first alternative was eagerly advocated by von François, but the other corps had met with little success in the battle. It is probable that no reasonable hope remained of winning a thorough victory on the 21st, and nothing less would serve. The second alternative was not, at that moment, considered and the third was adopted in its most extreme form, retreat beyond the Vistula. The I. Corps was to move by train to Bischofsweier and Gossershausen, in order to bar the road to the Vistula, the XX. to fight for time, and the remainder to withdraw south-westward under cover of these corps. A factor in the decision was the activity of Russian cavalry which, in large and small bodies, was appearing in the interior of the province.

In the *Kriegsspiel* exercises of peace-time, this problem had often been fought out, and the idea of sacrificing E. Prussia—on paper—was familiar. But, as the elder Moltke observed in 1866, "in practice one does not abandon provinces." On the 20th, apparently on the initiative of Lieut.-Col. Hoffmann of the staff of the VIII. Army, who sent a protest direct to supreme headquarters at Coblenz, Moltke communicated with Prittwitz by telephone, and urged him to try the alternative of a manoeuvre on interior lines. The army commander replied that this was impossible and that he might need reinforcements even to secure an escape to the Vistula. Thereupon Moltke relieved him of his command, opened direct telephone communication with von François and von Scholtz (XX. Corps), telegraphed to General-Oberst von Hindenburg, in retirement, to offer him the command, and summoned Ludendorff (deputy chief of staff II. Army) to act as chief of staff.

This situation, in fact, was less alarming than it had been on the 21st. Neither Rennenkampf nor Samsonov displayed any important activity; and Prittwitz recovered confidence, decided to hold the line of the Passarge against Rennenkampf, and began to work out a scheme of attack against the Russian II. Army. But the order of dismissal reached him that evening.

On the 23rd Hindenburg and Ludendorff arrived at Marienburg (H.Q. VIII. Army). Already, after a conversation with Moltke, Ludendorff had (apparently on a suggestion from François) fixed Deutsch-Eylau and eastward, instead of Goss-

ershausen, as the rendezvous of the I. Corps and ordered all available Ersatz and Landwehr units from Thorn and Graudenz to strengthen von Unger, thus beginning to prepare a group of two active corps and other troops to check Samsonov. The other forces lately engaged at Gumbinnen were to remain, temporarily, opposing Rennenkampf—all measures designed, evidently, to arrest the sense of retreat and panic. Not until the staff of the VIII. Army had reported the situation in detail was a clear idea of possibilities formed by the new leaders. In principle the plan was adopted of holding up Rennenkampf, maintaining the lake region against any break-in from Lomzha, and concentrating offensive effort on Samsonov. Both the newcomers and the staff already on the spot were in agreement as to this. But it remained to be seen whether, and even how, it was to be accomplished. On the evening of arrival, Hindenburg reported to Coblenz "assembly of army at XX. Corps and enveloping attack planned for Aug. 26," but next evening, developing the idea in some details, he added: "moral determined but not impossible things turn out badly."

The intention was to disengage some, or even all, of the troops opposing Rennenkampf, and with them by a flank march close behind the lakes, to envelop Samsonov's right; to bring in the I. Corps and the nearest portions of von Unger's force against his left, and to hold him frontally with the XX. Corps. It was on this last that everything hinged. Short of a simultaneous effort by both Rennenkampf and Samsonov—the case feared by the Germans—pressure by the II. Army alone was of greater significance than that of the I. Army alone would be. Rennenkampf, however active, could only drive the I. Res. and XVII. Corps south-westward towards the Passarge (and the Königsberg troops into their fortress) and work a passage down the rear side of the lakes to join hands with Samsonov, whose VI. Corps was made to diverge towards Ortelsburg for that purpose. Samsonov, on the contrary, could by an energetic advance bring three corps (XIII., XV., XXIII.) against Scholtz, and in case of success break into the midst of the new dispositions of his opponent. On the 23rd-24th this seemed probable, for on those days he attacked the XX. Corps and forced it to swing back from the line Gilgenburg-Orlau to the line Gilgenburg-Hohenstein. At that moment the 3rd Res. Div. at Hohenstein and even the first arrivals of the I. Corps at D. Eylau were being drawn into the fight to assist von Scholtz. The arrival of the rest of the I. Corps, destined for the flank attack on the W., was delayed by misadventures; and this western attack (I. and Unger) was itself becoming imperilled by the advance of yet another Russian Corps, the I., from the IX. Army forming at Warsaw. Of the other German corps not one was disengaged for its southward march before the 24th.

On the 24th, however, the withdrawal from Rennenkampf's front began. It was carried out in the midst of an emigration *en masse*, main roads being so crowded with refugees that troops were marched in some cases entirely by tracks and by-roads. Russian cavalry parties were by now riding about the country as far as the Passarge.

The Angerapp line having been given up on the 22nd, the front of contact opposite the Russian I. Army now (24th) ran along the Deime and the lower Alle, astride the Pregel, to Allenburg, thence by Gerdaun to Angerburg at the N. end of the lakes. North of the Pregel, the Königsberg force was slowly retiring on its fortress and had left Wehlau. South of it there were withdrawn, each in succession and covered by the rest, the XVII. Corps, which was directed on Bischofsburg-Ortelsburg; the I. Res. Corps, directed upon Seeburg; and finally the 6th Landwehr brigade from Lützen, the key of the lakes, to the same region. Only the Königsberg force, one cavalry brigade and some Landsturm, remained in front of the Russian I. Army.

Meantime, Samsonov continued his methodical advance, but very slowly—the VI. Corps on Bischofsburg via Ortelsburg; the XIII. on Allenstein; while the other two, followed in echelon to the left rear by the I. Corps, were sent against Scholtz (20th and 3rd Res. Div.), whose left was driven from Hohenstein. But already the two wings of the envelopment were being pre-

pared and directed according to the indications of Russian wireless messages sent in clear. On the W., the German I. Corps, with additional troops under Müllmann coming up on its right, attacked towards Usdau on the 26th. On the same day the Russian VI. Corps was met and defeated at Gross-Büßau by the oncoming eastern enveloping wing. Von der Goltz's Landwehr division, arriving opportunely from Schleswig-Holstein, was added to Scholtz's threatened flank. From the 26th the battle was general. Strategy had done its part. By the 31st the destruction of Samsonov's army by double envelopment was complete, only the attached I. Corps écheloned back on the left being outside the ring and able to escape as a formed body. Samsonov himself fell, and 92,000 prisoners and 300 guns remained in the hands of the victors.

Meantime the German supreme command at Coblenz had taken a step which is generally regarded as having been fatal to Germany's success in the war. Moltke had recognized from the first that the strength of the VIII. Army was little above, if not below, the safety limit, and in the background there was Conrad's repeated demand for effective coöperation in the Siedlce scheme. Only after much hesitation was the IX. Res. Corps in Schleswig-Holstein taken to reinforce the W. on the strength of Prittwitz's optimistic reports on the eve of the battle of Gumbinnen. Two days later came the crisis which led to Hindenburg's appointment, but at that moment the battle of the Frontiers was developing all along the line in the W. and Moltke did not suggest (nor did Ludendorff ask for) a reinforcement of the E. On Aug. 25, however, caught apparently in a wave of optimism which pervaded the armies of the W. after five simultaneous victories, Moltke decided to send no less than six army corps to the VIII. Army, not so much in order to re-establish a compromised situation there as to deal the offensive blow in the E. that was only waiting upon a decision in France. Two corps were to go from each portion of the western front, and the Guard Reserve and XI. Corps, being reported by their army commanders, after the fall of Namur, as free, were sent first, along with the 8th Cav. Div. In the event, the other four were never sent, as the results of Tannenberg altered the balance of forces in the E. at the same time as a new crisis was arising in the French theatre.

These reinforcements arrived too late for the battle of Tannenberg, but began to be available in the first week of September. Meantime the VIII. Army Command had to decide whether to pursue immediately to the southward, forcing the Narew line and making rendezvous with Conrad about Siedlce, or to deal with Rennenkampf's army which still stood, inactive but threatening, on the Deime-Wehlau-Allenburg-Angerburg-Bialla line. The latter course was preferred, as was practically inevitable. The progress of the Austrian I. Army and Woyrsch (see below) in the Lublin region was evidently being neutralized by the advance of Ruzsky and Brussilov in E. Galicia, and Rennenkampf's inactivity could hardly continue. Moreover, he occupied a great part of E. Prussia and the call of the civil population for rescue from the Cossacks could not be ignored.

Rennenkampf's halt on the Deime-Angerburg line, when enemy forces were daily slipping away from him to take part in the destruction of Samsonov's army, was and is severely criticized, and exposed him to the reproach even of treason. Part at least of the causes of this passivity lay in the inherent slowness of Russian military practice—a slowness which equally characterized the unfortunate army of Samsonov, as we have seen. For the rest, it is to be noted that the Grand Duke was himself at Insternburg during the critical days. Such evidence as is available suggests that the intention of the Russian supreme command was not to press even Samsonov's offensive, still less the frontal advance, farther than it would go, but to give the whole campaign a wider sweep by means of the new IX. Army assembling at Warsaw and intended to move on Thorn and Posen,¹ turning the Vistula barrier from the south.

¹ The I. Corps of this army was not placed at Samsonov's disposal till Aug. 26, the Guard not at all. One cavalry division was actually taken from Samsonov.

From the German point of view, although information was no doubt lacking as to the large undisclosed reserves moving in the "corridor," it must have been clear that the defeat of Rennenkampf would effectively answer any renewed threat from the S. by endangering the Grodno-Kovno artery. In the conditions of the moment this defeat could best be ensured by attacking his left wing, and in the first days of Sept. the VIII. Army with the corps from the W. were disposed accordingly on a long line from Preussisch-Eylau to E. of Willenberg: in order from left to right Guard Res., I. Res.; XI., XX., XVII., I. Corps and 3rd Res. Div. Von der Goltz with his own division and another made up from Unger's and Müllmann's forces (called 35th Res. Div.) watched the southern front on both sides of Mlava. The Königsberg force still held the Deime line. On his side Rennenkampf had already brought up two of his reserve divisions from the Niemen for the siege of Königsberg, and he now strengthened his left from both active and reserve formations assembled about Grodno. As had been the case at Tannenberg, the forces were numerically almost even. On neither side was any important condensation of force at particular points effected, and the resultant battle, known as the battle of the Masurian lakes, or of Angerburg, was practically "linear."

The idea pursued by Hindenburg was to press the Russian right, as far S. as Angerburg, with four corps, to break out of Lötzén (the key of the lakes, which had been kept throughout) with the XVII. Corps while the I. Corps and 3rd Res. Div. advanced from their Tannenberg positions eastward along the frontier railway. These 2½ corps were intended to roll up the left of Rennenkampf and press northward, with an échelon to the right against the fresh enemy forces reported detaining about Grayevo. The battle began on Sept. 7 and on the 8th was general. But the lake barrier this time favoured the Russians. The German XVII. Corps made only slow progress in advancing from the pass of Lötzén, and most of the I. Corps was soon drawn north-eastward. The balance, however, passing S. of the lakes along the axis Johannsburg-Bialla, made marked progress, and on the night of the 9th-10th Rennenkampf decided to take down his front by successive fractions from right to left, and retire into the Mariampol region whence he had come. The battle then became one of tactical incidents, with all the local vicissitudes of a general chase. At the end, thanks to the traditional rearguard aptitudes of the Russian soldier, Rennenkampf's army had flowed away to safety, leaving the bulk of the VIII. Army congested round Vladislavov and Eydtkühnen with the I. Corps E. of Vilkovishki and the 3rd Res. Div. at Suwalki. Goltz's southern cordon had meantime extended eastward as far as Marggrabowa.

The battle of the Masurian lakes freed E. Prussia, and the victors gleaned a harvest of some 30,000 prisoners in manifold combats amidst woods and lakes. But it was not a Tannenberg, and already events elsewhere were in progress which involved the VIII. Army in a general eastern front campaign.

The Galician Campaign of August-September 1914.—As has been said above, Conrad had determined to carry out the offensive in the region Lublin-Chelm, where the Russians were concentrated, though without definite assurances of coöperation from E. Prussia. In the offensive, the forces to be employed formed two armies—the IV. Army (Auffenberg), consisting initially of the II., VI., IX. and newly formed XVII. Corps, and four cavalry divisions; and (detrainment area Yaroslav-Przemysl) the I. Army (Dankl), I., V., X. Corps and two cavalry divisions (detrainment area middle and lower San).

East of Lemberg it was intended to place two armies, the II. and III. But owing to the belief that the war crisis would be limited and localized as a campaign against Serbia, the II. Army was assembled initially on the Danube, and could only be brought N. by degrees. At the outset it was represented in Galicia only by the Army-group Kövesz (XII. Corps and some extra divisions S.E. of Lemberg and on the Dniester), but the IV. and VII. Corps were being disengaged from the Serbian front and sent up gradually. The III. Army (Brudermann) E. and N.E. of Lemberg consisted of the XI., III. and XIV. Corps

and some other divisions, of which the XIV. Corps was presently taken to form the Army-group of Archduke Josef Ferdinand and placed N. of Lemberg to maintain liaison between the IV. and III. Armies, intervening as required by either.

On the left of the I. Army, along the N. side of the upper Vistula (i.e. in the Polish salient) an Army-group under von Kummer, formed of Landsturm troops, and to the left of Kummer, the German Landwehr Corps of Woyrsch, were to advance in the direction of Sandomir and Ivangorod respectively, driving back such Russian mounted forces as remained in this region. These formed an échelon protecting the left rear of the I. Army, but were primarily intended to form a rallying-point for an insurrection in Poland. This hope was not realized, or realized only to a small extent, and the "Polish Legion" that was formed in fact consisted largely of Galician Poles.

The Archduke Friedrich was commander-in-chief, with Conrad as chief of staff and effective director of operations. The campaign which ensued constituted in reality a chain of battles and as such is described elsewhere. Here it need only be summarized very broadly. Apart from the movement of Kummer and Woyrsch, who started early, in order to be in position at the date of the general advance, the campaign opened on Aug. 20. Prior to that date, the Austrian cavalry divisions had made many attempts to ascertain the Russian movements in the "southern corridor" and the adjacent parts of Bessarabia, but without obtaining much information. The Russian masses were in fact still in the stage of rail transport, and their mounted troops, trained to fire action and favoured by the country, easily kept the screen intact. The Austro-Hungarian offensive was therefore in its first stages carried out according to the *a priori* scheme.

The objective of the I. Army was Lublin, that of the IV. Chelm; they therefore aimed at the concentration centres of the IV. and V. Russian Armies respectively, and the conditions of this concentration led to a series of encounter battles in which the Austrian left was constantly écheloned forward, with the result on the other side that the Russian V. Army's tended to strike south-westward rather than southward, and so in turn exposed a flank to the Austro-Hungarian IV. Army. This army, again, depended for security on its right upon the Army-group (Josef Ferdinand), which was itself attracted now to the N. for intervention in Auffenberg's battle, now to the E. to protect Brudermann's exposed left. On the one side, therefore, an advance in échelon, on the other successive detrainments, produced a battle of marked day-to-day fluctuations. The I. Army in a series of combats collectively called the battle of Krasnik reached the line S. of Chodel-Borzechow-Turobin by Aug. 26, against increasing Russian resistance especially on the left nearest Lublin, where it was found necessary to bring Kummer and Woyrsch E. of the Vistula in order to strengthen the forces aiming at that place while the right advanced to Krasnostav. On Dankl's left, meanwhile, Auffenberg was advancing into the area between the Wieprz and the Huczwa, and on Aug. 26 the battle of Komarów began. In this, between Aug. 26 and Sept. 1 the Austrian IV. Army broke the Russian V. Army into two fractions, the more important of which, half-surrounded, only escaped through a maladroitness withdrawal of that part of the Austrian army which had seized its line of retreat. The withdrawal of the one Russian fraction to Chelm and the other to Hrubieszow on the Bug, with heavy losses, constituted a signal victory, and would have had great results but for events in E. Galicia.

There, in accordance with the prevailing doctrines and also in order to keep Russian influences as far as possible from the Ruthenian capital, Brudermann III. Army and Böhm-Ermolli II. Army (in reality Army-group Kövesz) had been sent forward to carry out an offensive defence, although in the one army Josef Ferdinand's group was limited in its range by its liaison task,¹ and in the other the IV. and VII. Corps were still on their way to the theatre of war. This numerically weak offen-

sive encountered the Russian III. and VIII. Armies in full force—as has been mentioned above, these armies had been given priority in equipment and otherwise—and was brought to a standstill in the battle of Zloczów (Aug. 26–27) fought on the line upper Bug-Złota-Lipa. On Aug. 29–30 a new battle, defensive this time, was accepted and lost on the Gnila Lipa (battle of Przemyślany) and the III. Army fell back on Lemberg itself, which the supreme command thereupon decided to give up. It was evacuated on Sept. 2.

Thus Conrad was confronted with new problems. His left army (I., Kummer, Woyrsch) was already close upon Lublin, the victorious IV. Army pushing towards Chelm with its main body and Hrubieszow with its lesser half. In the region of Sokal and Rawa Ruska only cavalry activity had occurred, and Ruzsky's right wing was trending to the S.W. in the Lemberg direction. The beaten III. and II. Armies were assembled in good order on the strong line of the Grodek lakes (near Wereszyca), while no important attack had developed on the Dniester. There were, substantially, three courses open—to pursue the northern offensive, trusting to distance and water to make interference with the right flank impossible during the necessary time; to take down the whole northern front and come back to the Vistula-San-Dniester position; and to use the advantageous position of the IV. Army for a manoeuvre on interior lines against Ruzsky's right flank. In principle, he preferred the first course, and as we have seen, he invited Hindenburg's coöperation in the still valid Siedlce scheme. But Hindenburg declined, as *Rennenkampf* had not yet been dealt with, and opposition in front of the I. Army had visibly stiffened. The second alternative had obvious advantages and disadvantages; in the existing conditions, the disadvantages which had weighed heavily in peace-time—that E. Galicia was thereby abandoned—no longer applied since that region was now lost, and the preservation of the only available armies of the Dual Monarchy was of the highest importance. Nevertheless, Conrad chose the manoeuvre on interior lines, as the VIII. German army had done. It may be that Tannenberg contributed to the decision.

The germ of this idea appeared in the orders for Sept. 2, in which the IV. Army was ordered to suspend its offensive and change its front from N. to S. in readiness for a south-westward attack towards Lemberg, or for a south-eastward retreat towards the San. At the same time the lines of communication of each army were shifted westward, so that the base of the system became the region between Cracow and the Carpathians. The effort of the I. Army to gain ground northward was not given up, so that in effect, at this date, the supreme command had not made up its mind. In the orders for Sept. 4, on the other hand, the choice was definitely made in favour of a IV. Army offensive in the Lemberg direction, though the I. Army, Kummer and Woyrsch, were still left with their mission unchanged.

On the 6th, the complicated manoeuvre of the IV. Army was completed, but in its southward progress it had developed considerable opposition on the E. flank, while the W. and centre passing by Rawa Ruska and Niemirów met little or none. The result was that the army practically swung into line with the III. instead of striking from N. to S. against the assailant of that army. On the 7th, therefore, Conrad changed his plan again. The Austrian leader now proposed to take down the northern front by degrees, to use the IV. Army as a fixed pivot between Rawa Ruska and Magierów and to swing up the II. and III. Armies against Brussilov. This plan came to nothing. Russian pressure increased on the front of Woyrsch, Kummer, Dankl, and the Russian V. Army, beaten at Komarów, resumed the offensive against the group of divisions under Josef Ferdinand which had been left by the IV. Army to protect its rear. Finally, Ruzsky's right, augmented by a process of regrouping which had been going on at the same time as that of the Austro-Hungarians, emerged in great strength on and beyond Auffenberg's left, N. of Rawa Ruska. There was no surprise, as marked indications of such a move had been discovered in the southward advance of the northern army. But when the Russian V. Army, joining the general offensive, began to drive

¹ In fact, it was wholly absorbed in the battle of Komarów.

into the weakly held gap between Dankl's right (Krasnostav) and Auffenberg's left rear (group Josef Ferdinand about Lasczów), Conrad gave up the battle altogether and ordered a retreat to the line of the San and the Carpathians. The various forces along the Dniester retreated to the Carpathians, the II. Army to the region of Sambor, the III. to that of Przemyśl, the IV. to Yaroslav, and the I. with Kummer and Woyrsch to the lower San (Sept. 11-15).

On this line, however, no stand could be made. Already on the 14th the Russian IV. Army, strengthened from the assembling IX., had been able to force a passage of the San near its mouth. The Austrians thereupon resumed their retreat south-westward (followed up in the later stages very cautiously by the Russians) and stood on Sept. 22 on the line of the Wisłoka, the Visłok and the Carpathians. Przemyśl was left to be defended by its garrison. On the 26th the retreat came to an end on the line of the Dunajec-Tarnów-Gorlice-Uscie-Ruskie-Carpathians. But at that date, the German IX. Army was beginning to assemble in Upper Silesia. The eastern front had come into being.

The Vistula-San Campaign (October 1914).—In the last stages of the Marne battle Moltke had been succeeded, in effective direction of the German operations, by von Falkenhayn. Possibly because he had held, and for a time continued to hold, the office of war minister, certainly from judgment and temperament, Falkenhayn took a broad view of the eastern front problem from the first. The war, after all, had become a war on two fronts instead of two successive single-front campaigns, as had been hoped, and it would have to be conducted accordingly. This involved, first, a more intimate coöperation between the German and the Austro-Hungarian forces than had existed hitherto; secondly, the necessity of keeping the Austro-Hungarian army, in spite of its heterogeneous composition and known deficiencies, in a fighting condition similar to that of the German forces working with it; and thirdly, constant reconsideration of eastern plans, whether German or Austrian or joint, in the light of the situation on the western front; that these three were interdependent the first united operations clearly showed.

The immediate problem was to fulfil the second requirement without neglecting the third. This meant, in concrete form, the reestablishment of the Austro-Hungarian army without bringing over forces from the west. At that moment—mid-Sept.—the battles of the Aisne were developing northward into Picardy and Artois. The "race to the sea" was in progress and the chance of decisive victory in the W. had not been lost on the Marne. On the other hand, it was clear that the Austro-Hungarian army had not only lost Galicia but had suffered very heavily in casualties and material, and was shaken by its experiences. The retreat to the Dunajec had on two occasions come near to disaster—in the early stages when the IV. Army's left flank was exposed and out of touch with the I. Army, and in the later stages when strong Russian efforts were made to drive the armies off their S.W. direction by enveloping the left flank of Woyrsch and Kummer. After reviewing various alternatives offered by geography and the railways, he came to the conclusion that to press the advance of the VIII. Army on Kovno-Grodno, i.e. to pursue the victory of the Masurian lakes, would not serve, and decided to form a "South Army" in Upper Silesia as a direct support to the Austrian left. At first it was intended that this should be a small army, practically no more than a reinforcement of Woyrsch, but within a few days Ludendorff's proposal to transfer the bulk of the VIII. Army to South Poland, with its implication of a serious counter-offensive campaign, was accepted. The object of Falkenhayn in agreeing to this was, by enabling the Austro-Hungarian army to reassert itself in the offensive, to gain time for achieving a decisive result in the west. The theatre in which risks were taken was, as before, E. Prussia. Hindenburg's victories had altered the situation there, and a sort of pursuit could still be maintained by a small force for some time, before the inevitable reaction set in and Rennenkampf came on again. Moreover, the barrier of the lakes and the Angerapp was now being seriously fortified, and it was to be expected that Rennenkampf could be brought

to a halt on that line if not in front of it. On the Mława side, no repetition of Samsonov's offensive seems to have been feared. But as a precaution one of the 6½ newly raised reserve corps was sent to E. Prussia, and two more cavalry divisions were extricated from the west. The forces of E. Prussia under von Schubert retained the title VIII. Army. Those in South Poland were designated the IX., under Hindenburg.

The Grand Duke Nicholas, meantime, was pursuing more and more vigorously the idea which was first evidenced in the creation of the IX. Army behind Warsaw. This army had been absorbed in the fighting against Dankl, but by now the more distant active corps as well as numerous reserve divisions were detained and ready. Reinforcements had to be provided to enable Rennenkampf's I. and X. Armies to check and drive back the probable pursuit on the middle Niemen, and to reconstitute the shattered II. Army on the Narew. But even with these demands to be satisfied, enough remained for the constitution of an offensive group between Warsaw and Ivangorod. With this group he meant to transfer the centre of gravity to S.W. Poland, making Warsaw-Częstochowa and Ivangorod-Beuthen the principal axes of his advance. Accordingly, in the last days of Sept. and Oct. 1, the Russian army in front of the Austrians began to be reduced.¹ And a formidable mass—the "steam-roller" for which the world waited—gathered behind the middle Vistula. Meanwhile, lighter forces, keeping level with the advance S. of the upper Vistula, had advanced beyond Kielce, Petrikov and Łódź.

The Austro-German offensive thus struck the Russians in the act of regrouping. Its plan was:—the German IX. Army and part of the Austro-Hungarian I. Army, N. of the upper Vistula, to advance, driving back all forces met with, to the line of the Vistula above and below Ivangorod, and there to form the pivot of a sweep of the Austro-Hungarian IV. (Josef Ferdinand) and III. (Boroevic) Armies which should advance to the San, relieve Przemyśl, and then strike northward and north-eastward. The II. Army (Böhm-Ermolli) in the Carpathians and the left of the I. Army (Dankl) on the Vistula about Zawichost were to conform to the movement as it developed. Danger of counter-attack upon the extreme left of the IX. Army from the Warsaw bridgehead was provided against partly by causing the various frontier guards of Posen, Hohensalza and Thorn to advance into Poland, partly by echeloning out a mixed force called Frommel's corps—chiefly cavalry—on the middle Pilica.

Moving out from the concentration area in Upper Silesia on Sept. 28, and joined on its right by the left of the Austrian I. Army from Sept. 30, the German IX. Army reached the line Klimontów (Austrian I. Army), Opatów (Woyrsch and XI.), Ostrowiec (Guard Res.), Szydłowiec and Ilza (XVII.). W. of Opoczno and S. of Rawa (Frommel). At that date the Austro-Hungarian I., IV. and III. Armies had also begun their advance; and reached the Wisłoka, while in the Carpathians the II. Army and Hoffmann's Corps to the E. of it began to dislodge the various bodies of the Russian VII. Army that had established themselves in and beyond the passes. Along the whole front only light troops of the enemy were met, and the advance continued during the following days. But, almost simultaneously, the Austrian IV. and III. Armies were brought to a standstill on the San barrier and at the gap of Chyrów which gave access to the Dniester, and both Mackensen's XVII. Corps and Frommel's mixed force advancing north-westward, came into contact with the heavy Russian forces now debouching from Warsaw.

This growing intensity of the fighting S. and S.W. of Warsaw deflected the advance of the German IX. Army northward, causing a corresponding extension of front of the Austrian I. Army, which now passed wholly to the N. of the Vistula, its left centre facing Ivangorod. On Oct. 20, the battle was gen-

¹ The III. Army (now commanded by the Bulgarian Radko Dimitriev), minus several of its units, was employed in besieging Przemyśl; the VII. had come up from Bessarabia and taken over the Dniester front from about Stryi eastward. Its designation was shortly afterwards altered to that of "Dniester Group," but in 1915 a new VII. Army was formed in the same region.

eral along the whole front from Blonie W. of Warsaw, by Kalvarya S. of that city, along the Vistula and the San to Przemyśl (relieved on the 9th) and thence across the Chyrów gap to the Carpathians. Here and there both sides sought to force the water barrier. In most cases no foothold was obtained, but where a bridge-head could be established, or where it existed as at Warsaw and Ivangorod, effort was concentrated.

By the 14th the assembly of Russian forces about Warsaw and Ivangorod was so great that no less than three army staffs were required to direct operations—in order from right to left the I. (brought down from Kovno region), the reconstituted II. and the IV. (from the San): on the left of the IV. was the IX., on the left of this the V., while the III., VIII. and VII. (Dniester Group) held the front of the San, Chyrów and the Dniester foreground. The process continued on the following days; the V. Army, taken out of the line S. of the Vistula, was put in between the II. and IV., the IX. was brought up to Ivangorod, and more and more Russian troops passed the bridge-heads, while the thinned lines of both sides contended on the San-Chyrów-Turka front without material changes, and the opposed detachments of the Russian Dniester Group and Hoffmann and Pflanzer-Baltin fought local battles on the various routes between the mountains and the Dniester.

On Oct. 17, Ludendorff, already warned of the strength of the enemy's Warsaw armies by events and by a captured order, advised Hindenburg to retreat. The want of success on the Chyrów front indicated that the scheme for which the German IX. Army had been brought to the Vistula had failed, and the IX. Army and Dankl's I. Army were now exposed to the convergent attack, from Warsaw, from Ivangorod, and from Zawichost, of five hostile armies, while Josef Ferdinand, Boroevič, Böhm-Ermolli, and the forces eastward were pinned.

The retreat after a last attempt to gather a striking force on the Pilica for a blow against the Russian II. and V. Army—made at the expense of thinning the front of the Austrians before Ivangorod—set in on the 21st, and spread from left to right as far as the Vistula above Zawichost. The San-Turka line, on the other hand, continued to be held by the Austrians, fighting being concentrated principally upon the right of the II. Army, where a break-through was narrowly averted on the 27th. During the next days, the lost ground was regained; and progress was made between the Carpathians and the Dniester by the smaller forces operating there. But on Nov. 2, operations were suspended on the whole front S. of the upper Vistula.

During this period, the E. front of E. Prussia had been subjected to attack, as had been expected. Rennenkampf, advancing from Kovno and from Ossowiec as well as frontally, had pressed back the VIII. Army (von Schubert, later von François) to Kibarty and to the W. of Lyck. François, sanguine in temperament, defending his own corps district, inspired by a personal order from the Kaiser to protect E. Prussian territory, and conscious that the work in the lake defences was incomplete, was determined to hold his forward position to the last possible moment. Falkenhayn, objective in mind and uneasy in spirit, reinforced him with the new XXV. Res. Corps, which retook Lyck and Grayevo, threatening Suwalki from the south. The front then became quiet, for the Russians had no serious offensive intention. Their I. Army was already on its way to Warsaw when the German counter-advance took place, and the X. Army left to flank-guard the northern corridor was reduced in strength to 13 divisions, as compared with some 47 in Poland and 30 from Zawichost to Turka. On the Mlava front, held by von Zastrow with a Landwehr Corps called the XVII. Res., all was quiet in the period of the Vistula-San operations.

The Campaign of Lodz-Cracow-Limanova.—The retreat had been foreseen in time for the German IX. Army to make elaborate preparations for delaying the enemy's advance along the south-westerly railway lines by which, evidently, his intention was to reach Upper Silesia and the Moravian gap. In the course of the retreat the demolitions planned as well as the evacuation of stores and supplies, were carried out, if not completely, at any rate sufficiently for their purpose. But both Hindenburg's

and Conrad's headquarters realized that they had now^o deal with the full effort of the enemy. The "steam roller," after breakages and delays, had started. By Oct. 31 the German IX. Army had gone back to the line Syeradz-Szczerców, Radomsk, Włoszczowa, Chechiny, the Austro-Hungarian I. Army to Kielce, Opatow, R. Opatowka. On Nov. 1-2 it latter was driven back from the Opatowka line, necessitating the withdrawal of the IV. and III. Armies from the San and the abandonment of the offensives in progress on the E. of the Stary Sambor region. A few days later the Russians had again invested Przemyśl and were advancing to the Dunajec. The centre of gravity, however, was no longer S. of the Vistula.

The crisis brought out, in the three men who had to deal with it, Conrad, Falkenhayn and Ludendorff, the characteristic quality of each.

Conrad proposed to Falkenhayn that no less than 30 German divisions should be brought over from the W. at once, bringing Hindenburg's strength up to about 53 divisions. Forces in the Carpathians and in E. Prussia were to be economized, and the bulk of the Austro-Hungarian and German Armies were to seek decisive victory in battle in Poland. Now that the Russians had gathered, and gathered so far W., it would be possible to bring this about without fear of their retreating into the limitless interior of their own country. In short, the war could now be won in the E. It could also be lost, for unless some such decision were attempted, Conrad held that it would be necessary to retreat to the Danube. Falkenhayn, on the other hand, was becoming convinced—especially by the experience of Ypres, that the war would be a protracted trial of endurance, and must be handled on the principles adopted by Frederick the Great in the latter part of the Seven Years' War, viz. a wary, economical defensive, with offensive sorties on every favourable opportunity or necessary occasion, but no staking of all upon a throw.

If Conrad was the Lee of the Central Powers, Falkenhayn was their Johnston. Had the Southern Confederacy possessed a Grant, the parallel would be complete, for Ludendorff met the problem as Grant would have met it, by a strategy that was at once objective and grandiose. Hindenburg was now commander-in-chief of the German eastern front, and his headquarters could deal with the situation as a whole. Ludendorff's plan was to transfer the bulk of the IX. Army by the Silesian railways to W. Prussia (Thorne-Hohensalza region), whence by a sudden advance through the north-western part of Poland, he could strike upon the right or right-rear of the enemy's system. To reinforce the offensive mass, the E. front of E. Prussia was to be stripped almost bare of troops and the country in front of the lakes and the Angerapp deliberately evacuated and broken up.¹ The S. front of E. Prussia (Zastrow's and other formations) was to participate in the offensive by advancing on Plock, Ciechanov and Przasnysz, with the mission of flank-guarding the main attack on the E. side of the Vistula, and of keeping the Russian I. Army busy on the axis Mlava-Ciechanov; and to ensure that these forces should not be drawn away to the E., they were placed directly under General Headquarters. To fill the place of the IX. Army in S. Poland, Woyrsch's Landwehr Corps was reinforced, and by agreement with Conrad, Böhm-Ermolli with the bulk of the Austro-Hungarian II. Army, was brought on rail from the Carpathians to the upper Warta, while to the left of Böhm the "Posen"² and "Breslau" corps of Ersatz and Landwehr were brought forward on the Kalisch-Sieradz line. To prepare for the worst, arrangements were made for destroying the mines of Upper Silesia. By all these drastic measures, Ludendorff expected to obtain a partial success that would suffice, without at present calling upon Falkenhayn, to provide the mass of divisions asked for by Conrad. At the moment at which the plan was put into effect, more was scarcely possible. The continuance of the retreat, especially on the front of the Austro-Hungarian I. Army which was taking

¹ Von François resigned his command in indignation and was replaced by von Below.

² This was the second reserve of Posen. The first, as Bredow's division, was already on the field.

the weight of the Grand Duke's attack on the line Kielce-R. Katowka, brought the enemy ever nearer to Cracow and Upper Silesia, and the destruction of bridges and railways on the IX. Army front could only have a temporary effect. Moreover, new dangers threatened both the eastern and the southern fronts of E. Prussia.

On Nov. 5, the Austrian I. Army had retired behind the Nida, Zastrow's advanced forces were retiring on Mlava, Below was preparing to meet a new thrust of the Russian X. Army (Sievers). On the 8th Ludendorff asked Falkenhayn for 6 to 8 more divisions as soon as possible, and for more later. The crisis, and with it the hope of decisive victory, was becoming more acute. On the 10th the regrouping was complete, except in the centre, where Böhm-Ermolli was not yet on the scene. Here, cavalry alone held the country to the N. and N.E. of Kalisch. The Posen and Breslau Corps were beginning their advance from Kalisch and Kempen respectively. Woynsch (Ldw. Corps, 1st Gd. Res. Div., 35 Res. Div.) was in front of Czesochowa; from Zarki to Wielun the Austro-Hungarian I. and IV. Armies had fallen back concentrically on Cracow, in front of which they now stood; the XI. Corps covered W. Galicia; the III. Army had taken over the front of Böhm as well as its own and stood on the line Virempna-Dukla Pass-Uzok Pass, and Pflanzer-Baltin, his offensive suspended, was at Veretzze, Okormezzo, S. of Delatyn, R. Pruth. But the offensive group (IX. Army under Gen.-Oberst von Mackensen) was ready—the XI. and XVII. Corps astride the Warta where it enters Germany, the XX. at Hohensalza, the I. Res., XXV. Res. and 3rd Gd. Div. between Hohensalza and Thorn.

At that date the Grand Duke's Armies were thus disposed—X. on E. Prussian eastern front, I. (8 divisions) on E. Prussian S. front (Plock to Mlava), with advanced troops approaching Soldau, Rypin and Lipno and one corps S. of the Vistula about Wloclawek; II. (6 divisions and a cavalry mass), W. of Lodz, advancing on Kalisch, with the II. Corps between Kutno and Lenczyka as a protective échelon; V. (8 divisions) nearing the Widawka river, cavalry approaching the Upper Warta; IV. (6 divisions) between the Pilica and Jendziejow, pointing towards Beuthen; IX. (8 divisions) in the angle of the Nida and the Vistula; III. following up the Austro-Hungarian retreat towards and beyond the Dunajec, VIII. and Dniester Group on the Carpathian front; XI. (newly formed) besieging Przemyśl.

On Nov. 11 the advance of the German IX. Army began. On the 12th at Wloclawek, parts of three corps quickly overwhelmed the corps of the Russian I. Army there, and drove it over the Vistula. The next phase was a concentric advance on the Russian II. Corps, right échelon of the II. Army, which held a position from Kutno to Lenczyka; out of this position it was driven with heavy losses on the 15th, losing at Lenczyka the gate between the Bzura and the Ner (Warta) waterlines. Then, while part of the German army pushed forward down the Vistula to intercept any assistance that might come from the I. Army, the XXV. Res. and XX. Corps from Kutno and Lenczyka, with the XVII. and XI. Corps from the Warta valley, advanced on Lodz, the manufacturing centre of Poland.

The battle of Lodz, which began on Nov. 17, is described elsewhere. In its intensity, its vicissitudes and its significance, it was the Ypres of the eastern front. In it took place the epic incident of the break-through, envelopment and final self-rescue of the XXV. Res. Corps and 3rd Guard Division. No battle of the World War shows such varied, involved and difficult tactical situations. Here we are concerned with the results only. From the 10th the Posen Corps and Frommel's cavalry were actively engaged on the left of the XI. Corps, thus connecting the battle of Lodz with the fighting which went on all along the line to Cracow, where the Austro-Hungarian I. and IV. Armies contended without defeat or victory against the thrust of the Russian IV. and IX. Armies. Further E., the Austro-Hungarian XI. Corps and III. Army engaged, equally without decisive results, the Russian III. and VIII. Armies. But Ludendorff had undeniably won his "Teilerfolg," for the Russian onset on all parts of the line S. of the Lodz area was partly or wholly

suspended in order to assemble all possible forces for the prevention of disaster on the right wing. Pressure was relaxed also on the two fronts of E. Prussia as the uncommitted reserves of the attack were taken away. In his regrouping the Grand Duke was successful; a continuous line of battle was formed by Dec. 6 from Ilow on the Vistula, W. of Lowicz, E. of Lodz, W. of Petrikow, W. of Novo Radomsk, and so to the Cracow battle-field. But the cost had been heavy, and the Russians were unable, then or thereafter, to resume the tidal advance on Silesia and Moravia. With the formation of this long continuous line from N.W. of Warsaw to S. of Cracow began a new phase of the struggle, in which the battle of Lodz merges into the battle of Lowicz, and that of Cracow develops, on its southern side, into the battle of Limanova-Lapanow.

It has already been mentioned that Ludendorff had on Nov. 8 asked Falkenhayn for 6 to 8 divisions to be sent at once from the W. and more later. At that date Falkenhayn was still contemplating an attempt to revive the battle of Ypres, and had not reconciled himself to position warfare. On the 18th, before the decision had fallen at Lodz, Falkenhayn in agreeing to send 6 divisions had at the same time expressed his belief that it would even so be impossible to bring Russia to admit defeat, and that the outcome—certainly desirable in itself—would only be to relieve Austria-Hungary by the reconquest of the Vistula-San-Dniester line, and perhaps of Lemberg also. But a week later, under the influence of Mackensen's victory, he said that success in N. Poland might decide not only the Galician question but the whole war. He thought this might be achieved by building up yet another striking force E. of the Vistula, where the Russian I. Army was continually giving up divisions for the battle of Lodz. Ludendorff, on the contrary, saw no prospects in such a piecemeal building up of strength which the Russians could answer *pari passu*. Power and surprise combined, he held, were essential. At this moment, there were in Germany 9 new divisions under training, but the awful wastage of the lives and energy of their predecessors at Ypres had convinced Falkenhayn that it was necessary to avoid cutting short their training and to give them more experienced leaders before committing them to battle. Ludendorff, in spite of the achievement of the XXV. Res. Corps at Lodz, seems to have concurred in this view. Thus the reinforcement reduced itself to a gradual incoming of 8 divisions from the W. (II., III. Res., XIII. and XXIV. Res. Corps) which, with the I. from the now relieved E. Prussian front were all absorbed in the frontal battle about Lodz and Lowicz, save one which was sent to assist the Austrian IV. Army S. of Cracow. The battle of Lowicz began and continued as a front-to-front battle in which each side sought to condense enough force for a blow, now here and now there. It ended, in mid-December, with a general withdrawal of the Russian line to a winter-position, which ran along the Bzura and Rawka to Rawa, and thence southward, crossing the Pilica E. of Tomaszew and following the upper course of that river, 5-15 km. E. of it, till near Jendziejow it reached the Nida, to follow it to the upper Vistula.

South of Cracow, in a country of hills where manoeuvre was possible and open flanks frequent, advance and counter-advance alternated during the month of December. In conforming to the general retirement of the Allied forces in October, the Austrian I. and IV. Armies had gathered about Cracow, and during November they had maintained their front against the Russian IX. Army (battle of Cracow). At the end of the month, however, the enemy had developed a strong attack S. of the Vistula, which reached the line Wyelica—Sieprow—Droginia, and threatened by turning the fortress from the S. to make the desired breach for passage into Moravia. This danger was averted by a regrouping of the Austrian IV. Army, which enabled an attack-force to be assembled on the right wing about Mzana Dolina and Dobra, almost in the mountains. On the 3rd this force attacked northward, bringing the Russians' advance at once to a standstill, and forcing them to make new dispositions. The fighting was prolonged and heavy. On Dec. 8, forces of the Russian VIII. Army, condensed on the western flank of that army, be-

gan in turn to attack the flank of the Austrian attack-group, which had gained ground northward as far as Lapanow and Rajbrod. At Limanova, the scene of this flank attack, three dismounted Austrian cavalry divisions had to meet the onslaught of more than an army corps. At the same time, the centre of the Russian III. Army farther N. assumed the offensive again, and threatened at Lapanow, to break the Austrian main body in two. But resistance at Limanova continued till the Austro-Hungarian III. Army, defending the Carpathians with varying fortune, had managed to assemble a group on its left which struck in on the flank of the Russian forces about Limanova (Dec. 11). Thereby the battle of Limanova-Lapanow was decided. A last Russian force which was seeking to reach the flank of this Austrian counter-offensive was itself engaged in flank by other forces of the Austrian III. Army, and the Russians withdrew along the whole W. Galician front to R. Dunajec-Krzostek-Krosno-Lisko (Dec. 14-16). A few days later the Russians launched a fresh offensive which in the battle of Jaslo (Dec. 21-23) drove back the inner flanks of the Austrian III. and IV. Armies to the line Zaklicyn on Dunajec-Gorlice-Uscie-Ruske-Konieczna, and pressed the front of the former back to some places behind the Carpathian line. Here, and farther E., the operations were entering on the phase known as the Battle of the Carpathians, which will be dealt with later. But from Tilsit to Gorlice, the campaign of 1914 closed in "stabilization."

At this period, according to Falkenhayn, the combatant strengths on both sides were: 105,000 Germans and 320,000 Russians E. of the lower Vistula (E. Prussian fronts); 525,000 Germans and Austrians and 847,000 Russians between the lower and the Upper Vistula; 525,000 Austrians (including 1 German division), and 521,000 Russians between the Upper Vistula and the Rumanian frontier. In sum, 1,155,000 Germans and 1,688,000 Austrians (of whom 502,000 were German-Austrian).

Acknowledgments are due to General Y. Danilov for certain information as to the Russian plan of campaign and strategic deployment.

(C. F. A.)

III. CAMPAIGN OF JANUARY-SEPTEMBER, 1915

By the third week of December, 1914, the struggle in the central salient had died down to a trench-warfare contest, in which the remaining energy of the troops was devoted to consolidating gains or to preventing the opponent from doing so. The situation of Ypres was reproduced in that of the eastern front at the end of the battle of Lowicz. But there was the important difference that on both flanks there was still room to manoeuvre. On the N. flank, the region of Plock, Mlava and Myszyniec was open, and the Russian army's position, in front of the Angerapp and the lakes, reached for the third time as the result of the battle of Rominten Heath (Nov. 13-16), rested its flanks on no very secure obstacles. On the S. flank, the line was continuous from Cracow to the Carpathians, but thence eastward the position was fluid. The Grand Duke, therefore, determined to assert his offensive will and power, and, confiding in the hardness of his men, for whom winter was less terrible than for the enemy, began to group his forces with greater density on the flanks. The first signs of this tendency appeared in the counter-stroke of Jaslo, which nullified the reverse of Limanova-Lapanow and initiated the battles of the Carpathians. The second consequence was the reinforcement of the X. Army, and the re-formation, under a new army staff (XII.), of an offensive mass on the Narew.

At the outset, in the latter part of Dec. 1914, this new policy seems to have aimed at tactical results only, but in Jan. the offensives maturing on the outer flanks became evidently strategic. Interpreting the experience of the previous campaigns, the Russian headquarters could see not only the insecurity of their northern corridor, which must continue until E. Prussia had been cleared to the Vistula, and the similar but lesser risk to their left flank, but could also judge that the conquest of E. Prussia and the invasion of Hungary would be very heavy blows to the heart of the war-sentiment in Germany and Aus-

tria-Hungary. Reinforcements were constantly coming in, and it seemed that what the Russian headquarters chose to adopt as their plan they could impose upon the enemy. One factor, however, was already causing anxiety, that of munitions. Although the ammunition expenditure on the eastern front was on a much lower scale, both then and thereafter, than that in the W., yet even so it was far greater than had been foreseen; and Russia, with her low industrial development and her difficulties in communication with the outer world, was less well equipped than either her allies or her two opponents to meet the strain. Later, the shortage was to become disastrous and tragic; at present it was an additional argument for transferring operations to those parts of the line where trench warfare had not set in. It was not regarded as a reason for suspending the offensive, but rather for choosing for it those areas where conditions favoured human manoeuvring-power.

On the other side, the problem of 1915 was, like those of 1914, viewed differently by the three men concerned, Falkenhayn, Conrad and Ludendorff. The first named, after a moment of enthusiasm in the Lodz period, had returned to his normal method of conducting the war as a war of endurance, with limitations on particular acts of it. One of those limitations in the present instance was the necessity sooner or later of opening a way to Turkey by seizing at least part of Serbia. Another, and the principal, was the necessity of holding firm on the western front. German strategy was now paying the penalty for having doubled its fighting front there by bringing in Belgian territory. Throughout 1915, the year in which Russia was the principal theatre, just as in 1914 when it was only secondary, we find Falkenhayn working with extremely narrow margins of free strength. At a time when Germany alone possessed some 160 to 170 divisions, the adoption or rejection of operative schemes of the highest importance was made to depend on availability or otherwise of four, six or ten of them. Yet there was no remedy for this, short of a considerable surrender of occupied territory in the W.; and in the war of endurance, as conceived by the Falkenhayn school, occupied territory is an asset not to be sacrificed for the sake of a showy, but indecisive, tactical victory. The principle of working from situation to situation was, with Falkenhayn, fundamental, and in the winter of 1914-5 his projects in the east did not go beyond the formation of a German "South Army" under General von Linsingen to aid the Austrians in the Carpathian struggle. In this the motive was direct stiffening and not manoeuvre—in fact, only half of this army (4 divisions) was German. To find these divisions, the German chief had to postpone *sine die* his Serbian project, to which he attached very great importance; but the condition of the Austro-Hungarian army in the bitter winter fighting of the Carpathians left him no alternative, especially as the prevention of a Russian break-through into Hungary was a condition precedent of any Danube operation.

Conrad von Hötendorff, for his part, was sanguine as ever, and the plight of Przemyśl—undergoing its second and more terrible siege—continually spurred him to activity. While meeting, with local counter-offensives, the growing Russian pressure on the Carpathian front, he proposed, first an offensive in the centre of the Polish salient on Radom (scarcely a promising direction), and then a resumption of the old scheme of an Austrian and Prussian rendezvous near Siedlce. Neither was accepted by Falkenhayn, and Conrad then proposed the direct relief of Przemyśl by means of a great offensive from the Carpathian line. It was for this offensive and this purpose that the German South Army was formed and, later, Böhm Ermolli's II. Army brought back from Poland. Substantially, then, Conrad, unlike Falkenhayn, was eager for battle as such. But, like Falkenhayn, he had no manoeuvre—in the true sense of the word—to propose, that was in the given conditions practicable and worth the supreme effort.

At Field-Marshal von Hindenburg's headquarters, on the other hand, the idea of manoeuvre was always uppermost. Its basis was the fixed conviction that it was possible not merely to lame but to destroy Russia's fighting power on the field of battle.

To achieve this result against superior numbers, manœuvre was the only way, and by the term "manœuvre" Ludendorff understood the preparation and sudden delivery of a destructive blow by locally superior force upon that part of the enemy's system which was the key of the whole. In the present case, this key position, Ludendorff held, was the Russian X. Army in the foreground of the Masurian lakes. In this quarter, and also between Mława and Myszyniec, Russian offensives were maturing as early as mid-Jan., and in any case Hindenburg's headquarters had to consider the question of a preventive offensive in E. or W. Prussia or both. But the operative aim became higher as soon as it was known that Conrad meant to attempt the relief of Przemyśl by winning through to the San and the Dniester. The four new army corps completing their training in Germany were asked for, for the purpose of a winter offensive which should not only anticipate that of the enemy, but also, in conjunction with Conrad's effort, "decide the whole war." These four corps (XXXVIII.-XLI. Res.) were Falkenhayn's cherished reserve, with which he meant to parry any great crisis that might arise out of the "Winter Battle of Champagne" then in progress, and himself to attempt a decisive offensive in France.¹ From the contemplated blow in Prussia he expected no more than the temporary and local disablement of the enemy, so that he did not think it necessary to coördinate the effort closely in date or direction with Conrad's advance. Nevertheless, "with a heavy heart," as he says, he surrendered the four corps to the east, though at first—till the Champagne crisis cleared in March—he reserved the right to withdraw them again. Actually, the XXI. Active Corps of Alsace-Lorrainers was sent from the French front, the XLI. Res. Corps taking its place there; the other three, with the XXI., went to E. Prussia at the end of Jan. and constituted the new X. Army (General-Oberst von Eichhorn).

The two operations with which the campaign of 1915 began in the W. were not, in the strict sense, coördinated, though their combined effect, owing to geographical conditions, was expected to be the destruction, according to Ludendorff, or the prolonged paralysis according to Falkenhayn, of Russia's offensive power.

The Carpathian Winter Battles.—Owing to the relatively low development of Hungarian lateral railways—the Galician laterals were in the hands of the Russians—it was not feasible for Conrad to form a really important offensive mass in the eastern Carpathians and the Bukovina, as Hindenburg did in the region of the Masurian lakes, without great loss of time. The struggle therefore resolved itself into surges of frontally-opposed tides, the one seeking to break into the Hungarian plain, the other to rescue Przemyśl. Although, the lines being for the most part discontinuous, tactical and local outflanking efforts, for the time and place decisive, were constantly made by both sides, there was no systematic attempt at strategic envelopment on either. At one moment indeed (Feb. 20), Pflanzer-Baltin's army group, victorious in Bukovina, sought to wheel in on the rear of the battle-field of the German South Army; and at a later stage the Russian Dniester forces were heavily reinforced for the purpose of driving Pflanzer-Baltin away and so gaining the flank of Linsingen. But in the main the opposed tides affronted each other and were broken, each in turn. In W. Galicia, the Russian offensive of Jasło came to a standstill in the first days of January, and for the next three months nothing of importance took place W. of Gorlice. Here the Russian III. Army (Radko Dimitriev) and the Austro-Hungarian IV. Army (Archduke Josef Ferdinand) were opposed. In the middle Carpathians, where Brusilov's VIII. Army was opposed by Boroevič's III. Army and by the left wing of the widespread Pflanzer-Baltin group, the year opened with the evacuation by the defenders of the important Użok Pass, under a local threat of envelopment. The Dukla Pass and the adjacent mountain region had already been lost, and from the Użok the withdrawal spread east to the

Volocz and Wyszów Passes. In the eastern Carpathians and Bukovina the Russian Dniester group (Webel) pushed back the light forces which Pflanzer-Baltin had in the foreground of the mountains, but in the last week of Jan. the arrival of the Austrian XIII. Corps from Serbia gave Pflanzer-Baltin enough forces to enable him on the 31st to begin the reconquest of the lost ground. Meanwhile, the right of Boroevič's III. Army had held on, in spite of the loss of the Użok and the Dukla Passes, and it was now reinforced. After covering the assembly of the German South Army about Munkacs, this wing was to constitute the striking force of Conrad's offensive for the relief of Przemyśl, the South Army (including Hofmann's Austrian Corps facing the Volocz Pass) following it in échelon on the right.

The offensive began on Jan. 23, and as usual in this part of the eastern theatre, met at first only light forces of the Russians. The whole Austrian line, from E. of the Dukla to the Wyszów Pass, moved forward, the left wing of Pflanzer-Baltin conforming. The Użok, Volocz and Wyszów passes were retaken by the South Army, and Boroevič's striking force reached and passed the upper San (line Czeremcha-Baligród-Lutowiska-Borynia-Smorze) by Jan. 31. But the Russians had already answered by accelerating their projected offensive against the centre and left of Boroevič (front Mezölaborca-Konieczna) and especially southward and south-westward from the Dukla. From this point the battle was a contest of will-power and manpower. The inactive fronts were stripped of more and more divisions. Early in Feb. Böhm-Ermolli's headquarters returned from Poland to their old place on the right of the III. Army (front Lupkó Pass-Użok Pass), and on the other side Letchitsky's IX. Army headquarters were withdrawn from the Nida for the Dniester theatre. Between the end of January and the end of April the strength of the opposed forces in Poland west of the Vistula were approximately halved. In the event the Grand Duke Nicholas not only succeeded, during the first three weeks of Feb., in checking (and in forcing back somewhat) the Austrians on the Upper San, but considerably enlarged his gains S. and S.W. of the Dukla Pass, taking Mezölaborca and the Lupkó Pass, and penetrating the Laborca and Ondava valleys. On the other hand the German South Army made its way forward, very slowly, astride the Munkacs-Strýi railway.

Further E., the counter-offensive campaign of Pflanzer-Baltin, begun on Jan. 31, was successful in clearing all Bukovina and the Carpathian foreground as far as the Pruth on the right and the Dniester in the centre, but its left, attempting to intervene in the rear of Linsingen's opponents, was involved in heavy fighting about Krasna on the Lomnica, and in the last week of Feb. the heavy counter-attacks of the assembling Russian IX. Army drove the centre from its forward position on the Dniester. By mid-March, Pflanzer-Baltin had been forced back still farther to a line marked by the upper Lomnica-Solotvina (on the Bistrica)-Czernelica-Horodenka-Snyatin-Czernowitz, on which operations came to a standstill. These operations were however of secondary importance in which only some 10% of the whole forces of each side were concerned.

The real crisis, which culminated in March, was on the front between the upper San and the head of the Ondava valley, N.E. of Bartfeld (Bartfa). As in Feb., the right of the Austrians sought to force a way to Przemyśl—now in extremity—and the right of the Russians to enlarge the bridge-head in front of the Dukla and Lupkó Passes. The fighting was again intense, for the Austro-Hungarian II. Army had been reinforced for a last effort; but in the main its advance on Przemyśl was definitely stayed by the middle of the month, while the Russians in the Dukla region made continuous, if slow, progress. The German South Army progressed along the railway to Tuchla, but at this stage of the battle its advance had not and could not have any great result, and its left was held up for weeks before the strong positions known as Zwinin and Ostry, covering Koziowa. Finally, on March 20, sure of the imminent surrender of Przemyśl (which in fact fell on the 23rd) the Russians launched all along the front of the Austrian III. Army new attacks which, fed by troops released from the blockade of Przemyśl, drove that

¹ The German contingent of the South Army had been formed from local reserves already in the east. Its staff was formed from that of the II. Corps.

army back to the line S. of Zboro-Kurima-Strzopko-S. of Virava-Wola Michowa. At the same time Böhm's forces on the upper San front were compelled to fall back to the starting line of Jan. 23, whence they were withdrawn, in a state of exhaustion, to a line generally behind the mountain crest. The right, still in front of the recaptured Uszok Pass, was transferred to the control of the South Army.

Three weeks longer the battle lasted, but without material change, though both sides were 110,000 to 120,000 stronger in combatants than they had been in January. In the area of the Austrian III. Army two fresh German divisions, grouped as the "Beskiden Corps," arrived to stiffen the defence. In its new positions the Austrian II. Army held its own. The South Army maintained its ground also from N. of the Uszok Pass to Tuchla, and stormed at last the positions of the Zwinin (April 9) and Ostry (April 25) and Koziowa. To the E., Pflanzer-Baltin's right wing and centre, reinforced by German mounted troops, regained its positions on the Dniester and held off a new attack which Lechitzky mounted against its outer flank between Czernowitz and Usciebkupice on the Dniester. By April 20, however, the Battle of the Carpathians was at an end, after three months of continuous mountain fighting, in temperatures sometimes as low as -22 deg. F.

The apparent effect of these battles was to give the Russians more secure possession of a bridge-head S. and S.W. of the Dukla Pass which they could not use, and to waste the remaining war-energy of the Austro-Hungarian army in attempting to relieve a fortress which certainly contained fewer men than the number sacrificed in the attempt. But in reality the indirect consequences of the battle were of much greater importance than the direct. In the Carpathians, no less than in the Masurian winter battle presently to be described, the Central Powers had managed to snatch the initiative before the Russian offensives had got under way, and thus put back the date and place of those offensives so far that the break-through into Hungary proved impossible. For the third time the "steam roller" had been brought to a standstill. Moreover it was showing signs of wear. Manpower had been unsparingly expended by the Russian command in its determination to break through; the trained officers and under-officers of peace-time were reduced to a skeleton, and the supply of munitions and even arms was becoming a very grave problem. In the majority of cases, it had been the Russians who attacked and the Austrians who defended the strong mountain and hill positions, and, though specific figures are not known, all the evidence available points to the Russian losses having been far greater than those of the Austrians and Germans. In sum, the Russians needed a pause even more than their opponents.

The Masurian Winter Battle and the First Battle of Przemyśl.—The plan of campaign formed by Ludendorff for E. Prussia, as already mentioned, aimed higher than the simple preventive-offensive for which Falkenhayn had "lent" the four new army corps. His line of reasoning, differing from Falkenhayn's, was, and remained, this:—the war will be decided by military victory in the W.; but this victory will not be possible till after the definitive defeat of Russia, because the degree of numerical and material superiority required for the double task of breaking through the strong trench-system of the W. and exploiting the break-through in an open-field campaign was not attainable till Germany could devote practically every battle-worthy man and gun she possessed to the western theatre. Meantime, nothing was gained and much lost by using up reserves in repetitions of the battle of Ypres. Whether, in Feb. 1915, the time was ripe for such a blow as Ludendorff contemplated is however more doubtful. Both on the Mlava-Mysyniec front and on the E. front of E. Prussia the Russians were well in advance of the natural barriers protecting the northern corridor. Victory W. and N. of those barriers could only lead to a limited exploitation unless the barriers could themselves be carried in the tactical pursuit. Victory on the barriers themselves, on the contrary, would give an unlimited field for strategic exploitation inside them. In the situation of Feb. 1915, then, an effort to inflict a completely disastrous defeat on the Russians required two successive efforts,

or successive maxima in a continued effort; hence a double allotment of force would have to be made. A large part of the required divisions could have been found from the army reserves of the central salient, or by thinning the line itself there, had it not been for the formation of the German "South Army," which, raising the number of divisions absorbed in the Austro-Hungarian front from 1 to 5, left only limited possibilities of drawing on the IX. Army and Woyrsch, for the benefit of the E. Prussian Army, which ever since Nov. had been on a very low footing. Woyrsch and Mackensen were in fact able to provide six free divisions. For the rest, if nothing could be spared from France, the eight new divisions were the only available reinforcement. Hence Falkenhayn's well-founded scepticism as to the scope of the E. Prussian offensive, and hence also Ludendorff's regret, after the event, at having parted with so much of his local reserves for the bolstering-up of a Carpathian attack.

The secret augmentation of the E. Prussian forces from the figure of 10 divisions (8 of which were Landwehr and Ersatz) in mid-Jan. to that of 24 in the first week of Feb. was itself no small task, and had it not been for a very fierce diversionary attack by the IX. Army at Bolimow, in the angle of Bzura and Rawka, on Jan. 31-Feb. 2—memorable as the first occasion on which gas-shell were employed on a large scale—it is doubtful whether it would have been accomplished, for the assembly had to be made under cover of a thin screen of mounted troops, and by hypothesis the opponent himself was preparing to attack. The plan itself was comprehensive, and suggests that Ludendorff had not given up hope of being able to extract more divisions from Falkenhayn. It consisted in three main elements:—(1) the destruction, by means of breaking through and envelopment combined, of all enemy forces lying between Lyck and Tilsit, (2) the attempt to carry the Bobr line with a rush so as to break into the "corridor" south of Grodno, and (3) an advance on the Mlava-Willenberg front, in conjunction with (2), so as to bind the Russian I. Army while the X. was being destroyed and the Bobr forced.

The German forces were divided into three armies:—the VIII. (Otto v. Below) of 7 divisions (including one of the new corps), which, after covering the whole eastern front during the assembly was to form an attack front on its right wing (Johannisburg); the X. (v. Eichhorn) of 7½ divisions, including the XXI. active and the other two new Reserve Corps assembled between the Niemen and the Lakes; and the Army Group Gallwitz, ten divisions, of which six came from central Poland, holding the southern front from the Orzyc to the lower Vistula.

The scheme of the German offensive, though it was to be carried out over much the same ground as the September battle, differed considerably from the plan of that battle. The winter trench-line represented the halt of the Russians after the Rominen Heath battle, in front of the Lakes-Angerapp barrier. It ran N. to S. from the Schorellen Forest by Darkehnen, E. of Lötzen to W. of Johannisburg, where it began to curve away to join the southern front. The right wing therefore presented to the Germans better chances of envelopment than *Rennenkampfs* right had shown in Sept., and it was on this flank that Ludendorff meant to make the chief effort. But the most significant difference was that it was now intended to treat the attack on the Russian S. flank as a break-through and not an envelopment problem. For this reason, not only was an attack-group formed behind Lake Spirding but von Gallwitz, guarding the S. front, was to occupy the Russians on the Narew and prevent them from assembling large forces against the S. side of the VIII. Army attack. Moreover the attack was to aim at seizing crossings of the Bobr at and near Osowiec. Tactical coöperation in the encirclement of the Russian forces north of Lyck was the primary but by no means the principal task of the VIII. Army's attack-group. If the power and speed of the X. Army's blow from the N. proved as great as was hoped, the exact position of the anvil on which it crushed the Russians was of secondary importance compared with the seizure of Osowiec and the Bobr by brusque attack in the Liège manner. On this, and on the progress made by the XX. Corps (Gallwitz's left) by Mysyniec on

Lomzha, would depend the strategic, as against the tactical results of the whole enterprise.

The "Winter Battle of Masuria" therefore may be regarded, if not as the first great battle of the latter-day type, at any rate as in a transitional style. Although an open flank existed and was utilized to produce the tactical envelopment or "Cannae" of pre-war theory, yet the effective victory was intended to be gained from a break-through, tactically difficult, but aimed in a strategically favourable direction.

The attack of the VIII. Army began on Feb. 7, that of the X. Army on Feb. 8, in the midst of snowstorms which, during the battle, changed to rain—the worst conditions for the carrying out of the scheme and notably its strategical part, which depended on the marshes of the Bobr being frozen hard. In sum, the X. Army drove the Russians southward without intermission from the first day. By the 10th the northern portion of the Russian line was being taken down with all speed, and by the 12th the German X. Army stood on a line from Ludwinow to Rominten Heath at right angles to the VIII. Flank guards were put out toward Pilwiszki and Mariampol against intervention from Kovno, but neither then nor later did anything more serious than threats by light forces develop on that side. Meantime, however, the VIII. Army's attack (XL. Res. Corps and parts of the I. Corps) from Johannsburg Heath and Lötzen on Lyck was brought to a standstill in front of Lyck by the fierce resistance of the III. Siberian Corps, which not only suspended the advance eastward, but led the German forces that were to the S. of it to swing north-eastward on Rajgrad so as to envelop the Lyck position. The expected Russian counter-attacks from Lomzha and Osowiec proved too feeble—being absorbed chiefly by the advance of a division of the XX. Corps farther W.—to interfere seriously with this tactical manœuvre. But thenceforward the Osowiec portion of Ludendorff's scheme was doomed. The battle became the purely tactical "Cannae." As such, it was brilliantly successful. By Feb. 14 Lyck had fallen and the VIII. and X. Armies had made good a semicircular position from Rajgrad, by Raczki and Seyny to the N.E. corner of Augustow forest. In the forest the Russians (no longer able, for want of routes, to withdraw with speed) fought with desperation to gain time for orderly withdrawal to Grodno, the one remaining avenue of escape. But by the 18th, forces of the XL. Res. Corps from Rajgrad reached the Bobr about Krasnybor, and, on the other wing, part of the XXI. Corps from E. of Seyny drove down at all risks, parallel with the Niemen and within range of the guns of Grodno, to Lipsk, thus closing the ring round four Russian divisions left in the forest. In this extraordinary situation, the German X. Army slowly completed the destruction of the encircled Russians, who resisted for several days and made fierce efforts to break the ring, while small German forces, fighting back to back with the encircling troops, held off relief attacks from Grodno and the Bobr. Finally—but some days too late for the realization of Ludendorff's plan—the remnant of the four divisions in the forest surrendered. In all, this astonishing victory gave the Germans 110,000 prisoners, over 300 guns, and a vast quantity of stores which the Russians could ill spare.

Even before the end, Ludendorff had attempted to extricate enough forces from the W. and N.W. portions of the ring to form the attack on Osowiec and the Bobr. He reconstituted the management of the mixed-up armies as best he could by putting all forces W. of Augustowo under Below (including the XX. Corps) and all engaged in and N. of the forest of Augustowo under Eichhorn. But most of the troops destined for this were involved in the forest battle, and the Osowiec groups had to be made up chiefly out of the troops that had been crowded out of the line as the wings converged. Of the XX. Corps only one division was available, and this had advanced no farther S.E. than Stawiski and Lipniki since it moved from its concentration area three weeks before. The other division was engaged on the Omulew river, and was connected to Lipniki by a thin screen of Landsturm. In sum, it was impossible with exhausted and scattered troops to force the now sodden marsh-valley of the

Bobr or to reduce Osowiec. Hindenburg therefore ordered the attacks to be discontinued.

Moreover, the position of the X. Army, far ahead of regular supplies, had become untenable, and as soon as the battlefield had been cleared it began to withdraw, just in time to secure good conditions for meeting a Russian counter-offensive from Grodno and Olita. There the Grand Duke, "by stamping his foot on the ground"—as it seemed to his opponents—had called into being a new X. Army.

This counter-offensive penetrated through the Augustowo forest, almost to Augustowo, and, to the N. of the forest zone, it reached and passed Seyny and Simno (March 5-7). But, thinking that at Simno it had found the flank of the German defence—i.e. miscalculating the promptness of the German decision to regroup on a rear line—the Simno force swung in to the S.E. toward Łozdzieje (March 8), exposed its own outer flank to counter-attack from Eichhorn's left, which stood between Simno and Kalwarja, and on March 9 fell upon the flank and rear of the Russians, at the same time as the frontal defence in and north of the forest turned to counter-attack. The Russians thereupon withdrew behind the Niemen again. The German X. Army now returned to its prepared line Augustowo-Krasnopol-Kalwarja-Mariampol-Pilwiszki-Szaki.

But the real crisis of the second half of Feb., which lasted till mid-March, lay not on the Niemen, but on the front of the new German VIII. Army and more particularly on that of Gallwitz. Here with his XII. Army (Plehve) the Grand Duke had all along intended to make the main effort of his Russian offensive, as geographically dictated; and the advances of Gallwitz and of the German XX. Corps, as diversions and flankguards for the Masurian battle, had merely put back the Russian preparations in time and place. Anger at the disaster to the X. Army, and fears for the safety of the "corridor" at its sensitive point N.E. of Osowiec, caused the Grand Duke to divert forces from the XII. Army to form the new X., but without affecting the mission of that army, which accordingly took the offensive against Gallwitz about the same time as the struggle in Augustowo forest came to an end. At the same date the attempts of the German VIII. Army against Osowiec and the Bobr line were dying out, and the division of the XX. Corps north of Lomzha was pinned by heavy counter-attacks from that place, while the other division of that corps was making head on the Omulew against similar efforts from Ostrolenka, and the Landsturm screen between them was holding its ground with difficulty against other attacks from Novograd. The crisis, from the German point of view, was so grave that even in Ludendorff's memoirs, written four years after the event, satisfaction in the "Cannae" of Augustowo is almost completely smothered in the remembrance of anxieties, makeshift reinforcements, and critical decisions concerning the S. front. All energy on both sides was now focussed on this front.

In the winter of 1914-5, light forces of the Germans had been advanced, originally as an element of the battle of Lodz, a considerable distance S. of Strassburg and Mława, and the reinforcement of these troops to the strength of an army group had taken place on this forward line. Gallwitz had then advanced, in conjunction with the Masurian offensive, deep into the concentration zone of the Russian XII. Army (Feb. 13). In a few days he had reached the line Plock-Racionz-Przasnysz. But by about the 24th, Plehve's interrupted concentration was sufficiently near completion for him to advance. Pressing the front of Gallwitz on each main route, he developed his greatest strength in the Orzyc and Omulew valleys. In the latter, the division of the German XX. Corps above mentioned engaged the Russian advance in a series of combats which in the event were undecisive; but in the Orzyc region the Russian blow upon Przasnysz succeeded in driving back three divisions under v. Morgen (I. Res. Corps) with very heavy losses (Feb. 25-27). The whole centre and left of the German line then fell back, pursued by the Russians, to the line Radzonovo-Mława-Chorzele. On and about this line fighting remained severe till about March 19, kept alive on the German side by successive reinforce-

ments from the X. Army, and by assumption of responsibility for the Omulew front by the VIII. Army, which enabled Gallwitz to group his forces more closely on the Chorzele and Mława fronts.

The crisis died away in local attacks in the latter half of March. The Russians were becoming weak in munitions; the Germans continued weak in men. The last fluctuations of the battle brought the Germans from Chorzele close up to Przasnysz.

Thus the E. Prussian offensive of the Russians closed, in the same way as the Carpathian offensive was soon to close, with little gain and great loss of leaders and of irreplaceable ammunition. The Germans, on the other hand, like the Austrians, had failed to achieve their strategic purpose. The general results were thus, for both sides, negative, in spite of the accomplished "Cannae" in Masuria—itself an exhausting effort.

Intentions and Plans for the Summer Campaign.—On both Prussian and Galician fronts a pause of some weeks was imposed by the weariness of both sides. The latter part of March and early April in the N., and the last half of April in the S. were devoted to discussion and formation of plans. At this stage the distribution of force was, according to an Austrian headquarters statement of April 20, as follows, in rifles and carbines:—

East Prussian fronts: 263,000 Germans of X., VIII., and Gallwitz Armies, and 508,000 Russians of the X. and XII. Armies. Frontage 380 km.

Central salient: 245,000 Germans and Austrians of IX., Woyrsch, and Austro-Hungarian I. Armies, and 436,000 Russians of the II., I., V., and IV. Armies. Frontage 275 km.

Upper Vistula to Beskidengebirge: 108,000 Austrians (IV. Army) and 100,000 Russians (III. Army). Frontage 110 km.

Carpathians and Bukovina: 385,000 Austrians and Germans (III., II., S. Army, Pflanzer-Baltin) and 406,000 Russians (VIII., XI., and IX. Armies). Frontage 387 km.

In sum, there were 1,001,000 Germans and Austrians to 1,540,000 Russians.

According to the distribution table given by Falkenhayn for the end of that month, 366,000 German combatants faced 640,000 Russians between the Baltic and the Vistula; 184,000 Germans and 54,000 Austrians, in all 238,000, were opposed to 407,000 Russians in the Polish salient; and 80,000 Germans and 610,000 Austrians, total 690,000, stood on the W. Galicia, Carpathian and Bukovina fronts against 720,000 Russians. In sum, 1,303,000 soldiers of the Central Powers to 1,767,000 Russians. The difference between the two sets of figures is partly accounted for by the fact that artillery personnel is included in the second and not in the first set; but whether taken separately or together, the figures throw a strong light on the state of the Russian army on the verge of the tremendous campaign of summer, 1915. It will be noticed that the total of 1,767,000 combatants is approximately the same as the mean monthly strength with the colours in peace (1,700,000). At this period no considerable forces were maintained in any but the eastern European theatre, so that, in effect, practically the whole of Russia's resources in men had been absorbed in maintaining the formations existing in peace and some 35 reserve divisions created on mobilization.

It will be noticed also that under the imperative needs created by the two-front war the German forces in the East had trebled, as compared with the strength at the time of the Masurian lakes battle in Sept., but that the Austro-Hungarian forces, though far above the nominal figure of Sept. 1914, were well below their mobilization figure. Hitherto, it must be remembered, the policy of "winning the war in the East" had not been accepted by Falkenhayn, and the German increases represented simply defensive and counter-attack requirements, and in particular the relief of pressure on the Austro-Hungarian armies. Correspondingly, German ideas and execution began from this date to predominate over Austrian. But no effective united command was ever created. German interferences in Austrian operations and operative methods, imperatively necessary to the common cause, but very often tactless, were constantly resented by Conrad and by most Austrian leaders; and moreover great divergencies of policy developed between the two imperial Governments in respect of Poland, Italy, and the Balkans.

Falkenhayn neither then nor thereafter accepted the principle that a decision could be obtained in the East. But his ideas had undergone a change since he conceded the eight new divisions to the eastern theatre "on loan." The French attempt to break through the Champagne lines had failed. A large number of German divisions were being reorganized on the basis of three infantry regiments instead of four, and the forces thus obtained were grouped in new handy divisions of veteran troops, which gave greater freedom in the play of reserves. He had abandoned, after detailed study, his Jan. prospect of a break-through on the Albert-Arras front, and therewith all offensive plans in the western theatre, while Conrad had refused to agree to his renewed proposal to force a way through Serbia for munitions for Turkey, though the peril of a Dardanelles break-through was becoming more and more evident. On the other hand, indices collected both on the Carpathian and Prussian fronts pointed to a growing shortage of material on the Russian side, as well as to a decrease of efficiency owing to losses in leaders and pre-war soldiers. Falkenhayn further thought it possible to keep both Italy and Rumania neutral, at least for a long time. All things considered, he came to regard a very heavy blow on the Russian front as necessary, possible, and desirable; and on Conrad's reviving, on April 7, the old scheme of combining blows from the lower San, and from the S. front of E. Prussia, with a rendezvous near Siedlce, he agreed, not indeed as to the plan, but as to the principle. It was still only a "sufficiently" heavy blow that he intended to deliver, but the limitation implied in the adverb was considerably relaxed. Eight divisions (Guard and X. Corps, XLI. Res. Corps, and two of the new divisions) were to be brought over from the western front, this time simultaneously and for use as an army. Of this army (XI.) Mackensen was appointed chief, with Colonel v. Seeckt as his chief of staff, Prince Leopold of Bavaria succeeding Mackensen at the head of the IX. Army. To cover the withdrawal from the W., sharp local actions were initiated at different points on the trench-line. One of these, involving ten or more divisions, is known to history as the Second Battle or "gas attack" of Ypres.

The theatre of Mackensen's operations was to be the country between the upper Vistula and the mountains (Dunajec-Gorlice-Tarnow), where the front of contact was in much the same position as it had been at the end of the battle of Jaslo. It was held by the Russian III. Army (Radko Dimitriev) on the one side and by the Austro-Hungarian IV. Army (Joseph Ferdinand) on the other, both being relatively weak. Supposing surprise to be effected, a mass of eight first-class divisions, supported by the troops already on the front and by artillery on a scale never before seen in the East, had every prospect of breaking through. Falkenhayn took many precautions to secure his surprise, and in the main with success, although the Russians and their Allies were well aware that a blow was impending at some point of the eastern front. The troop trains were sent by roundabout routes, false rumours were circulated, and Conrad himself was not informed of Falkenhayn's decision till the movements of concentration had begun. Hindenburg, whose jurisdiction only extended to the left of Woyrsch's line, was instructed to make demonstrative attacks at different points. One of these, the raid of v. Lauenstein's group into Courland, had an important sequel, and will be discussed later. The significance of the other two, an attack at Suwalki by the X. Army and a gas attack near Skierniewice by the IX. Army, was only momentary. In direction the attack was partly frontal, and it has been criticized for that reason. But a prime factor was the necessity of relieving the situation for the Austrians on the Carpathian front as soon as possible; and, besides in all probability compelling the Russians to retire in the southern part of the central salient, a drive N.E. and E. from the front Gorlice-Tarnow would make the Russian positions in the Carpathians untenable at least as far as the Lupkow pass inclusive. Falkenhayn went further, and proposed to involve the Russians even more thoroughly in mountain difficulties by retiring the right of the III., and the II. and South Armies. To this, however, Conrad would not agree; and Mackensen's blow lost part of its effect through this refusal.

The Dunajec-San Operation.—Reinforced by the Austrian VI. Corps already on the front, and placed in general charge of the Austrian IV. Army as well as of his own, Mackensen was himself subordinated to Conrad's headquarters, though in fact no major decision could be taken without Falkenhayn's agreement. On the Nida front the Austrian I. Army, and in the Beskidengebirge the Austrian III. Army, stood on the flanks of the two attack armies, and in case of success would be carried along as supports. On May 1 (see DUNAJEC-SAN, BATTLES OF) Mackensen's artillery preparation began. The scale of artillery and trench-mortar strength—hardly higher than that of a quiet sector in France in 1918—was, for the East and for 1915, overwhelming. At night, as a final diversion, an Austrian division crossed the Dunajec a little above its mouth and established two bridge-heads. On May 2 Mackensen's attack was launched between Woynicz on the Dunajec and Malastov (S.-S.E. of Gorlice). The troops of Radko Dimitriev gave ground, fighting stubbornly. By the 6th they had retired with heavy losses beyond the Wisloka; and the Austrian III. Army, taking up the attack in echelon rightward, had regained the Dukla Pass. By the 9th Mackensen had forced the Wisloka, Boroević was at the evacuated Lupkow Pass, and even Linsingen's left was advancing. On the 11th, on the other flank, the Russian IV. Army evacuated the Nida position, pivoting on Kielce. Operations were fluid, and it was Falkenhayn's and Conrad's problem to maintain them so.

Falkenhayn's intention was to ensure this by making the operation continue as a tactical one, with as little regrouping as possible outside the limits of the battle that was in being. For this reason he rejected a proposal of Conrad to reinforce, at Mackensen's expense, the Pflanzer-Baltin group (now called VII. Army), which by reason of its position might be enabled thereby to reach the rear of the Russian southern wing. He ignored the relief offensives started by his opponent against the front of Pflanzer-Baltin and elsewhere, and he even sought to utilize the attack upon Pflanzer-Baltin as a means of setting in motion the German South Army and the still stable portion of the Carpathian front, E. of the Lupkow Pass. But at first he had no intention that the effort should go in the slightest beyond its tactical limit, which he fixed as the San-Dniester barrier. Conrad agreed. Both leaders were anxious to disengage large forces for use against Serbia or Italy or both.

As foreseen, the rush of the Gorlice offensive came to a stand on the San-Wisznia line. The Grand Duke had, under cover of his relief offensives, collected adequate forces on the III. Army front and was prepared to hold it firmly. By the 14th Mackensen had taken a total of 140,000 prisoners and more than 100 guns, and had reached the line Tarnobrzeg on Vistula (link with Opatowka line)—Nisko on San-Sieniawa (Austrian IV. Army); Sieniawa-Jaroslów-Radymno (XI. Army); Magiera and Chyrow region (III. Army); Stary-Sambor (II. Army). But along the lower San, in the bridge-heads of Jaroslów and Radymno and the fortress of Przemyśl, the Russians were ready to fight again, on the alert, in prepared positions, and had by demolitions of all sorts made the supply problem difficult for the Germans and Austrians. At that date Brussilov's VIII. Army and Shtcherbachev's XI. on its left were intact; Szurmayer's and the left of Linsingen's were only beginning to advance; while Pflanzer-Baltin was on the defensive along the Pruth except at Kolomea where he still held a bridge-head. Moreover, Italy was on the point of declaring war (as she did on the 24th) and Rumania's intentions were impenetrable. On the western front, the French and British had opened their relief offensives of May 9 (battles of Caen and Festubert). The Dardanelles was under military as well as naval attack, and the Turkish and Balkan problems, always obscure, had thereby become acute as well.

Nevertheless, during the fourth week of May, Falkenhayn finally determined to carry on the Galician offensive and even to extend it. It appeared, from Mackensen's reports, that the shortage of munitions on the Russian side, already observed here and there, was general, and that it was possible in consequence to keep the offensive alive till it had secured a decision "sufficient for our purposes," in Falkenhayn's own words. Fresh

troops were drawn from the West—in spite of the crisis north of Arras. Hindenburg was invited to press the advance of Woyrsch's army group—which had already begun on the 12th to move forward on the left of the Austrian I. Army and was in front of Radom by the 16th—up to the Vistula below the San confluence. As in the Vistula-San operation of October 1914, the threat of turning the San line by Josefow was thought to be an effective means of weakening it against frontal attack. Ludendorff, however, declared this operation to be impossible, in spite of the offer of fresh divisions—his mind was already set upon a more grandiose scheme. Falkenhayn thereupon gave the incoming divisions (2½ from France and 2 from Poland) to Mackensen, and on June 3 that general received instructions to push the XI. and IV. Armies over the San barrier, south of the Tanev, in coöperation with an eastern advance of the Austrian II. Army (now comprising what was left of the III. after Boroević's departure for Italy), which should "finally" beat the enemy still remaining south of the Dniester in front of the South and VII. Armies. Hindenburg was merely "to take any chance that offered itself anywhere of profiting by the enemy's shortage of munitions." In sum, then, the scheme was simply a prolongation eastward of the Gorlice-Tarnów effort by means of a fresh engagement of reserves. No new operative idea was involved. But the decision to continue the battle was in itself an operative decision of the first importance, and, in view of the general war situation, a very bold one.

Mackensen meanwhile, partly urged by his own fighting spirit, partly compelled by Russian counter-attacks, had been involved in constant fighting on and for the San line. The Austrian IV. Army was strained to the utmost in holding on to the positions it had gained on the middle San (below Sieniawa) and in front of the link Nisko-Tarnobrzeg (or "San angle position") which joined Radko Dimitriev's front to that of Evert on the Opatowka. The right of the XI. Army was similarly held up by the Russian positions about the Radymno bridge-head, and Przemyśl interposed a formidable obstacle between that army and the advancing Puhalló group (the relic of the Austrian III. Army, which included also the German Beskidenkörps). But the left of the XI. Army stormed the Jaroslów bridge-head and, crossing into the Lubaczówka valley, pressed the right rear at the Radymno bridge-head farther up the San. On May 24 a general assault carried this line, and the Russian centre, its right still holding the "San angle" position and the San below Sieniawa, fell back to the line of the Wisznia, the Grodek lakes, and the Wereszyna. Practically at the same time, the right of the XI. Army, Puhalló, and the left of the II. Army closed upon Przemyśl from the N., W., and S.; after severe fighting the fortress fell on June 3, as described under PRZEMYSL. Farther E., the right of Böhm-Ermolli's and the South Army, advancing in the last ten days of May, reached the line Weliko Bloto ("great marsh") on the Dniester—E. of Drohobycz—S. of Stryj-Dolina, making connexion at Jasien with the left of the VII. Army, which was holding, still with success, the Pruth line.

The Russians, however, failing as were their resources, reacted powerfully. The Grand Duke's instructions were that "for political reasons, it is imperative to hold" the Opatowka-San-Grodek line "at all costs," and he carried them out by a series of heavy counter-strokes. First on the lower San against the Austrian IV. Army, then on the Pruth against Pflanzer-Baltin, and lastly against Linsingen on the Stryj front, offensives on a large scale were delivered in the latter half of May and the first week of June. New masses were drawn from an army at Odessa which was to have coöperated in the attack on Constantinople. Even Woyrsch's advance, far away on the Kielce-Radom railway, was opposed by stubborn defence and sharp local counter-attacks. But in the last resort the Grand Duke's forces were inadequate for prolonged defence. The long exposed flank of the northern corridor compelled him to keep fairly large forces inactive on the Narew, the Bobr, and the Niemen; and the Lauenstein operation in Courland (described below) made a continual drain on his northern resources. But above

all, the failure of munitions led to enormous losses, both in counter-attacks and in rearguard operations. By June 16 the Russians had lost, in the battles of Gorlice-Tarnow, the San, Stryj and the Pruth, no less than 302,000 in prisoners alone, besides 304 guns. The last acts of this phase were the forcing of the Grodek lines by Mackensen's two armies on June 16-19 (see LEMBERG, BATTLES ROUND, Section II.) and the successful two-fronted battles of Linsingen's South Army about Stryj and Drohobycz, in which his left, facing north, held off the counter-attacks of the Russian XI. Army, while his right, by intervening in the flank of Pflanzer-Baltin's opponents (IX. Army, Letchitsky), made them retreat to the Dniester (May 31-June 15).

The Bug and the Narew Campaigns.—Although the Russian retirement in E. Galicia was not, as Conrad imagined for a moment after the fall of Lemberg on June 22, a retreat in dissolution, it was definitively a retreat on the largest scale. Once the gap between the San and Dniester had been forced, neither was tenable by the defence. Very soon, therefore, the Russians on the Dniester were taking down their line from right to left, to re-form on the positions offered by one or another of the N.-S. tributaries of that river. From the San, the Tanev and the region of Rawa Ruska, the retreat took a northerly direction and thus there came up again the same possibilities, risks and alternatives for the Austrian offensive as those of Aug. and early Sept. 1914. The conditions were, however, partly changed. The Russians and Austrians alike had lost most of their peace-trained leaders and their offensive energy. Instead of the general clash of an encounter battle, it was now a case of retreat and of a follow-up, upon which delay was imposed by the necessity of restoring demolished communications, and caution by the risk of counter-attack striking the pursuit at a weak spot as it opened out fan-wise towards Lublin-Chelm and towards Sokal. Such a counter-attack did in fact bring the German XI. Army into momentary peril between July 7 and July 12.

The prospect of a slow advance of indefinite depth made it imperative for Falkenhayn and Conrad, and especially for the former, to reconsider the position. Hitherto the German leader had proceeded from one limited objective to another, all along the same general direction. Now—at the beginning of July—the choice had to be made between initiating a far larger operation and calling a halt to consolidate gains.

There were in reality two decisions to be made, one of principle and one of method. On the principle of continuing the offensive against Russia, Falkenhayn's opinion was, fundamentally, unchanged, and he foresaw new dangers in France owing to the impending appearance there of 12 British new army divisions, considered as heralding an attack. But deciding, on the evidence, that the great French offensive would not take place till Sept., and relieved of fears for the Italian front—impressed also, without doubt, by the repeated counter-strokes of the Russians—he decided on June 28 to initiate a new eastern offensive effort.

The second decision, as to the form and direction of this effort, was more difficult and controversial. Apart from Conrad's proposal, made once again, to strike from two directions against Siedlce, there were two schemes under consideration. One was from Ludendorff on behalf of Hindenburg; the other from von Seeckt, representing Mackensen. In the sequel, Falkenhayn accepted the latter, with additions of his own.

In Section I. of this article, mention was made of the geographical barriers, both flank and transverse, of the "northern corridor," and it was noted that the tendency of the latter was to turn southward in their upper courses, so that a series of gateways existed along the inner flank of the corridor. Seeckt's proposal, first made as early as June 15, was to wheel the two Mackensen armies sharply northward, pivoting at about the mouth of the San, to the line Ivangorod-Wlodawa, with, as flank-guard against dangers from the Luck direction, the Austrian II. Army, which should advance, in échelon from the left, toward Vladimir Volhynskiy, E. of the Bug. Only the South Army and the VII. Army would remain to drive the Russians remaining S. of Brody out of E. Galicia. The Austrian I. Army on the other side of the Vistula was to conform by pushing the enemy back

to about Josefow, and, itself crossing there, to come into line to the S.E. of Ivangorod, thereby allowing Mackensen (I., IV., and XI. Armies and Beskidenkorps) to condense on his right wing and drive forward on the Bug, with on his right, beyond the river, a deep échelon which could pull out and outflank the enemy's left wherever it was found. To this scheme it was open to Falkenhayn to add a similar enveloping element on the northern flank.

But, in accepting the plan, Falkenhayn and Conrad modified it considerably. The situation in E. Galicia did not seem to them to justify the plunge of the II. Army northward on Vladimir Volhynskiy. They therefore reserved this army, as heretofore, for operations in the Brody direction, and instead withdrew the I. Army from the central salient—Woysch extending, in place of it, to the Vistula—and reconstituted it about Rawa Ruska with orders to line the Bug as a flank guard in proportion as Mackensen progressed. It was during this regrouping that the Russian counter-attack of July 7, above mentioned, was delivered. A serious objection to Seeckt's scheme was, in Falkenhayn's eyes and probably in Conrad's also, the fact that the II. Army would have become involved in the marshes of the Pripet region N. of Vladimir Volhynskiy. Both Seeckt and, incidentally, Ludendorff considered the difficulty of this country to be exaggerated, and Falkenhayn admitted after the event that this was so. In any case much would have depended upon the scale of the operations E. of the Bug, and this was just the unknown factor in the problem.

Falkenhayn therefore limited the Mackensen operation to the area between the Vistula and the Bug, thus turning some, but not all, of the transverse barriers by their inner gates. Reckoning upon obstinacy in the command and slowness of the machinery of his opponent, he considered that it would suffice to come in upon the rear of the Russian centre during its presumed evacuation of the central salient, at some point between Siedlce and Brest-Litovsk. But he was aware that the centre of gravity of the whole Russian line now lay opposite Mackensen, who would be called upon to make a purely frontal advance through country that was destitute of railways and would certainly be devastated. He therefore intended to deliver an additional blow from the other wing generally in the same direction; that is, to reinforce Gallwitz to such strength as would enable him to force, in succession, the Russian XII. Army's Przasnysz lines and the Narew barrier, and so to descend upon the same region from the other side, N. of the middle Bug. Thus he expected to obtain the maximum result that was possible, and within a time-limit set by the forthcoming French offensive in Champagne and by the Bulgarian peasants' harvest.

Ludendorff, on the other hand, aimed at the "annihilation" of the Russian armies and thereby the certainty of winning the war. He argued that Mackensen's movement on the left of the Bug would be a slow frontal drive; that a Gallwitz offensive toward the Narew would be brought to a standstill, or at the least reduced to the condition of Mackensen's, very little beyond the Narew; that Byelostok could not be reached with certainty by an offensive from the VIII. Army front (Oswiec), such as had been projected in the Masurian campaign, though he and Falkenhayn were agreed as to this being, ideally, the decisive point; that Kovno and Grodno effectively held the middle Niemen line; and that, in effect, the only practicable envelopment was one which, starting from the N. of Kovno, swept round and invested that fortress and swung in by Vilna toward Molodechno and Minsk. The cross-barrier of the Vilya, and that alone, was sufficiently far back from the present Russian front to ensure the cutting-off of the entire Russian army in Poland, Polyessie, and southern Lithuania. To complete the "Cannae," he proposed that the Mackensen group of armies should place its centre of gravity on, and even E. of, the Bug, as laid down in Seeckt's original plan.

To understand the significance of this proposal and the arguments for and against it, it is necessary to realize the new position of affairs on the extreme left of Hindenburg's front. At the close of the Masurian winter operations the X. Army

leaned to the left on the lower Niemen, rather east of Tilsit. In March there had been some advances and retreats on both sides but no substantial change in the situation. A raid on Memel, beyond the left flank of Eichhorn's Army, by a small body of Russian militia from Libau (who were expelled after doing some damage) was the only incident of importance N. of the Niemen till, in mid-April, Hindenburg received orders to deliver feint attacks in order to divert attention from the forthcoming Gorlice offensive. He chose, for this purpose, the region N.E. of Tilsit, and formed a mobile army group of infantry and cavalry divisions under General von Lauenstein. In this quarter the Russians had only small forces, and the advance could be carried out in three separate columns, thus covering an enormous front. In all, 3 infantry and 3 cavalry divisions were sent out on April 27, by Memel toward the Vindava, by Tauroggen on Shavli (Schaulen, Szawle), and by Yurburg on Sredniki and the Dubissa line. A small raiding body, in conjunction with light naval forces, took possession of Libau early in May.

Lauenstein's movement was unexpected, and his left column penetrated to Mitau before the reaction set in. The others made good Shavli and the line of the Dubissa, and during May and June a series of fierce battles on a small scale took place all along this line. The Russians brought up considerable reinforcements under the V. Army staff, and the first object of Lauenstein's enterprise thus attained marked success. But, like other wide extensions of front in the war, as soon as serious infantry fighting opened, manœuvre began to call upon reserve resources for its maintenance. Two infantry and 2 cavalry divisions were added to the German force, which became the "Army of the Niemen" under Otto von Below, Scholtz succeeding this officer as the head of the VIII. Army. Thus, at the end of June, when the plan of future operations was being settled, the ground was prepared for the manœuvre advocated by Ludendorff. From Shavli, with flank guards set out successively towards Riga and Dvinsk, the Niemen army could, after being made sufficiently strong to defeat the Russian V. Army assembled in front of it, turn Kovno and reach the Vilya line long before the Russians in retreat from western Poland could do so. On the other hand, so grave a peril would clearly bring into existence a new Russian army of relief in the Riga-Dvinsk-Petrograd region, and this army would make short work of a few flank-guard divisions facing Riga, Jakobstad and Dvinsk. One necessary condition of Ludendorff's plan, therefore, was heavy reinforcement of the Niemen army; another the reduction of Kovno, so as to clear a direct and safe line of communications Insterburg-Vilna and to bring the X. Army into action E. of the Niemen. From Falkenhayn's point of view, however, the eccentricity of the whole manœuvre was its gravest drawback. He doubted whether so distant an operation would affect the situation of Mackensen, but especially whether it would not become just that plunge into the unlimited interior of Russia which, with his time-limit fixed, he dreaded above all. Operations N. and E. of Kovno were permissible, in his opinion, only for hunting down an army already in dissolution, not as a preliminary to the battle that was to bring about that dissolution.

Such, in sum, were the elements of a controversy between Falkenhayn and Ludendorff, which in the course of the summer created a serious breach between the Supreme Command and the commander-in-chief East, and undoubtedly handicapped the operations, for Falkenhayn never swerved from his intention to close down the campaign as soon as an "adequate" result had been achieved, and Ludendorff on his side returned to the charge at every opportunity, with the result that the few available reserves were handled without singleness of purpose.

The Ludendorff plan, first proposed as early as June 7, was discussed fully at a conference on July 2, in the presence of the Emperor William, who, bound by the practice of the German army either to follow the counsels of his sole and responsible adviser or to dismiss him, chose the former course.

It was decided therefore that Mackensen, after completing his wheel-up, should advance with all possible energy against his immediate opponents between the Vistula and the Bug,

with the reconstituted Austrian I. Army protecting his right flank by making good the line of the upper Bug as he advanced; and that Gallwitz's army group, reinforced, should break through at Przasnysz and on the Narew. When Gallwitz's operation, with its immediate relief to Mackensen, should have been completed, then Falkenhayn was prepared to allow an extension of the offensive to the middle Niemen region.

On Mackensen's front the wheel-up was completed in the midst of a heavy Russian counter-attack, and the advance that was to follow was involved in great difficulties from the outset. His three armies—from left to right, the Austrian IV. and the German XI. and Bug Armies (the last newly formed under Linsingen)—had not moved appreciably when Gallwitz's attack was delivered. The Russians had massed considerable forces to deny access to the inner gates of the corridor, and under cover of their activity had already begun the evacuation of the central salient. There all the old line had been already given up S. of Inowloz on the Pilica, and, on Mackensen's intention becoming evident, the retreat was continued to the line of the Vistula itself, where, however, the foreground of Ivangorod and, especially, the great entrenched positions west of Warsaw continued to be held in force. The German IX. and Woysch Armies in front of this line, now constituted as a group of armies under Prince Leopold (probably in order to give Falkenhayn a force independent of both Hindenburg and Conrad), had been weakened and could do little more than follow up, boldly on the right but very cautiously on the left where the Warsaw positions and Novogeorgievsk imposed respect.

When Woysch reached the region of Ivangorod (July 21) so little progress had been made on the Mackensen front that Conrad proposed that Woysch should cross the Vistula above that fortress, so as to intervene in rear of Joseph Ferdinand's opponents. This movement, which would have thrown the axis of Woysch, and eventually that of the IX. Army also, away from the region of the middle Bug and put an end to all hopes of cutting off the Warsaw group of the enemy, was opposed by Falkenhayn and also by Mackensen, and Woysch received orders to cross the Vistula below Ivangorod, as he did on the night of July 28-29 near Muciejowice. The IX. Army meanwhile felt its way forward to the Warsaw lines and the S. front of Novogeorgievsk.

Before any of these movements were under way—largely indeed with the intention of helping them to get under way—the Gallwitz group, reinforced from the central salient by 4 divisions to a strength of about 15, had opened its offensive on July 13-16 by breaking through the Russian XII. Army's trench-lines at and west of Przasnysz (see NAREW, BATTLES OF THE). On the night of the 17th Gallwitz stood within range of Ostrolenka on the left and the N. defences of Novogeorgievsk on the right. But a new and more severe effort was needed for the forcing of the Narew line itself. Russian counter-attack forces arrived in time, and it was only on Aug. 8—more than 3 weeks after the offensive began—that the Gallwitz group, now styled XII. Army, had made good a line E. of the river defined by Serock-Wyszkow (on the Bug)—E. of Ostrow-R. Ruz, the last named being occupied by the right of Scholtz's VIII. Army which had advanced in sympathy. The right of the German XII. Army meantime, W. of the Narew and facing S., was holding its own, not without considerable difficulty, against repeated counter-attacks issuing from the Novogeorgievsk defences, where the Grand Duke maintained large mobile forces up to the eleventh hour—and indeed beyond it.

In these 3 weeks Mackensen's right, the Bug Army, had been engaged (see BREST-LITOVSK, BATTLES OF) by the Russian XIII. Army, at the halt on almost every line of E.-W. streams available. It had fought on the line Grabowiec-Grubieszow from July 19-21, on that of Chelm-Annopol from the 21st to the 31st, and along the Ucherka river and at Sawin in the first days of August. The XI. Army, with better conditions, had advanced first astride and then east of the Huczwa, and by Aug. 6 had reached Lubartow-Sawin; while Joseph Ferdinand had—without the suggested flanking assistance from Woysch—reached the

line Novo Alexandryn-Lubartow. In the centre Woyrsch had extended his Muciejowice bridgehead and was passing all his forces over the Vistula for the advance on Siedlce-Lukow, and under this threat the Russians had entirely evacuated the left of the Vistula. Warsaw city fell on the 5th, though the German IX. Army was unable to force the river—there a kilometre broad—till the 8th. Ivangorod was evacuated on the 5th. Thus the German front had assumed a still more pronounced N.E. direction than at the beginning of the Mackensen manoeuvre; owing to its battle and route conditions, Linsingen's Army was back instead of forward of the alignment, and the Russians had retreated clear of the dangerous central salient to a line marked by the Liwiec, the Bystrica and, facing Mackensen, the middle Wieprz, the Swinka and the Ucherka. The Austrian I. Army, occupied principally with flank-guarding Linsingen along the Bug, had advanced its right to Vladimir Volhynskiy but no farther. On the other flank of the Russian retreat Gallwitz was firmly held for the time being. In other words the Russians—handled with great skill by General Alexeiev, commander-in-chief of the N.W. front, were successfully effecting their retreat to that line (Kovno-Grodno-Brest-Litovsk-W. of Kovel-Luck-Dubno) which had been already in peace-time regarded as the line of safety for deployment. In territory, they had abandoned no more than they would have been prepared to give up gratuitously in their pre-war concentration scheme.

But this in itself was, after a year of warfare, a confession of defeat. The enormous losses of that year in men and material—losses such that the great army of peace-time with all its resources had practically ceased to exist and the stocks of arms no longer sufficed to equip even the men in action, let alone new formations, with rifles—left no doubt that as a dominant factor in the war Russia was out of the reckoning. In the light of after events, the decision to continue the struggle after the loss of the San line in June is seen to be the first step to the Russian Revolution. Yet, on purely military grounds, it was justifiable on the assumption that the French effort to break through the Champagne front would succeed. Only this confidence in victory in September, indeed, can explain the stagnation on the Western front from April to August (broken only by the May battle in Artois), enabling Falkenhayn to withdraw some 12 divisions for the Eastern operations.

By August it was evident that the chances of cutting off any considerable formed army of the Russians in the Kielce region was at an end, and again there came up on the German side the controversy between Falkenhayn and Ludendorff as to what the operations were intended to achieve. Falkenhayn held firmly to the view that the Russian army must be beaten before any wide enveloping movement was undertaken to surround its debris. Writing after the war, he maintained the same opinion, only reproaching himself with not having compelled G.H.Q. East to give Gallwitz 20 divisions instead of 14. And certainly, if prisoners and booty were considered, he had in fact inflicted what by all military standards was a "sufficient" or "decisive" blow—for by the middle of Aug. the Russian losses in prisoners alone had reached the figure of 750,000 since May 1, nearly 50% of their combatant strength as it had been at the end of April. But the time-limit was close at hand, and the withdrawals of forces to France and Serbia, delayed as long as possible, had now to be begun. The weeks remaining must, according to Falkenhayn, be devoted to inflicting as much additional loss on the Russians as was possible by frontal pressure coupled with flank attacks on the middle Niemen and east of the Bug, i.e. in the immediate vicinity of the frontal fighting, and possibly raids by light forces on the communications behind Kovno and Brest-Litovsk. At a suitable date the operation would be closed down, and the best line of defence taken up as a winter front.

Ludendorff, on the contrary, considered that the actual annihilation of the Russian armies was the only "sufficiently decisive result" that would give freedom of action in the West, and with renewed insistence—which went as far as a personal appeal by the Field-Marshal to the Kaiser—demanded the

reinforcement of his left (Niemen army) with a view to quick swooping down on Vilna and Molodechno and the closing of the "corridor." The axis Orany-Lida, originally suggested, was now too near for the required effect, but the principle was the same, and the movement would originate from a more favourable situation of the Niemen army than that existing in June. Preparations for the attack on Kovno by the X. Army were already well advanced, and Ludendorff considered that even at this stage complete success would be possible.

At this period the fighting on the Vindava-Schavli-Dubissa line had definitely turned in favour of the German Niemen army, the Russian V. Army receiving little or no further reinforcements when Mackensen's and Gallwitz's attacks developed. Below was progressing beyond the line named in each of the three directions Mitau-Riga, Poneviesh-Dvinsk, Keidamy-Wilkomir, and about Aug. 1 his various columns, totalling about 7½ inf. and 5½ cavalry divisions, were approximately on the line River Aa-R. Musha-E. of Poneviesh-Keidamy. To the southwest, the German X. and Russian X. Armies were still making war in the same fashion as in March, the Germans based on the Suwalki-Schali lines, and the Russians on their Kovno-Niemen-Grodno fortifications, making periodical thrusts in the region between. But the last important Russian thrust was delivered early in May, as a "relief offensive" toward Schali; and the German reaction became a methodical advance toward Kovno and Olita, which at the time here considered brought their left almost up to their opponent's stronghold. Behind the German advanced line preparations had been made for the siege of Kovno, an essential part of the scheme which Ludendorff still advocated.

The Final Phase.—It was evident that the scheme of bringing Below and Eichhorn down upon Vilna and Molodechno, and capturing Kovno in time, would call for the reinforcement of either or both, and, on this ground principally, Falkenhayn preferred to continue the campaign on the same lines as before, though a little later he conceded to Hindenburg freedom to dispose as he chose of the forces in his own area and to Mackensen freedom to pass to the E. of the Bug. Conrad, meantime, was planning an operation in East Galicia with the II., South and VII. Armies.

Thus the last phase of the tremendous campaign consists of 4 parts: (a) the frontal drive of (right to left) the Bug Army, the XI., Woyrsch, IX., XII. and VIII., (b) the attack on the north flank and the rear of the "Corridor" by the German X. and Niemen Armies, (c) the N.E. swerve of the Bug Army and the A.-H. I. Army, and (d) the autumn campaign in E. Galicia. All these were carried out without any great regrouping or reinforcement, and indeed, as regards (a) the forces concerned, were gradually reduced in order to form the army for the Serbian front and to increase the reserve in France. In the case of the operations in E. Galicia, the Russians followed a clear purpose and the parts of their efforts were coördinated. But elsewhere, under the tremendous pressure of the row of hostile armies stretching from Lomza to Wlodawa and Vladimir Volhynskiy, the only general policy was that of gaining time at the expense of ground and of avoiding envelopment at all costs, and the day-to-day situations were met as best they could be. On the German and Austrian side the offensive energy of the troops was beginning to approach its limit, except as regards troops N. of Grodno, so that it may be said that the allied left and the Russian left alone retained the capacity for fresh achievement, while the rest were wearing each other out at an increasing rate.

The central campaign, between the Bobr and the Bug, may best be summarized by recording the battlefields of each of the German armies in succession.

Protected on its right by the Austrian I. Army, the Bug Army fought and won the battles of the Ucherka (Aug. 7-12) and of Wlodawa (Aug. 13-17), and in concert with the XI. Army continued its advance northward along the Bug against Brest-Litovsk. Meantime, the crossing of the Bug was authorized in so far as concerned the establishment of bridgeheads; and in carrying out orders with this object the German subordinate

leaders became involved in fighting E. of Włodawa, which inevitably formed the starting-point of an offensive against the eastern communications of Brest-Litovsk. By Aug. 21, then, the greater part of the Bug Army was engaged on the line of the Kapajowska from its mouth to Switiaz lake inclusive, well inside the region of the great marshes; the remainder (Beskidenkorps only), still west of the Bug, was nearing the outworks of Brest.

To the left of the Bug Army, the XI., already being reduced for the forthcoming Serbian campaign (for the conduct of which its staff was presently withdrawn), moved forward correspondingly against the W. of Brest. On Aug. 19 its left had reached Janow on the Bug below the fortress, while the Beskidenkorps stood at Koden on the same river above it. To the left of the XI. Army, again, the Austrian IV. Army at that date lined the Bug between Janow and Niemirow; and beyond Joseph Ferdinand, already N. of the river, was Prince Leopold with Woyrsch's and his own armies, which, as soon as they had debouched from Ivangorod and Warsaw, had made rapid progress, as the Russian centre retreated at the fastest possible pace to escape while Gallwitz and Mackensen were still being held off. The German IX. and Woyrsch Armies stood, on Aug. 19, N. of Niemirow, facing the line of the Pulwa and the Nurzec on which the Russians were preparing to make a stand.

Meantime Gallwitz, in his bridgehead position in the angle of the Bug and Narew, had overcome the Russian counter-attacks, but not before their purpose of keeping open the railways and roads for the retreat of the Warsaw and Ivangorod forces had been achieved. The battles of Ostrow (Aug. 8-10) and Tschishew-Sambrow (Aug. 11-12) and the advance in the direction of Bielsk which ensued were thus similar in character to the operations of the IX. and Woyrsch's Armies, viz.: a direct pursuit where an envelopment had been hoped for. At the date of Aug. 18-19, Gallwitz stood between the Nurzec and the upper Narew, facing Biala, where the Russians were prepared.

The rightmost troops of the XII. Army, viz. those which in the battle of the Narew were facing south against counter-attacks from Novogeorgievsk and the strong points of the lower Bug, had now been combined with the leftmost troops of the IX. Army for the siege of Novogeorgievsk, in an army group under von Beseler, the captor of Antwerp; and the siege, pressed with energy, was nearing its close. On the 20th the place, with a large garrison, surrendered. On Gallwitz's other flank, the right of the VIII. Army had conformed to his advance and was taking the direction of Byelostok; its centre had mastered Lomza and Wiszna on Aug. 10; and its left was again, as in Feb., battering Osowiec, which fell to the superheavy artillery on the 22nd. Kovno, as will be seen, had already fallen on the 18th, to the attack of the German X. Army.

Throughout, these pursuit operations large numbers of prisoners continued to be taken by the Germans, and the Russian fortress artillery swelled enormously the total of captured guns. At Novogeorgievsk some 85,000 men and 700 guns were taken. Shortly it was to be the turn of Brest-Litovsk and Grodno, though these places were not defended after the withdrawal of the battle-lines outside them.

The later stages of the frontal pursuit may be very briefly dealt with. The general direction of the Woyrsch, IX. and XII. Armies was eastward. From Aug. 19-24 Woyrsch and the IX. Army were engaged in mastering the Pulwa-Nurzec line, on which the Russians delayed their opponents long enough to cover the evacuation of Brest-Litovsk against interference from the N.W. or N. From the 25th to the 31st these two armies were involved in a fresh series of combats in and about the "primeval forest" of Byelovitsa. Meantime the XI. and (till its withdrawal) the Austrian IV. Armies, with the Beskidenkorps of the Bug Army, had attacked Brest-Litovsk concentrically from the W. and S., and the last Russian rearguards had been driven out of the evacuated stronghold on the 26th. The Germans and Austrians then continued the pursuit eastward, where the operations of the Bug Army and the Austrian I. Army (presently to be described) came into line with theirs in the early part of Sept. The XII. Army drove the Russians from the Bielsk posi-

tions on the 26th, from the Swislocz river a few days later, and from the Naumka-Wereczysa line on Sept. 4, at which date the IX. Army and Woyrsch had at last debouched from the Byelovitsa forest towards the Jasiolda river.

In general, the effort of the Bug, XI., IV., Woyrsch and IX. Armies in the earlier stages of pursuit had tended to crowd the Russians into the area round Brest-Litovsk, and at a certain stage in this process the Bug Army had been authorized to push through the marshes E. of the river so as to reach the line of communications Brest-Litovsk-Kobrin-Pinsk. At the same time the Austrian I. Army about Vladimir Volhynskiy advanced to Kovel, and thence eastward (see *Autumn Campaign in East Galicia* p. 907) while from Kovel its cavalry worked up through the marshes northward to join the swinging right wing of the Bug Army. But that army, although it drove the retiring and diminishing forces of its opponent N.E. from the Kapajowska to Kobrin, was unable to reach that point before the Russians evacuating Brest-Litovsk had flowed past it. The Russian rear-guard stood to fight on a line N.W.-S.E. through Kobrin, but, the Austro-German Cavalry Corps of General von Heydebreck from Kovel arriving on their flank, they soon fell back to the oblique line of the Dnieper-Bug canal, where they were temporarily secure against all but frontal pressure. Thus in this quarter too the pursuit became a direct one. The Russians were driven by the Bug Army and by what remained of the Austrian XI. and Austro-Hungarian IV. Armies—the whole now commanded by Linsingen—out of the canal lines in the battle of Horodec (Aug. 31-Sept. 1) and out of the defences of Drohiczyn-Chomsk (Sept. 4-6). But Linsingen's offensive, more and more hampered by poor communications, came to an end with the occupation of Pinsk on Sept. 16, and positions were taken up here which remained unchanged till the end of the war.

With the almost simultaneous capture of Brest-Litovsk, Bielsk, and Grodno (the last named fell to the German VIII. Army on Sept. 2-3), the Germans obtained possession of that line across the northern corridor which had usually been regarded as the Russian stabilization line. Falkenhayn, however, took full advantage of the shortening of front which resulted from the directions taken by his armies, and then at last Ludendorff's scheme came into play.

Such an operation as Ludendorff contemplated, or at least one from the middle Niemen, Falkenhayn had been willing to agree to from the first; and as the occasion approached he relaxed his hold on Hindenburg's dispositions, stipulating only for the observance of his general directions and for the release of certain divisions for the West. In practice he approved the attack on Kovno. Ludendorff promptly took advantage of this, and the intended wheel-in upon the rear of the "corridor" was already in progress before the fall of Grodno and Brest-Litovsk. On Aug. 8 the X. Army was able to begin the siege of Kovno. Ten days later the fortress was in its hands—even earlier than at Novogeorgievsk, Osowiec, and Brest-Litovsk. On condition of strengthening either the Niemen army or the left of the X., therefore, Ludendorff's plan had become feasible, if feasible at all, while masses of the enemy were still south of Brest-Litovsk, on the Pulwa and the Nurzec, about Bielsk and Byelostok and Grodno. At that date, Aug. 18, the Niemen army had pushed its left columns close up to the Riga-Urküll bridgehead on the Dvina, and to Friedrichstadt on that river, whence its centre and right ran southward along the Jara and Sventa to the north side of Kovno. It was still very strong in cavalry, but some of its transport had been taken for the armies pursuing through the devastated areas to the South.

Nevertheless, no serious advance was made to the westward from Kovno for more than a week, and even then part of the X. Army swerved full to the south against Olita to open an advance in the direction of Orany, and also to help the VIII. Army in cutting off Grodno, now a pronounced salient. At this late stage Ludendorff himself had doubts of the efficacy of the westward movement, and for a moment contemplated taking the direction favoured by Falkenhayn, viz.: Orany, Lida, Baranovichi. Not only was this the shortest route to the enemy's

heart—the shortest, that is, as measured by the time necessary for concentrations and for rebuilding routes—but it offered hopes of driving a large mass of the enemy into the marsh region round Slonim, where the avenue of escape was narrowest (whereas at the latitude of Vilna-Molodechno the corridor broadens out considerably). However, he chose, in the end, to follow the current scheme of operations, as offering “annihilation” of the enemy as a prize, though admittedly that prize might escape him. On the 28th, therefore, with the expressed or implied consent of Falkenhayn, the X. Army was ordered forward on Vilna, with centre of gravity on the north wing, north of the Vilya. Reinforcements were collected from the troops lately besieging Novogeorgievsk and from the VIII. Army, which, after the fall of Grodno, would evidently be crowded out of the line. The Niemen army was directed to press up to the Dvina bridgeheads and, especially, up to Dvinsk, to coöperate with its left wing in the operations of the X. Army north of the Vilya, and to prepare a mass of cavalry to break through the thin line of the Russians near Swentsiany and seize or destroy the railways at Molodechno and Minsk.

The last great battle of the campaign, known as that of Vilna-Molodechno, began after the Grodno episode had been closed on Sept. 9. At that date Linsingen was advancing on Pinsk, Woyrsch and Prince Leopold driving the enemy slowly from one river-line to the next, over the Jasiolda, in the direction of Slonim; and Gallwitz and the remnant of the VIII. Army were pressing slowly forward up the Niemen in the same direction. The Niemen army was, by its activity between Riga and Dvinsk, forestalling and perhaps diverting the attack of new Russian forces which were coming up from the Baltic provinces. From Wilkomir, north of the Vilya, to Orany, the X. Army engaged the very heavy forces that the Russians had collected for the last effort to hold the flank of their corridor—the final act of command of the Grand Duke Nicholas before the Tsar took over the control from his able hands. The German offensive progressed slowly, like all offensives against the Russian flanks in this campaign, but after some days it was judged that the forces on the Dvina and amongst the Dvinsk lakes had obtained sufficient security for the left flank, and on Sept. 11 the German cavalry divisions broke through the cordon west of Novo Swentsiany and made for Swentsiany and Molodechno. On Sept. 14 the horsemen reached and broke the Vilna-Molodechno line at Smorgon. At Wilejka and farther north at Gluhokoye they cut the vital Lida-Plotsk line. A party even reached the Minsk-Orsha line at Smolewice.

This last crisis was also the most dramatic. The first wave of cavalry was followed by others till about seven divisions were collected about Wilejka, Smorgon and Molodechno. But, recovering from their first surprise, the Russians quickly sent troops from Vilna and from Minsk, as well as from the southeast of Dvinsk, to clear their intercepted lines of retreat. These had to be recovered at all costs, for, while the forces retiring before Gallwitz, Leopold and Woyrsch still had the lines focussed on Baranovichy at their disposal, these could not help the northern masses, and it was in the north, towards Vilna, that the centre of gravity lay.

Thus a race to build up forces about Smorgon, Molodechno and Wilejka set in. The Russians, having the better communications and consequently the larger forces, won it. They drove back the German cavalry, after a continuous skirmish of five days, to the west of Smorgon and the northwest of Wilejka. Two days later the first infantry divisions arrived on the German side from the left of the X. Army. The détour of these troops along the north bank of the bending Vilya had enabled the Russians, moving on the shorter line, to reopen their line of communications; and, with this, the battle of Vilna became, like the battles farther south, a slow frontal drive. Thereupon Falkenhayn ordered operations to be broken off and more divisions to be withdrawn for other theatres, and fixed in general the line to be taken up as a winter line. The concluding operations of the campaign, mostly completed in early October, consisted in the methodical advance of all armies to this line,

which, so far as the Hindenburg, Leopold, and Linsingen groups were concerned, ran from Tuckum, on the gulf of Riga, past the south side of Riga and parallel to the Dvina to Novo Alexandrovsk, and thence southward by Lake Drisyvaty and Lake Naroch, Smorgon, Krewo and Baranovichy to Pinsk, south of which point Linsingen's right came into touch with the left of the Austrian operations in East Galicia.

Autumn Campaign in East Galicia.—In East Galicia the pursuit of the Russian VIII. and IX. Armies, after the Grodek-Lemberg break-through in June, had been left by Conrad and Falkenhayn to the Austrian II. Army, the German-Austrian South Army, and to Pflanzer-Baltin. Although the first impressions of the victors in that battle had been that the Russian armies remaining in East Galicia were incapable of more than retreat and rearguard fighting for a long time to come, in fact it cost the Austrians and Germans much fighting and manœuvring to establish themselves on the line of the upper Bug and the Zlota Lipa; and Pflanzer-Baltin was at one time subjected to a heavy counter-attack by General Lechitsky's Army, for in this quarter the Russians had an ample supply of reinforcements in their Odessa army. Towards the end of July, however, the fighting in Galicia died down.

Towards the end of August, as a part of the same final offensive act which produced the battle of Vilna-Molodechno in the other flank, Conrad initiated a campaign which was intended to confirm the separation of the northern and southern groups of the enemy and to clear the latter out of Austro-Rumanian territory definitively. The thinness of the defensive cordon in the Pripet marshes, revealed by the lack of serious opposition to the movements of Puhallo's I. Army on and beyond Vladimir Volhynskiy, and the advance of Heydebreck's Cavalry Corps across the swamps and forests to Linsingen's Drohiczyń battlefield, led the Austrian command to make its effort on the north side of the Lemberg-Brody watershed. Profiting by the general shortness of the line between the Bug and Vistula, Conrad withdrew the Archduke Joseph Ferdinand and the IV. Army from the Brest-Litovsk field of operations in the last few days of August, concurrently with the withdrawal, mentioned p. 906, of the German XI. Army for Serbia. During the gradual withdrawal of the IV. Army, Puhallo began his offensive from the line Vladimir-Volhynskiy-Kovel in a south-easterly direction.

The fighting which followed is described in the article ROVNO, BATTLE OF. The incoming of the Austrian IV. Army on Puhallo's left, on the one side, and the arrival of reinforcements for Ivanov's VIII., XI. and IX. Armies, on the other, led to the battle spreading along the whole front from the Pripet to the Pruth. In sum, the Austrians, after advancing from Kovel to the rivers Goryn and Putilowka N.W. of Rovno, and from the Zlota Lipa to the Galician Sereth, were checked and driven back by a counter-attack group formed by Brusilov's VIII. Army in the region of Rajalowka. The rest of the Russian front taking up the movement, the Austrians were driven back from the Sereth to the Strypa, and from the Horyn-Stubiel line to the upper Styr and Stokhod, while the centre held practically all its gains. From the fourth week of September the battle, after some further fluctuations on the left, became a stabilized trench-warfare conflict which dragged on till mid-November, when both sides settled down in their winter lines. These ran from the Pripet along the Styr and the Kormin and thence past Dubno to Zhorow and so along the Strypa. From the Strypa mouth to the Sereth mouth, the Austrians retained positions north of the Dniester, and from that point Pflanzer-Baltin's front substantially followed the frontier to Rumanian territory E. of Czernowitz. Thenceforward up to the opening of the great Russian offensive in 1916 the only important operations which took place in East Galicia were the relief offensive known as the “New Year battle” (see STRYPA-CZERNOWITZ) initiated by the Russians in the hope, which was not realized, of calling off Austrian troops from Montenegro, and the Russian capture of the Dniester bridgehead of Uzcieszko on March 10—a diverting attack in aid of the spring offensive of the north.

(C. F. A.)

IV. RUSSIAN FRONT, 1916-17

Operations in Russia and East Galicia, 1916 and 1917.—About the end of 1915 and the beginning of 1916 the rival belligerents in the World War were confronted with the necessity of making vital decisions. For the Central Powers and their allies the past months had been rich in results. In the Balkan Peninsula Bulgaria's entry into the alliance, and the conquest of Serbia and Macedonia, had opened the way to Constantinople and Asia Minor. The Allied army in the East had tried in vain at Salonika to bring about a change in the state of affairs. The Entente troops had been withdrawn from Gallipoli. Even the bloody battle in East Galicia and on the Bessarabian frontier at the New Year had had no effect upon the general situation. Against Italy, and in the French theatre of war, the armies of the Central Powers had successfully maintained their position.

The chief of the Austro-Hungarian General Staff, Gen. Conrad von Hötzendorff, proposed to clear up the situation in the Balkans as far as possible. Rumania must be forced to give up her ambiguous attitude by an ultimatum, supported by the presence in South Hungary of a powerful force of troops. Montenegro and at least the north and centre of Albania must be occupied by the Central Powers. These measures having been taken, an offensive, prepared in the meantime, on Salonika would end the campaign in the Balkans. But the chief of the German General Staff, Gen. von Falkenhayn, had since late autumn, 1915, remained with his plans in the West in the French theatre of war. He pronounced against an offensive at Salonika on several grounds, and his view of the political, military and technical difficulties of such an undertaking could not be waived aside. The German Gen. von Seeckt also upheld Falkenhayn in this, on the strength of a conference with the Bulgarian Army Command. While the plan of an attack on Salonika was rejected in this manner, pressure on Rumania was now likewise deemed unnecessary, since the military successes of the Central Powers had meanwhile caused a more conciliatory attitude at Bucharest.

As regards the Austro-Hungarian Army Command's plans for dealing with Montenegro and Albania, Falkenhayn tried to postpone these indefinitely. But Conrad clung to his point and carried out his intentions, more or less against the will of his German colleagues, whereupon a most acute personal quarrel broke out between the two generals, lasting nearly a month.

This quarrel, in the course of which Gen. Conrad had the satisfaction of seeing his troops take the Lovchen (Lovćen) and subdue Montenegro, obviously laid no promising foundation for their common decisions in the future.

The idea of bringing about a decision in the war by a campaign against Kiev or Odessa in the spring of 1916 seems to have engaged political rather than military circles in Vienna and Berlin. In the latter the Russian operations in 1915 only strengthened the old conviction that the Russian armies—thanks to the illimitable area of operations and the skill of the Russian leaders in retreat—would always slip their heads out of the noose again, and that any further advance of the Central Powers towards the east could only result in an inconvenient extension of the front. The war, according to the view of both the General Staffs, could only be won against the western opponents. Conrad proposed a combined offensive against Italy. An annihilating blow delivered against this enemy would have been not only in accord with his personal feelings and those of his armies, but was worthy of consideration on many other important grounds. The tension on the Italian front was increased for the Austro-Hungarians by every new defensive battle; the Italian menace to Trieste became more intolerable week by week. On the other hand, Italy was easier to overthrow than France—or England, for that matter; and, as often before in history, the fate of the Rhine might be decided in the plain of the Po. Falkenhayn did not refute these arguments; but he was doubtful whether, in the first place, it would be possible to force Italy to break with the Entente, in view of her dependence on England, and, in the second, whether even if, contrary to expectations, Italy's overthrow should be brought about, the Western Powers would take the loss of this Ally so

very much to heart. Falkenhayn was convinced that the decisive campaign could be fought only in the French theatre of war. Conrad held to the other solution, but declared himself willing to place a few particularly good fighting corps at the disposal of the German Higher Command for use in France. This offer was declined by Falkenhayn both on military grounds and as a matter of prestige. He proposed as an alternative that his allies should take over, in addition to the 400 km. of front which they were defending between the Bessarabian Pruth and the Pripet (Prypeć) against the Russians, a further portion of the Lithuanian front stretching towards the north. In this way it would become possible to set free more German troops for the attack on Verdun. But Gen. Conrad could not bring himself to accept this purely passive rôle, and the result of this difference of opinion was that the two empires of central Europe divided their forces, the one proceeding to the attack in France, the other to the Venetian mountains.

The Eastern Front in March 1916.—For the execution of these attacks, forces that had been set free in the Balkans were brought up and others from the Russian theatre. The German eastern troops were, between Oct. 1915 and Feb. 1916, reduced from 56 to 45 or 47 inf. divs., not to mention the exchange of other fighting troops for less serviceable units. Heavy artillery and technical supplies were also withdrawn and sent to France, but these could be adequately replaced, thanks to the mechanical power of German industry.

The Austro-Hungarian eastern front in March 1916 was so organized as to have 6 divs. less than at the close of the fruitless October campaign in 1915. To balance this, however, a series of regts. and batts. were brought up from other divs., so that the Austro-Hungarian eastern armies gave up, in all, 120 batts. for the attack on Italy. The drafts for the infantry in this fighting force were supplied mostly from home at regular intervals, the drafting reserve being overfilled owing to the slight losses entailed by the war of positions. Out of this superfluity of men the regts. formed 5th and 6th Batt's. Thus there could be no question of numerical weakening on the Austro-Hungarian eastern front. Far more heavily weighed the fact that the best and most reliable troops had been picked for the Italian attack, including nearly all the German-Austrians and a great proportion of the Magyars. The eastern armies were seriously weakened thereby on the moral side; and the militia-like character, which the Austro-Hungarian army had begun to take on in the Carpathian battles in the spring of 1915, now became particularly apparent in the east. Still more severely felt was the withdrawal of the whole of the heaviest artillery, and a considerable portion of the medium-heavy, to the Italian theatre, and the considerably smaller share of technical supplies which had been assigned to the eastern front when these were divided.

In the beginning of March there were about 40 Austro-Hungarian and 46 German divs. on the Russian front. Of these, 43 German and 2 Austro-Hungarian held the front (Pinsk) between Riga and the Pripet and were under the German Higher Command; the other half of the fighting forces, in the south portion of the front, was under the orders of the Austro-Hungarian Army Higher Command (Teschén). Each section had a breadth of 400 km. The Austro-Hungarian divs. were on an average 14 batts. strong, the Germans only nine. The inferior rifle-shooting of the Germans was abundantly compensated by their superior equipment in artillery and fighting material of all sorts. The entire rifle strength of the forces of the Central Powers on this front amounted at this time to rather more than a million. It would be safe to estimate the Russian front at double that strength. The Russian Higher Command, controlled since autumn 1915 nominally by the Tsar but actually by his chief-of-staff, Gen. Alexeiev, could draw on its drafting reserve to the fullest extent. In the spring of 1916 the regiments, in spite of the gigantic losses suffered in the last campaign, had been replenished for some time. Immediately behind the army front were enormous masses of reserves, and all the recruiting depots were full. Half of the world's munition factories were straining to supply equipment for the Tsar's armies. A number of En-

tente officers were instructing Russians in the western methods of attack. Along with all this the greatest efforts were made to raise the soldiers' moral.

By March 1916 about 130 inf. divs. and 40 cav. divs. stood on the Russian front, the inf. divs. consisting of 16 batts.—almost double the number of the German. This did not include the draft formations standing in readiness immediately behind the fighting reserve. The rifle strength of the front might safely be estimated at 2½ millions. Her allies might well hope that Russia, in spite of her defeat in 1915, would come up to expectations in the general offensive planned for the summer.

Battle of Lake Narocz (Naroch), March 18-29 1916.—The German attack on Verdun in Feb. 1916 brought the Russians into action earlier than was expected. Like Italy, who was now making her fifth attack on the Isonzo, the empire of the Tsar was expected to lose no time in doing its utmost for the relief of France. Russia had already transferred her centre of gravity to the area N. of the Pripiet before this demand reached the Higher Command. On this section, that is, opposite the German front, were 80 out of 130 Russian divisions. Since the beginning of March Hindenburg's general staff (Kovno) had located a concentration of Russian troops at Smorgon, Dvinsk (Dünaburg) and Jakobstadt. On the other hand, the attack of the II. Russian Army under Gen. Smirnov on both sides of the Narocz lake on March 18 took the Germans somewhat by surprise. After a preliminary bombardment, such as had not yet been seen on the eastern front, this army flung itself upon the German XXI. Army Corps commanded by Gen. von Hutier. It was assumed from orders of the supreme commander of the Russian west front (Gen. Ewerth), which were captured by the Germans, that the Russians meant more by this attack than a mere relief offensive. While Gen. Litvinov's I. and Gen. Plehve's V. Armies were holding the weak German forces occupying the trenches at Widsy, Dvinsk, and Jakobstadt, Smirnov was to force a way through in the direction of Vilna-Kovno and then to wheel northwards and so drive the German wing to the sea.

The "Narocz Offensive" led at first to considerable successes for the Russians. The attack delivered between the Narocz and Wiszniew lakes by Gen. Balujjev with 4 army corps pressed the weak German forces backwards some miles between March 18 and 21. Though the groups attacking farther to the N. were not so fortunate, the Russians might yet hope for success. Then, to the rescue of the Germans, came a sudden thaw. This, indeed, increased the difficulty of bringing up the reserves which they had scraped together so painfully, but incomparably worse was the plight of the attackers in this melting of snow and ice. Their second and culminating attack on March 26, according to the German reports, was choked literally "in mud and blood." Towards the end of March the Russian spring offensive of 1916 died away, without ever getting beyond the local success on Lake Narocz. Their losses were estimated by the Germans at 150,000 men, while the Germans sacrificed not more than 15,000.

On April 28 1916 the troops of the German X. Army under Gen. von Eichhorn snatched from the Russians the greater part of that tract of country which they had captured during the March battles in the confined area of Lake Narocz.

The Luck (Lutsk) Campaign, Summer of 1916.—At the conference held on March 18 1916 the Allies had fixed July 1 for the opening of the great general offensive on all fronts. For this the Russian Supreme Command was now making ready. By the end of May all their preparations pointed to the probability of their decisive attack again being made N. of the Pripiet marshes, and again on the German front. Of the 130 Russian divs., comprising over 2½ million rifles, as to which the Austro-Hungarian and the German intelligence service had accurate reports, 74 to 77—or less than two-thirds—were in the northern section. On the side of the Central Powers there were at the same time on the eastern front 83½ inf. divs. and about 20 cav. divs., each cav. div. counting almost as many rifles as one regt. of inf., and often fewer. Altogether these amounted to 600,000 fighting men for the Germans and the same number for the

Austro-Hungarians. The distribution of forces was the same as in the beginning of March.

In the middle of May the Austro-Hungarian offensive against Italy had started, meeting at the beginning with great success. Once more the Russians were faced with the necessity of relieving their hard-pressed allies, and at least preventing any further transference of Austro-Hungarian fighting forces to the Italian front. Now the preparations for the Russian attack were not yet complete. Also it was evident that active relief to the Italians could only ensue from an attack, not on the German, but on the Austro-Hungarian eastern front—that is, between Pinsk and the Bessarabian Pruth. The Russian Supreme Command were not easily induced to depart from their original plans or to attack prematurely before July 1. In the end, however, they had to yield to the pressure of the Allies. Gen. Brusilov, supreme commander of the Russian "south-west front," with the Quartermaster-General, Gen. Dietrich, as the real source of energy at his side, received the order to advance to the attack from Rovno town to Bessarabia. The very first assault, made with attack groups that had been got together at haphazard, brought Brusilov great and unexpected success on both wings in the battles of Luck and Ocna, although the defenders were not unfavourably situated as regards numbers. Thereupon the Russian Supreme Command decided to refrain from the great attack on the German front altogether and transfer the centre of gravity of their operations to the southern section. The advances on the Russian side during the next three months, at Riga, Jakobstadt, Dvinsk, Smorgon and Lake Narocz, were therefore undertaken only at odd moments, without any successes worth mentioning, and must be treated simply as demonstrations. But meanwhile Brusilov had snatched from the Central Powers large portions of Volhynia and East Galicia and the Bukovina.

Battles of Baranovichi (Baranowicz).—On the other hand, the objective of the Russian Supreme Command in the three battles at Baranovichi had a close connection with the operations at Luck. In the first battle, on June 13 and 14 1916, the attacks led by Gens. Rgosa and Lesch failed completely. Gen. Woyrsch maintained the upper hand over the Russian grenadiers with his Silesian Landwehr. The Germans lost 150 men, the Russians 7,000. In the second battle, on July 2-14, the Russians put in 16 of their divs. against the 2½ German and 2 Austro-Hungarian divs. holding the section Gorodishche (Horodyszczce)—Baranovichi. The Russian main blow fell on the Austro-Hungarian XI. Corps under Gen. von Henriquez, and forced it back to the second position. German battalions were hastily scraped together to reinforce their hard-pressed allies. There were critical hours and critical days. But on the last two days of the battle the greater part of the ground captured by the Russians was torn from them again. East of Baranovichi Gen. Ragosa's troops were fated to achieve only unimportant local successes. The defenders lost—in dead, wounded and missing—180 officers and 8,000 men; the attacking Russians many times this number.

For the third time the battle of Baranovichi blazed forth on July 25 1916, this time as an introduction to the great Russian general attack N.W. of Luck. Once more the Russians flung themselves against the Gorodishche section, but were driven back by the Germans after a fierce three days' fight.

Operations in the Summer of 1916.—The Russian offensive in the beginning of June 1916 brought the attention of the Central Powers with a jerk to the eastern front, where all at once the situation had become extraordinarily tense, and the anxiety became all the greater with the reflection that the results in the other theatres of war had not come up to their expectations. The Verdun undertaking had cost the Germans heavy sacrifices without making them masters of the fortress, and it was but a small consolation to know that the French had bled even more than they. On the Somme an English-French attacking force of prodigious size and fighting strength was massing itself. In the Venetian mountains at Asiago, the Austro-Hungarian corps, though it was still attacking, had lost much of its momentum since May 25. A pause in the fighting at the end of that month

had given the Italians an opportunity of flinging powerful masses of troops on to the hard-pressed mountain front, thus averting catastrophe for the time being.

The turn of events in the east called for new decisions, and a few days after Luck the two chiefs of the General Staffs of the Central Powers met in Berlin to form these decisions. The idea of leaving the eastern front—in Falkenhayn's words—"to look after itself" was, it may be assumed, only theoretically discussed. Neither did such resolutions come under consideration, either then or later, as those executed in 1912 by the Central Powers when they shook off the enemy by one mighty move backwards and thus again deprived him of the initiative. The scarcity of food alone, under which the peoples of the Central Powers were already beginning to suffer heavily, made it imperative to cling to every foot of fruitful soil in Volhynia or East Galicia at all costs. On the other hand, the situation was so grave on all other fronts that for the moment any assistance proposed for the eastern front must be of a modest order. The commanders of the armies fighting against Russia indeed attempted, even within their own areas, to keep their forces together for use as units rather than to use them to fill up gaps. Gen. von Linsingen, for example, made frequent efforts in the area of his own group of armies at Luck to concentrate strong forces for counter-attack. But the strength of these attack-groups, in most cases, very soon exhausted itself against the numerical superiority of the enemy. Similar attempts were made several times in East Galicia and also in the Carpathians. Mention should be made in this connexion of a plan formed in the beginning of July 1916 to form a XII. Army out of the German and Austro-Hungarian troops in East Galicia and to attack with it on both sides of the Dniester. This idea certainly promised success; but the divs. selected for the purpose were, in view of the new increase of the Russian attacks, in most cases diverted to some particular danger-spot on the wide-spreading defence front; and the construction of the XII. Army, together with the task to be entrusted to it, had to be given up. There was nothing for it but to persist in the method practised since the middle of June, and contest every inch of ground in dogged local defence-battles. And even this mode of warfare was conditional on a considerable expenditure of force. Between the beginning of June and the end of Aug. about 17 German divs. had to be brought over from France and 8 to 9 Austro-Hungarian divs. from Italy. In addition, the front to the N. of the Pripiet transferred a large portion of its regts. and divs. to the southern section, receiving in exchange only worn-out troops.

Since the beginning of July 1916 the Russians had also withdrawn strong forces from Kuropatkin's and Ewerth's fronts to add them to Brusilov's. Finally, at the beginning of Sept. the area S. of the Pripiet, with 71 divs. had 20 divs. more than the northern section. The attacks during the summer offensive of 1916 cost the Russians enormous bloodshed. Great as were the results, the sacrifices far outweighed them. The Russian Supreme Command remained true to the methods practised in the Carpathians. It is quite impossible to point to any great conception underlying the operations of the Russian Command in these battles. They worked on purely local considerations and prospects, and often did not even make use of these, as for instance immediately after the first great blows delivered at Luck, when they gave their opponents time to close a gap of 50 km. which had been made. More than once did the Russian Supreme Command let slip an opportunity of a mortal blow.

Creation of the "Hindenburg Front."—The great crisis on the eastern front, lasting several months, reacted strongly on the relations between the armies of the Central Powers. The Austro-Hungarian troops had, from the very first Russian attacks, shown considerably less power of resistance than the German. The Austro-Hungarian armies fighting at Luck and Ocna had, within a few days, left a quarter of a million prisoners in the enemy's hands. Even in peace-time the conditions in the polyglot Dual Monarchy were less favourable by far than those in the German Empire for a display of military power, and the unexpectedly long duration of the war increased the

difficulties enormously. It should also be remembered that in the first year of the war the Austro-Hungarian military forces had had a considerably larger drain on their men than the German. At the end of 1915 only a small remnant of the forces deployed at the beginning of the war was left at the front. The rest were dead, wounded or prisoners. In the quiet period before the Russian summer offensive of 1916 the training of the drafting reserve was certainly better organized than in the first year, when recruits had on occasion to be sent to the front after a month's training. But between the young, systematically trained peace-time forces, full of heroic self-sacrifice, with which the war started, and the Landsturm troops of the later campaigning years, some of them physically and morally unsound to begin with and many of them far too old, there could be no comparison. This was particularly the case with a considerable proportion of the Slav and Rumanian forces, on whom the great national crisis could not act as a spur but rather as the reverse, as was not infrequently proved. Under these difficult conditions the lack of good regular officers was most keenly felt. The flower of these had been left on the battle-fields of 1914.

In consequence of the internal weakening of the Austro-Hungarian army in the east—which was not noticeable in anything approaching the same degree where the army was opposed to its "hereditary enemy," Italy—a rule was made that on every point of the battle-front where the Russians were using great pressure German units should be flung in. In this way, from the beginning of July, the whole Austro-Hungarian section was interspersed with German troops. This system of "stay-boning," as it was sarcastically called, naturally brought with it a powerful increase of German influence in the combined army. It also happened that the Austrian leading provoked frequent criticism on the part of the German commanders. Immediately after the first Russian assault at Luck, for instance, the commander of the IV. Army, Archduke Joseph Ferdinand, was relieved of his command on the explicit demand of the German General Staff. Added to this, between the new commander and his Austrian subordinate commanders intermediate posts were interposed and filled by German generals, who alone exercised direct power of command over the troops. As the number of German forces on the Austro-Hungarian front increased, the ambition of the Germans to get the principal commands into their own hands became more and more evident. Immediately after the beginning of the Russian offensive, the area commanded by the German Gen. Linsingen, which began on the Pripiet, was extended to the boundary of Galicia. At the same time Falkenhayn proposed to entrust Field-Marshal Mackensen, who was in Bulgaria, with the supreme command of all the allied troops fighting S. of the Pripiet. Conrad von Hötendorf was opposed to this arrangement, but offered to confer on Mackensen the command of a group of armies in East Galicia. This Falkenhayn declined.

In July Falkenhayn made the proposal to recall Field-Marshal von Hindenburg from Kovno and appoint him supreme commander between the Pripiet and the Dniester. To this plan Conrad agreed, though without seeing any particular meaning in it. As a matter of fact Falkenhayn's proposal was made more on personal than on practical grounds. The chief of the German General Staff had from the start few friends but many enemies. Since the failure of the attack on Verdun, Emperor William had begun to be besieged with complaints against the man who had his particular confidence. The Imperial Chancellor also urged that Falkenhayn should be replaced by Hindenburg, with a vigour quite unusual with him. The summer battle made the situation more acute. A depression fell over Germany, the army lost faith in the Supreme Command, and louder and louder became the clamour for Hindenburg.

Falkenhayn, though realizing that his relations with Hindenburg and Ludendorff had been somewhat strained for more than a year past, felt obliged to fall in with the general opinion. He therefore proposed—assuredly more or less against his inward conviction—that Hindenburg should receive the appointment alluded to, that of supreme commander from the Pripiet to the

Dniester. This he followed up a few days later, under pressure from all sides, by offering to place the Field-Marshal in command of the whole eastern front from the Baltic Sea to the Carpathians. For some such unity of command there was urgent need on military grounds. Indeed the proposal had received a passing consideration in Nov. 1914, when the Archduke Frederick was to have held the command with Ludendorff as his chief-of-staff. But Conrad was opposed to this solution, arguing that the Russian assaults were not to be stopped by new commanders but by strong battalions, that the non-German peoples and troops of the Austro-Hungarian Monarchy would regard any too conspicuous manifestation of German influence as a burdensome tutelage, and finally that in the southern section of the eastern front so many specifically Austrian interests were at stake—in particular with respect to the danger from Rumania—that this section ought not to be withdrawn from the immediate influence of the Austro-Hungarian Higher Command. But, however worthy of consideration Conrad's objections may have been, it is only human to suppose that personal grievances also played their part. The solution proposed by Falkenhayn was tantamount to making a clean sweep of the Austrian General Staff from the command of the war in the east. Yet, the leader of the Austro-Hungarian army was practically alone in his opinion. Even in those Viennese circles most jealously concerned to uphold Austrian prestige there was a pressing demand to have the question of the command straightened out on German lines, since Conrad's leadership no longer inspired full confidence. In principle the old Emperor, Francis Joseph, agreed also. Emperor William, for his part, proposed a compromise to his allies. Hindenburg was certainly to have supreme command from the Baltic Sea to Lemberg, by far the greater portion of the eastern front, but the southern portion on both sides of the Dniester and in the Carpathians was to be placed under the command of the Austrian heir-apparent, Archduke Charles Francis Joseph, who later became emperor. The Archduke had been fetched from the Italian front to take over the command of the XII. Army, and now, since this army had not come into being, was temporarily commanding a group of armies on both sides of the Dniester. To protect German interests the German Gen. von Seeckt, formerly Mackensen's chief-of-staff, would be attached to the Archduke. This solution was accepted by the Austrians and acted upon in the beginning of Aug. 1916. It was the prelude to the establishment of a Supreme War Command (*Oberste Kriegsführung*) over all fronts.

The impulse to create a general supreme command of this nature, to apply to all fronts, emanated from Sofia and Constantinople. Germany was agreeable to the proposal, which also gained ground rapidly in Vienna's political circles, but here again it was Conrad who, in defiance of his superior commander, Archduke Frederick, sharply opposed the idea, even threatening to resign. Emperor Francis Joseph's personal intervention alone was able to overcome this opposition. On Sept. 16 1916 the agreement on the *Oberste Kriegsführung* was signed in the German headquarters at Pless in Prussian Silesia. According to these arrangements, shortly after acknowledged as binding by the Bulgarian and the Imperial Ottoman Army Commands, the German Kaiser became responsible for the higher leading of operations in general without disturbing the relations between the allied sovereigns and their fighting forces. The Kaiser was assisted by the chief of the General Staff of the German armies in the field, who before every important decision was to consult the chiefs of the allied General Staffs and, as far as possible, bring them to an agreement. This done, the German chief of the General Staff would issue orders, binding on all, in the name of the *Oberste Kriegsführung*. In order to meet Conrad's particular misgiving the German Kaiser bound himself, in a special supplementary note which was kept secret from Sofia and Constantinople, that the integrity of Austria-Hungary should be as carefully protected as that of Germany.

The institution of the *Oberste Kriegsführung* was undoubtedly an advance on the method of dealing with each case as it arose, which had been practised since the beginning of the war. But

the undertaking, set on foot with such difficulty, still lacked one thing to complete it—the creation of a common political and domestic policy. This was never achieved. On the contrary, the forces involved in these matters fell farther and farther apart the longer the war lasted, particularly after the change of Government in Austria-Hungary. To make matters worse, when the young Emperor Charles took over the Austro-Hungarian command, alterations were made in the most important parts of the agreement in consideration of his position as sovereign, so that in the end the old methods employed in the first two years of the war came back into use.

The New German Supreme War Command (Oberste Kriegsführung).—The agreement on the Supreme War Command had been signed on the part of the Germans by Field-Marshal von Hindenburg as new chief of the General Staff. On Aug. 29 1916 Falkenhayn had left the Supreme Command. It had long been only a question of when the Kaiser would be forced to yield to the storm raised by Falkenhayn's critics; the immediate cause of his dismissal was Rumania's declaration of war on Austria-Hungary on Aug. 27 1916. Up to the last hour, in spite of the well-founded warnings of Austria-Hungary, Falkenhayn had been unable to believe that Rumania was on the point of coming in, and had perpetually reassured the Kaiser to that effect. When the event happened the Kaiser was thunderstruck, and Falkenhayn's fall followed. The German nation and its allies greeted the new men, Hindenburg and Ludendorff, with the utmost confidence.

The first task to fall upon the new command was the organization of the Rumanian campaign (see next section). Meanwhile the defensive battle against Russia had to be carried on. This constantly flamed up again along the whole front from Luck to the Carpathians till the end of Oct., although the Russian attacks had fallen off in strength and determination, and no more successes worth mentioning were gained by them. The relief offensive, too, which the Russians undertook between Nov. 28 and Dec. 13 1916 in the Wooded Carpathians against Kövess' and Arz's armies, to relieve Rumania, hard pressed in Wallachia, was without results and could save neither Bucharest nor Focshani. Neither did success attend the Russian surprise attack on Jan. 23 1917 on the Aa at Riga, great as were the prospects of success on the first day. The German position was indeed rushed, but the defenders' reserves, brought up in haste, restored the situation.

The enormous drain on Russia's forces in the summer, and the difficulties of her interior political situation, had sapped the marrow of her army. The armies of the Central Powers and their allies had come through their difficult crisis. As in the end of 1915 and the beginning of 1916, so now they experienced a great relief in the east.

The Russian Revolution.—The Austro-Hungarian chief of the General Staff, Conrad, who since Nov. 11 1916 had been a field-marshal, was once more proposing to take the opportunity of attacking Italy. The attack was to begin in the spring of 1917 and was to be carried out by an equal division of Austro-Hungarian and German forces. But the new German *Oberste Kriegsführung* in the middle of Jan. rejected the plan for the time being. They relied on the ruthless submarine war, begun in Feb. 1917, to bring their enemy to his knees. Gen. von Arz, who had succeeded Conrad as chief of the Austro-Hungarian General Staff in March 1917, received the decision of German Headquarters with unqualified approval. The Russian Revolution, which broke out in the middle of March, was extraordinarily favourable to the military situation of the Central Powers. It could not, of course, be seen as yet whether Russia's armies would permanently withdraw from the list of enemies, which now included America. But for the moment the crash was so enormous that it must be months before the Russian High Command could consider offensive operations. The Central Powers now left nothing untried that could hasten the process of disorganization among their enemies. This purpose was above all to be served by an extensive peace propaganda, which was to be carried to the Russian trenches—though Ludendorff's consent

to this step had not been easy to obtain. Meanwhile the war fell practically fast asleep, as was natural. On April 4 1917 the troops under Prince Leopold of Bavaria, who had taken over the eastern front between Riga and the Carpathians from Hindenburg in the autumn of the previous year, captured the small Russian bridgehead, Stochod, at Tobol in Polyessie, by a *coup de main*, on which occasion the Russians gave themselves up as prisoners in swarms. On the political circles of the Imperial Powers this action produced a most disturbing impression, and the troops were now ordered to suspend all hostilities against the Russians unless they should provoke them.

In preparing the line to be taken with regard to propaganda in the trenches, the Austro-Hungarian Government would have liked to make use of the Petrograd catch-words, "Peace without annexation or indemnity" and "the right of nations to self-determination." But the dominating influence of the German Supreme War Command, which was not prepared to give up its Balkan aspirations in a hurry, prevented this. Nevertheless it was hoped, especially when the Workmen's and Soldiers' Councils became a stronger political factor in Petrograd in the beginning of May, that a way might be found to force Kerensky's Government to agree to an armistice and consent to open peace negotiations. This hope was to prove deceptive. When at last an envoy from Prince Leopold of Bavaria succeeded in penetrating beyond the Russian trenches to Gen. Dragomirov, commander of one of the armies on the north front, he was met with an absolutely unequivocal refusal. Meanwhile, at numerous points of the front, a local truce had been declared. But in June a remarkable change was noticeable on the Russian side. Kerensky, relying on Gen. Brussilov and numerous Entente military missions, succeeded gradually in converting a considerable portion of the army to the idea of carrying on with the war to make the world "safe for democracy," and in restoring their fighting spirit.

Battles in Galicia and the Bukovina, Summer of 1917.—By the end of July the Army Commands of the Central Empires had reason enough to count upon a revival of the war in the east. Indeed, the Russian Supreme Command, apart from the concentration of troops at Riga, Dvinsk and Kriewo¹ in the Courland-Lithuania section, had assembled two powerful attack groups in East Galicia. The one, a division strong, stood N.E. of Brzezany opposite the Austro-Hungarian II. Army (Böhm-Ermolli); the other, 15 inf. and 2 cav. divs. strong, was piling itself up adjacent to the first and opposite the German Southern Army under Gen. von Bothmer.² These powerful attack-masses were charged to overthrow the enemy and to take Lemberg.

The Army Higher Commands of the Central Powers did not look on idly at the Russian preparations for attack. By June 27 the German Emperor, in concert with the Austro-Hungarian General Staff and Prince Leopold of Bavaria, was ready with the order to counter-attack in case of a Russian attack in East Galicia, and to throw back the enemy beyond the frontier of the Austrian Empire. Besides the allied troops already on the spot, 5 divs. could be brought up from the west and 3 to 4 divs. from that section of the eastern front which was not threatened.

Battle of Brzezany, July 1-6.—The anticipated Russian attack was launched on July 1 1917 on both sides of Brzezany. The Western Powers had supplied their Russian allies with artillery, munitions and war supplies of all sorts in abundance. The battle of Brzezany lasted six days with only slight interruption. The Russians made only slight gains in fighting the German Southern Army E. and S. of Brzezany, and these were for the most part wrested from them again. N.E. of Brzezany, in the village of Koniuchy, they were more successful. Here they had brought into the fight a Czechoslovak brigade against Austrian battalions of Slavonic speech, large sections of which surrendered, with the result that the Austro-Hungarian line was driven back

¹ At Kriewo the Russians actually attacked with 10 inf. divs. on July 21 and 22, forcing back the German front 2 km. deep along 4 km. of front.

² The designations "Austro-Hungarian II. Army," "German Southern Army," etc., refer only to command and staff. The troops were thoroughly mixed on the whole of the eastern front.

some 4 or 5 km. on a front of 10 km. On the evening of the second day of the battle, however, the Russian blow was countered by the German troops. Since, to the immediate N. of the battle-field and N.W. of Zborów, the first echelons of the German divs. rolling up for the counter-attack had arrived, and the Russian attack had so lost its force, Prince Leopold of Bavaria now supposed the danger to be averted.

Far more unpleasant was the effect upon the command of the heavy set-back to the Austro-Hungarian III. Army under Gen. von Tersztianszky at Stanislaw only a few days later. Here Gen. Kornilov, the ambitious commander of the Russian VIII. Army, had advanced to the attack at 7 A.M. with an attack-group thrown together anyhow. On the following day he already held in his hand the key to the enemy's position—the Jutrena Gora height dominating Stanislaw. Tersztianszky hoped at first to have to withdraw the north wing only, but the Russians pushed the Austro-Hungarian regiments back so vigorously that by July 11 the whole of the III. Army had to be withdrawn behind the Lomnica. The town of Stryj, and the East Galician petroleum district, Drohobycz-Boryslaw, on the possession of which the continuance of the submarine war very largely depended, were in the utmost danger, and Prince Leopold of Bavaria was forced to let 3 inf. and 1 cav. divs. of the units rolling up for the counter-blow be diverted to the III. Army.

When the Russians again attacked at Kalisz and made progress there, Prince Leopold and his chief of the General Staff, Col. Hoffmann, were confronted with the difficulty of deciding whether in the given case the counter-blow at Zborów, already being prepared, should be given up, and help sent in haste to the sore-pressed Gen. von Tersztianszky. The Prince resolved to adhere to the original plan. He proved to be right. The attacks of Kornilov's troops lost their sting as rapidly as those delivered at Brzezany by the Russian VII. Army. Aided by German reinforcements, Gen. Kritek, who relieved Tersztianszky in the command of the III. Army, was able by the 16th to prove his troops' newly established powers of resistance in counter-attacks at Kalisz.

Meanwhile, between the upper Sereth and the railway line between Lemberg and Tarnopol, immediately W. of Zborów, 8 inf. divs. (including the I. and II. Guard Divs.) and one combined cavalry div. were deployed for the counter-blow along 25 km. of front behind the divisions of position. The German Gen. von Eben was in command on the battle-field. The intention was on the first day to make a hole in an easterly direction in the south wing of the Russian VIII. Army which stood opposite, and then to wheel to the S.E. and grip the massed Russians of the VII. Army standing on either side of Brzezany, in the N. flank and in rear.

The Battle of Zborów.—This idea underlying the battle of Zborów (July 19-26 1917) was carried out according to plan. Early on the 19th the German and Austro-Hungarian forces drove the Russians from the Zlota Gora height, N. of Zborów, under the eyes of Prince Leopold of Bavaria. Simultaneously the German Guard, reinforced by a line division, broke through the Russian front immediately S. of the Sereth. Only in places did the Russians offer resistance. Their retreat frequently degenerated into precipitate flight. While the Guard Div. in the following days drove down on Tarnopol, the divs. brought forward from the 2nd line pressed after in a S.E. direction. The Russian masses at Brzezany were soon swept into the general retreat. By the 22nd the German Southern Army was able to take up the pursuit, also from the N. wing. On the 23rd the III. Army followed S. of the Dniester, and was able on the next day, after several fights, to push out to beyond its old positions at Stanislaw. On the 25th the German Guard took Tarnopol in presence of the German Emperor, and on the 26th the heights to the E. of it, thus assuring an adequate protection to the S.E. blow by the other allied forces. The S. wing of the II. Army was already beyond Trembowla, and the Southern Army beyond Buczac. They had rapidly broken the Russian resistance.

A few days after the defeat of Zborów the Russian command passed out of Brussilov's hands into those of Kornilov. The

Russian General Staff reports of those days give a tragic picture of the condition of the VII. Army and the S. wing of the VIII. Army at that time. It was clearly out of the question to maintain a hold on East Galician soil in this area. The decision was therefore made at Mohilev to withdraw the VII. Army and those parts of the VIII. Army pursued by the enemy behind the river Zbrucz on the frontier.

Capture of Czernowitz by the Austrians.—More cheering were the reports received by the Russian Supreme Command from the VIII. Army now commanded by Cheremissov, which was retiring S. of the Dniester. This army could, with some hope of success, be charged to hold Czernowitz and as much as possible of the Bukovina. Further relief was expected from the results of the Russian-Rumanian attack in the valley of the upper Susita in Rumania, which had commenced on July 23 and was accompanied by demonstrations along the whole Transylvanian east front. This attack had really succeeded by July 27 in forcing back the numerically very weak defenders to a not inconsiderable distance. But the fate of the Bukovina was nevertheless sealed. Between the Dniester and the Carpathians Cheremissov's troops several times put up a good resistance; in fact, the Austro-Hungarian III. and VII. Armies (the latter under Gen. von Kövess) had even to deliver counter-blows. But on the morning of Aug. 3 1917 the Russians, threatened on the N. and the S., had to surrender Czernowitz, and soon to retire from the Bukovina into the frontier area. The Austro-Hungarian III. Army pursued between the Pruth and the Dniester and the VII. S. of the Bukovina.

East Galicia had also been swept clean of the Russians, apart from the area N.E. of Tarnopol which had remained untouched by the offensive. Advanced detachments of the German Southern Army had set foot on Russian soil on the middle and lower Zbrucz. But here the soldierly characteristics of the Russian people, which had survived even the unnerving influence of the revolution, came to the fore again. The Russians not only cleared the E. bank of the Zbrucz, but roused themselves in an amazing manner to renewed resistance E. of Czernowitz and in the southern part of the Bukovina. It was undoubtedly to their advantage that the enemy in his rapid advance had come dangerously far away from his railways. The Austro-Hungarian III. Army at Czernowitz for instance was 120 km. removed from its main detrainning station lying W. of Stanislaw. This was particularly serious in view of the meagre means of transport supplied to the Austro-Hungarian troops. Had the armies been crossing a less fertile area the pace of the offensive must soon have slowed down very considerably. As it was the troops could subsist largely on the resources of the country and the rich booty left behind by the Russians. But now, on the frontiers of East Galicia and the Bukovina, the advance of the Imperial forces was arrested.

The Battle of Marasesti (Marashesti).—For some weeks past the Allied Higher Commands had been considering the idea of combining with the East Galicia offensive an attack on the Rumanians in Moldavia, which should drive them behind the Pruth, thus gaining a particularly useful defence section in which troops could be economized. Accordingly, on Aug. 6 1917 Mackensen advanced to the offensive against the Rumanians N. of Focshani. The battle of Marasesti ended unfortunately for the forces of the Central Powers. In view of this, and of the difficulty of obtaining fresh drafts in the Bukovina, the Central Powers abandoned the idea of occupying Moldavia for the present, and dropped it completely when, at the end of Aug. and the beginning of Sept. the Isonzo battle led to the combined Oct. offensive against Italy. Ludendorff lays stress, in his memoirs, on his own reluctance to give up the Rumanian campaign.

In the Bukovina and on the Transylvanian-Rumanian front minor operations lasted until the middle of September. Local attacks and counter-assaults were distributed on both sides. Then gradually the fighting died down.

German Capture of Riga.—Meanwhile, in the extreme N., the Germans had won a fresh victory over the Russians. During the second half of Aug. they had been quietly preparing to cap-

ture Riga. By order of Gen. von Hutier, supreme commander of the German VIII. Army, 6 divs. were placed in readiness for crossing the Dvina opposite Üxküll, to the S.E. of Riga. Other forces were to follow. Altogether there were 14 divs. available for the undertaking, including the Guard and other units brought from East Galicia.

The crossing at Üxküll was carried out most punctually on Sept. 1 1917. By now 3 bridges had been built. The Russian XII. Army (Parski), 20 inf. divs. strong, made only a slight resistance, and by the 2nd had evacuated all the positions S. of Riga. On the following day the 2nd Guard Div. and the 1st Res. Div. were able to enter the ancient Baltic trading-centre, the one from the east, the other from the west. The Russians now evacuated the whole N. bank of the Dvina up to beyond Friedrichstadt. On the 4th the German infantry reached Hinzenberg railway station, 40 km. N.E. of Riga. The permanent position was now formed along a line drawn from Üxküll to Hinzenberg and thence westwards to the sea. Only the German cavalry now pursued the enemy, who first came to a stand 20 to 40 km. E. and N. of the German line.

The occupation of Riga needed to be supplemented for the Germans by the capture of the Baltic islands, Ösel, Moon and Dagö, and this was duly achieved in the middle of October. For the first time in the war, on the side of the Central Powers, the navy was present in some strength to assist in the operations of the land army. The landing corps consisted of the German 42d Inf. Div. and the Cycle Bde., and was commanded by Gen. von Kathan. The spot selected for the landing was Tagga Bay on the N.W. corner of Ösel Island. While Adml. Erhard Schmid's German squadron penetrated through the Domesnäs straits, after silencing the coast batteries, the torpedo boats went round Ösel in a northerly direction, in order to bring their guns to bear on the mole connecting Ösel with Moon and to cut off the retreat of the Russian troops on Ösel. From the N. they were to press on into the Moonsund. On Oct. 13 the German troops landed in Tagga Bay. The enemy, about one div. strong, tried to effect their escape, some southwards to the Sworbe Peninsula, others over the mole to the island of Moon. By evening on Oct. 16 the whole of Ösel was in possession of Gen. Kathan. Ten thousand Russians were taken prisoners, among them one divisional and three brigade staffs. On the 18th Lt.-Gen. von Estorff, advancing over the mole, occupied the island of Moon, and on the 21st Dagö had also been taken by the Germans. In the waters of Moon it came to fighting engagements between German and Russian ships, in the course of which the Russian battleship "Slava" was set on fire.

The Armistice.—On Nov. 7 the Bolshevik Revolution broke out in Russia. On Nov. 9 the congress of the "Workmen's and Soldiers' Council," meeting at Petrograd, issued its proclamation of peace "to all." In vain did Kerensky and Kornilov attempt to give matters a different turn. An army corps sent by them against Petrograd on Nov. 12 was defeated at Tsarkoye Selo. On the 20th the Council of People's Commissaries gave instructions to the new Russian Supreme Commander, Dukhonin, to offer an armistice to all the belligerents. As Dukhonin hesitated to carry out the order he was replaced by Ensign Krylenko. On Nov. 28 the troops of the Imperial forces on the eastern front intercepted a wireless message in which Lenin and Trotsky invited the earliest possible preliminary arrangements for the armistice and peace negotiations. On Dec. 2 the armistice negotiations between the Imperial forces and Russia were begun at Brest-Litovsk, at Prince Leopold of Bavaria's headquarters. The only questions which caused serious difficulty were that of the Baltic islands, which the Russians wished the Germans to evacuate at least in part, and that of the transference of German troops to the west. On the first point the Germans refused to give way; on the second they compromised. After a formal 10 days' truce had been agreed to on Dec. 5 and the armistice had set in on the Rumanian front on the 10th, the cessation of hostilities for one month on all the Russian fronts against the Central Powers was declared on Dec. 15. On Dec. 22 the peace negotiations of Brest-Litovsk began. (E. G.-H.)

V. RUMANIAN CAMPAIGN, 1916-7

Operations in Transylvania and Rumania, 1916-7.—After the unexpectedly great results of the Russian summer offensive under Brussilov in 1916 the conviction gained ground in Rumania that the moment had now come for her intervention on the side of the Entente Powers. In accordance with the policy pursued since the Balkan Wars of 1912-3 of harvesting from international quarrels the greatest practicable advantage with the least possible sacrifice, Rumania now hoped to be able to realize the desire, cherished by the entire nation, for the enlargement of the kingdom by the incorporation of the districts of Austria-Hungary inhabited by her nationals.

The Austro-Hungarian Supreme Command had foreseen most clearly the intervention of Rumania, while at German Headquarters the danger did not appear so imminent; and the Hungarian Government—fearing unrest among their own population and in the hope of not destroying the last chances of maintaining peace with Rumania—avoided taking in the threatened frontier districts the measures necessary in the event of war breaking out. Thus it happened that Transylvania was quite inadequately defended from the military point of view against the Rumanian attack, and the country was hardly prepared at all as a theatre of war. On account of the pressing need for all effective units on the Russian and Italian fronts, the Austro-Hungarian Supreme Command could transfer to Transylvania in the beginning of Aug. only the seriously reduced 61st Div., the 51st Honved Div., and the 82nd Inf. Regt., troops for which an urgently needed rest had been intended. The 11th Honved Cav. Div., disentrained in Transylvania, was at once constituted the southern wing of the VII. Army. The removal of the war-worn 30th Honved Div. began in the last days of Aug. 1916. In addition there were in Transylvania, at the end of Aug., 8 newly formed inf. batts., 2 Landsturm batts., 10 communication batts., 3 mining batts. (armed coal-miners from Petrozsény), 9 "alarm" batts. (march batts. not yet fully trained), about 5,000 frontier police, 3 Landsturm squadrons and 9 field batteries, which were formed into newly created larger units whose formation was, with many changes, only completed in Oct. 1916. All the troops above mentioned, in the areas between the Hungarian frontier of the Bukovina and the Danube at Orsova, were from Aug. 13 onwards under the newly created Austro-Hungarian I. Army headquarters, under Gen. Arz von Straussenburg, at Klausenburg (Kolozsvár). Preparations were also made for the thorough destruction in the passes, of the roads and railways leading to Rumania.

At the end of July a convention was concluded at Pless between the German, Austro-Hungarian and Bulgarian Army Commands for common action in case of hostile Rumanian intervention, and to this Turkey shortly afterwards became a party. The plan of campaign was laid down in its main outlines and the contingents to be provided by the separate States agreed upon. The Germans allotted 5 to 6 inf. and 1 to 2 cav. divs., which, however, the German Supreme Command in expectation of coming events did not yet wish to place in reserve in Transylvania, as they would certainly be missed at critical points on the other battle-fronts. They therefore confined themselves for the time being to sending German construction troops to strengthen the existing railway lines in Transylvania, S.E. Hungary and northern Bulgaria for the advance of larger bodies of troops. The German detachment under Kauffmann, already placed in northern Bulgaria with a view to the creation of a German-Bulgar-Turkish army on the Dobruja frontier, was reinforced, and had heavy artillery, mine-throwers and flying formations.

Bulgaria placed on the Dobruja frontier the III. Army, commanded by Gen. Toshev, consisting of the 1st, 4th and one-third of the 6th Inf. Divs.,¹ one cav. div., the garrison of Varna, and a part of the Kauffmann detachment, while the Danube was guarded from Tekija (opposite Orsova) to the mouth of the Vid by the Bulgarian 12th Inf. Div., and from there eastwards as far as Ruschuk by the German Kauffmann detachment. At

Sistova there was a heavy Austro-Hungarian bridging train with its complement of men, some heavy batteries, and the Austro-Hungarian Danube flotilla. The supreme command over all the troops in Bulgaria for operations against Rumania was exercised by Mackensen, with headquarters at Tirnovo.

It was considered most probable that Rumania, when she struck, would begin by invading Transylvania, in order to gain possession of the country and to use it as a base from which completely to shatter the Carpathian front, which the Austro-Hungarians, as it was, were only maintaining with difficulty, while comparatively weak forces only would be employed against Bulgaria. On this assumption it was proposed to surprise and overrun the Rumanian positions in the Dobruja with the German-Bulgar-Turkish forces, in order to penetrate to the narrowest part of the district between the Danube and the Black Sea. The strongest possible forces would then be collected, and held ready at Sistova, where the heavy Danube bridging train was already placed, for a forward push in the direction of Bucharest. In Transylvania the Austro-Hungarian forces were to hold up the Rumanians in the mountains on the frontier if possible, but at latest on the position prepared on the upper Maros and the Little Kuküllo (Kleine Kokel), until the attacking troops being concentrated meanwhile could be marched up. These, and Mackensen's troops to be held ready at Sistova, would then proceed to the reconquest of Transylvania and the overthrow of Rumania. In this case the unusual happened, and the actual operations in their main lines were successfully executed as had been proposed in the discussion of war plans at Pless.

Rumania had pushed forward her mobilization, and by continuously reinforcing the troops on the Transylvanian border had so nearly completed their concentration that operations could begin immediately on the declaration of war, which was handed in at 9 P.M. on Aug. 27. It was intended first to conquer Transylvania. For this purpose strong forces were to push forward from the E. over the mountains on the frontier, and advance westwards through the valleys of the Kuküllo, the N. Kuküllo and the Maros. The calculations included a simultaneous push forward of the Russian front adjoining on the N., whose advance would be greatly facilitated by the offensive of the Rumanian army S. of the chain of the Carpathians stretching from Hungary into the Bukovina. The forces which penetrated the passes on the Transylvanian southern front were then to hold these by means of positions in the nature of bridgeheads, and to join the forces of the main offensive from the E. as these advanced.

On the Rumanian side expectation of an easy victory prevailed. In conformity with the plan of operations there was a concentric advance. The I. Army (Gen. Culcer), with about 4½ inf. divs. and 3 cav. bdes., and a stronger group on the E., advanced through the Roter Turm pass on Hermannstadt (Nagy Szeben), and with a weak group on the W. over the Vulkan and Szurdok passes in the line Petrozsény-Hátszeg (Hateg). The Orsova group (about one reinforced div.) on the Danube defended the left flank and the rear communications of the portions of the I. Army fighting in Transylvania against any advance from the Banat. The II. Army (Gen. Grăiniceanu), with about 4 divs. and 4 cav. bdes., operated from the Törzburg to the Ojtoz pass through all the defiles leading into the Kronstadt (Brasov) basin and the Háromszék. The IV., or Northern Army (Gen. Presan), with about 4 divs. and 1 cav. bde., operated N. of the II. Army and in connexion with the Russian Carpathian front through the Uz, Gyimes, Békás and Tölgyes passes into the basins of the Csik and the Gyergyó. The III. Army (Gen. Averescu), with about 4 inf. divs. and a cav. bde., faced Bulgaria on the Dobruja frontier in strong, well-fortified positions, and was to maintain the defensive. On the stretch of the Danube from Turnu Severinu to the mouth of the Alt stood protecting troops, one div. strong. In the district S. of Bucharest the Rumanians assembled a group of several res. divs. and other new formations for disposition as reserves.

The Rumanian Invasion.—The Rumanians crossed the frontier on the night of Aug. 27-28 over all the passes into

¹ A Bulgarian inf. div. had 3 bdes. of 8 batts., i.e. 24 batts. in all.

Transylvania, driving back the weak Austro-Hungarian defence troops in numerous small engagements, not without suffering appreciable losses at many points. The Rumanian advance was substantially delayed by the destruction of roads and bridges effected by the Austro-Hungarian frontier troops, and especially by the bad roads of the mountain country.

By Sept. 3 the Rumanian Orsova group reached the lower course of the Cerna, and the western group of the I. Army occupied the important coal area between Urikány and Petroseny and had driven back the ineffective Landsturm and miners' battalions of the 144th Inf. Bde. over the saddle of Merisor. The eastern section of the I. Army, which had penetrated by the Roter Turm Pass, occupied positions S. of Hermannstadt, without attempting to take the town though it was garrisoned only by a weak Landsturm detachment. They were plainly apprehensive that by occupying Hermannstadt they would have to extend their bridgehead-like formation beyond capacity.

The II. Rumanian Army deployed cautiously in Burgenland and in the Háromszék, allowing their columns to close up, and receiving fresh reinforcements. The IV. Army forced their way, in continuous fighting touch with the 61st Inf. Div., through the narrow mountain valleys, and on Sept. 3 their advanced troops reached the eastern edges of the basins of the Gyergyó and the Csik. Meanwhile the first troops sent by the Central Powers were rolling up towards Transylvania. Gen. von Arz was instructed not to use the forces assembling on both army wings to strengthen the covering troops with them as they arrived, but first to concentrate them and hold them ready for wider action. In view of the expected continuation of the Rumanian advance he directed the 39th Honved Inf. Div. and what eventually, after many changes, became the 89th Inf. Div., to the district half-way between Szász Régen (Reghina-Sas) and Klausenburg (Kolozsvár); the 187th Inf. Div. and 3 German cav. regts. of the 3rd Cav. Div. were to be disentrained at Maris Illye; the 1st Austro-Hungarian Cav. Div. S. of this place between Hátszeg (Hateg) and Karansebes; the 1st Royal Hungarian Landsturm Hussar Bde. at Tövis. The first of the two German General Commands to arrive, Lt.-Gen. von Morgen, took over the command of the 61st and 71st Inf. Divs., the 1st Landsturm Hussar Bde., the newly arrived 30th Honved Inf. Div. and the 89th German Inf. Div., while under Lt.-Gen. von Staabs were placed the 51st Honved Inf. Div., the 187th Inf. Div., the 1st Cav. Div. and the 3rd Cav. Div., together with the covering troops at Hermannstadt, Hátszeg and Mehadia. The very slow progress of the Rumanians made it possible for the incoming divs. of the Austro-Hungarian army to move forward their disentrainment stations. Accordingly the following disentrainment arrangements were made: the 39th Honved Inf. Div. at Szász Régen, the 89th Inf. Div. at Marosujvár, the 1st Cav. Troops Div. and the 3rd Cav. Div. (which had been united in the Schmettow Cav. Corps) at Mediasch and Elisabethstadt, the 187th Inf. Div. at Piski with a regt. intended for Hermannstadt at Alvinet.

Since the Rumanian group pushing northwards over Petroseny might endanger the transport of further reinforcements on the Maros Valley railway, the bulk of the 187th Inf. Div. was directed against Merisor, in order, in conjunction with the Austro-Hungarian 144th Inf. Bde., and strengthened by the 3 first arriving German Jäger batts. of the Alpine Corps, to throw back the Rumanian Mountain Corps over the frontier; and this task was accomplished between Sept. 14 and 22.

The Schmettow Cav. Corps, linking up on the E. with the 51st Honved Inf. Div. standing directly N. of Hermannstadt, was posted on the heights N. of the Alt as far as Fogaras (Făgăra). The Alpine Corps, which was only one div. strong but consisted of excellent troops, equipped for mountain warfare, was disentrained with the main body at Mühlbach. The German 76th Res. Div., which was on its way, was to be assembled at Karlsburg (Gyula Fehérvár). The Austro-Hungarian 143rd Inf. Bde., which had been stationed at Hermannstadt, was moved behind the N. wing of the I. Army, and there formed into the 72nd Inf. Div. These measures, taken by the I. Army Command, on the

one hand averted the menace to the Maros Valley railway at Piski, and on the other established the operative basis on which the battle of Hermannstadt was afterwards fought.

Bulgarian Offensive in the Dobruja.—Meanwhile events of far-reaching importance had taken place in the Dobruja. On Sept. 1 the III. Bulgarian Army crossed the Rumanian-Bulgarian frontier. The aim of the operation was the conquest of the Dobruja. After the capture of the bridge-heads of Turtucaia and Silistra the advance was to be made by the Cernavoda-Constantza railway to the narrowest part of the territory lying between the Danube and the Black Sea. The fortress of Turtucaia consisted of a girdle of 15 forts on the S. bank of the Danube, which were connected by strongly built field positions. While very great care had been bestowed on the technical development of the place during the 3 years of preparation, the armament, consisting of only about 100 guns, including the field artillery, was inadequate. Artillery fire against Turtucaia began on Sept. 3; in the comprehensive attacks following on Sept. 4-5 and carried out by the 4th and sections of the 1st Bulgarian Inf. Divs. and the German detachment under Hammerstein, the bridge-head was stormed. The capture of this place by a *coup de main* was an admirable feat of arms. Only a very small portion of the garrison of the place, the 15th and 17th Rumanian Inf. Divs., which suffered heavy and bloody losses, escaped. Many soldiers were drowned in trying to swim the Danube, across which there remained no bridge. Twenty-one thousand men and 400 officers, including 3 brigade commanders, together with the whole armament, were captured.

While the remainder of the Bulgarian 1st Inf. Div. pushed forward by Akkarynlar and the 1st Cav. Div. by Kurtunar, the 2nd Bde. of the 6th Inf. Div. and the garrison of Varna attacked the Rumanian 10th Div. on the plateau N. of Dobric (Hagi-Oglu) on Sept. 4 and threw them back northwards.

In contrast to Turtucaia the bridge-head of Silistra was in a state of unpreparedness. It fell on Sept. 9 into the hands of the cavalry of the 1st Div. after a short bombardment directed against the Rumanian cavalry.

While the Bulgarian III. Army was pressing forward successfully on the whole front, the retreating Rumanians were reinforced by the Russian Expeditionary Corps under Lt.-Gen. Zajanczkowski, which consisted of the XLVII. Corps with 3, and later 4, inf. divs., among them the 1st Serbian Div. (formed from Austro-Hungarian deserters) and the VI. Cav. Corps. The Bulgarian III. Army put their main weight in the advance in the space between the Danube and the Dobric-Medzidie (Hagi-Oglu-Megidia) line, while E. of the railway on the right wing only sections of the 1st Cav. Div. drawn from the centre of the army front operated.

On Sept. 15 the Rumanian-Russian fighting forces, which attempted to offer resistance on the line Lake Márkeanu-Teke Deresi-Karalij-Kara Omer-Mangalia, were attacked by the Bulgars and compelled to retreat along the whole line. The III. Rumanian Army, reinforced by hurriedly-brought-up Russian and Rumanian units, prepared to fight again on the position Rasova-Copadin-Toprai Sari-Urtukioj, which immediately protected the Cernavoda-Constantza railway and had been partially prepared in time of peace. The attacks executed by the Bulgarians on Sept. 19-20 did not penetrate the line this time. Instead, the III. Bulgarian Army Command were compelled to withdraw their troops some kilometres, to wait for the bringing up of munitions and the arrival of sections of the Bulgarian 12th Div., and the VI. Turkish Corps (25th and 15th Divs.). But the counter-attacks undertaken by the Rumanian eastern wing on Sept. 22 were repulsed by the recently arrived 25th Turkish Div., and the Bulgarian-Turkish front was again established on the line N. of Amuzacia.

In the Dobruja generally operations for the time being came to a standstill.

The Liberation of Transylvania.—In Transylvania the IV. Rumanian Army advanced from the basins of the Gyergyó and the Csik through the Maros valley, then over the Görgény and Hargitta mountains, and continuously pressed back the 61st

Inf. Div., subsequently reinforced by the 1st Landsturm Cav. Bde. It was feared that it would all too quickly reach the inner region of Transylvania, with its excellent communications. In that case it would threaten the rear of the 71st Inf. Div. which occupied positions on the W. bank of the Alt (Oltu) between Fogaras and Repts, and farther N.E. to Homorod and Okland, at the weak angle where the front of the I. Army from a direction W. to E. bent sharply from S. to N. Generally, too, it would deprive the covering troops of the possibility of protecting according to plan the picked attacking troops coming up to the front. The commander of the east front, Lt.-Gen. von Morgen, therefore, planned to make a surprise attack on the Rumanian IV. Army on its emergence from the Görgény and Hargitta mountains, using for the purpose the concentrated strength of newly arrived units. He proposed to attack either from the area N. of Szász Régen (Reghina-Sas) southwards or from the upper course of the Great and Little Kuküllo valley in a N. E. direction, and by pressing on the Rumanian communications to prepare an annihilating defeat for them. This plan, however, was not approved in higher quarters; it was determined merely to strengthen the E. front by hurrying up the Austro-Hungarian 72nd Inf. Div., and a more active conduct of the defence was recommended. Both Supreme Army Commands adhered to the original plan of concentration and to the idea of striking first at the inactive enemy S. of Hermannstadt.

Before daybreak on Sept. 15 the Rumanian II. Army crossed the Alt between Fogaras and Repts in several columns, for the most part without bridges or river transport, and advanced farther N. from Barôt, through Homorod-Okland-Draas towards Katzendorf. In order to make a mobile defence possible the 71st Inf. Div. had left only weak covering troops (about 3,000 rifles) on the 60-km. front, placing the main force in readiness in the district Petek-Mehburg. The weak defence naturally had to give ground before the far superior weight of the Rumanian attacking columns. But in the afternoon the main force of the div. made a surprise attack, advancing southwards through Pâlos and struck the 6th Inf. Div., marching as the most northerly column of the II. Army, in flank and rear. The surprise and confusion of the Rumanians were so great that the II. Army, which had only just crossed the Alt, ceased to advance, and remained inactive for a week.

The Rumanian IV. Army, on the other hand, continued to advance steadily, thereby compelling the command of the I. Army to support the Landsturm Cav. Bde. by 4 newly formed Bosno-Herzegovinian inf. batts., which really belonged to the unit of the 71st Inf. Div. In addition the 30th Honved Inf. Div., N.E. of Maros Vásárhely, was pushed up to the front; the 80th Inf. Div. was advanced to Maros Vásárhely, and an inf. bde. of the 37th Honved Inf. Div., coming up without artillery, was placed in readiness at Teke, N.W. of Szász Régen. The newly arrived Austro-Hungarian VI. Corps Command took over the command of the N. wing (72nd Inf. Div., half the 61st Inf. Div. and half the 37th Honved Inf. Div.), while the I. Res. Corps Command retained command of the Landsturm Hussar Bde., the 30th Honved Inf. Div., the 71st Inf. Div., supported by the 10th Mountain Bde. of the 61st Inf. Div., and the 80th Inf. Division.

At the end of Sept. the IV. Rumanian Army in the N., with the reinforced 14th Div., had reached Déva in the Maros valley and Kásva in the Görgény valley, and with sections of the 8th Div., was already pressing at Kibed on the Kuküllo position. With the reinforced 7th Div. the west of Székely-Keresztur was reached, where the 10th Mountain Bde., already much weakened, could only defend itself with difficulty against the overwhelming pressure, while the 71st Inf. Div. on their left wing had definitely to give way.

On the evening of Sept. 17 Gen. Erich von Falkenhayn, with the staff of the newly formed German IX. Army, arrived at Déva, and took over the command of Gen. von Staabs' troops, and of all the reinforcements coming into this district. His commission was, in conjunction with the I. Army, to throw the enemy out of Transylvania, and for this purpose, while masking

the Vulkan and Szurduk passes, to surround the enemy posted at Hermannstadt, with a double ring, and beat him. Gen. von Falkenhayn first ordered Lt.-Gen. Sunkel, commanding the 187th Inf. Div. in the neighbourhood of Petroseny, who was about to push the Rumanians back to the frontier passes, after reaching this line to send all the troops he could spare from his div. and the Alpine Corps towards Hermannstadt; he ordered the assembly of the 187th Inf. Div. at Reussmarkt, of the Alpine Corps at Sinna, and the disentrainment of the 76th Res. Div. at Markt-Schelken. Finding by a reconnaissance in the direction of the Roter Turm Pass that the road was practicable for mountain troops without wheeled transport, he decided to direct the Alpine Corps by way of Cindrelu and Prezbe towards the Roter Turm, in order to hinder the retreat of the Rumanians by this route, while the 187th Inf. Div., the 51st Honved Inf. Div., the 76th Res. Inf. Div., and sections of the Schmettow Cav. Corps, were to attack W. and E. of Hermannstadt in the direction of the northern outlet of the pass. This was not indeed a double encirclement of the enemy, as had been ordered by the Supreme Command, for which the forces of the eastern wing, where only a few squadrons could be made available, were insufficient. It was, however, a far-reaching enveloping movement against the one passable rearward communication of the enemy, in coöperation with an energetic attack on the front, of which the object was to destroy the group composed of the 2nd and 13th Rumanian Inf. Divs., under Gen. Popovici commanding the I. Corps.

On Sept. 22 Gen. Popovici attacked, but only attained success southward of Cornaticlu against the extremely thinly held positions of the 7th Cav. Bde. of the 1st Div., being everywhere else completely repulsed. The expected continuation of the Rumanian attack on Sept. 23 did not take place, and it was possible to issue orders for the projected battle. By Sept. 25 the XXXIX. Res. Corps with the 187th Inf. Div. were able to be assembled at the foot of the mountains S.W. of Hermannstadt, the 51st Honved Inf. Div. to the N.W., and the 76th Res. Inf. Div. to the N.E. of the town, while the Alpine Corps was to be within a day's march of the Roter Turm Pass. The general attack in the direction of the pass was to begin on Sept. 26; the Alpine Corps was to endeavour to reach the E. side of the pass in order there also to block the bridle-tracks leading over the mountains. The Schmettow Cav. Corps might, in the event of further pressure by the enemy, give way with its right wing, but with its centre on the Alt and its left wing towards Fogaras it was to hold its ground obstinately, and, in addition, if the operations proceeded according to plan, to arrange to push forward from the N.E. over the river towards the entrance of the pass. The I. Army Command was asked, as soon as possible, to place the 80th Inf. Div. in readiness at Schässburg (Segesvár).

The Rumanians standing at Hermannstadt did not interfere further with the preparations for the attack; on the other hand the 11th Rumanian Div. stationed at the Szurduk Pass attacked again on Sept. 25, and regained possession of Petroseny. The 144th Inf. Bde., reinforced by two German battalions and two batteries, held the heights N. of the place. The IX. Army Command did not contemplate further reinforcement, but the unattached staff (i.e. without troops) of the German 301st Infantry Div. was sent there, under the direction of which were placed the 144th Inf. Bde. and the Austro-Hungarian 2nd Mountain Bde., which had arrived on the 28th; and with these forces the Rumanians were again compelled to give up the extremely valuable coal basin.

The Battle of Hermannstadt (Nagy Szeben).—On Sept. 26, favoured by beautiful autumn weather, the attack began, and it continued with undiminished violence against the obstinate defence of the Rumanians until the evening of Sept. 28. It ran, on the whole, the course intended by Gen. Falkenhayn.

The Alpine Corps had already reached Roter Turm, Riu Vadulin and Căneni with their advanced troops on the road to the pass, early in the forenoon of Sept. 26. The Rumanians indeed now thoroughly realized the magnitude of the danger which threatened them, and delivered the most violent counter-attacks from N. and S. against the detachments of the Alpine

Corps. These troops might be temporarily pushed back at one point or another, but the road over the pass now lay continuously under German fire, which inflicted heavy losses on the Rumanian columns still attempting to break through. The Alpine Corps, however, did not succeed in reaching the E. bank of the Alt, and sections of the Rumanians were thus able to escape the threatened encirclement, and to cross the western spurs of the Fogaras Mountains.

The three divs. of the XXXIX. Res. Corps made a concentric attack between Orlat-Hermannstadt and the heights to the E. of it. It was only with difficulty that they at first gained ground, and not till Sept. 28 did they succeed in breaking the Rumanian resistance; but then, in consequence of the heroic endurance of the Alpine Corps, which made both escape and the bringing up of reinforcements from the S. impossible, the Rumanian defeat became a complete collapse. This collapse was precipitated when on Sept. 27 the 3rd Cav. Div. had succeeded, with two regts. of light horse, in crossing the Alt and narrowing S.W. of Porumbacu the circle of fire round the Rumanians, while the 18th Hussar Regt. of the 3rd Cav. Div. at Chertisiora secured the front towards the E., whence there had been since Sept. 27 increasing indications of an advance by the Rumanian II. Army.

As the bringing up of reinforcements through the Roter Turm Pass from the S. failed, the Rumanian Command were compelled to set the II. Army on the march towards Hermannstadt to relieve the seriously threatened group under Gen. Popovici. The II. Rumanian Army executed their movements slowly and with difficulty, and since an advance on the shortest line in the Alt valley from the N. over Fogaras from the Agnetsheln-Hennndorf district might easily have been threatened on the flank, the Rumanian Army Command thought themselves first compelled to secure freedom of movement N. of the Alt river. The sections of the 71st Inf. Div. in the forward positions were therefore first pressed back, and then the 6th Cav. Bde. of the 1st Cav. Div. standing N. of Klein Schenk were thrown back westwards. Meanwhile, the Austro-Hungarian I. Army Command had sent from Schässburg to Hennndorf the greater part of the 80th Inf. Div., one infantry regt. and one light field-howitz detachment going off by rail as army reserve to Salzburg (N. of Hermannstadt). Pushing between the 71st Inf. Div. and the Cav. Corps, they made on Sept. 28 a successful attack in a southerly direction, and so put the brake on the advance of the Rumanian troops N. of the Alt. The I. Army of Gen. Arz had to withdraw steadily westwards under the superior weight of the IV. Rumanian Army, and as the seriously weakened 10th Landsturm Mountain Bde. especially had great difficulty in withstanding the continued Rumanian attacks in the direction of Schässburg, the I. Army Command considered it necessary to withdraw the 71st Inf. Div. to the Little Kuküllo (Kokel). Gen. Falkenhayn urgently dissuaded them from this move, as it would expose his eastern flank to an unbearable threat. He also expressed his doubt as to the ability of the I. Army, when once it had been pressed back behind the line of the Maros and the Little Kuküllo, to maintain that position permanently with its present forces. Thereupon the withdrawal of the southern wing of the I. Army was delayed.

On the afternoon of Sept. 28 the Rumanians again attacked the 1st Cav. Div. N. of the Alt, and pressed them back to the heights E. of the Haarbach; the reserve, not required at Hermannstadt, was hastily sent with heavy motor wagons through the Haarbach valley to the aid of the heavily engaged Schmettow Cavalry Corps. Meanwhile, however, the fate of the Rumanians in the Roter Turm Pass was sealed, the attacking troops of the XXXIX. Res. Corps ceasing to meet with serious resistance in the early morning of Sept. 29. Those who were not able to escape through the forests over the mountains fell a sacrifice to the inexorable onslaught. The bulk of the Rumanian I. Army was destroyed. Three thousand prisoners—a relatively small number—were taken, but the whole of the artillery and the whole train fell into the hands of the victors.

It was now necessary rapidly to take new decisions for fighting the II. Rumanian Army, the threat of whose approach was im-

minent. In accordance with the instructions received, the IX. Army was to gather all its strength, and to deliver an enveloping attack from the S. against the southern wing of Rumanian main forces pushed forward W. of Fogaras. Falkenhayn intended to relieve the Alpine Corps for this purpose by the 51st Honved Inf. Div., to assemble the 76th and 187th Inf. Divs. on the heights of Scorei on both sides of the Alt, and then to push forward in an easterly direction, an enveloping attacking movement in the Fogaras mountains being assigned to the Alpine Corps. But the rapid and violent push of the Rumanians in the space between the Haarbach and the Alt on Sept. 29 entailed changes in the plan of operations. The relief of the Alpine Corps had to be given up, as involving too much time; instead, the 51st Honved Inf. Div. and the 76th Res. Div. were to reach as rapidly as possible the Alt valley S. and N. of Avrighu and the 187th Inf. Div. Cornatielu in the Haarbach valley. The seriously weakened Cavalry Corps was to attach itself for the forward movement to the N. wing of the 187th Inf. Div. Of the I. Army, the 80th Inf. Div. and the strongest possible sections of the 71st Inf. Div., under the command of Lt.-Gen. von Morgen, were asked to attack in the direction of Bekokten. The beginning of the attack was proposed for Oct. 1.

To the surprise of their enemy the Rumanians did not continue the attack N. of the Alt on Sept. 30, but withdrew a little from the Cavalry Corps. With this object they attacked S. of the Alt and drove back the 18th Hussar Regt. westwards of Chertisiora. The weariness of the troops and the almost impassable state of the roads, owing to the rain which had set in, delayed the forward movements, and it was agreed to begin the attack on Oct. 2. The Rumanians did not take advantage of the loss of time this entailed on the German-Austrian side, but entrenched themselves in the positions they had reached.

The unification of the command in Transylvania was established by placing the Austro-Hungarian I. Army from Oct. 1 under the operative control of Falkenhayn.

On Oct. 2 began the advance of the XXXIX. Res. Corps, the Schmettow Cav. Corps and the I. Res. Corps. South of the Alt the Rumanians offered no resistance, but retreated according to plan before the German advanced troops. North of the Alt, after strong forces had been brought up by way of Gross Schenk in a westerly direction, the advance also began. The 80th Inf. Div. attacked in the direction of Bekokten, and at first obtained a great success, but was thrown back to its point of departure by a Rumanian counter-attack. The 71st Inf. Div. had not been able to join in this attack because its artillery was not yet in position on account of the softness of the chalky roads after rain. Lt.-Gen. von Morgen thought the situation of these two divs. so endangered that he intended to withdraw them as far as the sector Hennndorf-Jakobsdorf. On Oct. 3, however, this idea was abandoned, as the enemy themselves had withdrawn eastwards. Owing to this movement touch with the Rumanians became extremely loose, which made it exceedingly difficult for the Austro-German Command to discover betimes the measures taken by them.

On their side the Rumanians had obviously abandoned as early as Oct. 2 the idea of continuing the offensive. Impressed by the annihilating defeat at Hermannstadt and recognizing the impossibility of attacking in a tactically unfavourable situation the IX. Army, rapidly advanced eastwards, they had decided to withdraw betimes in order to defend the frontier passes. In order to secure the time necessary for the threading of the marching columns into the passes of the Geisterwald, the Hargitta and the Görgény mountains, the Rumanians undertook a series of forward pushes: on Oct. 1 S. of the Alt, and on Oct. 2 against the 80th Inf. Div. Against the I. Army these attacks continued until Oct. 5, and during them the Rumanians, especially on Oct. 3, obtained a fresh success against the 10th Landsturm Mountain Bde. and the Landsturm Hussars.

Though the IX. Army Command could not yet fully discern the intentions of the enemy, the puzzling behaviour of their opponents seemed no reason for delay, and the advance was therefore pushed forward with the utmost speed. The 3 divs. of

Lt.-Gen. Staabs were taken into the space S. of the Alt, the I. Res. Corps was to reach the passages over the Alt at Comana and Héviz, while the Cav. Corps was to reach the N. wing of the IX. Army.

The Battle in the Geisterwald.—The Rumanians retired on the whole E. front, without being brought into action by the pursuing troops of the Austro-Hungarian I. Army and the German IX. Army. It was only after dusk on Oct. 4 that the XXXIX. Res. Corps was able to bring the Rumanians to a stand on the western slope of the Geisterwald in a prepared position behind the Șinca brook. The corps were ordered to attack early on Oct. 5, while the 76th Res. Div. was to advance along the high road to Vulkány, the 51st Honved Inf. Div. to Vledény, and the 187th Inf. Div. over the mountains, enveloping the enemy on the N., in the direction of Krizba. The 8th Mountain Bde., just arrived at Hermannstadt, was ordered to follow the XXXIX. Res. Corps forthwith in the Alt valley. It was intended to allow them to advance W. of the Königstein towards the road Kronstadt—Câmpolung.

Morning mists and the time taken by the enveloping movement of the 187th Inf. Div. in roadless mountain country delayed the beginning of the attack on Oct. 5. In order to lose no time Lt.-Gen. von Staabs ordered the 76th Res. Div. and the 51st Honved Inf. Div. to attack alone in the forenoon; they soon captured the Rumanian positions, the Rumanian 4th and 3rd Inf. Divs. suffering heavy and bloody losses in their violent counter-attacks. But when the enveloping movement of the 187th Inf. Div. became effective the Rumanians began their retreat into the Kronstadt basin with the utmost haste, at the cost of a great part of their artillery. Close upon them followed the victorious divs. of Gen. von Staabs. Meanwhile the advance guard of the 89th Inf. Div. had reached Comana on Oct. 5, after, by quick action, succeeding in putting out the fire which the Rumanians had set to the bridge. After a stiff pursuing action the 71st Inf. Div. took Repts, but, N. of Héviz, met with strong resistance from the enemy which was only broken down on the morning of the 6th. The 89th Inf. Div. which had been brought up here, was marched through Héviz in front of the 71st and directed over the Bogat saddle towards Földvár. The Schmettow Cav. Corps had assigned to it the task of throwing back the 2nd Rumanian Cav. Div. over the line Mehburg—Pálos. But the Rumanian Horse escaped attack by a hasty retreat towards the N.E., and established temporarily contact in the Upper Alt valley between the two Rumanian armies, which were diverging more and more.

The Battle of Kronstadt (Brasov).—On Oct. 6 the divs. of the XXXIX. and I. Res. Corps in their marching lines sought to reach the western outlets of the defiles of the Burgenland. The attack on the 3rd, 4th and 6th Divs. of the Rumanian II. Army, crowded together around Kronstadt and entangled with one another during the retreat, was fixed for Oct. 7. The 76th Res. Div. was to reach the Törzburg Pass by way of Tohanulu—Törzburg. Kronstadt was the goal fixed for the 51st Honved Inf. Div., advancing by Feketchalom, while the 187th Inf. Div., attacking to the N. of it, was to wheel inwards, its flank protected from the N.E. in order to envelop Kronstadt and the entrance to the pass S.E. of it. On Oct. 7 the 89th Inf. Div. was to reach Földvár and the 71st Inf. Div. Miklosvár. Of the Cavalry Corps the 3rd German Cav. Div. was to push forward through Barót towards Mikoujfalú, to hinder Rumanian movements of troops in the Alt valley; the 1st Cav. Div., pressing forward towards Szt. Egyházás—Oláhfalú, was to bar the retreat of the rear sections of the Rumanian troops still on the Szekely—Udvárhely—Csiksereda road.

On the early morning of Oct. 7 the vanguard of the 76th Res. Div. emerging from the mountains at Tohanulu was caught by the Rumanian artillery fire, and could penetrate no farther. The main body had therefore to make a wide détour by Zernesti against the Rumanian left flank, and a pause was made for the arrival of the heavy artillery. Thus this div. could make no further progress on the 7th. But the 51st Honved Inf. Div. and the 187th Inf. Div. rapidly approached Kronstadt, meeting,

however, with violent resistance from the Rumanians on the N. and W. sides of the town, so that it was not until evening that the vanguard of the 187th succeeded in penetrating into the northern part of the town, where an obstinate street fight raged all night. Next morning the 51st Honved Inf. Div. also won their way in and stormed the heights S. of the town.

In consequence of the enveloping movement through Zerneste and the threat exercised by the 8th Mountain Bde. approaching W. of the Königstein it became possible for the 76th Res. Div. on Oct. 8 to seize Törzburg and the heights on either side of it, together with the entrance to the Törzburg Pass. The advance against the pass was continued, and, in addition, a detachment was pushed forward through the Klein Weidenbach valley towards the Tömös Pass in order to bar the Rumanian retreat here. Although this div. failed to reach the road, its appearance in threatening proximity caused a panic-like flight of the troops and transport hastening southwards.

Meanwhile the Rumanians tried to hold up the German advance N. of Kronstadt, and, with reinforcements hurried up partly by rail from Seps-Szt. György, delivered violent counter-attacks against the E. wing of the 187th Inf. Div., standing at Szentpéter, which was hard pressed till the attack of the 89th Inf. Div. from the N. struck the Rumanians unawares.

Early on Oct. 9 the victory of the IX. Army was complete. The beaten troops of the 3rd, 4th and 6th Rumanian Divs. retreated hurriedly through the passes, so that, supported by the 10th, 21st and 22nd Inf. Divs. brought up for the purpose, they might undertake the defence of their country against the pursuing German and Austro-Hungarian divs. in fortified positions on the frontier prepared during peace.

Gen. von Falkenhayn in his pursuit tried to cross the mountains simultaneously with the Rumanians, and by a fresh distribution of his army, the I. Res. Corps with the 76th Res. Div. and the 8th Mountain Bde. attacked over the Törzburg Pass in the direction of Câmpolung. Through the encircling movement of the 8th Mountain Bde. the pass was soon successfully opened, and the 22nd Inf. Div. which had arrived to support the seriously exhausted Rumanian 4th Inf. Div. was repulsed. But the attack of the I. Res. Corps was held up by the strongly-fortified positions N. of Câmpolung.

The XXXIX. Res. Corps had orders to push forward through the Tömös Pass with the 51st Honved Inf. Div., and through the Altschanz Pass with the 187th Inf. Div. towards the line Sinaia—Isorele. The 51st Div. did indeed succeed in storming the summit of the pass, but could not penetrate the 21st and 10th Rumanian Inf. Divs. in their strongly constructed positions. The 187th Div. had a similar experience against the Rumanian 3rd Inf. Division.

The 89th Inf. Div. had to attack through the Tatarhavas and Bodza passes. After reaching the basin lying S. of the frontier, it was held up by the main body of the Rumanian 6th Inf. Div. and by separate regts. of the 3rd, 15th and 22nd Inf. Divisions.

As the German Supreme Command urgently demanded that the strongest possible infantry and cavalry forces should be directed towards Ocna, to control the communications from there northwards by rail, road and telegraph, the 71st Inf. Div. was put under the command of Gen. Count Schmettow, commanding the Cav. Corps, who led the div. in forced marches to the Ojtoz Pass. On the summit of the pass the div. overran a position held by the Rumanian 2nd Cav. Div. and forced their way over the frontier. Recognizing their peril the Rumanians rapidly pushed up the 38th Inf. Bde. and sections of the 7th, 8th and the newly formed 15th Inf. Divs., and after long engagements with many vicissitudes prevented the 71st Inf. Div. from reaching its goal.

The 3rd Cav. Div. assembled first in the basin of Kézdivásárhely, where the 1st Cav. Div., which had pursued the Rumanian 7th Inf. Div. up to the Uz Pass, had also been brought up. As the employment of cavalry on the route by way of Ocna into Moldavia had become impossible, the 1st Cav. Div. established communication in the forest-clad mountains, with their lack of roads, between the 89th and the 71st Inf. Divs. The three regts.

of the 3rd Cav. Div. were later on stationed between the Törzburg and the Tömös passes as the Transylvania Cavalry Brigade.

At the Roter Turm Pass the Rumanians—the remainder of the 13th and 23rd Inf. Divs. and the 2nd mixed Brigade of the 18th Div.—had discontinued their attacks against the Alpine Corps, reinforced by the 10th Mountain Bde. At Petrosény the 11th Rumanian Inf. Div. had again been pressed back to the frontier, whereupon the 2nd Mountain Bde. was shifted to the Roter Turm Pass. This was subsequently merged with the 10th Mountain Bde. in the 73rd Inf. Division.

In the Austro-Hungarian army the VI. Corps, with the 30th Honved Inf. Div., reached the frontier in the Uz valley and with the 61st Inf. Div. and the 1st Landsturm Hussar Bde., in the Trotus valley advanced far over the frontier and, after fighting with varying success against the Rumanian 7th Inf. Div., occupied positions on the height of Sulta. On the N. wing the XXI. Corps with the 72nd Inf. Div. reached the Békás Pass, and with the 37th Honved Inf. Div. the Tölgyes Pass. Thus Transylvania, six weeks after the invasion of the Rumanians, was again freed from the invader.

Plans for the Continuation of Operations.—New plans had now to be agreed upon, in order to beat the Rumanians in their own country. Naturally the centre of gravity of the operations against Rumania lay in the first instance in Falkenhayn's IX. Army. His attempt to push forward on the shortest line to Bucharest with the troops he had in hand in the pursuit over the passes S. of Kronstadt had not succeeded. The Rumanians now defended themselves much more obstinately, and the German and Austro-Hungarian troops, wearied with their rapid operations, and with their war establishments weakened, had suffered temporarily in buoyancy from this victorious career. Events moved slowly also on the Roter Turm Pass, from which, after crossing the mountains, the main push directed towards Bucharest ought to have been supported by an advance of the reinforced Alpine Corps through Pitești. The pursuit on all the many passes radiating from the Kronstadt basin had dissipated strength, and made the assembly of a strong main force impossible. New forces had to be brought up. These rolled up in Transylvania in the middle of Oct.—the 8th Bavarian Res. Div., the 11th and 12th Bavarian Inf. Divs. and the 6th German Cav. Div.; towards the end of Oct. two further German inf. divs. (the 41st and 100th) and the 7th Cav. Div. were to follow. Moreover, the Austro-Hungarian Higher Command intended to transfer the Austro-Hungarian 3rd and 10th Cav. Divs. to Transylvania, but these would first have to be equipped and organized for employment in the intended offensive.

The 8th Bavarian Res. Div. was sent to the Transylvanian E. front to reinforce the I. Army. The 12th Bavarian Inf. Div. was placed by Falkenhayn under the I. Res. Corps on the Törzburg Pass, the 11th Bavarian Inf. Div. was to attack over the Szurduk Pass with the 144th Inf. Bde., and the group of Lt.-Gen. von Krafft at the Roter Turm Pass was strengthened by 2 Bavarian inf. regts. and 2 German Landsturm regts. At the Tömös, Törzburg, Roter Turm and Szurduk passes the attacks were to be continued, and wherever a gap was first effected Falkenhayn intended to bring up the mass of cav. and the two later arriving inf. divs. to open up the remaining passes southward and in conjunction with Field-Marshal Mackensen's troops, to push forward towards Bucharest.

Both the Supreme Army Commands agreed to this plan. But the Higher Command at Teschen maintained in this connexion that it was desirable for the main pressure to be directed on the line Kronstadt-Bucharest. There the strongest opposing Rumanian and Russian opposing forces were to be expected; moreover, here they had to reckon with a threat of a Russian relieving offensive, urgently asked for by the Rumanians, coming from Moldavia in the general direction of Csik-Szereda. Falkenhayn therefore rather favoured a push through the Szurduk Pass, where, owing to the smaller width of the mountain chain, the Wallachian Plain would be most quickly reached.

On the E. front, meanwhile, the headquarters of the Army Front Commander, Archduke Charles Francis Joseph, in the

arrangement of the commands, was moved from East Galicia to Grosswardein, as from Oct. 13, and the German IX. and Austro-Hungarian I., VII. and III. Armies were placed under him.

The Conquest of the Dobruja and of Wallachia.—After the battle of Kronstadt the Rumanians were entirely reduced to the defensive. On the Transylvanian front they limited their activities to attempts to win back the lost frontier heights commanding important roads of invasion. The Rumanian Army Command also tried to induce the Russians to relieve the Rumanian troops in the Dobruja and on the Transylvanian E. front in order thus to set free forces for the defence of Wallachia.

On the Danube front the Rumanians on Oct. 1 had crossed the river at Rahova (S. of Bucharest) with a div., and had temporarily gained a firm footing. German and Bulgarian troops, rapidly assembled, compelled the Rumanians to return to the N. bank, the latter suffering severe losses, as the Austro-Hungarian Danube monitors had shot to pieces the Rumanian pontoon bridge. Rumanian forward pushes against the Bulgarian III. Army brought no success. On Oct. 19 an attack by Gen. Toshev's Army (Bulgarian 1st, 4th, 6th Divs., and sections of the 12th Inf. Div., 1st Cav. Div., Turkish VI. Corps, with the 15th and 25th Inf. Divs., German 217th Inf. Div.), broke through the Russo-Rumanian front on their E. wing, and drove the opposing army far over the Cernavoda-Constanza railway, Rumania thereby losing her only rail connexion with the sea.

While the bulk of the Bulgarian III. Army followed only as far as the line Lake Tasaul-Bazanliia-heights of Kualnik-Danube S. of Topal, and settled themselves for the defence on this shortest line between the Danube and the sea, the reinforced cav. div. pursued the retiring Rumanians and Russians as far as the line Sariuri-Sarighol-Docuzaci. Gradually the Russians again slowly pushed forward southward against the new position of the Bulgarian III. Army. The Rumanian troops were withdrawn in Nov. from the Dobruja into Wallachia. Of the Russians there were in the Dobruja the VI. Cav. Corps, the XLVII. and IV. Siberian Corps, with 6 inf. divs. and 1 cav. div. in all, which were placed under the command of the newly formed Russian Danube Army (Gen. Sakharov).

In the new defensive position of the Bulgarian III. Army, which was by this time under the command of Gen. Neresov, there remained the 4th and the combined 6th Inf. Divs., then the 1st Cav. Div. The Turkish VI. Corps stood for the time being at Medzidie in reserve. The other troops in the Dobruja and northern Bulgaria, together with the expected Turkish 26th Div., were collected in the district around Sistova, and were placed in readiness for crossing the Danube as the new Danube Army under the command of Gen. Kosch.

On the Transylvanian S. front the obstinate struggle for the passes was continued. The I. Res. Corps succeeded in reaching a point just N. of Câmpolung after the arrival of the 12th Bavarian Inf. Div. and with the assistance of the enveloping movement in the mountains of the 8th Mountain Bde. on the W. wing. At that point irruption into the basin of Câmpolung was barred by a new strongly constructed position in which the newly brought-up Rumanian 12th Inf. Div., in addition to the 22nd Inf. Div., offered the most obstinate resistance.

At the Roter Turm Pass Lt.-Gen. von Krafft intended to force an exit from the mountains by enveloping on two sides, with the 2nd Mountain Bde. eastwards with the 10th Mountain Bde. westwards, and the Alpine Corps in the centre. The attack began on Oct. 16. After easy initial successes the weather broke on Oct. 18, and this circumstance, together with hastily executed Rumanian counter-attacks, prevented complete success.

South of Petrosény the group of Lt.-Gen. Kneusel, with the 11th Bavarian Inf. Div., the 144th Inf. Bde., and the 6th Cav. Div., began the attack in numerous columns through the Szurduk and Vulkan passes and over the heights to the west. In spite of the fall of snow the advance began on Oct. 23.

News had been received that, under pressure of the preceding attack by Krafft's group and the I. Res. Corps, the Rumanians had deflected against these reinforcements which had been sent up, and that it would therefore be easier to break through. At first,

indeed, complete success attended the attacks of the Kneusel group. The troops, forcing back the Rumanian 11th Inf. Div., had worked their way to the foot of the mountains N. of Târgu Jiu, and were to fight their way out to the plain on Oct. 27. At this point, however, a counter-attack by the hurriedly summoned Rumanian 21st and 22nd Inf. Bdes., and a regt. of the 1st and 3rd Inf. Divs., struck the W. wing. After losing many in prisoners and guns the German detachments had again to withdraw to the frontier heights, whither the Rumanians pursued them only with skirmishing detachments. In spite of the defeat he had suffered Falkenhayn held fast to the idea of a break-through by way of Târgu Jiu, and directed the newly arriving troops (41st and 100th Inf. Divs. and 7th Cav. Div.) to Petrosény. After the experience just gained the most thorough preparations were to be made for this operation, which was to begin on Nov. 11, Lt.-Gen. Kühne of the LIV. Res. Corps being chosen for the command of this strengthened group.

Urged by the Rumanian Army Command, the Russians relieved the Rumanian troops facing the Austro-Hungarian I. Army, beginning from the N., and pushed the southern boundary of their IX. Army in the middle of Nov. to a point just N. of the Gyimes Pass. Simultaneously with the III. Cav. Corps and the XXXVI. Corps, they attacked in this new sector the Austro-Hungarian XXI. Corps on Nov. 6. In expectation of this Russian push forward the army front command had placed in reserve the Brudermann Cav. Corps (3rd and 10th Cav. Div.) in the district Olah-Toplica-Gyergyó-Szt. Miklós, the 10th Bavarian Inf. Div. brought southwards from the VII. Army in the district around Csik-Szereda, and the bulk of the 8th Bavarian Res. Div. at Kézvivasarhely. The Russian forward movement obtained small successes on both sides of the Tölgyes and Békás Pass. After the bringing up of the 10th Bavarian Inf. Div. and the 3rd Cav. Div. the situation was once more restored.

In the Ojtoz Pass also, where the 71st Inf. Div. and the 1st Cav. Div. were once more placed under the I. Army as from Oct. 29, and in the Trotus valley, the Rumanians, partly mixed with Russian units, attacked on Nov. 5 without obtaining noteworthy successes.

The Break-through at Târgu Jiu.—According to plan, the attack of the group of Lt.-Gen. Kühne began on Nov. 11 S. of the Szurdok and Vulkan passes. They were to force their way into the Wallachian plain before the approach of winter made mountain operations impossible. Simultaneous attacks on all the other passes of the Transylvanian S. front and at Orsova were to distract the attention of the Rumanians and divert their reinforcements from the principal theatre of attack, an intention which was successfully accomplished.

Protected by the 41st Inf. Div. on the W., with the 100th and 301st Inf. Divs. E. of the river Schyl, on the W. flank by sections of the 6th Cav. Div. and the 9th Regt. of the Hungarian Landsturm, the troops fought their way out of the mountains in an obstinate struggle lasting from Nov. 11 to 14, and on Nov. 15 reached Târgu Jiu. The Rumanian 11th Inf. Div., seriously weakened, retired to the heights S. of the town, where it again gave battle with rapidly brought up new forces of about the strength of two divisions. In the Kühne group the Schmettow Cav. Corps (6th and 7th Cav. Divs.) was brought along the road over the pass and placed on the W. wing for the envelopment of the enemy; the 11th Bavarian Inf. Div., hitherto in reserve, was placed on the front E. of Târgu Jiu, while the 301st Inf. Div. acted as covering troops on the east.

On Nov. 16 the Kühne group attacked once more. On Nov. 17 the Rumanians, in spite of the most courageous defence, were decisively beaten. The road into Wallachia lay open. The pursuit was undertaken without delay. With the right wing (6th Cav. Div. and behind that the 41st) in the Jiu valley through Craiova, the centre (100th and 11th Bav. Inf. Divs.) towards Slatina, and the left wing (301st Inf. Div.) in the direction of Drăgășani, the group swerved eastwards and made rapidly for the Alt. On Nov. 21, Craiova, the capital of Wallachia, was reached. The rapidly attacking vanguard of the 6th Cav. Div. succeeded on the 23rd in seizing the bridge E. of Caracalu,

which had remained undamaged, over which the main body of this division on Nov. 24 and the 7th Cav. Div. on the 25th crossed the Alt, in order to push on against the Vede sector.

The Rumanians, repulsed from Târgu Jiu (11th and 17th Inf. Divs. and parts of other divs.) placed themselves after the destruction of the bridges on the E. bank of the Alt between Slatina and Drăgășani, in order to bar at this point an advance by Lt.-Gen. Kühne's troops. Farther N. too, opposite the group of Lt.-Gen. von Krafft, the Rumanians had evacuated the W. bank of the Alt, so that the German troops were able to occupy Rimnik Valcea on Nov. 25. The attempts of the 41st and 11th Bav. Inf. Divs. on Nov. 25 and 26 to cross the Alt at Slatina failed, in spite of the support of some squadrons of the 7th Cav. Div., which had already come into action from a S.E. direction. The 100th Inf. Div. was now sent in support of the Cav. Corps by way of Caracalu, and was soon followed by the 11th Bav. Inf. Div. and the 115th Inf. Division.

In consequence of the rapid break-through at Târgu Jiu the retreat of the Rumanian Orsova group, 3 regts. of the 1st Inf. Div. with artillery, was cut off. Held in front by violent attacks on the part of the group of Col. Szivó, they were shut in on the rear by detachments of the Kühne group. In a series of engagements in which at one time they threatened the rear communications of the Kühne group, this Rumanian group went down along the Danube, until, completely surrounded at the mouth of the Alt, they laid down their arms before their pursuers on Dec. 6. Ten thousand men and 40 guns fell into the hands of the much weaker Szivó group.

In front of the group of Lt.-Gen. von Krafft, reinforced by the newly arrived 216th Inf. Div., the Rumanians also could not hold their own on the E. bank of the Alt in spite of the participation of the 7th and parts of the 8th Inf. Divs.; they retreated as far as Curtea d'Argeș and behind the Topolog sector, where they offered a temporary resistance.

The I. and XXXIX. Res. Corps (under which latter the 89th Inf. Div. in the Bodza Pass had been placed) maintained undiminished pressure on the Rumanian groups opposed to them. With the aim of building up a further reserve of the army front, the 187th Inf. Div. was relieved by the approaching Austro-Hungarian 24th Inf. Div., and placed in readiness in the Hâromszék. The Ojtoz group now under the command of Gen. von Gerok, of the XXIV. Res. Corps, was on Nov. 12 again placed under the IX. Army Command. On the E. front the Russians continued the relief of the Rumanians as far as the road over the Ojtoz Pass.

Crossing of the Danube Army at Sistova.—On the side of the Central Powers the Army Command now thought the moment had arrived for the Danube Army in position at Sistova to cross the Danube and push forward towards Bucharest, in order, in conjunction with the approaching IX. Army, to effect the complete conquest of Wallachia. The Danube Army consisted of the 217th German Inf. Div., the 1st and 12th Bulgarian Inf. Divs., the combined Cav. Div. of Maj.-Gen. Goltz, German and Bulgarian Landsturm troops, German and Austro-Hungarian heavy artillery, the 26th Turkish Inf. Div. and Austro-Hungarian pioneer formations. At 4 A.M. on Nov. 23, favoured by thick mist, and supported by the Austro-Hungarian Danube monitors and the German motor-boat flotilla, the transport across the river of the 217th Inf. Div., unnoticed by the enemy, was successfully accomplished without delays. Zimnica was occupied. Then the 1st Bulgarian Inf. Div. and the Landsturm formations crossed; the resistance of Rumanian detachments brought up was rapidly conquered.

On Nov. 24 the bridge-head was widened, and the construction of a pontoon bridge by the Austro-Hungarian pioneer group of Maj.-Gen. Gaugl was begun, and finished in the afternoon of Nov. 25 at 6 o'clock. The remaining troops were now brought over the bridge in unbroken sequence, and the advance was begun; on the left wing the cav. div. towards Alessandri, on its right the 217th Inf. Div., then the 12th and 1st Bulgarian Inf. Divs. The Turkish 26th Inf. Div. followed as Army Reserve behind the left wing. Rapidly advancing, and quickly

breaking the resistance of the Rumanian 18th Inf. Div. and the 1st and 2nd Cav. Divs. sent against them, the heads of the columns had already on Dec. 1 reached the Argeşu, S.W. of Bucharest. But in this hurried forward movement the Danube Army, after establishing only slight contact by means of cavalry at Roşi de Vede, again lost touch with the main body of the IX. Army, held up on the Alt sector; their left flank lay open.

Battle of the Argeşu.—The Rumanians recognized the opportunity offered them of falling on the rashly advanced Danube Army. They endeavoured, with their I. Army, to keep the Kühne and Krafft groups as far to the W. as possible, and also made violent frontal attacks across the Argeşu on the isolated Danube Army, and on Dec. 2 from the N.W., completely encircling the left wing of the Danube Army, with the Rumanian 1st Cav. Div., then parts of the 2nd, 5th, 9th and 10th Inf. Divs. The Danube Army was thus placed in an extremely critical position. Rapidly brought-up Landsturm battalions, a few pioneer companies and the 26th Turkish Inf. Div., advancing in the second line, compelled a pause in the Rumanian enveloping movements. This Rumanian manœuvre, which only failed of success because it was not executed with sufficient energy, was coincident with violent pushes carried out by the Russians on the Carpathian front, from the Tartar Pass southwards to the Ojtoz Pass and on the Dobruja front, and also with attacks by Gen. Sarraill's Army on the Salonika front, by which it was hoped to relieve the hard-pressed Rumanian Army and to snatch from the Central Powers the advantage developing in this area. Yet all efforts were in vain.

The right wing of the IX. Army, which had been placed from Nov. 30 under the army group command of Field-Marshal von Mackensen, was brought up with the utmost haste. The 100th Inf. Div., advancing northward on Nov. 27 and 28 on the E. bank of the Alt, had at last succeeded in compelling the Rumanian I. Army to abandon the Alt sector. The 41st and 301st Inf. Divs. could then cross the river at Slatina. The pursuit towards the E. was conducted in the following groups: along the projected Craiova-Bucharest railway the 11th Bavarian Inf. Div.; behind that the 115th Inf. Div.; N. of the Bavarians the 100th, 41st and 301st Inf. Divs. The Schmettow Cav. Corps had ridden in advance of the right wing. Thus the IX. Army approached the seriously threatened left wing of the Danube Army. On Dec. 2 parts of the Cav. Corps, and on Dec. 3 the 11th Bavarian and 100th Inf. Divs., swerving southwards, were able to participate in the battle. The Rumanians, now themselves enveloped, turned back with heavy losses to Bucharest. For the Danube Army the crisis was over.

While on Dec. 2 and 3 the main body of the Schmettow Cav. Corps and the 100th Inf. Div. covered the road to Bucharest, Lt.-Gen. von Kraft at the same time, with the 216th, 73rd and 301st Inf. Divs., struck the remnant of the Rumanian I. Army on the middle course of the Argeşu, and pushed forward with the Alpine Corps and the 2nd Mountain Bde. towards Tirgoviste, which, after the capture of Câmpolung, the I. Res. Corps was also approaching.

Attacks by the just arrived Russian 40th Inf. Div. and the 8th Cav. Div. on Dec. 4 and 5 against the Bulgarians on the S. wing of the Danube Army gave no results. The violent attacks delivered by the Russians against the Austro-Hungarian Army and against the Bulgar-Turkish Dobruja front in the beginning of Dec. were also continuously repulsed.

The Capture of Bucharest.—On the evening of Dec. 5, after successful engagements, the Danube Army stood E. of the Argeşu and S.W. of Bucharest, and the IX. Army in close touch N. of the town as far as the Prahova valley. Since it was doubtful whether Bucharest would be defended as a fortress, heavy artillery and all the means of attack were placed ready to hasten its capture. In the night of Dec. 5-6 cavalry of the Schmettow Corps rode up towards the N.W. front, and found the works blown up and ungarrisoned. The Rumanians evacuated their capital almost without fighting. On the night of Dec. 6 the troops of the Danube Army and parts of the S. wing of the IX. Army entered Bucharest, while on the same day

Falkenhayn's N. wing captured Ploesci, and with it the important petroleum area, where English hands had previously rendered the boring apparatus useless for a considerable length of time. Two days later, as the result of rapid enveloping movements carried out by Lt.-Gen. Morgen's group, the 4th Rumanian Div., left stranded in the mountains, were surrounded in the district N. of Ploesci, and were taken prisoners. The road to the S. now also lay open to Lt.-Gen. Staabs' group. The 51st Honved Inf. Div. was able to occupy Sinaia.

Pursuit to the Danube-Sereth Line.—Field-Marshal von Mackensen now received the order to push forward with his army group (III. Bulgarian Army, Danube Army and IX. German Army) to the shortest line of communication between the sea and the Carpathian front, that is the Danube mouth-Galatz-Sereth to Ajudumiu-Trotus river. The IX. Army was to advance between the mountain river and the projected railway line Bucharest-Urziceni-Forcivechii-Tecuciu; the Danube Army between this line and the Danube; the Bulgarian III. Army to advance in the Dobruja.

On Dec. 12 the IX. Army threw the Rumanian I. and II. Armies, reinforced by the Russian IV. Inf. and VI. Cav. Corps, out of a fortified position on both sides of Mizil, and on Dec. 15 took Buzău. There the 89th Inf. Div., which had advanced south-eastward from the Bodza Pass into the Buzău valley, joined Falkenhayn's army. The Danube Army on Dec. 14 won the way through the Jalomitsa sector against the Russian VIII. Inf. Corps and III. Cav. Corps. On Dec. 17 the two armies faced a Russo-Rumanian position running along the line from the lower course of the Calmatuciu by Forcivechii along the heights W. of Rimnicu-Sarat.

Meanwhile the Bulgarian III. Army had begun to clear the Dobruja and, meeting with little resistance, had soon reached the Danube estuary; turning towards the eastern bridge-head from Braila at Macin it transferred the Turkish VI. Corps to the Danube Army.

At Christmas the IX. and the Danube Armies broke through the enemy positions, and threw the Russians and Rumanians back northwards. On Jan. 4 1917 the Danube Army captured Braila, and pressed forward as far as the Sereth; on Jan. 8 the IX. Army took Focşani and the country N. of it as far as the Putna. On the S. wing of the army front the Archduke Joseph launched to the attack against the Russians in the last days of Dec. the Gerok group with the 218th Inf. Div., the 1st Cav. Div., the 71st Inf. Div. and the 187th Inf. Div. The S. wing fought their way through the extensive wooded mountain district, and effected a junction with the IX. Army. South of the Ojtoz road the attack came upon the Russians who were relieving the Rumanians. The Rumanian 15th Inf. Div. was again thrown into the action. The attack of the Gerok group only succeeded in winning a little more ground here. Fall of snow and sharp frost made further operations impossible.

The actual line won was fairly near the sector it had been intended to reach. On the side of the Central Powers it was decided to go into permanent positions here. There was reason to be satisfied with the success of the campaign. Transylvania was liberated; a country rich in resources, Wallachia, had been conquered; the Rumanian Army had been thoroughly beaten, and had for the most part ceased to be a factor in the fighting for a long time to come. The Russian Army, instead of giving the hoped-for support, had had in addition to take over another 400 km. of front. The Russians, too, were glad after a year too full of fighting to be able to rest. Besides the IX. Army (16th Inf. Div. and 2nd Cav. Div.), extending from the Bukovina to the Casinu valley south-eastward of Ocna, the Russian new IV. Army stood here from Racoşa on the Susita to Suraia E. of Focşani (6th Inf. Div.); from there eastwards to the Black Sea the VI. Army (9½ inf. divs. and 3 cav. divs.). Of the Rumanians only from 5 to 6 divs., reinforced by Russian troops, remained on the front as the Rumanian II. Army, between the Russian IX. and IV. Armies. The remnant of the Rumanian Army, saved with difficulty, was transferred to the district between Jassy and Târgu Frumos to recuperate. A French mil-

itary mission undertook to reorganize the army, and to give it a thorough education based on the principles of the conduct of modern warfare. This task it had finished by the summer.

The Battles N. of Focșani in the Summer of 1917.—In the spring of 1917 events took place of the most far-reaching significance for the conduct of the war in the East: the deposition of the Tsar, the outbreak of the revolution in Russia and the beginning of the collapse of the Russian army. As on all parts of the eastern front, so in Rumania, the Russian infantry had no more desire for fighting; the Russian artillery, left to carry on alone, were threatened by the infantry; indeed it came to regular battles between the two arms. It was only with difficulty that the numerous officers of the Western Powers distributed among the higher commands could prevent the collapse of the eastern front. The fighting value of the Russians did indeed improve at the time of the Kerensky offensive of June 1917, but the improvement was not a lasting one. The Rumanian troops remained untouched by all these happenings. Indeed it seemed as if Rumania's fighting strength increased in proportion as her ally became less reliable.

In the second half of July the reorganized Rumanian I. Army was placed between the Russian IV. and VI. Armies from a point E. of Nemoloașa to S. of Tecuciu on the Sereth front.

In connexion with the operations in East Galicia the Central Powers intended to strike a decisive blow against the Russians and Rumanians in Rumania, in order to shake the whole Carpathian front and if possible to gain Moldavia. The operation planned across the Sereth at Nemoloașa was to begin in August. The preparations for this were in train when the Rumanians anticipated the attack.

Rumanian Attack at Soveja.—On July 25 the Rumanian II. Army, with the IV. and II. Corps, and the Russian VIII. Corps on the N. wing of the Russian IV. Army, broke through the weak front of the 218th Inf. Div. and the 1st Cav. Div. and threw them far beyond Soveja back into the mountains, the wing division of the IX. Army being thereby surrounded on the N. and N.W. by the Russian VIII. Corps. Even though there was little need to fear Rumanian advance against Kézdivásárhely in the rear of the I. Army, on account of the width and impassable nature of the mountains, there was all the more danger that, after the capture of the Mt. Odobeshti (Odobeshti), the whole front of the IX. Army, which covered the sphere of the earlier Danube Army and was commanded by Gen. Kosch, might be rolled up from the north. This was obviously the intention of the Rumanians and Russians, but the troops in carrying out the operation did not strike hard enough. Precious time was thereby lost. On account of the want of roads direct support of the 218th Inf. Div. was hardly possible. It was only slowly that one regiment of the 117th Inf. Div., and then half the 37th Honved Inf. Div., which had been set free from the N. wing of the I. Army, could be brought up. The 217th Inf. Div. was supported by single regiments and battalions of 5 different divs. of the IX. Army, and the attack was thus barred.

In the counter-operation planned by the Central Powers it was intended to take up again the original plan of penetrating far into Moldavia. For this purpose the IX. Army was to conduct the main attack from Focșani W. of the Sereth in the direction of Ajudu Nuou, and simultaneously to cover this attack by the construction of a bridge-head on the E. bank of the Sereth in the direction of Tecuciu. A second push was to be delivered by the Gerok group from the Ojtoz valley on Onesci. By this means the Rumanian II. Army, which had advanced into the basin of the Soveja, was to be cut off.

Engagements North of Focșani and South of Oena.—For the attack which was to start from Focșani the following were placed in readiness under the command of Lt.-Gen. von Morgen (I. Res. Corps): the 12th Bavarian Inf. Div., 76th Res. Inf. Div., and the 89th Inf. Div., to be followed in second line by the 216th Inf. Div. As army reserve there stood at Focșani the 212th and 215th Inf. Divs. On Aug. 6 the attack began, and had indeed the desired success on the first day in a N.W.

direction. The attempt to cross to the E. bank of the Sereth, however, failed.

The Russian Corps which were attacked (the VII. and behind that the XXX.) put up a surprisingly obstinate defence. It was only after throwing in the army reserves that the German I. Res. Corps succeeded in overrunning the Susita sector. Moreover, the 5th and 9th Rumanian Divs. of the Rumanian I. Army also came forward to face the attacking Germans, and caused considerable delay, especially at Marasesti (Marasbeshti), by their violent, deeply echeloned counter-attacks.

On Aug. 10 the VIII. Corps with 3 (partly combined) divs. reinforced the attack of the Gerok group on both sides of the Ojtoz valley. They attacked the Rumanian IV. Corps (6th and 7th Inf. Divs.), and gained ground as far as just S. of Oena and Grozesci. But on account of the obstinate resistance of the Rumanians the objective, Onesci, could not be reached.

Left of the I. Res. Corps the XVIII. Res. Corps, reinforced by the Alpine Corps, once more in action, had meanwhile joined in the attack with their left wing, and after heavy engagements had taken Panciu N. of the Susita. On Aug. 15 the S. wing of the Gerok group (218th Inf. Div. and sections of the 117th Inf. Div., half the 37th Honved Inf. Div. and the 8th Mountain Bde.) and the 217th Inf. Div., standing on the left wing of the XVIII. Res. Corps, also joined the attack and slowly drove the Rumanians out of the basin of the Soveja. A bridge-head on the W. bank of the Sereth threatening the German flank, held by the Rumanian 5th Div., was stormed by the 216th Inf. Div. of the I. Res. Corps on Aug. 14, severe losses being inflicted on the Rumanians. The further attempts of the I. Res. Corps, under which was placed the newly arrived 13th Rifle Div., to advance over the line Marasesti-Panciu, failed through Russian and Rumanian counter-attacks.

In consequence of the events in East Galicia and in the Bukovina, where the Russians were driven back to the old boundary of the Empire, a regrouping of troops and new distribution of the armies in Moldavia was effected. The troops of the Russian IV. Army were withdrawn to the N. to the VII. Corps, and the Russian IV. Army Command took over from the IX. Army Command the sector on the Transylvanian E. front as far as the Slanic valley. The Rumanian I. Army also took over the sector held earlier by the Russian I. Army, so that the two Rumanian armies now stood side by side.

On Aug. 28 the XVIII. Res. Corps, with the 216th Inf. Div. and the Alpine Corps, attacked from the line Panciu-N. edge of the Mt. Odobeshti in a N.W. direction, to gain the upper course of the Susita. After stubborn engagements lasting for many days against the Rumanian II. Corps, Jresci and the heights S. of the Susita were captured, upon which practically the old line, as it stood before the Rumanian attack, was reached. On Sept. 3 attacks from the German side were again suspended.

At the beginning of Sept. the Rumanians with the IV. Corps conducted a series of violent attacks against the advanced positions of the VIII. Corps, especially against the 225th Inf. Div. standing just S. of Oena, but they were bloodily repulsed.

On the side of the Central Powers, after this unsuccessful enterprise, the troops which could be spared (the Alpine Corps, the 13th Rifle Div., the 117th Inf. Div. and much heavy artillery) were withdrawn for transfer to other theatres of war. The remaining units again went into permanent positions. On the Rumanian side the fruitless attacks ceased. They had suffered heavy losses in killed and wounded, and important loss in prisoners and material. The newly formed Rumanian divs., instructed by the French, had succeeded in defending their country from complete conquest. The battle of Marasesti, as it was called by the Rumanians, is the most famous page of the Rumanian Army in the World War.

Armistice of Focșani.—On Dec. 5 the commander-in-chief of the Russian S.W. front, Gen. Shtcherbachev, asked for an armistice. On Dec. 7 the negotiations began at Focșani under the presidency of Lt.-Gen. von Morgen; representatives of all the participating armies took part, and they were concluded on Dec. 10.

(R. K.)

EASTMAN, GEORGE (1854–), American inventor and philanthropist, was born at Waterville, N.Y., July 12 1854. He was educated at Rochester and early became interested in photography. In 1880 he began to manufacture dry plates and four years later produced the first practicable roll film. In 1888 he invented the "kodak." In 1900 he gave \$250,000 to the Rochester Mechanics' Institute. He has given laboratories to the university of Rochester and has donated \$500,000 toward that university's endowment. To its school of music he has given \$3,500,000 and to its medical school \$4,000,000 (1920). In 1920 it became known that he had given at various times large sums to the Massachusetts Institute of Technology, amounting to \$11,000,000.

EBERT, FRIEDRICH (1871–), first president of the Reich or German Federated Republic, was born Feb. 4 1871 at Heidelberg, where he attended the national elementary school and then learned the trade of a saddler; after he had become a journeyman he migrated, according to the German custom, from place to place in Germany, seeing the country and learning fresh details of his work until he finally settled at Bremen. There he became interested in the agitation of the Social Democratic party, obtained in 1893 an editorial post on the Socialist *Bremer Volkszeitung* and in 1900 was appointed a trade-union secretary and ultimately elected a member of the Bremen *Bürgerschaft* (comitia of citizens) as representative of the Social Democratic party; in 1905 he was elected to the presiding board of his party and was returned as a deputy to the Reichstag in 1912. In 1913 he was chosen as successor to Bebel to preside over the whole Social Democratic party. During the World War he endeavoured by negotiations with the Dutch and Swedish Social Democrats to prepare the way for united action by all the Socialists in the belligerent countries. He took part in 1917 in the Stockholm conference, which, however, had no practical result. He likewise endeavoured without success to bring about a German understanding with Russia. After the revolution he was one of the six commissaries of the people who formed the first provisional Government, in which he shared the presidency with the Independent Socialist Haase. His influence among the commissaries became predominant, and he rendered eminent services in conjunction with the Socialist War Minister, Noske, and the Socialist leader, Scheidemann, in the restoration of tranquillity and orderly administration. He was a keen opponent of all varieties of the Spartacist, Communist or Bolshevik movements, and bore a leading part in the suppression of the Spartacist insurrections. He was elected president of the Reich by the National Assembly at Weimar on Nov. 12 1919. (C. K.)*

EBNER-ESCHENBACH, MARIE, FREIFRAU VON (1830–1916), Austrian novelist (see 8.843), died in 1916. (See also AUSTRIAN EMPIRE: Literature.)

ECHEGARAY, JOSÉ (1833–1916), Spanish author and playwright (see 8.870), died at Madrid Sept. 16 1916. Together with Frederic Mistral, he was awarded the Nobel prize in 1904.

ECONOMIC ENTOMOLOGY (see 8.896).—During 1910–21 the value of economic entomology as an essential part of applied science had been definitely realized throughout the civilized world (for MEDICAL ENTOMOLOGY, i.e. insects in human disease, see, under that heading, a separate discussion as an independent science). In the United States alone had the conditions of agriculture and horticulture previously been such that the farmers and fruit-growers were compelled to deal with their pests if they were to obtain crops at all; and economic entomology was then developed in America to an extent unknown elsewhere. But this limitation is no longer in effect, and the factors that have combined to bring entomology to its proper place in the sciences that underlie the practice of agriculture and horticulture are simple and clear. So far as relates to the older countries, with an established and ordered system of crop-growing, whose stability and perseverance make in themselves for the minimum of insect prevalence, the comparatively small losses due to pests have now become important owing to the keener competition in crop production, the lowering of values and the

greater care that has to be exercised to make a profit; when agriculture flourished the margin of loss due to pests could be neglected; but this had often approximated, in the last ten years before the World War, so closely to the actual profit that the losses, small though they might be, had of necessity to be checked. In the tropics, the opening up to cultivation of increasing areas in cotton, tea, sugar, coffee, palms, citrus and specially rubber has brought in its train insects which may entirely inhibit the successful cultivation of the crop if they are not dealt with.

The decade 1910–20 was one of extraordinary developments in the trials of new crops in fresh areas, and it is one of the cardinal principles of modern entomology, as explained below, that the introduction of new crops to new areas stimulates the outburst of immense insect epidemics; the British Dominions and colonies have followed the lead of Cape Colony and the West Indies, and have found the entomologist a necessary officer on the staff of the agricultural department. The first entomologist appointed from the United Kingdom to such work took up his duties at the close of 1899; now a number leave England yearly to replace the vacancies or to fill new posts in the agricultural departments of the Dominions and the colonies of the Empire. A third factor, and one that will increase in importance, has been the immensely increased facilities for the rapid transport of plants and pests from one country to another, and also the increased desire to obtain the new varieties of tropical crops produced by the economic botanists of the tropical agricultural stations. Formerly the Royal Botanic Gardens, Kew, were the British centre of plant distribution, and while Kew was the home of many introduced scale insects, few pests were distributed apart from these; but the new varieties of cane from Java and the West Indies, the cotton seed from Egypt, Cambodia, Australia, the mango seed from the East, the rubber plants that circulated over the tropics, the countless shipments of tropical plants, have been the means of introducing pests to new countries, where, freed from the control of nature by means of natural enemies, they have bred and multiplied to their full extent and so constituted a very serious menace to cultivation. Experience has also shown that the new applied entomology is as practical a science as any other upon which the practice of agriculture depends. This was not always the case, and the amateur entomologist, whose interests were primarily confined to collections and nomenclature, did not impress the practical farmer as able to help him in his fight against enemies; this phase (from Great Britain and India notably) has not wholly passed, but it has so largely given place to the practical entomologist whose object is to eliminate the pest and thereby also the loss, that the entomologist is now recognized as necessary. A final factor is the growing recognition of the value of "team work," that is, of the coöperation of the plant breeder, plant physiologist, mycologist, bacteriologist, and "soil condition" expert, in tackling problems of plant hygiene, and their demand for the collaboration also of the entomologist able to deal with that aspect of the problem. Many insect problems are cases solely of gross damage by feeding insects; but many are tangled up with other disease phenomena, and in many cases an insect is the transmitter from plant to plant of virulent disease organisms. It will be evident that the older type of entomologist, whose interest in the insect ended with its classification and the enumeration of the synonyms under which it was known in the literature, must be replaced by the more widely trained man capable of collaborating in these complicated problems.

Training.—In 1900 there were few facilities for training outside of the colleges and experiment stations of the United States, and the entomologist selected for responsible work in the colonies was required to have taken a degree in zoölogy and to have an amateur knowledge of entomology as then understood. Even in 1910, the English universities provided no better training, and the groundwork of a very thorough education in comparative anatomy and zoölogy was regarded as the one essential upon which could be laid a small amount of

entomological knowledge. A single British college established in 1911 a fuller course of specialized training, and has since provided a four-year course, designed to teach not only entomology but also so much of allied subjects as to enable the entomologist to collaborate readily and intelligently with his colleagues in plant physiology, plant breeding, mycology, bacteriology; it embraces some training in all these; it is divorced from zoölogy and the comparative anatomy of animals, except in so far as these are necessary to a wide comprehension of biological questions, and it provides a full and complete training in all aspects of applied entomology; further, a feature is the inclusion of research on some problem of applied entomology as part of the actual training, so that the trained student has had some experience of the kind of problem he will spend his life solving. Progress in this direction was being slowly made up to 1921 at other teaching institutions in Great Britain, but it contrasted poorly with the progress made in the United States in the provision of full facilities for training at many colleges and experiment stations. The problem of economic entomology in England had been to escape from the dominion of the zoölogist; the problem in America had been to incorporate sufficient science and to escape the anti-academic demands of the "practical man," to whom science as such did not appeal. It is probably true to say that both countries err, the English in being still too academic, the Americans in being too practical and too little sympathetic with the value of the "scientific" method of thought. This question was discussed at the Conference of Agricultural Entomologists arranged by the Colonial Office in England in June 1920, and while this Conference did not express any definite opinion, feeling was general that the ideal training was a groundwork of general horticultural or agricultural science, with the special training of the entomologist thereafter, and this is very nearly a mean between the present training of the Imperial College in London and that of most of the American colleges. The total number of entomologists required for science in the British Empire was not in 1921 sufficient to justify the provision of facilities for training at a number of universities, and it was possible that the establishment of tropical agricultural colleges might lessen the need of facilities in Great Britain, while providing better training for tropical problems. Careers in entomology had become far wider in 1921 than they were in 1900; in 1910 there was no official entomologist employed in England. The entomologist attached to the Ministry of Agriculture was in 1921 stationed at Harpenden, where he was in close touch with the Phytopathological Institute, with several entomologists employed upon research, and a beginning had been made with the appointment of local entomologists, each to advise a small group of countries and to work on the staff of the institutes designed to assist the progress of agriculture and horticulture. There are entomologists attached to the departments of almost every British colony, and the Dominions of Canada and South Africa maintain larger departments with considerable staffs. India was in 1921 still provided only with a small number of entomologists attached to some of the provincial governments, and had a small teaching and publishing section, not directly concerned with the checking of insect pests, at the Agricultural Research Institute. The most complete economic entomology department in India was that of the Madras Government, but entomologists were attached also to the agricultural departments of the Punjab, United Provinces, Bihar and Orissa, and Burma. A recent phase in the development of this subject is the increasing utilization of entomologists by companies engaged in the cultivation of tea, rubber, sugar-cane and similar products, or by associations of such companies. The Indian Tea Assn., the United Planters' Assn. of South India, the Colonial Sugar Co., and similar organizations in Malaya, Fiji, Jamaica, etc., maintain scientific staffs usually with entomologists, and there are considerable developments probable, now that the commercial community is realizing that economic entomology can be a sound, practical affair, and not an amateur scientific business of naming insects. In the United States, the develop-

ment of entomology as a career for trained men has probably reached its limit; as the conditions of agriculture stabilize themselves, as the proportion of each crop becomes fixed, so the immense incidence of crop pests characteristic of America will diminish, and it is now probable that the main concern of the entomologist in that continent will be to safeguard the industry against the incursion of fresh pests from abroad. European countries have been developing very much as described above. Before the revolution in Russia, there had been an immense impetus to the development of entomology in that vast country; in France and Italy the entomologist is now being increasingly utilized, and while in Germany the subject had been neglected, since the war the Association of Economic Entomologists has stimulated the development of practical applied entomology. In Japan the development of the subject has come with the increase in scientific departments, and especially with the immensely valuable results derived from research on the silkworm-rearing industry.

Control of Pests.—The principles on which it is sought to control and check insect outbreaks developed very markedly during 1910-20 from "artificial control" based upon direct remedies and insecticides, to "natural control" based upon an understanding of the factors that produce outbreaks of pests and action arising from that knowledge. The first essential is a really intimate knowledge of the pest itself, its habits in all its stages, its senses and sense organs, its (almost) daily ways in the most minute particulars. It is now recognized that this must be carried to a degree of detail not contemplated before, and that upon the intimacy of this knowledge depends the successful application of any direct method. It is not sufficient to know that eggs are laid in such a way, in such number, at such a time, that the larvae moult so many times, feed in such and such a way and pupate, that the pupa takes a certain time, and then the adult emerges to mate, lays eggs and dies. An instance may be taken from the Codlin moth, whose larva hibernates in the winter in shelter; the full-grown larva leaves the fruit, crawls about, and for shelter will get under a flake of bark, spin a light cocoon and there remain. Will it do this on the trunk and branches, on the north (exposed) or the south (sunny) side, must the bark be dead or alive, will it prefer a band of bast, cotton, jute, wool, silk or what? Must this be double or single, tied on tightly or loosely, all round, at what height, when put on, when taken off? The investigator has to try to put himself as far as he can into the mentality of the insect, and the success of the entomologist depends much upon this instinct, which will yet be much developed. The second essential is a study of controls; what is it that, in its native habitat, checks the increase of the insect? Is it climate, food, plant scarcity, parasites, predaceous insects, birds, bats, lizards, frogs, etc., or disease due to fungi or bacteria? Usually it is direct parasites, predaceous insects, and perhaps, under suitable climatic conditions, disease due to fungi, bacteria or a virus. It is these natural checks which, in natural conditions, balance the rate of increase of the insect, which is large. The third essential is the nature of the conditions which produce an increase of the insect to such a point that it becomes a pest, that is, so injurious as to affect the crop yield materially. Normally there is under undisturbed natural conditions a balance of life; the checks and the natural increase of the insect are so balanced, in nature, that the insect never increases to a point of being destructive. But under artificial conditions of cultivation, man disturbs this balance; he clears land, disturbing the ratio of plant life; he interferes with the bird life particularly; he plants areas with crops, i.e. an unmixed plant area, which favours the increase of any insect capable of feeding upon that crop, since the parent insect has not to undergo a precarious hunt from plant to plant for the proper food plant for its young, but finds an unmixed block, thereby escaping many dangers. In addition, man introduces blocks of new crop plants, which have not acquired protection against indigenous insects, and which are at once attacked, lacking the protection they will in time develop. These are some of the factors

by which man's artificial cultivation of crops disturbs the delicate balance of life, and produces those fluctuations or "waves" of insect abundance which the entomologist recognizes as pest outbreaks that he has to deal with. If he can he has to trace to their origin these waves of increase, and the modern science of entomology is to do this as far as may be. In many cases the problem is the simple one of determining if the insect is an introduced one; if it is, it has probably been introduced without the natural enemies that checked it in its original home; and it is due to the work of an Englishman, R. C. L. Perkins, that this principle was applied in the Sandwich Is. against the insect so seriously destructive to the sugar-cane crop, the Cane-leaf-hopper (*Perkinsiella saccharicida*). Its natural home is Australia. Study of the insect there showed it to be kept in check by a variety of insects, some of which were introduced to the Sandwich Is., eventually reducing the insect to the status of an ordinary insect, not a pest. This principle has been followed in other cases, notably the Fluted Scale of Orange (*Icerya purchasi*), the Gipsy Moth in the United States (*Porthetria dispar*), the Brown-tail Moth (*Euproctis chrysorrhoea*) in the United States, the Sugar-cane Cockchafer of Mauritius (*Phytalus Smithii*); it is the natural principle to proceed upon in the case of introduced insects and it has been developed especially in the United States, which owes to importation so many of its principal pests.

In other cases the disturbance and consequent occurrence of pests is due to violent alterations in the proportions of the crops grown. Where there has been, as in England, a fairly uniform mixed cultivation of many crops over a long period, a balance of life has been established as under natural conditions; but where the variations in supply cause fluctuations in prices and large areas are put under other crops, this balance is disturbed, and there are waves of insect pests; naturally this manifests itself far more quickly under tropical conditions, where there are several broods of an insect a year, than under temperate conditions, where there is only one brood a year with a long resting period, and it is partly this factor which makes for the very great loss from insect pests in the tropics.

Having obtained any data as to the factors producing an outbreak, it is to be seen whether there is any way of quickly restoring the balance of life, or of so modifying cultural practice as to avoid the outbreak, and it is to this that the entomologists' attention is specially directed. The nature of the rotation of crops, the time of sowing, the use of early or late maturing varieties, these are important points; a further point is on what food plants or under what conditions the insect spends the time when the crop is not on the ground or is not fruiting, and modern entomology emphasizes more definitely the value of the old maxim of clean cultivation, of growing only crops, with nothing on the land besides—no weeds, no alternative food plants, no "volunteer" plants. This is particularly the case with permanent cultivation such as fruit or such tropical crops as tea, coffee, cacao, rubber and the like.

A point of great interest, which has as yet been scarcely touched, is that of "immunity," whether natural or induced. The discovery that American vine stocks were immune to Phylloxera, since they had always been exposed to it in America, whence Phylloxera came, did much to save the European vine industry; there are stocks of apple which are apparently immune to the root forms of woolly aphis (*Schizoneura lanigera*); vigorous plants growing under good conditions are frequently "immune" to attacks of such sucking insects as Leaf-hoppers (*Jassidae*), Scale Insects (*Coccidae*), *Psyllidae* and White Fly (*Aleurodes*). This question is far more developed in the case of Fungi (e.g. rust in wheat) than in that of insects; but it is a question which has come more definitely to the front during the past few years. It is not at present possible to induce immunity, but it may soon be possible to do so.

The fourth point in the entomologists' plan is that of the utilization of direct remedies, such as insecticides, fumigants, and soil insecticides. There was a considerable modification in opinion during 1910-20, and but for the large propaganda by

insecticide firms, the use of these artificial methods would have considerably declined. In the actual practice of spraying there have been few improvements and no radical changes. The arsenates, nicotine, lime, sulphur, soaps, these are still the principal insecticides; heavy oil emulsions have replaced paraffin, and the present tendency is to seek farther afield for new and more toxic substances. But progress has been small, there has been little systematic investigation, and there are only differences in detail in the use of insecticides and spraying-machines.

A feature of the development of the subject has been the broadening of knowledge among farmers, fruit-growers and even the general public, particularly in the United States, but also in Europe. In England, publicity and propaganda campaigns have been mainly concerned with the house fly, and there is still great ignorance about other pests; but this is passing with the increase of nature-study and the greater development of natural-history societies in schools.

Legislation.—Experience of the value of legislation in regard to the spread of plant pests and to their destruction has resulted in a very definite simplification of the laws and enactments relating to insect pests, and a conference of delegates of 26 nations in Feb. 1914 at Rome formulated the Rome convention, which still further simplifies the principles governing the regulation of plant traffic from country to country.

Almost every country now seeks to protect itself against new pests, which, introduced without natural checks, become immensely active and destructive in a new habitat. These measures were very varied and are now simpler, and when a convention is established finally, it will probably rely upon one definite principle; but there is still some variety. Countries seek to protect themselves by prohibiting the import of plants from a specified locality, of specified plants, of anything likely to cause disease, of insects, or of packing with infested articles; so, for instance, a sugar-growing country prohibits the importation of canes, and also, perhaps, of all plants from an area in which a virulent insect pest is active.

An alternative is to permit importation under conditions; ports of entry may be designated at which alone plants come in, the plant imports may be limited to special times, or must be in new packages, or only in postal packets. The most general condition is inspection on arrival by a competent officer, who may order their destruction if infested with a pest, or the plants must be fumigated on arrival, this being done usually with hydrocyanic-acid gas generated from potassium cyanide and sulphuric acid, the amount used being about 2 oz. cyanide per 100 cub. ft. space for half an hour.

Formerly great stress was laid on the value of quarantine; all plant imports were grown in a quarantine ground under the supervision of a Government botanist until it was certain that they had no disease. The objection was that if the plant was diseased the disease was brought into the country and, whatever the supervision of the botanist, might get loose and spread; an alternative to quarantine was "following up"; the importer notified the arrival of plants and the exact spot where he planted them; an inspector saw them at intervals in order to destroy them if any disease developed.

A more recent principle is that of admitting plants without delay if they were accompanied by a certificate that they had been inspected by an official of the Agricultural Department of the exporting country, and were declared free of pests scheduled by the importing country, or that they had been grown in an area declared free of the scheduled pest. The latter applied particularly to *Phylloxera* of vine; the former applies to the schedule of pests drawn up in each country, and this is the principle accepted by the Rome convention of 1914. Each country is to draw up a schedule of pests which are not epidemic in that country but which are recognized pests, and any country sending plants will have an adequate service of trained inspectors to give certificates that either the nursery sending the plants, or the actual consignment, is free of pests. This cannot be done without a "Phytopathological Service," so that the consenting countries bound themselves to create this, and this has to some extent been done in Great Britain, France, Italy, Holland, Belgium. The United States refused even to discuss the question, and has adopted drastic inspection and certificates of freedom from pests, but experience has shown it that few certificates are reliable and it is not willing to receive consignments from any country whose certificates are not really of established value (e.g. those of Holland are accepted).

A further difficulty is that plants may come from countries not able to give certificates, e.g. Tibet, and these plants are very liable to introduce disease. Inspection on arrival is the usual method but an effort has been made to enable such plants to be grown under quarantine when imported by a firm of established reputation in Great Britain, so as to avoid the risks of unpacking at the port.

Internal legislation, prescribing action on the part of growers, has made progress during recent years, and has been very much simplified. In Great Britain the sale of diseased-plants order of 1921 puts a penalty on the sale of plants "substantially attacked"

by a number of common insects and fungi. The actual enforcement of the order generally would require the services of many thousands of officials, and would be impossible, but it is designed to give powers to the Ministry of Agriculture to proceed against any nursery notorious for distributing diseased plants, and also to enable the Ministry to act freely in case of a new pest being introduced.

In America and the British Dominions such legislation is common. It prohibits the possession of diseased plants, the sale of infested plants, the sale of plants from an infested area, the removal from declared areas of plants, cases, bags, packages, earth, manure and even of persons; it is often aimed entirely at nurseries and seeks to control the distribution of plants; nurseries must be registered, must be inspected at fixed intervals, must send out certificates of inspection with all consignments, and may, if infested with a scheduled pest, be quarantined; and there are the usual provisions as to entry, to prescribing remedies, to penalties for non-compliance. The treatments of infested plants by the owner or by the State are prescribed, or the destruction, isolation or confiscation of infested plants. Further provisions are to compel destruction of insect breeding-places, and to prohibit the planting in infested land or within a certain distance of infested land.

In many countries, as in Great Britain, the occupier of land has to notify the occurrence of any of the scheduled pests to the Ministry of Agriculture and in some tropical countries there is a specific prohibition of the practice of driving locusts to one's neighbour's land. The tendency is to rely less on legislation, compulsion and penalties, and to move more towards education and reason. The spirit which enabled a Government to close all schools, courts, places of business, etc., while a whole province fought locusts, exists only in the least civilized areas of the earth, and the campaign against pests is carried on by propaganda, education and the arousing of public spirit.

Insects and Crops.—The importance of insect attacks as factors in the growth of crops varies from the case of cotton, where the insect is a dominant factor, equal in value to soil and climate, to that of rubber, where as yet scarcely any serious insect pest has arisen, certainly none equivalent to the fungoid diseases.

Cotton was formerly produced mainly in the southern United States. There the bollworm was the chief pest, causing loss that now averages some £2,500,000 annually, but in 1894 the Boll Weevil appeared in Texas, and in 1905 Dr. L. O. Howard, Chief of the Entomological Bureau of the United States Department of Agriculture, wrote:—"The Mexican Cotton Boll Weevil has the unique record of developing in less than 20 years from a most obscure species to undoubtedly one of the most important economically in the world. There was a hope that the increase in cotton in the United States would keep pace with the world's demands; now the weevil has rendered this impossible."

The damage is now averaged at about £5,000,000 annually. But there is worse to come. Another pest has been known in India since 1844; this is the Pink Bollworm, which reached Egypt between 1903 and 1910. There they already had another bollworm; but by 1917 the Pink Bollworm was destroying on the average 17% of the crop, causing a loss of £8,000,000 a year, and this pest reached Texas in 1917. In spite of the efforts of the U.S. Department of Agriculture it was established there in 1921, and in a few years it seems likely to destroy 2,000,000 bales, worth, say, £60,000,000.

Nor are these the only pests of first-rate importance. In India the Spotted Bollworm is a pest which also attacks Egyptian cotton. In 1905 this pest almost entirely destroyed the cotton crop of the Punjab and Sind, and it was known in 1921 only in India, Egypt, the Sudan and British East Africa.

The chief cotton-producing countries are listed here with the pests they have; what if the pests spread to all? The output is that of 1917:—

	Acres	Bales	Pests
United States of America	33,841,000	11,302,375	H.A.P.E.
India	24,781,000	3,228,800	H.E.
Egypt	1,761,000	1,287,000	P.E.
China		830,000	
Russia	(840,000)	578,000	
Brazil		400,000	A.P.
Mexico		125,000	A.P.
Peru		110,000	
Indo-China		20,000	P.
Corea		200,000	
Nigeria		2,621	P.
Nyasaland		4,448	H.E.
Uganda		20,000	E.
West Indies		3,000	P.H.

H—*Heliothis armigera*, the American Bollworm.—It attacks cotton in America but, while it occurs universally in the tropics, does not, in India, attack any cotton but Cambodia.

A—*Anthonomus grandis*—Mexican Boll Weevil.

P—*Platyedra (Gelechia) gossypiella*—Pink Bollworm.

E—*Earias insulana*—Spotted Bollworm.

Apart from cotton, the actual limiting effect of insect pests is less definite but it is a notable factor in many tropical crops: sugar-cane

suffers heavily from two pests, moth-borers and cane-leaf-hoppers; the loss from one species alone is, in Barbados, estimated at over 15%. With sugar selling at £15 per ton, this means a loss of £6 per acre, and this loss is avoidable by a small expenditure; but the crop is grown, the expenses of rent, management, cultivation, manuring, harvesting, manufacturing are all incurred, on canes diseased and affected by this pest, and the net result is a decreased yield, expenses being still the same, of some £6 per acre.

A similar situation occurs with nearly all crops, but it is difficult to say definitely what proportion of the loss is due to insects. In England, Green Fly may ruin the hops, frequently ruins the plum crop; in America a long cold spring gives the Spring Grain aphid scope to increase, and decreases the yield of wheat and reacts on every wheat sale in the world, or a wet summer destroys Chinch Bug, and the wheat crop increases next year with bigger supplies and lower prices. Of the many factors influencing wheat prices, insects are only a small one, but they may be, in some years, just the determining factor, since the factors of climate, rainfall, weather, production, transport, speculation may all be steady.

Stock Raising, Building and Grain Storage.—Insects are not only factors in crop production but in stock raising, in building protection, and in grain storage. The best example of the first is in the Blowfly pest of sheep in Europe, Australia, S. Africa, Argentina and other places. The loss of stock in Australia in 1916 amounted to £3,000,000, and the production of wool and meat in Australia will depend very much on whether control is obtained over this pest. In 1921 no real effort had been made to control it; but it will eventually be controlled, probably by the introduction of natural enemies and by the employment of substances protecting the animal from attack.

The importance of insects in buildings in Great Britain has been emphasized by the discovery that the glorious timber roof of Westminster Hall was in a dangerous condition owing to the attacks of the Death Watch (*Xestobium rufovillosum*, or *lesselatum*). It was found that the timbers were destroyed to a very remarkable extent, and H.M. Office of Works embarked on a scheme of strengthening the roof with an invisible steel frame while preserving intact as much of the timber as possible. It was essential not only to stop the activity of insects but to protect the timber from further infestation, and the solution was found in a treatment by which all infested timber is freed of the pest by dichlorobenzene, and all surfaces are impregnated with a coat of soap, paraffin wax and cedarwood oil, which prevents further insect attack. This method has been applied to other buildings, notably St. Paul's Cathedral.

A war problem of importance in which entomology was concerned was connected with the preservation of the accumulated wheat stocks in Australia. In 1917 there was a stock of some three million tons of wheat in bags in Australia, with another similar amount to be harvested. All was stored in the open, since no other storage was possible, the wheat usually being shipped immediately, and the result of storage under bad conditions was an immense infestation by weevil (*Culandra oryzae*), threatening the complete loss of a stock of wheat urgently required for the Allied countries. Two problems needed to be solved, the storage of wheat and the freeing from weevils of the already infested wheat harvested in 1916 and 1917 and then awaiting shipment. Since the Australian Government were unable to deal with this problem it was necessary for the British Wheat Commission to undertake it, and the solution was found in a method of storage which prevented access of weevil and in a treatment by heat on a large scale, so that in a single plant 1,000 bus. per hour were heated for three minutes to 140°F., killing all stages of the weevil and giving a weevil-free wheat suitable for milling and baking. This treatment cost less than one penny per bus. and enabled Australia to ship 200,000,000 bus. of wheat which was otherwise becoming totally unsalable or unusable. (H. M. L.)

ECUADOR (see 8.010).—The population of Ecuador was not altered much during the period 1920-20. Immigration was very slight. No census had been taken. In 1920, an official estimate gave the pop. as 1,500,000.

Government.—In a message to Congress in 1914 President Plaza G. raised the question whether or not presidential government in Ecuador had met the test of experience. Upon that subject he held conferences with the members of a special committee of the Chamber of Deputies and hoped that, as a result of its report, a joint committee from both Houses of Congress would be appointed to draw up a project for the reform of the constitution of 1906. The Senate, however, did not favour this action. President Plaza G. again mentioned the urgent need of constitutional reform in his message to Congress of Aug. 10 1915. Upon the following day he addressed a special message to Congress proposing the political reorganization of Ecuador by the introduction of the parliamentary system. Annexed to his message were certain proposed amendments of Ecuador's fundamental law which were framed to accomplish this end.

These, however, were not accepted by Congress. On June 28 1917, President Baquerizo M. promulgated a decree regulating the duties of his Cabinet. The Minister of the Interior was to be charged with internal administration, municipalities, police, prisons, houses of correction, public works, railways, sanitation, concessions, and with government of the province of Oriente and the Galápagos Islands. The Minister of Foreign Relations was to have direction of international affairs, consuls, post-offices, telegraphs, telephones, immigration, and colonization. The Minister of Public Instruction was to be charged with public instruction, statistics and civil registry, fine arts, theatres, charity, justice, religion, agriculture, improvements and national forests. The Minister of Finance was to supervise the collection of the national revenues, the auditing of accounts, public credit, the administration of national property, commerce, public lands and trade marks. The Minister of War and the Navy was to control the regular army, reserves, war vessels and lighthouses. By a decree of Sept. 22 1910, the control of the province of Oriente and the Galápagos Islands was transferred to the Minister of Foreign Relations.

Communications.—In recent years measures were taken by the national Government for the improvement of roads, most of which were merely trails or bridle-paths. Some internal traffic was carried on by the rivers, especially by the Guayas river and the tributaries of the Amazon. The most important railway was the Guayaquil and Quito railway, opened to traffic in 1908. To shorten the route between these two cities the Government planned a railway between San Juan Chico and Riobamba. Other short railways were projected, and in some cases partly completed. A contract was signed whereby a railway was to be built from Quito to Ibarra, thence to Tulcan, and to the coast in the province of Esmeraldas. Surveys were made and construction was begun on a section of the roadbed near Ibarra in Aug. 1917. Construction was begun also on a railway between Ambato and Curaray in Jan. 1913. By June 1918, the section between Ambato and Pelileo was practically completed. In 1914 work was begun on a railway between Huigra and Cuenca. After some preliminary surveys had been made the Government decided in Aug. 1915 to build it from Sibambe to Cuenca, and actual construction began the following month. A railway projected between Bahia and Quito had, by 1917, been built and opened as far as Chona. In 1913, one was completed between the seaport of Manta and Portoviejo, and by 1915 that road had been opened to Santa Ana. A short railway was begun in 1914 between Guayaquil and Salinas, and another was being constructed in 1920 between Babahoya and Guaranda. During a large portion of the year 1920 Ecuador was almost isolated from the world by sea; for, because of the prevalence of the bubonic plague and of yellow fever at Guayaquil, that port was avoided by large vessels. In April 1914, a radio station was officially opened at Quito and wireless communication was established with a small station in Guayaquil.

Sanitation.—Sanitary work was begun seriously when, in Dec. 1913, a contract was signed between the Ecuadorian Government and White & Co., of London, for the paving of Guayaquil and the installation of a modern water system. A yellow-fever commission of the Rockefeller Foundation made a scientific study of Guayaquil in 1916. A fight against the fever was, however, postponed because of the World War. In 1918 squads of men under Col. Gorgas began a scientific attack upon the *stegomyia* mosquito in Ecuador. So successful was this campaign that, on May 27 1920, the director-general of public health at Guayaquil issued a statement that yellow fever had been eradicated from that city as well as from the towns in the provinces of Guayas, Los Rios, and El Oro, where it had been endemic.

Foreign Commerce.—There was some fluctuation in Ecuador's imports and exports from 1910 to 1918, but not much increase. Figures compiled by the Pan-American Union show that in 1913 the imports of Ecuador amounted to \$8,836,689 U.S. currency; and that her exports in that year amounted to \$15,789,367. In 1918 her imports amounted to \$8,111,690, while her exports came to \$13,364,774, in both cases a decrease. Her import and export trade with the United States had grown greatly at the expense of trade with European countries. In 1913 imports from the United States amounted to \$2,817,754; in 1918 they aggregated \$4,632,761. In 1913, out of a total export trade of \$15,789,367 her exports to the United States came to \$3,833,728, while in 1918 they amounted to \$10,429,150. Among Ecuador's most important imports in 1918 were textiles (other than silk), food-stuffs, hardware, machinery, paper, and perfumes; while her most important exports were cacao, ivory nuts, Panama hats, coffee, gold and wool.

Army and Navy.—In 1917 the navy of Ecuador was composed of a destroyer, a cruiser, a coastguard vessel, a submarine, a launch, and a tender, with a small personnel. The territory of the republic had been divided into six military zones which were in charge of army officers. A general staff was in control of the regular army, made up of 10 battalions of infantry, two squadrons of cavalry, three

regiments of artillery and a company of engineers. The regular army including officers, numbered 5,200.

Education.—Although by a law of Ecuador primary education was free and attendance compulsory, the percentage of illiteracy was high. In 1914 an Ecuadorian writer estimated that over 70% of children from 5 to 14 years of age were illiterate. In a message to Congress in Aug. 1915, the President stated that there were in Ecuador 1,054 primary schools with an attendance of 95,019 pupils. Secondary education was being conducted in 13 national *colegios* (academies) with 1,778 students. In addition there were schools for professional or technical training: normal schools, a school of agriculture, schools of arts and trades, a school of fine arts, and a national conservatory of music. Later commercial schools were founded in important cities. In 1916 and 1917 decrees were issued reorganizing the curricula of normal schools, of the school of arts and trades at Quito, and of the national military academy. In 1917 the President decreed the establishment at Quito of a museum of archaeology and of a national gallery of painting and sculpture. Higher education is carried on in universities at Cuenca, Guayaquil and Quito. The central university of Ecuador at Quito is composed of colleges of science, medicine and law. The younger universities at Guayaquil and Cuenca have colleges of law, medicine and pharmacy.

Finance.—In Ecuador's budget for 1914 the revenues and the expenditure were balanced at 20,441,955.92 sucres (nominal value \$0.486 or one-tenth part of £1 sterling); the income for that year, however, amounted only to 16,913,768.97 sucres, while the expenditure came to 20,220,794.83 sucres. Revenues from import duties which were estimated at 10,883,055.02 sucres came only to 7,707,191.26 sucres. The end of the year left the Government with a deficit of 3,307,007.86 sucres. This deficit would have been larger but for certain economies and the postponement of some payments. In 1915, partly because of the decrease in import revenues due to the World War, Ecuador had to borrow 20,000,000 sucres from local banks. The Minister of Finance announced that on Dec. 31 1917, her domestic debt amounted to 34,001,651.04 sucres, while her foreign debt came to 18,923,508.10 sucres, making the total debt 52,925,159.14 sucres. Of the domestic debt 131,547.27 sucres and of the foreign debt 6,618,115.04 sucres were interest unpaid. The minister stated that up to Dec. 31 1917, the service of the foreign debt in interest and amortization was in arrears 10,710,276.55 sucres, because of the decrease in revenues.

History.—Gen. Eloy Alfaro's term as president expired Aug. 31 1911. On Aug. 12, however, he resigned the presidency and his resignation was accepted by Congress two days later. Emilio Estrada, who was elected in Jan. 1911, was inaugurated Aug. 31, but died Dec. 21 following. Dr. Carlos Freile Z., president of the Senate, who had served as chief executive upon the resignation of Alfaro, again assumed executive authority which he exercised until March 5 1912. Meantime a revolt, having as its object the overthrow of the legal Government and the establishment of Gen. Alfaro as supreme magistrate, was quelled. That leader was taken out of the penitentiary at Quito by the infuriated populace and killed in Jan. 1912. Acting President Freile Z. was succeeded by Dr. Francisco Andrade Marín, speaker of the Chamber of Deputies, who exercised presidential authority from March 6 to Aug. 10, when Dr. Alfredo Baquerizo M., president of the Senate, took the reins of power and served as president until Aug. 31 1912. Upon that day, as the result of a special election held in April, Gen. Leonidas Plaza G. was inaugurated as president for his second term. He selected Alfredo Baquerizo M. as his Minister for Foreign Affairs, who was succeeded by R. H. Elizalde. The first years of his administration were stormy, being marked by revolts and civil wars. Even after a troublesome insurgent leader, Gen. Carlos Concha Torres, was captured by Government soldiers in Feb. 1915, his followers were loath to lay down their arms. In elections held in Jan. 1916, Alfredo Baquerizo M., a Liberal, was elected president: he was inaugurated on Aug. 31. Various steps were taken by the President and Congress to lessen the economic and fiscal strain due to the World War. Embarrassing disputes arose between Ecuador and the Guayaquil & Quito Railway Co. about the execution of their engagements. On Aug. 31 1920, Dr. José L. Tamayo was inaugurated as president for the term to Sept. 1 1924.

International Relations.—Part of the territory claimed by both Ecuador and Peru has been occupied by Peruvians. Provision was made for the settlement of the boundary dispute between Ecuador and Colombia by a treaty signed at Bogotá July 15 1916. This treaty drew a boundary line between Ecuador and Colombia; it also stipulated that a mixed commission

should be appointed to place marks along that line where natural boundaries were not sufficient and to make such minor reciprocal compensations of territory as might be necessary to fix the boundary exactly. That commission began the delimitation of the Colombian-Ecuadorian frontier line about a year later, and it completed the task by July 1919.

The World War.—On Aug. 17 1914, the Ecuadorian Government issued a decree announcing that it would observe the strictest neutrality in the World War and stating that it would adhere to the Hague Convention of 1917 and to the general principles of international law. Soon afterwards France and England complained that Ecuador had permitted violations of neutrality, allowing German war vessels to use the Galápagos Is. as a naval base. On Nov. 21 1914, Minister Elizalde issued a justificatory circular to American chancelleries about the neutrality of his Government. Seven days later President Plaza G. issued a decree containing certain regulations that were to be observed by all neutral vessels reaching Ecuador. In Oct. 1917, when the ex-German minister to Peru, von Perl, who was also representative of his Government to Ecuador, expressed his intention to proceed from Lima to Quito, he was informed by the Ecuadorian minister at Lima that his reception by Ecuador would be incompatible with the principles of American solidarity. On Dec. 8 following, the Minister of Foreign Relations sent cablegrams to Ecuadorian legations stating that Ecuador had severed relations with Germany. As a party to the Treaty of Peace with Germany, Ecuador had the opportunity of becoming a member of the League of Nations. At the instance of its committee on foreign relations, on Nov. 1 1920 the Ecuadorian Senate postponed action upon the League until the next meeting of Congress.

(W. S. Ro.)

EDINBURGH, Scotland (see 8.937*)—By the passage of the Edinburgh Boundaries Extension Act of 1920 Edinburgh has become, as far as area is concerned, the second largest city in the United Kingdom, through an amalgamation with Leith, and the absorption of the suburban districts of Liberton, Colinton, Corstorphine, and Cramond. The municipal area was increased from 10,597 to 32,402 acres.

The number of municipal wards has been increased from 16 to 23 and the number of members of the town council from 50 to 71—three representatives of each ward in addition to the two *ex officio* members, the dean of guild and the convener of the trades. The four Leith wards form the parliamentary division of Leith, and the four new suburban wards are in the northern division of Midlothian and Peebles. The powers of the board of trustees under the Edinburgh Waterworks Acts of 1869, 1874, and 1896 and of the Edinburgh and Leith corporations gas commissioners are now exercised by the town council. The total valuation, as extended, is £4,696,504.

The pop. of Edinburgh by the 1911 census was 320,315, of Leith 80,488, of Liberton 8,360, of Colinton 6,664, of Corstorphine 3,870, and of Cramond 3,763—a total of 423,460 for the extended city. The estimated pop. in 1920 was 450,000. In 1917, the corporation agreed to purchase the plant of the Edinburgh Tramway Co., for £50,000, and the transfer took place in July 1919, at the expiry of the company's lease. The work of replacing the system of cable cars was begun in 1910. A tramway extension to South Queensferry and Port Edgar was sanctioned by the town council in 1917. The most important addition to the public parks was the establishment by the Zoological Society of Scotland, in conjunction with the town council, of a zoological park at Corstorphine hill, which was opened in July 1913. The site, which extends to 74 ac., was purchased by the town council and feued to the society. About 27 ac. have been laid out in a manner designed to give expression to the latest ideas

about the acclimatization and exhibition of wild animals, and to show the inmates living under conditions which invite them to display their normal instincts and habits. The park contains a large and varied collection, and when completed will rival the London "Zoo." Large corporation markets and slaughter-houses were opened in 1910, and in March 1914 the Usher hall, bequeathed to the city in 1898 by Mr. Andrew Usher, was completed and opened.

Additions to the large number of public memorials in the city include a Black Watch memorial (1910), a statue of Dr. Guthrie (1910), a life-size statue of Thomas Carlyle (by Boehm) presented to the National gallery by Lord Rosebery in 1916, and a Gladstone memorial (1917). In 1913, Lord Rosebery presented to the city the historic house in the Lawnmarket known as Lady Stair's house; and in 1920, the birthplace of Robert Louis Stevenson, 8, Howard Place, was purchased as a memorial by the R. L. Stevenson club. In 1911, the King and Queen dedicated the new chapel of the Order of the Thistle, in St. Giles' cathedral. The new Freemasons' hall was opened in the same year. The western spires of St. Mary's cathedral (carrying out the original plan of Sir Gilbert Scott) were completed and dedicated in 1915 and 1917. Reconstructions of the national museum of antiquities and of the national portrait gallery were in progress in 1920 and a scheme for a national war memorial provided for the utilization for this purpose of Edinburgh castle, which was to be disused as barracks.

Royal residence at Holyrood had emphasized the social position of Edinburgh as the capital of Scotland, and its importance as an administrative centre tended rather to increase than to diminish, as new government departments were established. Its commercial importance depends upon its being the headquarters of many of the Scottish banks and insurance companies and of the North British Railway Co., upon the continuance of its traditional position as the chief centre for the administration of Scottish landed estates and upon its preëminence in the legal world. Apart from the business of the high courts, Edinburgh firms of writers and chartered accountants are entrusted with a large proportion of Scottish legal and administrative work.

During the World War the proximity of Edinburgh to Queensferry and Port Edgar and the great battle cruiser and destroyer base in the Firth of Forth gave it strategic importance in the naval operations, and its position as the headquarters of the Scottish command made it a centre of military organization. Preparations for defence against an invasion by sea were made in its vicinity as in other coastal districts, but no serious anti-aircraft protection was given until after a Zeppelin raid, on April 2 1916, in which ten people were killed and eleven seriously injured and damage was done to warehouses, private houses, and public buildings including Donaldson's hospital. In the later stages of the war Edinburgh became a favourite leave centre for colonial and American troops.

EDISON, THOMAS ALVA (1847—), American inventor (see 8.946), made great progress after 1910 in perfecting a battery of large storage capacity for propelling vehicles. This proved of great service, for example, in moving baggage trucks at railway stations. He hoped to produce, with Henry Ford, an automobile so propelled. He was specially interested in the cinema, and early in 1913 displayed the first talking pictures, produced by synchronizing the motion-picture and the phonograph. Although as yet unperfected, the inventor believed that such pictures were destined largely to replace text-books in the schools. On the outbreak of the World War he urged "potential preparedness" through mobilizing facilities for research in America, on the ground that "future soldiers will be machinists." In 1915 he was awarded a Nobel prize for physics and the same year was made president of the Naval Consulting Board. After America's entrance into the World War he was in charge of several plants manufacturing chemicals used in warfare. In 1916 he announced a portable searchlight, fed by a storage battery, far more powerful than the acetylene lamp, for use amid smoke in mine rescues, train wrecks, etc.

EDMONTON, the capital of the province of Alberta, Canada (see 8.946), first established as a trading post by the Hudson Bay Co. in 1795, remained little more than a village until 1901. Since then its growth has been rapid, and in 1920 it had a pop. of 67,000. Edmonton has 5 railways with 13 radiating lines, and is the terminus of the Calgary and Edmonton branch of the Canadian Pacific Railway. The city council consists of a mayor and 10 aldermen elected from the city at large—the mayor for one year and aldermen for two—and the mayor and two commissioners act as a board for administration. There is also an elected board of six public school trustees, and another elected board of trustees for the separate (Roman Catholic) schools. The Supreme Court sits at Edmonton several times a year. Edmonton

* These figures indicate the volume and page number of the previous article.

is the chief educational centre of the province, and besides the university of Alberta has a branch of the Normal school, Alberta College, Westminster Ladies' College and a Presbyterian college.

Edmonton has extensive live-stock, dairy, milling and packing industries. There are 9 coal mines within the city limits and 24 on the outskirts, giving a yearly output of 1,680,000 tons. Gold, silver and oil are also found in the neighbourhood.

EDMUNDS, GEORGE FRANKLIN (1828-1919), American lawyer and political leader (see 8.949), died in Pasadena, Cal., Feb. 27 1919.

EDUCATION (see 8.951).—In the sections on Education, in the articles on various countries, mention is made of the progress made there during 1910-20. Here a general account is given of progress in the United Kingdom and the United States.

(1) UNITED KINGDOM

The first two decades in the 20th century opened a new era in the history of education in the United Kingdom. In England and Wales the Act of 1902 not only combined in a national system of elementary education both voluntary and state schools, but laid a wider foundation for a national system of secondary education. It was an Act which represented the spirit of compromise. It gave a new expression in one most important group of institutions to the English genius of harmonizing diverse elements within the State. At the same time the Act marked a great experiment in local government, by transferring the responsibilities for education, elementary and secondary, from the *ad hoc* school boards in England and Wales to the municipal and county councils, and bringing education thereby into closer relations with the other sides of civic policy.

It is necessary to the understanding of the development of English education between 1910 and 1920 to keep in view this fundamental change at the beginning of the century. For during these first 10 years the system of education was taking on a new character, which reflects a wider conception of education. The school becomes more publicly recognized as a great centre of social influence. Provision is made by statute to secure in necessitous cases that school children shall be properly fed. Inspection of the health of school children becomes a responsibility of the local education authorities. Increased attention is directed to the special problems of physically and mentally defective children. The care also for the leisure hours of the child and the provision of play centres become part of school life; and the creation of juvenile employment organizations, in connexion with the school, express the continuity of the elementary school with the after life and care of the child. Side by side with these developments there can also be observed a remarkable growth of corporate life amongst school children themselves, and of voluntary organization of social workers, anxious to help in the ways of the juvenile community. It is not too much to say that a broader human outlook marks English and Welsh elementary education in the first 20 years of the 20th century. And this is no less true of education in Scotland.

Meanwhile, a deeper sense of the need for secondary and continuation education was also awakened. The growth in the number and variety of continuation classes under the local education authorities, the rise of the Workers' Educational Assn. and of the university tutorial classes system are all signs of the new order in education. What this means in progress can only be realized by looking backward and reflecting how modern is the growth of the system of English public education. When the mind follows the story of education in England from 1831, when first small grant was made by Parliament for public education, the opening decades of the 20th century stand out above all as calling into consciousness a deeper and wider idea of national public education.

The second decade of the 20th century marks in a very peculiar degree the continuation and working out of the movements which had manifested themselves in the preceding 70 years. The great Act of 1918, with the corresponding Education (Scotland) Act, extended and deepened the work of the 1902 Act in England and Wales and of the 1908 Act in Scotland. The principles of

organization and the ideas of the relationships between the school and society, developed in the legislation and administration of the period 1907 to 1910, were being progressively carried out in the years immediately following. But the second decade of the 20th century is broken and deeply affected by the years of war. In these 10 years three periods may be distinguished. The first from 1910 to the outbreak of war in 1914; the second from 1914 to the Armistice period in 1918; the third from 1918 onwards, the opening of the period of reconstruction and reaction. The first period, from 1910 to 1914, was marked by the steady progress of the new order. The sectarian controversy which had raged round the Act of 1902 had subsided; a wider and deeper conception of educational relationships was growing steadily with a more general acknowledgment of the truth, that national education in England must combine a wide variety of opinions and a large freedom of curriculum. There was a new spirit of tolerance. The administrative authorities, central and local, had set themselves seriously to carry forward the extension upwards of the educational structure on the basis of the 1902 settlement. These are years of steady progress and widening outlook.

The second period is that of four years of war, a period in which there was much less check to the continuous work of school education than might have been expected. But necessarily the schools suffered by reason of the war. The young male teachers went off on service, many school buildings were required for military and emergency purposes, the restrictions as to the employment of children were relaxed. Yet the war gave a new impulse to school life. Examples of service and sacrifice were present to the mind. There was a strain and seriousness which affected both teachers and scholars, and gradually, too, there came to the nation a fresh realization of the value of education in developing individual and national life. Already in the early years of the war expression was given to the demand for a wider and fuller system of national education, and steps were taken for the systematic consideration of the problem of "continuation education" and later of "adult education." Before the conclusion of hostilities the Departmental Committee on "Juvenile Education in Relation to Employment after the War" had presented its report and the Minister for Education had framed, and Parliament approved, a measure which ranks with the great Acts of 1870 and 1902. Moreover the army itself had become a great school or university and the experiments carried out with the forces at home and overseas in adult education were fruitful in stimulating new ideas as regards the scope and method of national education and in directing attention to the place which education should have in the life of men engaged in the military and naval services.

The third period from the Armistice onwards, presents, in less than three years, marked contrasts. In the first enthusiasm for reconstruction there was a vigorous forward movement with the view of bringing into operation as rapidly as possible the provisions of the 1918 Acts. It was more than a period of reconstruction; it was a time of new national ideals. Then came the ebb, with economic pressure, industrial unrest, high costs of construction and equipment, and financial stringency, and the larger educational programme has been temporarily suspended. In the grey morning of reparation and economic reconstruction after a World War education had suffered, and there was some receding of the high hopes and feelings. But the check could only be regarded as temporary, and the ideas born in war and in the early days of peace were in 1921 already reasserting themselves.

In considering the period from 1910 onwards it must also be borne in mind that the educational movement has been increasingly closely interwoven with other developments. Thus the public library organization in the years immediately preceding the war was being linked more closely than before with the educational system. It must also be remembered that already before the war a stronger national spirit had been evincing itself in education in the several parts of the United Kingdom. England, Wales, Scotland, Ireland, each was shaping on its own lines its national system, and the comparison of the development in the several states is rich in instruction for the student of mod-

ern education. But while there has been an increasing measure of administrative devolution in education the main lines of progress are common to all parts of Great Britain, though to a less extent to Ireland. England, which had been in the past more backward in its general education provision of elementary and secondary education than Scotland or Wales, has perhaps shown a greater advance during these years than any other part of the United Kingdom, and has not only led the movement for an obligatory system of continuation education to the age of 18, but has opened a wider vision of adult civic education and culture.

Education in England.—When the position of education in England was reviewed at the opening of the second decade of the 20th century, it could be seen that the system established by the Act of 1902 had become firmly established. That Act had done three noteworthy things. First, it had abolished the school boards and transferred their powers as regards education to the county and municipal councils. Secondly, it brought the voluntary elementary schools under the local education authority and assisted them by support from local rates, while leaving them a large measure of control in management. Thirdly, it had given the new local education authorities power to provide for schemes of secondary education and to levy rates for this purpose. Since 1902 there had been no important change in the constitutional machinery of the educational system in England. The Act of 1918 in England called into being no new order of local education authorities, as had been done by the corresponding Act in Scotland. In 1921 there were in England nearly three hundred local education authorities, with powers of making schemes and levying rates, standing in direct relation to the Board of Education, whereas in Scotland the number of local education authorities had by the Education Act (Scotland), 1918, been reduced to under 40. The consolidating movement had, therefore, progressed much further in Scotland than in England.

As regards elementary education, already in 1910 the system in England had become well established. Attendance at school was required up to the age of 13, and by the Act of 1918 is obligatory on all up to the age of 14. The average attendance has varied from 86% to 89%. Apart from the abnormal period of the war there has been a gradual diminution in granting of exemptions from school, and the Act of 1918 abolishes whole or partial exemption under 14 years. There has been little change in the number of public elementary schools in England. In 1903 there were 18,487, and in 1919-20 their number was 19,070. But there has been a considerable change since the Act of 1902 in the number of council and voluntary schools respectively. Since 1903 the number of voluntary schools has fallen from 13,438 to 11,635, whereas the council schools have increased in number from 5,049 to 7,435 in 1920. The total average attendance of pupils in public elementary schools in England, in 1920, was 4,795,672. In respect of the provision of teachers the period also shows relatively little change, but gradual improvement. The number of teachers, per 1,000 pupils in average attendance, in 1910-11, was 30.9, of whom 19.01 were certificated, 8.10 were uncertificated, and 2.08 other adult teachers. In 1919-20 the number of teachers per 1,000 scholars was 30.4, of whom 21.8 were certificated, 6.3 uncertificated, and 2.3 other adult teachers. In certain other matters, however, there had been very marked advance. In the years 1907-10 steps had been taken to secure to the local education authorities in England and Wales powers to establish medical inspection, to provide meals for school children where this was considered desirable, and to organize information in co-operation with the labour exchanges for the guidance of children in the choice of employment on leaving school. Provision had also been extended for the purpose of dealing with the mentally and physically deficient and a much wider recognition was secured for "after care" work among school children. A wider conception of the school and its responsibilities was thus steadily emerging. The Act of 1918 has carried the movement forward and has converted these powers of local education authorities into a duty to look after the health and physical condition of the children in public elementary schools. A system of school health services providing not only medical inspection, but

also treatment, is now well on the road to accomplishment. Again, as regards the physically and mentally defective and epileptic children, the Act of 1918 requires that the local education authorities shall ascertain what children in their areas are thus afflicted and shall make provision for their education. It is also worthy of note that the Act of 1918 lays particular emphasis on the great importance of healthy recreation. The Act enables local education authorities, with the approval of the Board of Education, to supply, or maintain, or aid (a) holiday or school camps—especially for young persons attending continuation schools, (b) centres and equipment for physical training, playing fields, school swimming-baths, (c) other facilities for social and physical training in the day and evening. A very large proportion of the proposals already submitted have been concerned with holiday and school camps. In this connexion it may be noted that the 1918 Act specially encourages local education authorities to avail themselves of voluntary services, particularly in the development of the recreative side of school life, and the work of the Juvenile Organizations Committee in promoting healthy recreation is a sign of the new spirit which is now steadily pervading the educational system. Thus with the great development in State action, the sphere of voluntary action is also increasing. The ideal education policy requires voluntary and state agencies acting in close co-operation.

Secondary education in England presents a very different situation. It might almost be said that, until the opening of the 20th century, there was no national system of secondary education in England. The number of secondary schools, apart from the residential public schools and the old grammar schools, were few and the gateway from the elementary schools was very narrow. But the Report of the Royal Commission on Secondary Education in 1895, the Education Act of 1902, and the Regulations for Secondary Education in 1907, are stages in the foundation work of a new order, and during 1910-20 considerable progress was achieved in building up the framework of a national system of secondary education. The great public schools and grammar schools which have been so distinguished a feature of English higher education retain their independence and their well-deserved prestige. Like the ancient residential universities of Oxford and Cambridge, their position has been strengthened rather than weakened by the growth of new institutions. But the public schools (as the term is understood in England, meaning Eton, Harrow, and so forth) can only supply education to a very limited number and at a high cost, while there is a steadily increasing demand that there shall be easy provision of secondary education for all children who are willing and able to avail themselves of it. By 1911 there were 862 secondary schools on the Board of Education grant list, with 141,000 pupils; in 1920 there were 1,021 schools, with 282,005 pupils. There were also in 1911 96 secondary schools recognized as efficient but not on the grant-earning list, with over 17,000 pupils—while in 1920 there were 201 of these schools with 36,271 pupils. In the case of the schools on the grant list normally 25% of the places must be free; the actual proportion was considerably higher.

In considering however such figures of secondary education a caution is necessary. By far the greater number of pupils attending these schools are under 16 years of age. In the session 1919-20, out of the total of 282,005 pupils in the secondary schools 83,386 were under 12 years of age, 177,088 were of 12 and under 16 years, while only 20,631 were 16 years of age and over. Thus for all except a very small percentage, secondary education ends before 16 years of age. When it is recalled that there are close on 5 million children in the public elementary schools of England, and that the number leaving the elementary schools each year must be close on 600,000, it is evident how restricted the national provision of secondary education still remains. This in itself emphasizes the importance of the step taken in 1918 to provide obligatory continuation education. It is the case that in England the demand for secondary education has considerably exceeded the supply, but it is also true that the pressure of economic circumstances and the tradition of getting to work early will prevent a very large number of children in the elementary schools from

continuing or desiring to continue as full-time secondary school pupils. For the immediate future, therefore, a general system of continuation schools is the best hope of imparting the benefits of higher education to the majority of young people.

Already for many years local education authorities have been providing increased facilities for evening students—especially in technical and manual instruction. The circumstances of the war, however, stimulated greatly the public sense of the value of a much more complete system of continuation education, and brought into relief the defects of this side of educational organization when compared with the system of continuation education in Germany. Accordingly in 1916 the Minister of Education (Mr. Arthur Henderson) appointed a Departmental Committee on Juvenile Education in relation to Employment after the War. This committee submitted in its final report, in 1917, recommendations which the then Minister of Education (Mr. H. A. L. Fisher) largely embodied in a bill. Modified in certain particulars, this bill became the Education Act of 1918.

The Education Act of 1918 is, however, much more than a measure establishing an obligatory system of continuation education. It affects the whole scheme of elementary, secondary, and continuation education. It aims at the establishment of a "national system of public education available for all persons capable of profiting thereby," and local education authorities have, under the first section of the Act, been called upon to prepare schemes setting out the provisions which they have made and propose to make towards this great end. The Act makes important specific changes in respect of elementary education, including the provision of "nursery" schools for children between 2 and 5 years, the raising of the compulsory school age to 14, with power to the local education authority, by by-law, to extend the compulsory age to 15, the abolition of part-time attendance, the provision of central schools and special classes of more advanced and more practical instruction for the older and more intelligent children in the elementary schools, and it emphasizes the social welfare side of education.

In respect of secondary education, the Act requires local education authorities to coöperate in providing for the purposes of Part 2 of the Education Act of 1902 (i.e. higher education), particularly in respect of (1) the preparation of children for further education in schools other than elementary, and their transference at suitable ages to such schools, and (2) the supply and training of teachers. Also the very important duties and powers with reference to provision for medical inspection and treatment of children in elementary schools are extended by the Act to secondary and continuation schools. The Act removes the limitation, under section 2 of the Education Act of 1902, on the amount to be raised by the council of a county out of rates for the purpose of education other than elementary. The Act of 1918 is thus built on the foundations of the Act of 1902 and does much to complete the educational ladder.

But important as are these provisions, the main feature of the Act of 1918 is the institution of a compulsory system of part-time continuation education after the close of the elementary school period. "Young persons," between the ages of 14 and 18, are required to attend a continuation school for 320 hours a year—unless able to claim exemption under the Act. This is the cardinal fact of the new Act. For the first period of seven years compulsory attendance applies only to pupils between the ages of 14 and 16 years and a local education committee may reduce the number of hours' attendance to 280—modifications which give time to the authorities to make provision of schools and teachers where-with to meet the new situation. Owing, however, to contingencies, mainly financial, the operations of the Act have to a considerable extent been postponed. But these difficulties are temporary, and the experience of a national system of part-time work and part-time education will presently begin to furnish instructive evidence on the value of secondary education and continuation education respectively. It is a matter which merits the most careful observation in the next period.

In connexion with this very important subject it should be stated that in the session 1918-9, 125,000 students were in

attendance at technical and special schools in England, while the number attending evening schools, chiefly under the local education authorities, exceeded 465,000. Attention should also be directed to the very notable and encouraging growth of classes under the Workers' Educational Association and the university tutorial classes. England has been the home of this development, which is one of the most significant and encouraging signs of the times. In 1918-9 there were 87 one-year classes organized by the Workers' Educational Association and 132 tutorial classes which are three-year courses. In 1919-20, the number of one-year courses had increased to 159 and of three-year courses to 182. These classes have been concerned mainly with economic history and theory, political and social science, history, literature, and in some cases philosophy. Summer schools are now held at many of the universities, for students from the tutorial classes. The growth of the movement opens out a new vista for democratic education in and from England.

Education in Wales.—In considering the development of education in Wales, it will be remembered that while English and Welsh education have been under one Ministry there has been a growing movement towards Welsh autonomy in education. In 1889 Parliament passed the Welsh Intermediate Education Act which provided for separate local committees to make provision for secondary education in Wales. In 1896 the Welsh Central Board was established—a representative body with the duty of inspecting and examining the intermediate schools. In 1907 there was constituted a separate Welsh department within the Board of Education, with a permanent secretary and a separate inspectorate for Wales. But the great educational Acts of 1902 and 1918, together with minor educational measures, have in the main applied alike to England and Wales. Thus in Wales the system of elementary education broadly corresponds to that in England. In 1920 the number of elementary schools was 1,901, of which 1,270 were council schools and 631 voluntary schools. Education is compulsory up to 14 years of age, and in 1919 the average attendance out of a total of approximately 464,000 scholars on the register was 380,000.

The position as regards secondary education deserves more particular notice. There are three groups of secondary schools in Wales which are on the grant-earning list or are recognized by the Board of Education as efficient. The first and largest group is that of the intermediate schools numbering 101 in 1920. They are examined and inspected by the Welsh Central Board, but they are also reported upon and certified by the Board of Education in respect of qualification for the Treasury Grant. Secondly, under the Act of 1902 the local education authorities have established, particularly in the large centres of population, 12 secondary schools, which are not under the Welsh Central Board but are examined and inspected by the Board of Education. Thirdly, there are a few endowed schools, six of which in 1920 were on the grant-earning list and five were recognized by the Board of Education as "efficient." The total number of schools, intermediate and secondary, eligible for grants in Wales in 1919-20, was thus 119, and the number of pupils 25,754, while in the five efficient schools, not on the grant-earning list, there were 788 pupils—the total number of pupils in secondary schools recognized by the Board of Education being 26,542. Thus the situation with regard to secondary education has been complicated in Wales and has suffered from dualism of control. The constitutional powers of the Welsh Central Board have not been such as enabled it easily to make provision for the increasing demand for secondary education and recourse has been necessary to the municipal and county authorities established under the 1902 Education Act. Accordingly in 1919 a committee was appointed by the Board of Education "to inquire into the organization of secondary education in Wales and to advise how it can be consolidated and coöordinated with other branches of education with a view to the establishment of a national system of public education in Wales—regard being had to the provisions of the Education Act of 1918 and to the recommendations of the Royal Commission on University Education in Wales." In their report this committee, while recognizing the valuable work

achieved by the Welsh Central Board, drew attention to the fact that the system of secondary education as it has developed in Wales has, owing to the division of authority, provided an organization which "is less elastic and less adaptable than that of England to the new demands likely to be made upon it by the Act of 1918." They therefore recommend that the Welsh Intermediate Act, which being a "temporary" act has been periodically renewed, should be allowed to lapse, and that the intermediate schools and the municipal secondary schools should be brought under one local county education authority which should make provision for a completely coördinated scheme of secondary education within its area, and that a National Council of Education for Wales, representative chiefly of the Welsh universities and of the education authorities in Wales, should be set up under the Ministry of Education to which wide powers should be devolved in relation to the whole field of education, elementary, secondary and university. The aim is thus to provide in Wales a national educational authority more complete in its scope, and more representative in its constitution, than exists at present in any part of the United Kingdom. Meanwhile, as in England and in Scotland, there has been in Wales, especially since the war, a marked increase in the demand for higher education. The proportion of scholars who pass from the elementary to the secondary schools has, in nine years, risen from 35% to 53%. The further problem of the relation between the secondary schools and the university of Wales has received particular attention from the Royal Commission on University Education in Wales, and a scheme has been recommended whereby the county authorities shall assume greater responsibilities towards and receive increased representation in the National University, so that elementary, secondary and university education may be three closely related parts of one common system. The object in view is that no child on the ground of lack of means may be debarred from receiving the very highest education the nation can supply. Wales is thus in a most interesting and progressive stage of development towards a complete national scheme of democratic education. The growth of Welsh education is reflected in the great increase in the estimates of educational expenditure. In the year 1921-2 the estimates of net expenditure on elementary education in Wales amount to £4,090,804, while the estimates for higher education are stated at £846,716. Thus in Wales, elementary and secondary including continuation education already claim £5,845,000. So also in England the latest corresponding estimates (1921-2) provide for a net expenditure of £58,648,916 on elementary education and of £12,622,015 on higher education—the total figures for elementary education thus exceeding 71 millions. When it is remembered that considerably increased sums will be required for continuation education, and for further extension of university education, it will be seen how great and growing is the recognition of the service of education in England and Wales.

Education in Scotland.—The progress of education in Scotland in the period 1910-20 is in many respects similar to that which has been seen in England and in Wales. There was no Act for Scotland corresponding to the English Act of 1902, because conditions were different and at that time, as now, the local education authorities in Scotland were considerably in advance of those in England particularly as regards aiding, maintaining, and controlling secondary education. Scotland also did not follow the example of England by transferring the control of education from the school boards to her county and municipal councils. But at the close of 1908 the Education (Scotland) Act was passed, which can properly be regarded as marking an important stage in the development of Scottish education. For while it made no fundamental change in the educational system of Scotland the Act enlarged the powers and duties of local education authorities, and laid the foundations for the even greater Act of 1918.

In the history of education in Scotland, more than in any other part of the United Kingdom, there may be seen a steady direction of the national system along clearly marked lines, and the Act of 1908 and, later, that of 1918 illustrate this character. First, the idea of separate *ad hoc* local educational authorities has been

maintained and Scottish education thus continues to present an interesting comparison with the system in England established since 1902. But while the school board system was maintained in Scotland until 1918 the need of larger areas has steadily made itself felt, and in the Act of 1908 powers were given to school boards to combine for various purposes. This immediately took effect and in the report of the Scottish Education Department for the year 1910-1 it is stated that 13 unions of school boards have already been effected by voluntary arrangement, or by order of the Department. It was pointed out, however, in the same report that it was doubtful whether this policy of combination of school board areas could be carried very far, and that, however active individual school boards might be within their own areas, it was clear that there are educational functions which transcend the sphere of the ordinary school board. This is particularly the case in respect of secondary education, where for effective work authorities controlling wider areas are necessary. The Act of 1918 carries out the work of enlarging areas and consolidating local organization, which had been thus tentatively advanced by the earlier Act of 1908. Secondly, as in England and Wales, there has been a continuous movement of transferring voluntary schools to the control of the statutory local education authorities. Such schools have not been so many or so important in Scotland as in England, but there has been a growing appreciation of the value of a national system which leaves room for variety of type and which recognizes the place of the denominational school within the national system. The Act of 1908 assisted the transfer of voluntary schools to the school boards, and the completion of this movement has been secured under the Act of 1918. Thirdly, there has been a steadily widening conception of the educational duties of local authorities. The Act of 1908 enabled school boards to make provision, either by themselves or in combination with other school boards, for the supply of meals to pupils attending school within their district, to provide conveyance and travelling expenses in order to help children in outlying districts to attend school, to extend information as to employment open to children on leaving school, and to make provision for the maintenance and education of physically or mentally defective children. It gave powers also to school boards to secure medical inspection and supervision of children attending school. A special Act of 1913 added medical treatment to medical inspection, and the Act of 1918 made such duties obligatory on the local education authorities. Fourthly, there has been a consistent policy of building up a complete national system, not only of primary and secondary education but of continuation education, and of increased facilities of university or other specialized higher training. The Act of 1908 made important provision for the extension of the system of continuation schools above the age of 14 years, requiring school boards to make suitable provision for such schools, and it thus prepared the way for a universal system of continuation education.

In two other respects also the Act of 1908 made a notable contribution to the better organization of Scottish education. It made provision for a national system of pensions and superannuation of teachers, and it consolidated and simplified the financial arrangements for the control and distribution of State grants by the constitution of the Education (Scotland) Fund.

The Education (Scotland) Act, 1918, which in many respects corresponds to the Education Act for England and Wales of the same year, may be regarded as the most important measure relating to education in Scotland since 1870. In one sense the Act only carries out developments which had been making themselves evident even before and especially after 1908. But the new stage marks the transition from tentative and partial efforts to that in which a wider envisagement of the whole field of national education is realized. A new order of local education authorities is called into being, in order to carry forward the work of developing the larger policy. In place of the 945 school boards and 38 secondary education committees, 38 local education authorities have been established, elected under the system of proportional representation, known as the transferable vote. To these local and county education authorities are

committed the powers of determining and controlling the whole system of primary, secondary and continuation education within their respective areas. To aid them in their work a system of school district management committees has been provided, each county being left to determine the number of such committees within its area. At the same time a representative National Council for Education has been constituted under the Act with the view of advising the Scottish Department of Education—an important step in bringing the central administrative organization into more direct touch with a representative body. Locally, also, provision has been made for the establishment of advisory councils, which may stimulate on the one hand public opinion and on the other assist the local education authorities on special questions, particularly such as relate to economic and industrial conditions. The value of such local councils has yet to be proved, but the step taken is significant of the desire to bring the administrative system both centrally and locally as closely as possible into touch with public opinion. In considering the great change which the Act of 1918 has made in the representative machinery of Scottish education, it may be well to point out that the working of the new machinery of government will demand close attention. It is permissible to doubt whether the Act has not gone too far in abolishing the local school boards and in constituting in their place county authorities with school management committees, which latter bodies frequently are concerned with an area larger than that of the former school board. The school management committees are selected in a variety of ways, but they do not have behind them the simple strength and influence of popular election. The measure of the success or failure of this step will be found in the extent to which local interest in educational matters is sustained or weakened. That statutory bodies, exercising wide powers and controlling larger areas, were necessary does not admit of doubt, but the sweeping away of the local school boards may be found to have removed the most effective agency of stimulating local interest in education. The problem of securing the best form of representative machinery to deal with modern educational problems is a matter of very great importance, and its solution is yet by no means reached. For that reason the variety of experience presented in the United Kingdom is of peculiar interest. It may be added that, at the election for the new local education authorities in Scotland under the Act of 1918, only some 30% of the electorate recorded their votes. This in itself is a significant and disappointing fact, and indicates the need, even in Scotland, of stimulating local interest in education. Another important constitutional aspect of the Act of 1918 was the change made in respect of financial administration. The Education (Scotland) Fund, as established under the Act of 1908, is by the Act of 1918 so regulated that the distribution of grants will give to the local education authorities greater discretion and flexibility in the expenditure of the moneys entrusted to them by Parliament. Instead of earmarking particular grants for particular services, the earning powers and claims of the local education authority as a whole are assessed by the Department of Education, and great latitude is allowed to the authorities in the disbursements of the sums, provision, however, being required for the maintenance of secondary education. There has resulted thereby a simplification of finance and an increase in the responsibilities of local education authorities. Apart from these important changes in the representative system and in financial administration the chief features of the Act are the raising of the full-time school age to 15 years and the requirement of obligatory continuation education up to 18 years of age. For the period of three years from the passing of this Act, the compulsory age for continuation education is limited to 16 years, whereas in England seven years elapse before the full policy of the Act can take place. The 1918 Act carried out to its logical conclusion a development which had been steadily advancing for many years throughout Scotland. Under the Act of 1908 it was lawful for school boards with the consent of the Scottish Department to make a by-law, requiring attendance up to the age of 16 at continuation classes. Already in the session of 1913-14, before the war interrupted normal devel-

opment, 18 school boards in Scotland had availed themselves of this power, and in the Education Report for the year it is observed "that the need is apparent, after a lapse of five years since the Act of 1908 came into force, for more vigorous steps to be taken to interest and make more effective the provision of continuation-class instruction particularly in the rural districts," and it is pointed out that compulsory methods have stood the test well in the few districts where by-laws have been made.

The educational ladder in Scotland is now strongly established. There is an excellent system of primary education for children to the age of 14, and powers have been taken to raise the compulsory age to 15, while for those who have the ability to profit, and the desire to do so, there is a generous system of bursaries and maintenance grants from the elementary to the higher grade and secondary schools. It is claimed that any child of ability can now obtain higher education and in turn secure the further opportunity of a college and university education. In 1920 there were 3,019 primary schools in Scotland, with effective accommodation for 947,125 scholars, 104 intermediate schools or departments with accommodation for 16,420 scholars, 148 secondary schools or departments and 134 preparatory departments of secondary schools with total accommodation (including that of the preparatory departments) for 108,085 scholars, and 51 special schools for blind, deaf, mute or defective and epileptic children, having accommodation for 6,658 scholars. The total number of scholars in the register at the end of the school year 1919-20 was in primary schools (or departments) 760,343, intermediate schools (or departments) 11,009, preparatory departments of secondary schools 49,159, secondary schools or departments 44,095, special schools and classes 7,266—making a total of 872,772 scholars on a total estimated population of just over five millions. If the table of ages of scholars is examined it appears that rather more than a total of 20,000 pupils of 15 years of age or over were enrolled in the session 1919-20 in these various classes of schools. The proportion of secondary scholars to population is higher than in any other part of the United Kingdom, but it indicates how limited still is the number who, even in Scotland, receive full-time education beyond the age of fifteen. But there has been a steady increase in the total number of pupils attending intermediate or secondary departments. Even in the period of 1913-4 to 1918-9 the number of pupils enrolled in these schools rose from 47,742 to 58,048, and in the year 1919-20 the rate of increase has been fully maintained. As regards continuation classes the number of these in the session 1919-20 was 1,083, with 166,461 students. A feature, particularly of the last sessions, has been the development in Scotland as in England of classes organized by the Workers' Educational Association for adult pupils. As regards financial provision, the income of the education authorities under the Scottish Education Department was for the year ending May 15 1920 £9,629,430, in this total the chief items of interest being grants from the Scottish Education Department £5,400,078, local education rates £3,973,531, school fees £119,046. Great as have been these advances in the sphere of education there remains one matter which is always of the highest concern, namely, the training and provision of teachers. Powers may be extended and equipment improved, but the most vital problem is the supply of teachers and of the spirit in which they carry out their work. In the past in Scotland the teachers' training colleges owed their foundation to provision made by the churches. The training colleges have gradually shed their denominational character, and in 1905 they passed under national and undenominational control. There has been a steady requirement of a higher standard of training and, to-day, practically all teachers in Scottish schools under the Department of Education are certificated. In 1920 the number of fully qualified teachers in State-aided day schools was 24,782—the proportion of teachers to pupils being in primary and intermediate schools 1 to 37, in secondary schools 1 to 23, and in schools and classes for blind, deaf, mute, defective and epileptic children 1 to 17. A particularly satisfactory feature is that, despite the losses and difficulties of recent years, the proportion of teachers to pupils is considerably higher in 1920 than it was in

1913-4. The Scottish educational system is thus, to-day, strong and progressive and it maintains its distinctive independence. But it is a striking evidence of the way in which autonomy tends to follow similar lines of development, that at no time has there been so much in common between English, Welsh and Scottish education as at the present day. Left free, each system develops its own peculiar spirit and traditions, but it also tends to assimilate itself to the standard of other progressive systems.

Education in Ireland.—The system of education in Ireland has undergone no such marked development as was seen in England and in Scotland during the years 1910-20. Educational progress in one part of the United Kingdom must always affect the other parts to some extent, and steps have been taken in Ireland as in other parts of the United Kingdom to make better provision for medical inspection, for the care of physically and mentally defective children, and for attending to the feeding of school children. But the condition of affairs has remained far from satisfactory in both primary and secondary education, and this is even more the case as regards continuation education.

In Ireland the control of education is divided between three public departments. The Commissioners of National Education deal with primary education, the Intermediate Board with secondary education, and the Department of Agriculture and Technical Instruction, with agricultural and technical education. To a limited extent coördination is secured between the several departments, and the Consultative Committee of Education, on which all three departments are represented, is an evidence of this. But the autonomy of the several departments remains the outstanding fact. Education undoubtedly suffers from this division of control, and from time to time the question has been considered of uniting the various boards of educational administration in one system. In Nov. 1910 a comprehensive Education (Ireland) Bill was introduced by the Chief Secretary for Ireland, which among other things proposed to set up a single Department of Education in Ireland, but it failed to become law. In the past the educational problem has been constantly overshadowed by political considerations and no effective step has yet been made towards that unity of direction and completeness of supervision which can only be secured either by a single department or by the closest coöperation and harmony between the separate departments. The difficulties and disabilities arising out of division are further accentuated by the widely different systems represented by the three boards. The Commissioners of National Education who are responsible for the position of primary education in Ireland, and who, therefore, have by far the greatest task placed upon them, represent a centralized and bureaucratic system of administration such as cannot be paralleled in any other part of the United Kingdom. As primary and secondary education are not matters which have been handed over, as in England and Wales, to the local county and municipal authorities or to local education *ad hoc* authorities as in Scotland, the only local control rests with the school management of the individual school and the local attendance committees. It follows, so far as primary and intermediate or secondary education are concerned, that there are no local rates. The financial resources required for this most important part of national education have, therefore, to depend upon moneys voted by Parliament, or upon the yield of endowments, contributions, and school fees. The result of this is that, so far as primary and intermediate education in Ireland are concerned, the financial position is most unsatisfactory. The resources for the maintenance, and still more for the improvement, of national education are very inadequate, and the old order has continued to exist at a time when great measures of educational advancement are being carried out in the other parts of the United Kingdom. The day has passed when grants from a central department, supplemented by voluntary contributions, can be equal to the burden of a national system of education, and Ireland is constantly suffering from the fact that she has not faced the responsibility of establishing a system of local education authorities, and of charging the local rates with a share of the burden of primary and intermediate education. The problem in Ireland is complicated by

the denominational character of the schools and by the strong element of clerical control in local educational matters. But, if education is to advance, local and lay control must share the burden of responsibility, and developments in England, Wales and Scotland prove that alike the central Department of Administration and the local authorities can find a place in the national system for denominational schools. Until the people of Ireland locally and directly show their zeal for education by securing the establishment of local educational authorities with powers to rate, Irish elementary and secondary education cannot keep pace with the progress which is being made in the sister countries. The question is so fundamental that it must always be in view, as during the past ten years the difficulties inherent in the present system of primary and secondary education have been making themselves increasingly felt. In 1913 a Viceregal Committee of Inquiry into Primary Education was appointed to report upon the system of inspection of primary schools, the relations between teachers and inspectors, and the system of promotion of teachers in national schools, and both the evidence and the report illustrate how difficult is the problem of encouraging and remunerating teachers, and of giving scope for educational development where there are no local representative authorities and where promotion depends upon the report of inspectors and the decision of the National Board. Alike in Scotland, England, and Wales experience has proved how necessary it is to have wide areas and to link education closely with the interests of the community. In Irish primary education, the absence of local representative authorities controlling large areas with a wide range of schools accounts for much of the present stagnation of education, and places upon the Central National Board the increasingly invidious task of a bureaucratic system. Nor can it be said that there is any effective parliamentary control over Irish primary education. The system is thus constitutionally weak and fails to stimulate alike local interest and national public opinion in the vital question of education.

What is true of primary education in Ireland is also true in respect of intermediate education, though owing to the much more limited number of schools the problem is less acute. One of the most serious aspects, however, of Irish education remains the very inadequate provision which is made for secondary education, other than agricultural and technical education. The supply of schools, and the financial provisions for such as exist, fall far short of what modern Ireland should have. In Ireland, as in Great Britain, there is an increasing demand for higher education and with the change in the value of money the situation of the secondary schools is especially precarious. In their report for the year 1920 the Intermediate Education Board commented severely on the fact that the grants in aid of Irish secondary education from the Treasury are considerably less than the proper share which should have been allocated for this purpose when compared with the grants in England, Wales, and Scotland, and they conclude their report with the grave words "... remembering also the scanty funds with which our admittedly successful efforts were achieved, it is difficult for us at this juncture—when the whole edifice of secondary education in Ireland is toppling to destruction—to refer to these matters in language of moderation and restraint. Of one thing, however, we feel quite certain, and that is, that if something is not done immediately to place Irish secondary education in the position of financial equality with that of Great Britain, it is impossible to see how the complete disruption of the system can be avoided." In one respect improvement has been made in recent years in the work of the Intermediate Education Board, by the belated establishment of a system of local inspection. The Intermediate Board system has been in the past too much a central examining body rather than an educational department, and even with the limited step which has now been taken to secure supervision of the intermediate schools and their work by the board's inspectors, control is largely exercised through the medium of written examinations. Thus both in respect of primary and intermediate education, Ireland has presented a very unprogressive form of organization and even with the improvements made in recent years, the system remains very

far from satisfactory. There is no part of Irish public administration in which reconstruction is more vital or more urgent. According to the Commissioners of National Education in 1918-9, the average number of pupils on the rolls of the 8,802 primary schools in Ireland was 708,353, and the average attendance 488,031—or 68.9%. The highest average yearly attendance in the past ten years has been 72.6 per cent. These figures are in themselves eloquent as to the very backward state of Irish primary education. The State expenditure on Irish primary education amounted in 1918-9 to £2,375,362. In respect of secondary education, 386 schools in Ireland received grants under the Intermediate Education Board in 1920, the total number of pupils between 12 and 19 years of age in these schools being 27,250. The number of pupils between the ages of 14 and 19 years, who presented themselves for examination under the Intermediate Board, was 11,048, of whom 6,002 passed. The grants to intermediate or secondary schools from the statutory funds and the parliamentary grants of the Intermediate Board amounted in 1920 to rather less than £142,000.

The third department responsible for a part of Irish education is the Department of Agriculture and Technical Instruction, and at least in this field of agricultural and technical instruction Ireland can claim to have a system which is worthy of comparison with that of any modern state. The importance of the system established in respect of agriculture and technical instruction lies not simply in the merit of the education provided in the schools and colleges under the Department's supervision, but in the improved representative relationships between central and local authorities provided by the constitution of the Department. The Agriculture and Technical Instruction Ireland Act of 1899 provided for the appointment of local statutory committees of the county councils and municipal councils of Ireland to deal with the subjects of agriculture and technical instruction, including the raising of local rates for these purposes. It also brought about the establishment of a central Council of Agriculture, consisting in respect of two-thirds of its membership of representatives of county councils, the remaining third being nominated by the Department. At the same time provision was made for the appointment of a Board of Agriculture chosen in respect of two-thirds of its membership from the Council of Agriculture, the remaining third being nominated by the Department, and of a Board of Technical Instruction representing chiefly municipal and borough authorities concerned in technical education. Important functions and powers were given to these bodies of shaping the policy and the administration of the Central Department. The result of this representative machinery has been a closer harmony between central and local authorities than has been secured in any other field of public administration in the United Kingdom, and the great progress which has been made in Ireland in the two decades of the 20th century, both in agricultural education and technical instruction is in no small measure due to the admirable constitutional organization which was laid by the founders of the Department. The close relationships between central and local authorities have, even in a difficult period of national affairs, led to increased interest in the progress both of agriculture and of technical instruction, and no part of government in Ireland has succeeded in so fully associating the people with the work of administration and in educating public opinion and eliciting local financial support. The work which thus centres round the Irish Department of Agriculture and Technical Instruction has exercised a great influence on modern Ireland. It has given a much needed impetus and direction to science teaching and research, to agricultural study and investigation, to manual training and craftsmanship, to commercial and industrial subjects in relation to the economic conditions of the country and to domestic economy and public health education—all of which are peculiarly vital to a community in which education has suffered from a too narrow and bare curriculum. But it has done more, and has suggested, by experience, the possibilities of a much wider reestablishment of Irish education in which all parts will be brought into closer relation one with the other and strengthened by association with central and local

representative committees. In the year 1918-9 the grants made out of the parliamentary vote to technical schools and classes of science and art amounted to £114,210—while a further expenditure on technical instruction, amounting to £65,867, was made out of endowment funds. In addition to these sums the sum contributed from local rates amounted to £36,518. The number of students attending technical schools and classes was 37,241, and the number of students recognized for grants in connexion with technical instruction in day secondary schools was 14,822.

Conclusion.—Looking back over the period from 1910-20 and across at the varied developments in the countries which make up the United Kingdom, the year 1918 stands out as summing up the effort of the preceding years and projecting the task which succeeding years have to fulfil. Nineteen-eighteen is the symbolic year, and the place which education then filled in the thought of the nation is itself a revealing fact. There has been a great widening of the horizon. The school now goes down to the nursery school, and the leaving age rises. The defective children are being treated, and the child life of the nation is its care. Slowly but surely a national system in the full sense is evolving in England and in Wales, no less than in Scotland. Ireland still has to solve her educational problems and must do so in her own way and by her own genius.

The great task is now the building up of higher education on lines which call out and use the talent and spirit of the nation. The problems are vastly more complex and difficult than those of primary education. But they are being solved, and increasingly generous financial provision for education is forthcoming. The education estimates already bid fair to rival the place which the naval and military estimates have taken, and before long it may prove true that in no field of public expenditure has the State to shoulder so large a responsibility as in education. But education is not only a means but an end. And a Nation like an individual has to work and save in order that it may enjoy the fullest education. One can discern the coming of this spirit in England, and it is a sign of hope for the future. Nothing but a united community and the combined strength and experience of central and of local authorities, of state and of voluntary organizations, can provide a solution to the problems which the higher education of youth and adult life has in store. Nor must it be forgotten that social institutions are a great factor in national education. The Boy Scouts, and Girl Guides, the Women's Institutes, the village clubs, the allotments movement, the coöperative societies, these and many other voluntary agencies are growingly powerful factors in national development and education. And judged by the progress of such movements, the second decade of the 20th century and the closing years of that decade will stand out in the annals of English education. (W. G. S. A.)

(2) UNITED STATES

Each state in the American Union has its own system of education, which includes elementary and secondary schools, and, in all except the states of the extreme north-east, state institutions of higher learning. All of the 48 states have enacted compulsory school laws, but in their standards, and in the enforcement of them, they vary widely. School attendance is (1921) generally required of children between the ages of 8 and 14 or 16 during from 6 to 8 months in the year, and many states further require attendance upon part-time or evening classes by those who have not acquired a prescribed minimum of education or who can not adequately speak, read and write the English language. The National Government, through Congress in 1916, notably reinforced the compulsory school laws of the states by an enactment prohibiting the shipment, in interstate commerce, of any articles in the manufacture of which children under 14 have been employed. In place of the almost universal requirement of eight years in the elementary school and a nearly uniform curriculum, there is manifest a tendency to group together as a "junior high school" the seventh, eighth and ninth grades, which otherwise would constitute the last two years of the elementary school and the first year of the secondary school. The purpose of the rearrangement is to facilitate departmental teaching, to free the

child from the rigid grade system of promotion, by which a failure in one subject necessitates the repetition of the whole year's work, to permit earlier a choice of courses and thereby prepare the pupil for greater accomplishment in his chosen field during the later high-school years. The public secondary schools have grown by leaps and bounds in numbers and resources. Their enrolment doubled in the 10 years 1908-18 and between the years 1918 and 1920 there was a proportionate increase. They are no longer essentially stepping stones to college; they represent the continuation of the common schools, and their function is to complete the formal education of that vast majority which will never enter institutions of higher learning.

Colleges and Universities.—Throughout the country, but especially in the west and middle west, so called "junior colleges" are becoming numerous. The term is somewhat a misnomer. Some of these institutions are derived from small, non-tax-supported colleges which, finding themselves financially unable to continue satisfactorily the full four-year course, limit themselves to two years, and others, more significantly, from the upward extension of the vigorous public high schools. This type not only brings the opportunity for higher education within the reach of many who could not leave the immediate vicinity of their homes, but also reacts favourably on the pupils and teachers of the secondary schools from which it grew. The college remains the most characteristically American feature of educational development in the United States. In 1920 there were enrolled more than 250,000 college students. Entrance requirements have become less rigid, as indicated by the recommendation of the conservative Association of New England Colleges: that its members adopt "a system of tests for admission in which a certificate shall be taken for the quantity, and examination shall be held in a limited number of subjects for the quality, of school work." The curriculum covers a very wide range of subjects, but experience has shown that it is unwise to permit the student to exercise untrammelled freedom in the choice of his studies, and most colleges now limit the selection of courses in such manner as to prevent too great concentration and too great dispersion as well. The universities, though not more numerous, have in recent years grown stronger. Their graduate departments, better manned, attract more students. In this respect the development of the state-supported institutions has been remarkable. A few years ago only three had achieved distinction in this field; by 1921, 12 had qualified for membership in the Association of American Universities, and constituted one-half of its members. The enrolment of graduate students in all universities was in 1916 11,215; in 1920 it was upwards of 16,000. So great has become the demand among women for higher education that the colleges exclusively for women are no longer able to provide for the rapidly increasing number of applicants for admission. Bryn Mawr, Vassar, Wellesley, Smith and Mt. Holyoke have been forced to establish waiting lists. The doors of the universities for the most part stand open to women upon an equal footing with men. By 1920, 44% of the students, graduate and undergraduate, enrolled in the universities, colleges and technological schools, were women, and it may confidently be predicted that they will soon outnumber the men. The general admission of women to courses in medicine removes practically the last barrier discriminating between the sexes.

Professional Education.—Schools for professional training have grown rapidly. Whereas a century ago professional education comprised little more than preparation for the ministry, it now includes theology, medicine, law, the new profession of engineering, and two offshoots of medicine, dentistry and veterinary medicine. Pharmacy and nursing are sometimes regarded as professions because a specialized education is prescribed for those who would practise them.

Theology.—The colleges first founded in what is now the United States, Harvard, William and Mary, and Yale, were established to train men for the Christian ministry. As the colleges have developed into universities the original aim has been merged into the broader purpose of providing liberal education for all, while influential schools of theology have grown up,

for the most part, as strictly denominational institutions independent of the universities. During recent years the content of the curriculum and methods of teaching have been revised. Formal theology is emphasized less, a first-hand knowledge of human relationships more; Hebrew is not always obligatory, while the results of literary and historical criticism are fully discussed. Freedom of thought in some institutions has completely liberalized the training and greatly modified the traditional theology. During the years 1870-95 the number of theological students increased more rapidly than the general population. During the next 25 years the figures show marked fluctuations, but for the period as a whole neither student enrolment nor the number of graduates kept pace with the increase in population.

Medicine.—The medical schools of the United States were slow to adjust themselves to the new conditions brought about by the growth of medical science. They followed the model of continental Europe rather than that of Great Britain, in that the teaching was almost exclusively by lectures but imposed no definite requirement as to preliminary education. There was lacking also, for the most part, stimulating contact with colleges or universities of high academic ideals; and therefore there developed an organization which lent itself readily to commercialism. In recent years, however, medical teaching has been revolutionized, and now exemplifies the highest standards of professional education. The rapid development of physiology, pathology, embryology, chemistry and hygiene has necessitated the enlargement of the curriculum to include these subjects. Laboratory methods of teaching have been introduced at very great cost for buildings and equipment. Teachers qualified by training and experience have superseded practising physicians as instructors in the fundamental sciences; in the clinical branches also pedagogical standards have been raised. Satisfactory preliminary education is regarded as essential, and all recognized medical schools (1921) require of candidates for admission the completion of the four-year secondary school course and at least two years of college work, including physics, chemistry and biology. Cornell, Western Reserve, and Leland Stanford require three years of college for entrance; Harvard a degree from, or two years of high rank in, a college or scientific school; Johns Hopkins a Bachelor's degree or its equivalent. Most significant of all, the student is again brought into intimate contact with the sick; hospitals and dispensaries are used as laboratories where the prospective physician may acquire skill in examining patients and familiarity with the manifestations of disease. The degree of Doctor of Medicine is conferred on completion of the medical course, which in nearly all schools is four years in length. A few institutions require also a fifth year, spent as an *interne* in a hospital, before granting the degree. Advancing educational requirements, the consequently greater cost of medical training, and the increasing knowledge and interest of the public in matters of public health have combined to reduce the number of medical schools from its maximum of 162 in 1906 to 85 in 1920; of medical students from 28,142 in 1904 to 14,088 in 1920; and of medical graduates from 5,747 in 1903 to 3,047 in 1920.

Law.—Legal education in the United States began in a kind of apprenticeship, an intimate personal relationship with a practising lawyer. The increasing complexity of legal machinery and the resulting specialization on the part of legal practitioners rendered it impossible for a student to gain a complete education in a single office. Schools were therefore established offering systematic courses of lectures, and attendance on such schools, in addition to a clerkship in a law office, is now required for admission to the bar. The length of the law course has been increased from one to two and from two to three years and the curriculum correspondingly enriched. In some instances the student is permitted a choice of electives. Most schools have adopted the "case method" of teaching, which consists in presenting to the student the records of selected cases. These records he analyzes, and from them deduces the legal principles involved. Lectures and moot courts are also employed. The minimum of preliminary training required for admission to a recognized law school is the completion of the four-year secondary

school courses, but many of the universities demand in addition two years or more of college work. In 1921 the number of law students was more than 27,000, an increase of nearly 20% over the pre-war figures.

Engineering.—The beginnings of American technological training were made, not in the long-established colleges, but in a group of special schools, independently founded, such as the Massachusetts Institute of Technology in Boston and Stevens Institute in Hoboken, N.J. Later the universities took up engineering education with avidity, built up elaborate departments and offered the greatest variety of courses. Another type of technical school is the state college of "Agriculture and Mechanic Arts" supported by land grants from the Federal Government. Engineering schools require of applicants for admission the completion of the four-year secondary school course. Instruction is largely by means of laboratory courses. The university of Cincinnati has gone a step further and perfected an arrangement by which students spend half their time outside the college, actually employed in some form of engineering work; periods of two weeks of study alternate with like periods of practice in a shop. The degree of Bachelor of Science, with or without specification of the branch studied, is commonly conferred after four years of college work. Those of Civil Engineer, Mining Engineer, and so forth, are awarded for undergraduate work by some schools in place of the B.Sc.; by others reserved for more advanced study.

Dentistry.—Since 1900 there has been increasing uniformity among dental schools until in 1921 all recognized schools required for admission at least the completion of a four-year secondary school course, and gave four full years of professional training. It was even proposed that beginning in 1926 the entrance requirement for dental schools be raised to include two years of college work. The growing appreciation of the value of dentistry is indicated by the increase in the ratio of the number of dentists to the total population. In 1850 this ratio was 12 for 100,000; in 1910 it was 43; in 1920, 56.

Veterinary Medicine.—In this, as in other professions, there has come a realization of the necessity for a solid foundation of general education on which to base special training. The accepted standard in 1921 was the completion of a four-year secondary school course and three years in a college of veterinary medicine. In 1900 13 schools enrolled 362 students and graduated 100 veterinarians. In 1916 the numbers had increased to 22 schools, 3,064 students and 750 graduates. The war brought about a great reduction in the number of those choosing veterinary medicine as a career. In 1921 the number of veterinary schools declined to 14 and the student enrolment to 849.

University Extension.—Under this head are grouped all those activities of institutions of higher learning which are carried on for the benefit of people unable, through lack of time or training, to matriculate in the regular college or university courses, but who still desire some form of higher education, and this extension of facilities is designed to include in its scope persons many years older than the ordinary undergraduate. Originally no more than a series of public lectures on topics of literary, historical or scientific interest, this extra-mural teaching has extended its range, diversified its method, and multiplied its activities, until it has become, in some instances at least, an important function of the university. The spirit of service to the community which it embodies was expressed by the late President Van Hise in these words:—"So far as the university of Wisconsin is concerned, we propose to take up any line of educational work within the state for which the university is the best fitted instrument," and again, "It is my ideal of a state university that it should be a beneficent influence to every citizen of the state." In such a programme the whole realm of human knowledge is included, from sewing to Sanskrit and from plumbing to philosophy. Summer sessions, of from six to eight weeks' duration, provide valuable opportunities for those, chiefly teachers and students, whose work allows a long vacation. Varying standards prevail in the summer schools; in not a few the amount and quality of the work render it acceptable as part of the requirement for a degree. The university of Chicago has made its summer session the full

equivalent of one of the winter terms and operates on a four-quarter schedule. Teaching by mail is another method employed by some universities to widen their spheres of influence. Extension teaching is also carried on by local boards of education, especially in large cities. Much of it takes the form of part-time classes for children who have left school prematurely and for immigrants who lack command of the English language. Private enterprise outside of academic circles has contributed to extension teaching along two distinct lines. The Chautauqua Assembly is the prototype of the summer school, and has exerted a very wide influence through the thousands who each year attend its courses. Quite different in scope, but not less valuable, is the kind of work done by other institutions which provide opportunities and incentives for continuous and serious study as well as lecture courses and concerts having a wider appeal. Perhaps the most valuable extension teaching is that which reaches into the home, bringing to the mother such information as will aid her in solving her manifold and peculiar problems. The U.S. Government prepares and distributes upon request a comprehensive series of pamphlets containing instruction regarding the selection and preparation of food, infant feeding, child hygiene and many other subjects. Whenever possible, nurses and women trained in the household arts visit the homes and, by personal directions and demonstration, often succeed in promoting the welfare of the family where print alone would fail. Intellectual development is stimulated by courses of home reading. The recognition of the importance of home influences as factors in the child's success at school has led to the formation of "parent-teacher associations," from which the teachers gain a knowledge of the home environment of their pupils and the parents learn how best to coöperate in the education of their children.

Vocational Training.—This term denotes training of less than college grade, designed to fit the individual to earn a livelihood. Its beginning in the form of manual training may be traced back as far as 1880, but except for a few isolated experiments it is a development of the 20th century. Phases in the progress toward an understanding of the problem have been:—(1) attention was focussed on "misfits"; based on what might be called a "niche" theory of society, the problem was stated as that of finding the particular place or station in life that exists somewhere for each individual; (2) it was held to be the duty of society to regard with earnest concern and in some way to aid those that are defective; (3) then came the idea that the schools might prevent individual and perhaps unusual types from being spoiled in the making; (4) next came a shift in emphasis to the necessity for vocational training; and (5) finally has come a recognition of the necessity for an educational survey of the community in order to determine what opportunities are already available and what its industrial needs really are. The so-called Smith-Hughes Act passed by Congress in 1917 authorized appropriations which will aggregate \$7,000,000 a year for promoting, in coöperation with the states, special training in schools designed to meet the needs of those who are preparing to enter agriculture or industry; provision is also made for training teachers for this work by industrial or commercial corporations and by the coöperative effort of the schools and the corporations. The teaching of domestic science was begun in the schools of Framingham, Mass., in 1808. The desirability of such training for every young girl has led to the inclusion of one or more courses in home economics in the curriculum of every girls' high school and also in the upper grades of the better-organized elementary schools.

Agricultural Education.—Training for agricultural pursuits, more than any other branch of education, has been fostered by the Federal Government. Its development manifests several stages, each characterized by a different method. The land grants of 1862 led to the establishment of state colleges of "Agriculture and Mechanic Arts," which, however, for a generation at least, were predominantly schools of engineering. In 1887 Congress authorized subsidies to agricultural experiment stations under state control, a policy the wisdom of which was quickly demonstrated. In a few years these stations accumulated a wealth of exact knowledge relating to farm problems which

would have been of inestimable value if it could have been applied. Then came the development of agricultural extension education employing agencies such as lectures, bulletins, correspondence courses, reading courses, farmers' institutes, short courses at agricultural schools, travelling libraries, educational trains, demonstration farms, educational exhibits at fairs and moving pictures. This phase culminated in the Smith-Lever Act of 1914, which appropriated more than \$4,000,000 annually to be apportioned among the states for agricultural extension work. Such activity, creating a great demand for teachers and farm demonstrators, reacted beneficially upon the agricultural colleges. Meanwhile another tendency was becoming manifest. The science of farming was being taught in the secondary schools. This plan possessed so many obvious advantages and showed such satisfactory results, that during the decade following 1910 it was widely adopted. In 1920 1,797 public secondary schools, with an enrolment of 27,755 pupils, provided vocational instruction in agriculture. In most schools the boy or girl is required to carry out, under supervision, some definite enterprise such as the cultivation of a small plot, the raising of pigs or poultry or the conduct of a miniature dairy. A detailed record of the undertaking, including a financial statement, is required and affords a basis for grading pupils' work.

Certain private corporations, not directly engaged in teaching, have influenced education in the United States. The General Education Board, incorporated by Congress in 1903, has employed the funds at its disposal in assisting institutions of higher learning throughout the country, and in the southern states it has also promoted the development of the secondary schools and the teaching of agriculture. Recently it has entered the field of medical education. The Carnegie Foundation for the Advancement of Teaching, incorporated in 1906, starting with a programme of pensions for retiring college professors, has been led into the field of investigations and surveys. The published reports of its findings have contributed in large measure to educational progress. The Russell Sage Foundation performs similar service.

Statistics.—The magnitude of educational work may be indicated by figures from the report of the Commissioner of Education for the year 1918. The total enrolment of pupils amounted to 23,433,726, and the estimated total cost \$1,059,934,803, making the average outlay \$45 per pupil enrolled and \$10 the cost *per capita* of the whole population. Teachers and supervisory officers numbered 769,763, of whom 23% were men. The bureau reported 670 colleges, universities and professional schools, with an enrolment of 355,131. For the public schools of elementary and secondary grade the following figures were given:—

Number of pupils	20,853,516
Average number of days schools open	160.7
Average days' attendance by each pupil	119.8
Number of male teachers	105,194
Number of female teachers	545,515
Number of school-houses	276,827
Average annual salary of teachers	\$635
Value of all school property	\$1,983,508,818
Income from permanent funds and rents	\$21,517,030
Income from local taxes	\$580,619,460
Income from state taxes	\$101,305,057
Income from other sources	\$33,434,885
Expenditure for sites, building and equipment	\$119,082,944
Expenditure for salaries	\$136,477,090
Expenditure for other purposes	\$208,118,055
Expenditure <i>per capita</i> of whole population	\$7.26
Expenditure per pupil in attendance	\$49.12
Expenditure per pupil per day	\$3.07

(A. S. D.; N. M. B.)

EDWARD (EDWARD ALBERT CHRISTIAN GEORGE ANDREW PATRICK DAVID), Prince of Wales (1894–), eldest son of King George V. and Queen Mary, was born June 23 1894, at White Lodge, Richmond Park, and baptized twenty-five days later by the Archbishop of Canterbury. In 1902, Mr. H. P. Hansell was appointed his tutor, and remained with him from that time until Aug. 1914. During 1902–7 the Prince was prepared for the navy, and in the spring of 1907 he entered Osborne, where he remained for two years before going on to the Royal Naval College at Dartmouth. During his time at

were in command, and Capts. T. D. L. Napier and H. Evan-Thomas at Dartmouth. On June 24 1910 he was confirmed in the private chapel at Windsor Castle. While still a cadet at Dartmouth he performed his first public duty on March 20 1911, by presenting to the mayor and corporation of that town the silver oar which they held formerly as a symbol of the rights associated with the Bailiwick of the Water of Dartmouth. At the close of his Dartmouth training in June 1911 he was invested as a Knight of the Garter, and on July 13 1911 he was created Prince of Wales and Earl of Chester. He was shortly afterwards invested as Prince of Wales in Carnarvon Castle, of which Lloyd George was at that time constable, and on this occasion for the first time an English prince addressed the Welsh people in their own tongue. Shortly after this event the Prince became a midshipman, and was appointed to H.M.S. "Hindustan," in which ship he served for three months under Capt. Henry Campbell. The months which followed this cruise were spent quietly at Sandringham in preparing for Oxford, but during the spring of 1912 the Prince spent five months in Paris as the guest of the Marquis de Breteuil, during which period he was ably coached by M. Maurice Escoffier in the language and history of the country. In Oct. 1912 the Prince, accompanied by Mr. Hansell and Maj. the Hon. William Cadogan (10th Hussars), who had recently been appointed his equerry, became a freshman at Magdalen College, Oxford. During his time at Oxford the Prince entered heartily into the corporate life of his college and the usual athletic amusements of the undergraduates. The Prince resided in college rooms, dined in hall or at one of the university clubs, and mixed freely with his fellow undergraduates. Some of his vacations he spent in European travel, visiting Germany twice, in 1912 and 1913, and Denmark and Norway in 1914. The Prince's university career was ended by the outbreak of the World War in Aug. 1914 on the eve of his third year. On Aug. 7 he was gazetted 2nd lieutenant in the Grenadier Guards, and on the 11th he joined the 1st battalion at Warley Barracks, Essex.

In Nov. 1914 the Prince, who had been appointed aide-de-camp to Sir John French, arrived in France and took up his new duties at British G.H.Q. at St. Omer. During the next 18 months he served with the Expeditionary Force in Flanders and in France in various parts of the line, being first attached to the 2nd division under Maj.-Gen. Horne, to the I. Corps under the command of Lt.-Gen. Sir Charles Monro, and later to the Guards division under Maj.-Gen. the Earl of Cavan. In March 1916 he was appointed to the staff of the G.O.C. the Mediterranean Expeditionary Force, and proceeded at once to Egypt. He took the opportunity of seeing the troops in various parts of the line on this front, and also went as far south as Khartum. On his return journey he paid a visit to the Italian headquarters at Udine, and by the middle of June had returned to the British armies in France. He was then attached to the XIV. Corps (Lord Cavan) in Flanders and France, taking part in the battles of the Somme and Passchendaele, and subsequently proceeded with this corps, in Oct. 1917, to the Italian front, where he remained till Aug. 1918. In May 1918 the Prince paid a semi-official visit to Rome. The Prince then returned to France and was attached to the Canadian Corps, with whom he was serving at the time of the Armistice. He was attached to the Australian Corps in Belgium till the beginning of 1919, after which he visited the Army of Occupation on the Rhine, spending a few days with the New Zealand division, and paying a short visit to General Pershing at the American headquarters at Coblenz.

On his return to England at the end of Feb. 1919 the Prince almost immediately took up a number of public duties which had of necessity been deferred during the war, and on May 29 was admitted to the freedom of the City of London. On Aug. 5 1919 he left Portsmouth in H.M.S. "Renown" for Newfoundland and Canada, first setting foot on Canadian soil on Aug. 15 at St. John, New Brunswick. His tour extended through the entire Dominion from E. to W., and five days after reaching Victoria on Sept. 23 the return journey began by a slightly

different route. The Canadian tour ended at Ottawa, and on Nov. 10 the Prince left for Washington to pay a short official visit to the President of the United States. New York was subsequently visited, and after a long series of official engagements, the Prince sailed for Halifax, where he bade good-bye to Canada, and reached Portsmouth on Dec. 1.

After a short stay in England the Prince sailed again in H.M.S. "Renown," on March 16 1920, for New Zealand and Australia. The first port of call was Barbados, and then, passing through the Panama Canal, short visits were paid to San Diego (Cal.), Honolulu and Fiji, Auckland being reached on April 24 after a voyage of 14,000 miles. A month was spent in New Zealand, visiting all parts of the North and South Is., and on May 26 the Prince landed at Melbourne. During his stay in Australia he visited all states of the Commonwealth, and eventually sailed from Sydney harbour on Aug. 19. On the return journey stops were made at Fiji, Samoa, Honolulu and Acapulco, and, after passing once again through the Panama Canal, three weeks were spent in the West Indies. The last port of call was Bermuda, and H.M.S. "Renown" eventually reached Portsmouth on Oct. 11 1920. The Prince received a magnificent reception on his arrival in London, and, as had been done on his return from Canada and the United States, the conclusion of his world-tour was celebrated by the King and Queen at a banquet at Buckingham Palace, and the Prince was shortly afterwards entertained by the Lord Mayor at the Guildhall, where he gave an account of his travels.

After a brief holiday, spent for the greater part in the hunting-field, he resumed his public duties after Christmas, 1920. During the first six months of 1921 H.R.H. was occupied chiefly in London, but found time to visit, among other places, Oxford, Cambridge, Glasgow and the Clyde; his Duchy of Cornwall property in Devon, Cornwall and the Scilly Is.; Cardiff, Newport and Bristol. On June 23 1921 the Prince spent part of his 27th birthday with 1,000 East End children who were entertained by the Fresh Air Fund in Epping Forest. On Oct. 26 he sailed in the "Renown" on a State visit to India.

EDWARDES, GEORGE (1852-1915), English theatrical manager, was born in Ireland Oct. 8 1852. He was educated for the army but deviated into theatrical business and became manager successively to Michael Gunn at the Theatre Royal, Dublin, and to D'Oyly Carte at the Savoy theatre, London. In 1885 he joined John Hollingshead at the Gaiety theatre, London, and the next year took over the sole management of that theatre, which he ran with striking success up to the time of his death. He also built and managed Daly's theatre, was managing director of the Empire theatre and at different times acted as manager, or producer, at a number of other London theatres. Incidentally he was well known as an owner of race-horses. He died in London Oct. 9 1915, never having quite recovered from the effects of confinement in Germany, where he was interned on the outbreak of the war.

EDWARDS, ALFRED GEORGE (1848-), first Archbishop of Wales, was born at Llanymawddwy Nov. 2 1848, and was educated at Jesus College, Oxford. He was ordained curate of Llandinog, Carmarthen, in 1874, and became warden and headmaster of the college, Llandovery, in 1875, holding this position until 1885, when he accepted the living of Carmarthen. In 1889 he became bishop of St. Asaph. In 1920, after the disestablishment of the Welsh Church, of which measure he had been one of the most active opponents, he was created Archbishop of Wales, and was enthroned by the Archbishop of Canterbury at St. Asaph cathedral June 1.

Amongst his publications may be mentioned *The Church in Wales* (1888); *Common-Sense Patriotism* (1894); and *Landmarks in Welsh Church History* (1912).

EDWARDS, ENOCH (1852-1912), British Labour politician, was born at Talk-o'-the Hill, Staffs., April 10 1852. He was the son of a pitman, and worked as a boy in a coal-mine. In 1870 he became treasurer of the North Staffordshire Miners' Association and was elected secretary to the same body in 1877. In 1884 he

went to Burslem, where he became a member of the school board and town council in 1886, and later he became alderman and mayor. In 1880 he became president of the Midland Miners' Association; he was later president of the Miners' Federation of Great Britain and a member of the Staffordshire county council. He was elected to Parliament in the Labour interest as member for Hanley in 1906. He died at Southport June 28 1912.

EDWARDS, JOHN PASSMORE (1824-1911), English newspaper proprietor and philanthropist, was born at Blackwater, Corn., in 1824, the son of a carpenter, and was mainly self-educated. In 1844 he became London representative in Manchester of the *Sentinel*, an anti-Corn Law weekly newspaper. A year later he went to London and began lecturing, together with the practice of journalism, starting several small periodicals which in succession failed, until in 1862 he bought the *Building News*, which by 1866 had made a handsome profit. In 1876 he bought the London halfpenny evening newspaper, the *Echo*, and controlled it for 20 years. He was an ardent peace advocate, and supported a number of humanitarian and philanthropic objects, endowing various libraries and other institutions which bore his name, notably the settlement in Tavistock Place, Bloomsbury, now called, in memory of Mrs. Humphry Ward, the Mary Ward Settlement. He also founded a Passmore Edwards scholarship at Oxford for the conjoint study of English and classical literature. He published privately an autobiography, *A Few Footprints* (2nd ed. 1906). He died in London April 22 1911.

See E. Harcourt Burrage, *J. Passmore Edwards* (1902).

EFFICIENCY ENGINEERING: see SCIENTIFIC MANAGEMENT.

EGGLESTON, GEORGE CARY (1839-1911), American journalist and author (see 9.17), died in New York April 14 1911.

EGYPT (see 9.21).—Turkish suzerainty over Egypt was formally abolished in Dec. 1914 when a British protectorate was proclaimed, while the acquisition of Tripoli and Cyrenaica by Italy and the establishment of Palestine as a separate state under a British mandate cut Egypt off from all territorial connexion with the Turkish Empire.¹

Population.—At the census of March 1917, the inhabitants numbered 12,750,918, as contrasted with 11,287,359 in 1907, an increase of 12.9% (compared with an increase of 14.9% for 1897-1907). The number of foreigners in the country in 1917 was 238,661, a figure which owing to war conditions did not represent the normal foreign population. While the area of Egypt is some 350,000 sq. m., the cultivated and settled area—the Nile valley and delta—covers only 12,226 sq. m., and in this restricted area the inhabitants in 1917 exceeded 1,000 per sq. mile. The number of nomads and semi-nomads was estimated at 452,263. The pop. of the chief towns in 1917 was: Cairo, 790,939; Alexandria, 444,617; Port Said (including Ismailia), 91,090; Tanta, 74,195; Mansura, 40,238. Classified by religions there were in Egypt in 1917: Moslems, 11,658,148; Copts, 854,778; other Christians, 155,168; Jews, 50,581, and "others," 23,243. On July 1 1919 the pop. was calculated at 12,878,000.

General Economic Conditions.—By 1911 the State finances had recovered from the effect of the economic crisis of 1907—a crisis due to over-speculation and extravagance following a period of much prosperity. But at the opening of 1914 the liabilities left over from 1907 still weighed heavily on private finance. The outbreak of the World War in Aug. 1914, just when the cotton crop was about to be harvested, threatened once more to place

¹ The question as to how far Egyptian territory extended along the Mediterranean W. of the Nile was settled in 1911. The Italians upon declaring war on Turkey in that year proclaimed a blockade of the coast as far E. as Ras el Kanais, thus reviving the Turkish claim as to the limits of Cyrenaica. The British Government on behalf of Egypt protested, maintaining that, as both Turkey and Italy had been notified in 1904, Egyptian territory extended to the Gulf of Sollum, 150 m. W. of Ras el Kanais. In this contention Italy acquiesced and the frontier between Italian territory (Cyrenaica) and Egypt was fixed at the head of the Gulf of Sollum, the small part of that name being left to Egypt. The British Government further announced that inland they regarded the oasis of Jarabub as part of Egypt. In 1919, however, it was agreed to transfer Jarabub to the Italian sphere (see SENUSSI AND SENUSSITES).

Egypt in great economic difficulties. The price of cotton fell by a third and a panic was averted only by drastic measures taken by the Government. As part of these measures a general moratorium was proclaimed and an emergency currency obtained by making the notes of the National Bank of Egypt temporarily legal tender and inconvertible. But cotton, stimulated by war demands, had again risen to pre-war prices by the end of 1915, and this, together with forced economy and the large sums spent by the army stationed in the country, restored the situation. Taking the country as a whole a new period of prosperity set in, chiefly due to the soaring price of cotton—which in April 1920 was almost ten times its value in 1913. During the war exports greatly exceeded imports in value, and, deprived of normal means of employing capital in the country itself, the Egyptians sought foreign investments, putting their money to a large extent into British war securities. It was calculated that between Aug. 1914 and April 1920, as much as £150,000,000¹ had been invested abroad. Yet at the same time Egypt (apart from the public debt) was still a debtor to foreign countries for a still larger sum, chiefly loans on mortgage and capital invested in industrial, transport and other companies. But the wave of prosperity—which depended to an unhealthy extent on the inflated price of cotton—was accompanied by very real distress among the *fellahin* (peasantry). The great increase in the cost of living acted upon this class (who form 62% of the pop.) with extreme severity, and their plight was accentuated by the natural tendency to extend the area under cotton cultivation at the expense of the area under cereals. The poorer classes in the big towns were even more affected than the *fellahin*; in Cairo in 1920 the cost of living was thrice as high as in the beginning of 1914. An attempt by the authorities to fix maximum prices was found to do rather more harm than good. The Government was reduced to seeing that certain staple articles of food—chiefly wheat, flour and maize—were supplied at reasonably cheap rates. Wheat had to be imported for this purpose and sold at prices involving a loss.

As one result of the increased cost of living there was a general demand for higher wages and improved conditions, and labour organizations resembling trade unions made their appearance. Many strikes occurred, some of long duration and some political rather than economic. A Labour Disputes Conciliation Board, established in Aug. 1919, did much good work in regulating questions of pay, hours of work, payments for sickness, etc.

The great drop in the price of cotton during the last half of 1920 naturally affected Egypt, and 1921 proved a year of considerable stringency. The restriction in the purchasing power of the community was a reflex of the fall in cotton. The price of Egyptian cotton (*sakel*) on the Liverpool market was 84.50d. in April 1920 and but 17.75d. in April 1921. The fall came too late to affect the trade returns of 1920, which were the highest recorded. The figures were largely delusive, as they were mainly the result of higher prices and not of increased production.

To a certain extent the poorer *fellahin* enjoyed advantages which protected them against the worst effects of bad harvests and low prices. By a law of 1912, passed at the instance of Lord Kitchener, holdings up to five *feddans*² were secured from distraint for debt, and as native owners of land of five *feddans* or less numbered at the 1917 census over 1,500,000, or about one-tenth of the total population, the benefit of the Five *Feddans* law was very appreciable. Moreover, the peasantry could obtain loans from the Agricultural Bank at the fixed rate of 8% interest.

Agriculture, Mining and Trade.—The Agricultural Department, established by Sir Eldon Gorst in 1910, was in 1913 transformed by Lord Kitchener into a Ministry of Agriculture. Cotton maintained its position as the mainstay of Egyptian prosperity. The crop of 1910 realized £E35,840,000, being £E5,700,000 above the previous best. The crops of 1908, 1909, and 1911 were, however, poor or medium, and steps were taken to put the industry on a sounder basis. Reclamation of land had been pushed northward in the Delta into low-lying areas where there was no natural drainage, while a middle zone had become salted and water-logged. Thus arose the necessity

of drainage works on a large scale. Undrained soil, indiscriminate destruction of bird life³ and the loss in seven years of a quarter of a million head of cattle through disease had led to a great increase in cotton pests, while a harmful system prevailed of mixing different varieties of cotton-seed for sowing. In Nov. 1912 a cotton congress was held in Cairo, representatives of master cotton-spinners from every European country and Japan being present. At this congress Mr. Dudgeon, director-general of the Agricultural Department, outlined a scheme whereby in five years seed for producing species approved by spinners could be obtained for the whole of Egypt. A Cotton Research Board was created in 1919 and in that year Mr. H. M. Leake, a leading authority on cotton-breeding, visited Egypt with the object of improving the quality and increasing the yield of the cotton crop. From 1916 the crop had represented practically only two varieties of cotton, *sakel* (72%) and *askumani* (28%)—the latter grown in Upper Egypt. The *Misafy* and *Nubari* varieties, 26% and 15% respectively in 1913, had shrunk in 1919 to 2.2% and 1.5%. The pressing and baling of the cotton are done almost exclusively at Alexandria.

The attraction of cotton caused the cultivator to restrict the areas under food crops; so much so that in 1915 and again in 1918 the Government was compelled to limit the area under cotton. The chief food crops are wheat, barley, maize, rice and sugar-cane. In 1919 the area under cotton was 1,573,000 *feddans* as against 1,274,000 under wheat. In 1916 the figures had been: cotton 1,677,000 *feddans*, wheat 1,075,000. The figures for the 1920 wheat crop were, however, illusory; in many instances wheat sown was rooted up, or allowed to be grazed by cattle, and cotton planted in its place. While the cotton crop varied considerably in amount the average annual production was about 315,000 tons. The crops of 1920 realized the unprecedented price of £E75,096,000, an increase of 15% in value over 1917, though a big decrease in quantity.

With a view to broadening the basis of the agricultural resources of the country decrees were issued (Dec. 1920–May 1921) prohibiting for the three years 1921–3 the planting of more than one-third of each holding with cotton. This action was taken at the request of the provincial councils.

From 1912 onward there was a notable development in the mineral wealth of Egypt. Nitrates and phosphates, the last-named from the Red Sea coast, together with a little gold, were up to then the chief mineral exports. Petroleum was known to exist on both shores of the Gulf of Suez but it was not till 1912 that the export of crude oil began. This oil was from the Gemsa mines. In 1914 a new oil-field was discovered at Hurghada and the oil from this field did much to save Egypt from a fuel famine during the World War. This led the Government to undertake drilling operations on its own account, but up to the close of 1920 the stage of production from Government mines had not been reached. The value of the mineral output (in its raw state) rose from £E400,000 in 1914 to £E1,420,000 in 1919. Oil refineries were erected at Suez where, in 1916, harbour extensions were carried out to provide for the increase in the oil trade and the bunkering of oil-burning ships. The output of petroleum rose from 12,700 metric tons in 1913 to 281,800 tons in 1918. Phosphate was next in importance among minerals. The output varied greatly; it was 104,000 metric tons in 1913, rose to 125,000 in 1916, fell to 31,000 in 1918 and was 78,500 in 1919. Manganese ores have been exported since 1913 but the mines were much damaged by the Turks in 1915–6. In 1918 the manganese ore mined was 27,498 tons, the export 9,400 tons.

Of other industries cigarette-making at Alexandria from imported tobacco—a business almost entirely in the hands of Greeks and Armenians—showed wide fluctuations. Before the World War the tobacco was obtained chiefly from Greece, Turkey and Russia. During and after the war the place of Turkey and Russia was taken by China, India and Japan. The tobacco imported in 1913 was 7,269,000 kilogrammes; in 1919 it was 8,350,000 kgm. The export of cigarettes, 493,000 kgm. in 1913 fell to 285,000 kgm. in 1917, but rose to 561,000 kgm. in 1919.

The external trade of Egypt in the decade 1911–20 rose from £E55,826,000 to £E187,348,000, the figures for 1920 being the highest recorded. Imports in that year were £E101,880,000 and exports £E85,467,000. They compared with the previous highest returns of £E51,156,000 imports in 1918 and £E75,880,000 exports in 1919. There was a great increase of imports, following the removal of war restrictions, in 1918–20, but the rise was more in values than in quantity. In 1911 the balance of trade had been almost even, exports being £E28,598,000 and imports £E27,227,000.

As to exports, cotton, throughout the decade, represented 90% of the total; the other chief exports were cereals and vegetables, sugar, cigarettes and, from 1913–4, minerals. The largest exports in 1920, after cotton, were cotton seed and cakes, £E4,087,000; sugar, £E1,144,000; and cigarettes, £E951,000. The chief imports were cotton textiles (valued at £E18,771,000 in 1920), metal and metal ware (£E11,842,000), coal (£E8,315,000), wheat and flour (£E9,443,000).

³ In 1912 a law was passed for the protection of birds useful to agriculture. Many of these birds, such as the buff-backed heron (egret), had been almost exterminated. The new law proved effective and these birds again multiplied.

¹ £1 0s. 6d. approx.

² One *feddani* = 1.038 acres.

000), and tobacco (££3,184,000). Much of the coal imported in 1919 and 1920 came from South Africa and Australia.

Alexandria is the principal centre of trade, taking normally over 90% of the total. Its share in 1913 was 91.8%. In that year Port Said had 11% of imports and 1% of exports. War conditions caused Port Said (and Suez) to obtain, temporarily, a much larger share—25%—of the trade, but in 1919 Port Said had dropped to 18% of imports and under 4% of exports. In that year Alexandria took 87.9% of the total trade.

The following table of the trade of Alexandria for 1913 and 1919, showing the chief importing and exporting countries, may be taken as showing the economic relations of Egypt as a whole. The most noticeable features of the table are the entry of Japan into the Egyptian market and the increasing competition of the United States. Japan first appeared as a customer in 1916.

The share of the United Kingdom and of British possessions in the import trade of Egypt as a whole was 37.6% in 1913 and 58.2% in 1919. In the last-named year the United States came next with 6.1% of imports, being followed by Italy, France and Greece. In 1913 the United Kingdom took 43.1% of exports, Germany 12.8%, Austria 5.6% and the United States 7.9%. The British share of the exports in 1919 was 54.3%, that of the United States 22% and of France 7.7%. The increase of United States trade was largely due to the demand for cotton; of the 1920 crop the U.S. took 35% compared with 42% taken by the U.K. and 10% by France.

The value of merchandise in transit during 1920 was ££13,000,000 as compared with ££21,000,000 in 1913. It consisted almost entirely of coal and petroleum and passed largely through Port Said. Re-export trade (*entrepôt*), to which the geographical situation of Alexandria is peculiarly favourable, was valued at ££2,500,000 in 1920 compared with ££500,000 in 1913, and consisted mainly in the export of textiles, metal goods, kerosene, oil fuel and vegetable oils to adjacent countries of the Levant, notably Syria and Palestine.

Shipping.—The tonnage of ships entering Alexandria in 1911 was 4,095,000, the British share being 39%. Austria-Hungary coming next with 10%. In 1913 the tonnage was 3,718,000, a figure nearly maintained in 1914. During the World War the commercial tonnage greatly dwindled and in 1918 was 738,000 tons, of which 527,000 tons were British. The British passenger services were completely disorganized and this traffic was in 1919 almost wholly absorbed by Italian companies, notably the Lloyd Triestino (formerly Austrian Lloyd). Including vessels in transit through the Suez Canal, but excluding warships and all vessels on military service, the shipping figures for 1918—Alexandria, Port Said, Suez and all minor ports combined—were: Steamers entered, 2,108; tonnage, 5,329,000; steamers cleared, 2,161; tonnage, 5,489,000. Sailing vessels entered, 422; tonnage, 20,000; cleared, 463; tonnage, 25,000.

War and post-war developments included the establishment of regular lines of cargo steamers by Japan, Norway and the United States. Trade with the United States was still, however, maintained mainly by British ships.

Railways, Telegraphs, etc.—In 1915-6 the Egyptian railway system was prolonged from Salhia to Qantara on the Suez Canal, whence a line was built (originally for military purposes) across the Sinai Peninsula parallel to the coast, and was later continued to Jerusalem and Haifa. A steel swing-bridge over the Suez Canal at Qantara, completed in May 1918, gave through communication between Cairo and Jerusalem, but at the end of 1920 the Suez Canal Co. pressed for the demolition of the bridge on the ground of its interference with the canal traffic. The bridge was taken down by May 1921; while the question of a permanent alternative means of transit was being studied, a floating transporter carried goods across the canal in the railway trucks without break of bulk.

The railways suffered severely during the war owing to heavy military demands and had not in 1921 recovered from the overwork and arrears of maintenance. There was no considerable renewal of permanent way in the period 1914-20. This caused increased use of the canals, notably the Mahmoudia Canal, which runs from the Nile at El'Atfi to Alexandria. It is open to navigation throughout the year

and has wharfrage at Gabbari (the Alexandria goods station). In 1919 the building of short lines to give the Delta towns better access to Alexandria and Port Said was under consideration.

Wireless telegraph stations were erected at Cairo and Assiut and aerodromes laid out at Alexandria, Cairo and other towns, some of which served as stations on the trans-African route. In April 1919, a Ministry of Communications was formed, which took over control of railways, telegraphs, telephones, the post-office, ports and lights, etc., including air service. The telephone system had then recently been purchased by the State from a private company.

Irrigation.—The task of raising the Asuan dam was completed in 1912. The regulator at the head of the Menufia Canal—built about 1850—having suddenly collapsed in Dec. 1909, a new regulator had been built by Messrs Aird & Co. by July 1910, in time for the Nile floods. In 1912 extensive works for improving the irrigation and drainage of the Delta were begun; their completion was delayed by the financial stringency caused by the outbreak of the World War.

In 1916 the Egyptian Government in conjunction with the Sudan Government began investigations for new irrigation works on a larger scale. The scheme, approved in 1920 after much criticism, included the construction of a dam at Gebel Aulia, near Khartum, with a storage capacity double that of the Asuan dam, and of a barrage near Nag Hamadi in Upper Egypt. The object as defined by Lord Allenby in 1920 was to "permit the perennial cultivation of the remaining waste or basin areas of Egypt, amounting to some 1,900,000 ac. which are now uncultivated, and 1,200,000 ac. which under basin irrigation produce one crop a year." The works were also intended to reduce danger from floods. (*See* SUDAN.)

Education.—In 1917 census returns showed that 8% of the population over five years of age could read and write as against 6% in 1907. These figures hardly reflect the desire for education among all classes. The provincial councils, which since 1910 have had part control of elementary education, showed in many instances keen interest in their work. A commission presided over by Adly Pasha, then Minister of Education, reported in 1918 that the existing schools were inadequate and outlined a scheme for sites and buildings costing over £12,000,000, with an ultimate maintenance cost of some £2,000,000 a year. In 1916 higher elementary vernacular schools were established by the Ministry of Education; in 1920 the Ministry maintained 6 and the provincial councils 18 such schools. In that year the Ministry of Education had 54 girls' elementary schools—increased interest by mothers in the education of their daughters was a feature noted by the authorities in the report for 1919. "A few years ago," it was recorded, "it was rare to find a mother taking a direct personal interest in the welfare of her daughter at school; this was left to the father who . . . often had to overcome maternal opposition to (his daughter's) education." In 1917, 18 per 1,000 of the female population above five years could read and write compared with 3 per 1,000 in 1907. The corresponding figures for males were 85 per 1,000 in 1917 and 120 per 1,000 in 1907. In Feb. 1920 219,642 boys and 42,911 girls attended *maktabs* (elementary schools) under Government control or inspection.

In secondary and higher education there were no great developments during 1910-20, and no effective steps were taken to found the proposed State university. Much injury to education was caused by the strikes, for political reasons, which began among the students in many higher and secondary schools in March 1919.

Finance.—The revenue in 1911 was ££16,793,000, exceeding that of 1910 by ££827,000 and that of 1907 (the highest figure previously recorded) by ££125,000. Expenditure in 1911 was ££14,872,000. During 1913 the Domains loan was extinguished and the profit on the working of the domains became available for general purposes. The revenue had increased to ££17,368,000 by 1913 and expenditure to ££15,728,000. The effect of the outbreak of the World War was seriously to contract revenue and to necessitate great economies and the finding of new sources of income. The accounts for 1914-5 showed a deficiency of ££1,468,000. The recovery in the price of cotton and the expenditure of the British army stationed in Egypt, however, enabled the Finance Ministry to show a surplus of ££1,165,000. By 1919-20 the revenue had risen to ££33,677,000 in which year expenditure was ££28,991,000. On April 1 1920, the general reserve fund stood at ££15,576,000. Meantime, in 1917-8, the Egyptian Government had taken over charges amounting to about ££3,000,000 incurred by the Egyptian Expeditionary Force. The budget for 1920-1 (the financial year ending March 31), framed when cotton was at its highest price and trade increasing, was estimated to balance at the unprecedented figure of ££40,271,000. This included a sum of ££5,654,000 on new works. During the year the great fall in the price of cotton occurred, with a general contraction of trade, while food subsidies and emergency purchases of coal were a great drain on the revenues. The year closed with a deficit of ££12,900,000. This was made good out of the general reserve fund, which in April 1921 was reduced to ££3,000,000. The budget for 1921-2 was framed to meet the altered economic position. Revenue was estimated at ££36,701,000, and expenditure at ££38,682,000 with a draft on the general reserve fund to balance accounts.

The public debt stood on Dec. 31 1919 at £93,299,000 sterling, of which £5,282,000 was held by the Government and £88,017,000 was in the hands of the public. Interest on the debt was £3,350,000.

Administration.—In 1913 the two legislative bodies, the General Assembly and the Legislative Council, were replaced by a single body called the Legislative Assembly consisting of (1) Cabinet ministers; (2) 66 elected members; and (3) 17 members nominated to represent minorities. Members were to hold their seats for six years, one-third being elected every two years. The Legislative Assembly met in 1913 and had a somewhat stormy session. In 1914 martial law was proclaimed and there were no further sittings of the Assembly.

On the proclamation of the British protectorate (Dec. 4 1914) a High Commissioner replaced the British consul and agent-general. The then ruler, the Khedive 'Abbas Hilmi, was deposed and his cousin Husein Kamel, a son of the Khedive Isma'il, was placed on the throne with the title of sultan; on Husein's death his brother Ahmed Fuad Pasha became sultan (Oct. 9 1917). The capitulations continued in force pending the elaboration of measures which satisfied foreign Powers that under a new judicial system the interests of their subjects would be safeguarded. (See below, *History*.)

The most useful records of the finances, administration and social and economic condition of Egypt are the Reports of the British Agent-general published annually in London down to 1914. In 1920 appeared a Report from the High Commissioner covering the period of 1914-9, a report to which the present writer is indebted. Detailed information is given in annual reports of the various Egyptian ministries issued at Cairo. For a recent study of the Copts see S. H. Leader, *The Modern Sons of the Pharaohs* (1918). See also M. S. Briggs, *Through Egypt in War Time* (1918).

(F. R. C.)

POLITICAL HISTORY 1909-21

The Pre-war Period.—The policy of entrusting the Egyptians with a larger administrative responsibility was initiated under Sir Eldon Gorst, who succeeded Lord Cromer as British Agent and Consul-General in 1907. Considerable success attended the extension of ampler powers to provincial councils, which in 1909 took over the direction of elementary education. But a sufficient period of time did not elapse before his premature death in 1911 to give the experiment a fair trial, and the new policy, which was generally interpreted in Egypt as an attempt to conciliate opposition by concession, rather stimulated than discouraged Nationalist agitation. In Feb. 1910 Boutros Ghali Pasha, the first Copt to attain the rank of Premier, was assassinated by a young Egyptian of the Nationalist party, which proclaimed the murderer a patriot and provoked demonstrations during his trial. Their influence had affected the General Assembly, which displayed its anglophobia by rejecting a proposal to extend the existing concession of the Suez Canal Co. after its expiry in 1968. The British Agent was compelled to recommend drastic measures to stop anti-British manifestations and Sheikh 'Abd el 'Aziz Shawish, the moving spirit behind them, was expelled from Egyptian territory. It is significant that he established his residence in Berlin. Mohammed Said Pasha became Prime Minister and Jusuf Saba Pasha, hitherto Director-General of Posts, joined the Cabinet. A long-felt want was supplied in 1910 by the creation of an Agricultural Department under the Minister of Public Works. After the murder of Boutros Pasha the tension between Copts and Moslems increased and a Coptic Conference held at Assiut in March 1911 drew up a memorandum preferring complaints of unfair treatment which the British Agent was unable to regard as justified. Sir Eldon Gorst, who had long been in failing health, requested to be relieved of his functions early in July 1911 and a few days afterwards he died. His long and intimate knowledge of the country lends special importance to his final report for 1910, in which he recognized that the Legislative Council and General Assembly had become instruments of agitation against the occupying Power and that the new policy had failed.

It might be open to question how far it would generally be opportune to appoint a former servant of the Egyptian Government to be representative of Great Britain in Egypt. An exception was, however, certainly justifiable in the case of Lord Kitchener, who had, moreover, been employed for many years elsewhere and who enjoyed exceptional prestige. He arrived

in Egypt at the end of Sept. 1911. A fortnight later the Italian landing in Tripolitania followed a declaration of war with Turkey. Egypt was at once declared neutral. H.M. Government contested on behalf of Egypt the claim of Italy to blockade the coast up to a point 100 m. E. of Sollum, that post, which was occupied by an Egyptian force, being regarded as the limit of her western frontier. In spite of a general feeling of sympathy with a Moslem belligerent, intensified by geographical proximity and racial kinship, the Egyptian people displayed self-control, and neutrality was strictly observed. But the Libyan War had the effect of stimulating the patriotic sentiment which is largely a patriotism of Islam. The anarchical spirit displayed by the murder of Boutros Pasha was again revealed in July 1912, when a plot was detected to murder the Khedive, Lord Kitchener and the Prime Minister.

Lord Kitchener's energies were first devoted to the needs of the Egyptian peasantry. A law was introduced exempting small holdings up to 5.15 ac. from distraint for debt, while usurious money-lending at more than 9% was made punishable by fine and imprisonment. Boards of local magistrates were instituted to summarily decide trivial cases and avoid costly suits. Steps were taken to preserve the bird life so necessary to keep down cotton pests. Thanks to his efforts the beautiful egret, which was rapidly being exterminated, has once more become conspicuous in the fields. A representative international cotton congress was summoned to meet at the end of 1912. In that year Mohammed Said lost the services of Sa'd Zaghlul Pasha, his Minister of Justice, who subsequently became the leader of the Nationalists. But his administration was strengthened in 1913 by the formation of two new ministries, those of Waqfs (see 17.413) and Agriculture. Tension with the Khedive, however, led to his resignation in 1914. He was succeeded by Husein Rushdi Pasha, who remained in office throughout the period of the World War.

New Legislative Assembly.—The salient measure of Lord Kitchener's administration was a revision of the Organic Law of 1883 and the institution of a Legislative Assembly on a broader electoral basis than that of the old Legislative Council and General Assembly. Under the previous system the villages appointed representatives by manhood suffrage to elect provincial councils. The provincial councils returned 14 members from their own body to represent the provinces in the Legislative Council, to which 12 more were nominated by the Khedive. The council of 26, with the ministers and 46 other delegates elected by the village representatives, constituted the General Assembly. All laws and decrees before approval had to be submitted to the Legislative Council, which could invite information, submit petitions and criticize the budget. The General Assembly, with similar powers of discussion and criticism, met at rarer intervals. Its concurrence was necessary for any measures involving fresh taxation, but it had no power to initiate legislation. There was no justification for the existence of two bodies performing practically the same functions, and the inclusion of members of the provincial councils, whose duties were entirely different, was an anomaly. A single Legislative Assembly was now substituted for these two bodies, with considerably extended powers, including that of initiating measures on its own responsibility. It was made incumbent on the Government to justify persistence in legislation disapproved by the majority, and machinery was also introduced enabling the Government to directly consult the electors in regard to proposals rejected by the Assembly. The electorate was based on the old register, with the addition of all newly qualified voters, and numbered some two millions. Electors were divided into groups of 50, which returned delegates to carry the vote of each group to the poll.

Three weeks elapsed between the choice of delegates and the final elections. The first Assembly consisted of 40 landowners, 2 lawyers, 3 religious dignitaries and one engineer. The president and one vice-president were appointed by the Government. As elective vice-president Sa'd Zaghlul Pasha, who was already hailed by the opposition press as the champion of

Egyptian liberty, was chosen by an overwhelming majority. He led a bitter attack against Mohammed Said and indirectly against the British Agency in the early debates. The hostility of the new Assembly received encouragement from the Khedive, who now acted in complete understanding with the Nationalists.

Egypt during the War.—On the outbreak of the World War in 1914, and the change that was made in the status of Egypt, the sittings of the Assembly were suspended, and the term of its mandate expired without their having been renewed. Lord Kitchener was absent from Egypt on leave when Great Britain entered the war, and he never returned there, his services being demanded at home, where he was appointed War Minister. On Oct. 1 1914 enemy subjects were ordered by the G.O.C. in chief, Sir John Maxwell, to register themselves, and German or Austro-Hungarian male subjects of military age, or under suspicion, were deported to Malta. A proclamation of Nov. 2 placed Egypt under martial law. This enabled administrative measures to be enforced without reference to the Legislative Assembly and, where foreign subjects were concerned, without the elaborate procedure for obtaining the consent of foreign Powers. A further proclamation on Nov. 6 notifying a state of war with Turkey announced that Great Britain would take upon herself the sole burden of the war "without calling on the Egyptian people for aid therein." A number of Egyptian artillery nevertheless volunteered for service in defending the canal and took part in the repulse of the German-Turkish offensive, which was not supported by any movement in Egypt itself. Volunteer labour battalions were also raised, which played an important part in the conduct of the war. From 1917 onwards an Egyptian force, enrolled under the Frontier Districts Administration with British officers, maintained security and suppressed contraband in the Arabian and Libyan desert zone, hitherto patrolled by the coast-guards.

As the Egyptians were nominally subjects of the Sultan the entry of Turkey into the World War as the enemy of the occupying Power created an intolerable situation which demanded immediate settlement. Turkish suzerainty might have been determined by the annexation of Egypt to the British Empire. But it was decided rather to proceed along existing lines and to place Egypt under British protection. By a proclamation issued Dec. 18 the Secretary of State for Foreign Affairs gave notice that, "in view of the state of war arising out of the action of Turkey, Egypt is placed under the protection of His Majesty, and will henceforth constitute a British Protectorate. The suzerainty of Turkey over Egypt is thus terminated and His Majesty's Government will adopt all measures necessary for the defence of Egypt and protect its inhabitants and interests." A second proclamation issued the following day announced the deposition of the Khedive, 'Abbas Hilmi, who was in Constantinople, on the ground of his adherence to the King's enemies, and the acceptance of the succession by his uncle Prince Hussein Kamel, who was henceforth to bear the title of Sultan of Egypt. The arbitrary and corrupt methods of the deposed Khedive had rendered him generally unpopular with Egyptians, who had also little reason to regret the severance of the last link with Turkey. At the same time Mussulman feeling could not be indifferent to the danger which threatened the caliphate, and German agents had freely promised the eventual liberation of Egypt from British control after the victory which they confidently predicted. Sultan Hussein's position was therefore no easy one, in spite of the personal respect which he commanded.

Sir H. McMahon, High Commissioner.—The new status of Egypt was nevertheless introduced without disturbance, if without enthusiasm, under the direction of Sir Milne Cheetham as acting High Commissioner, pending the arrival early in 1915 of Sir Henry McMahon, who had been selected for that post. The British representative now took over the direction of foreign affairs and the Egyptian minister disappeared.

The complete failure of the Turkish attack on the Canal had its effect on public opinion, and as time went on the Sultan's personal popularity increased. On the other hand the Russian

retreat, the failure of the Dardanelles attack and the final withdrawal produced some reaction and confirmed the general impression of German invincibility. In April and again in July 1915 attempts were made on the life of the Sultan. In justice to the Egyptians, however, it should be recorded that, whatever anticipations had been raised among them as to the outcome of the war, they bore with patience and goodwill the unwelcome disabilities which it entailed, and laid Great Britain under obligations both moral and financial. Requisitions of cereals and of live stock, the control imposed on the price of cotton, recruiting for the labour and the camel transport corps, without which the Palestine campaign could not have been brought to a successful conclusion, and finally the assumption by the Egyptian Government of the whole liability for expenditure on services connected with the war, held over in a suspense account which reached £3,000,000, constituted a British obligation for which too little credit was given.

Nationalist Propaganda.—The war had entailed the recall of a great number of British officials from Egypt for service elsewhere, and not only was much abusive action by uncontrolled local agents ascribed to British pressure, but a free field was left open for Nationalist propaganda, which had grown ever-increasingly active as the generation died out which had experienced the pre-occupation régime. Nationalist sentiment, legitimate and worthy of sympathy in itself, might have assumed a moderate and healthy form had it not from the first received an anti-British impulse from rivalries and jealousies among the Western Powers, making use of the indeterminate position of Great Britain as a serviceable political weapon. The situation was considerably modified by the Anglo-French understanding of 1904. But the Nationalist movement founded by the late Mustafa Kemal and fanned by Sheikh Shawish and others, had assumed a definitely anti-British colour, which the ex-Khedive had at one time exploited for his own personal ends. The members of a dissatisfied civil service, who regarded the presence of an ever-growing number of British officials in the higher posts as a bar to their promotion and interest, swelled the ranks of the Nationalists, reinforced by the students, who felt that their prospect of obtaining State employment, to qualify for which they had often made real sacrifices, was diminished by the competition of the foreigner. The lawyers, a very numerous class, who anticipated that the protectorate would entail a modification of the judicial system prejudicial to their situation, were unanimously hostile, as indeed were the members of all the professional classes. Not only had British officials increased in a manner which seemed disproportionate to the expanding activities of the departments and hardly consistent with the principle of training Egyptians to manage their own affairs, but, in contradiction of that very principle, they had tended to absorb administrative functions and not merely to advise. With increasing numbers they had become a community living their own lives, wholly aloof from the Egyptians and the other foreign communities, and with this loss of contact their influence and moral control had weakened. Finally, the war between Great Britain and Turkey, the seat of the caliphate, had emphasized the latent but always present impatience of the Moslem under Christian rule. The strength which the Nationalist movement continued to acquire during the earlier and middle phases of the war does not seem to have been sufficiently realized.

Sir R. Wingate, High Commissioner.—In Dec. 1916 Gen. Sir Reginakl Wingate, who had filled the posts of Sirdar of the Egyptian army and Governor-General of the Sudan since Dec. 1890, was called to Cairo as High Commissioner in succession to Sir Henry McMahon. The health of Sultan Hussein, which had for some time caused anxiety, did not improve and it became urgent to settle the question of succession, left in abeyance in 1914. Prince Kamel ed Din, his only son, who had married the sister of the ex-Khedive, finally declined the position of heir-apparent, which was then offered to Prince Ahmad Fuad, the sixth son of the Khedive Isma'il. He had been educated at Turin, where he passed through the military school.

Sultan Hussein died Oct. 9 1917. The removal from the scene of a ruler remarkable for his character, public spirit and thorough knowledge of his own country was a misfortune for Egypt. Certain modifications in the Ministry, in which it was proposed to include Sa'd Zaghlul Pasha, were considered after the accession of the new Sultan. But eventually only one resignation took place, Fathi Pasha, Minister of Waqfs, being replaced by Ziwar Pasha, the Governor of Cairo. But the discussions engaged in made it clear that the Prime Minister intended on the conclusion of peace to raise the question of autonomy and the regulation of Egypt's relations with Great Britain by convention.

After-war Plans.—As the World War drew to a close the principles formulated by the President of the United States, to which Great Britain and her Allies subscribed, had a far-reaching and even a decisive effect on educated opinion in Egypt. The numerous declarations of British statesmen, disclaiming any intention of permanently occupying the country, were insistently recalled, and the aspirations of the Egyptians to govern themselves were represented as having received international sanction through the acceptance of the principle of self-determination. Such sentiments were by no means confined to the discontented and the ambitious, who in the furtherance of their political aims would even have welcomed a German victory. Moderate opinion also adopted the view that the attitude of Egypt during the war and the sacrifices made by her people justified a claim for special consideration and that the time had come to reconsider the relations between their country and Great Britain. When in Nov. 1918 an Anglo-French declaration was published announcing that the policy of the Allies in the East contemplated the complete enfranchisement of the peoples so long oppressed by Turkish rule and the "institution of national Governments and administrations deriving their authority from the initiative and free choice of the local populations," Egyptians felt their title to manage their own affairs to be as good as that of Syria and Mesopotamia. They, moreover, regarded their own country with its progressive organization and western methods as far ahead in development of Arabia, where an independent kingdom had already been established. At the moment when concrete expression was being given to these sentiments certain other factors combined to excite public opinion. Early in 1918 a commission had been appointed under the presidency of the Prime Minister to consider the future organization of the Legislative Assembly in Egypt. Sir W. Brunyate, the Judicial Adviser, who during the long illness and after the death of Lord Edward Cecil also acted as Financial Adviser, was requested by the commission to prepare a basis for discussion and to consider the question of the participation in legislation of the foreign colonies, in view of an eventual abolition of the Capitulations. Another commission had already for some months been discussing the judicial reforms which such a measure would entail, and an impression which gained ground that in any new courts replacing the mixed tribunals the English language and legal procedure would predominate had confirmed the hostility of the legal profession in Egypt. The memorandum regarding the Legislative Assembly was submitted to the Prime Minister in Nov. 1918. Though only intended as a basis for confidential discussion its contents became known and were regarded as having the approval of H.M. Government. The project was interpreted as restricting the Assembly to consultative functions while all legislative power was to be vested in a Senate, in which the members officially appointed with a group of elected foreigners would constitute a majority. Its divulgement roused a storm of indignant protest.

Aspirations for Autonomy.—A Nationalist committee was formed at the end of 1918, under the chairmanship of Zaghlul Pasha, who now definitely became the leader of the party. On Nov. 13 he paid a visit to the High Commissioner and expressed the desire to go to London to put forward a programme of complete autonomy, a proposal which was rejected as calculated to serve no good object. At the same time the Prime Minister, with the approval of the Sultan, proposed that he should himself proceed to London with the Minister of

Education, Adli Pasha Yeghen, to discuss the affairs of Egypt, urging that, as the Peace Conference would give official sanction to the protectorate, its nature could not be left indeterminate. Sir R. Wingate appealed for their reception with some insistence. But as the Foreign Secretary and other Ministers were shortly leaving for the Peace Conference and would be unable to devote sufficient time and attention to the problem of Egyptian internal reform, they were invited to defer their visit which would not at that moment be opportune. The real urgency of the issue and the danger involved in postponing its consideration appear still not to have been fully appreciated. Rushdi Pasha together with Adli Pasha then tendered their resignations. Every effort was made to induce the two ministers to remain in office and an approximate date was eventually suggested for the visit. But the ministerial crisis was still unsolved when in the middle of Jan. Sir R. Wingate was summoned to London to report personally on Egyptian affairs. He pressed for the immediate reception of the ministers and the withdrawal of restrictions on the movement of Nationalist leaders. The contentions of the Nationalists, to whom many of the moderates had rallied, were now receiving so much general support in the country that the ministers were only disposed to repair to London provided similar facilities were accorded to Zaghlul and his colleagues. As the latter were now openly engaged in a campaign aiming at the severance of all connexion between Egypt and Great Britain, their reception by the Foreign Office could not be entertained. On the other hand the invitation to the ministers was renewed. Rushdi Pasha, however, adhered to his resignation, which was accepted.

Meanwhile documents addressed to the foreign representatives and residents in Egypt announced that a delegation of 12 members, under the presidency of Sa'd Zaghlul, had been formed to lay before other countries the legitimate aspirations of Egypt. On March 3 this delegation forwarded to the Sultan, who had declined to receive them, a petition which, though drafted with all the forms of oriental courtesy, maintained the nullity of the protectorate and was clearly designed to intimidate His Highness and to prevent the formation of a new Government. Vigorous action was therefore taken without delay. On March 8 Zaghlul Pasha and three of his principal adherents were arrested and deported the following day to Malta.

Disturbances in 1918-9.—The immediate effects of this assertion of authority revealed the gravity of the internal situation. Anti-British demonstrations by the students in Cairo rendered military intervention necessary. On March 12 there were serious disturbances at Tanta and during the following days similar outbreaks occurred in the Delta provinces, characterized by looting and attacks on British soldiers and civilians. Railway lines were simultaneously torn up in different places, in accordance, it would appear, with a plan originally prepared for a rising had the Turkish attempt to cross the Canal proved successful. On the 16th Cairo was isolated by the severance of railway and telegraphic communication both with the Delta and with Upper Egypt, where foreign colonies were besieged in the quarter where they had taken refuge. On the 18th the fanaticism roused by the reports of unscrupulous agitators led to the brutal murder and mutilation at Deirut station of a British inspector of prisons, two officers and five of other ranks. Mobile columns had been dispatched with all possible expedition to the disturbed areas and by March 26 the main lines of communication were reestablished, the danger points were in military occupation and the situation well in hand. But it required the employment of considerable forces and stern methods of repression to restore order and prevent further bloodshed. The leaders had probably never contemplated such a serious upheaval and were alarmed at a situation which had passed beyond their control. But the Nationalist committee, which continued to sit after the deportation of Zaghlul Pasha, cannot escape responsibility for the effects of their propaganda. During these and subsequent manifestations the Egyptian police in the great cities carried out their duties in an exemplary manner. The army, with the exception of a few units, was in the

Sudan, which remained entirely unaffected by events in Egypt. The extent and influence of the Nationalist organization appear to have been underestimated, and the British authorities evidently did not anticipate that within a week after the deportation of the leaders the anti-British agitation would develop into a national movement, supported by elements from every class, including the Copts, many of whom were no doubt prompted by prudential considerations to proclaim their solidarity with the Mussulman. That the fellahin, a pacific peasantry which had derived the greatest benefits from the British occupation, should have been so readily led by agitation to commit acts of savage violence had occasioned some surprise.

The movement among the fellahin was only of a very partial character, and generally restricted to the neighbourhood of large centres. At the same time several factors had by the end of 1918 combined to create a spirit of discontent and some loss of confidence in the British administration, which was made responsible for all the grievances experienced during the war. Recruiting for the labour and camel transport corps was in its earlier and really volunteer stage not unpopular, as the good wages paid were a boon to the poorer people, who enlisted again and again on the termination of their engagements. But when the voluntary system ceased to produce a sufficient number of men administrative pressure was exercised and the local officials took advantage of the absence of control. Unscrupulous Omdas in many cases abused their position, accepting bribes for exemptions and sending their enemies to serve under methods resembling those of the press-gang, while alleging British pressure as their excuse. In spite of the good prices paid, the requisition of domestic animals pressed hardly on the small farmers, who had to part with their only means of transport. Still more resented was the requisition of cereals and the manner in which it was enforced. Requisition rates ranged lower than market rates, which tempted local officials to collect larger amounts than they were required to furnish in order to sell the balance at the higher price, while cultivators who grew no wheat had to buy their quota at the market rate and sell at requisition rates. The process of verification and repayment was inevitably slow and opened the door to abuses. Collections for British Red Cross Funds, intended to be purely voluntary, were enforced by officials seeking to acquire merit for the amounts realized in their districts, and were often regarded by the ignorant fellah as a contribution imposed upon him to the British war-chest. The prices of food, clothing and fuel rose to an unprecedented degree during the war, and the average wages of the labouring class became inadequate to meet the enhanced cost of living and supply the necessities of life. Meanwhile the fortunate producer of cotton and the privileged foreigner were seen to be accumulating fortunes. The discontent thus engendered among the poorer peasantry created a favourable field for the agitator, who proclaimed that the removal of the British occupation would ensure prosperity.

Lord Allenby's Régime.—Lord Allenby, the C-in-C. in Egypt, who had left for Paris on March 12 1919, was directed to return at once as special High Commissioner during the absence of Sir R. Wingate, with instructions to restore law and order and "to administer in all matters as may be required by the necessity of maintaining the King's Protectorate on an equitable basis." The situation now passed from one of active to one of passive resistance. A general strike was maintained for only a few days, but students, lawyers and a large number of public officials declined to resume their activities. Lord Allenby adopted a policy of conciliation and, notwithstanding the dangerous interpretation to which such a rapid change of policy was liable, the removal of the embargo on the free movement of Egyptians was approved. This entailed the liberation of Zaghlul and his associates interned at Malta, who left for Paris, where their arrival almost coincided with President Wilson's recognition of the British protectorate. Their efforts to obtain a hearing at the Peace Conference were disappointed. Punitive measures for the outrages perpetrated during the outbreak inevitably tended to maintain embitterment.

On April 9 Rushdi Pasha reconstituted a Ministry with Adli Pasha as Minister of the Interior. An additional Ministry to take charge of all communications was now instituted. But the life of the new Government was ephemeral and, having failed to terminate the official strike while deprecating intervention by the High Commissioner, Rushdi once more resigned on the 21st. A stern proclamation by Lord Allenby, acting as C-in-C. under powers of martial law, which announced that all officials not returning to duty forthwith would be struck off the lists, had the desired effect.

Appointment of the Milner Mission.—H.M.'s Government now decided to send to Egypt a mission, under the chairmanship of Lord Milner, "to inquire into the causes of the recent disorders, and to report on the existing situation in the country and the form of the constitution which, under the protectorate, will be best calculated to promote its peace and prosperity, the progressive development of self-governing institutions, and the protection of foreign interests." Such were the terms of reference eventually drawn up. It would have been well if such a commission could have proceeded at once, while the impression of repressive measures was still strong, before the Nationalist movement had completed its organization, had exploited industrial unrest and extended throughout the country a propaganda which now received open encouragement from sections of the Arab university of El Azhar. But circumstances rendered its departure impossible before the autumn. A month after Rushdi's resignation, Mohammed Said Pasha (Prime Minister 1910-3) formed a new Ministry, in spite of the opposition which was henceforth to be anticipated to any combination from the Nationalists. Certain changes were also regarded as opportune in the British personnel. Sir Paul Harvey, who had resigned the position of Financial Adviser during Lord Kitchener's administration, returned. Sir W. Brunyate, who had acted in that capacity since the death of Lord Edward Cecil, also resigned his position as Judicial Adviser. Mr. Douglas Dunlop, Adviser to the Minister of Education, whose department had been much attacked, was replaced by Mr. R. S. Patterson, the Director-General of Accounts, as was Mr. Haines, the Adviser to the Interior, by Brig.-Gen. Sir G. F. Clayton, chief political officer to the Egyptian Force. A period of drift now ensued during which, though conditions appeared outwardly calm, the Nationalists continued to be active and to advocate a boycott of the Mission.

Among the arguments used to discredit the British administration much capital was made among the small landowners by the allegation of an intention to curtail the water-supply of Egypt in favour of the Anglo-Egyptian Sudan. A project had been adopted for the construction of barrages at Gebel Aulia and Sennar on the White and Blue Niles respectively. The former was designed to create a reservoir which would enable the remaining waste lands of Egypt, some 1,900,000 ac., to be cultivated, while extending *perennial* irrigation to some 1,200,000 more, now under *basin* cultivation, and therefore restricted to one crop in each year. The Blue Nile dam to be constructed near Sennar contemplated the raising of the river to a level necessary to feed a great canal which would irrigate the triangle south of Khartum known as the Gezira, approximately equal in area to the Egyptian Delta, and suitable for raising cotton. The unfortunate attacks made by Sir W. Willcocks and Col. Kennedy on Sir Murdoch Macdonald, Adviser to the Ministry of Public Works, which were shown by the report of the eminent irrigation experts serving on the Nile Projects Commission to be unfounded, did much to encourage these misrepresentations. Charges repeatedly preferred against the Adviser of having falsified figures to justify his proposals rendered inevitable a prosecution for criminal libel which ended in conviction.

The proposal to boycott the Milner Mission gained strength from the protest of the Prime Minister against its arrival before the signature of peace with Turkey, and his resignation which followed. Wahba Pasha, who had acted as Minister of Finance in the last two Cabinets, consented with no little courage to preside over a Ministry of Affairs.

Reception of the Mission.—The special mission to Egypt was thus composed: Viscount Milner (chairman), Sir J. Rennell Rodd, Gen. Sir John Maxwell, Brig.-Gen. Sir Owen Thomas, Sir Cecil Hurst, and Mr. J. A. Spender, with A. T. Loyd and E. M. B. Ingram as secretaries. The mission arrived in Egypt on Dec. 7 1919. Every possible measure had been taken for its security in view of the attitude of organized antagonism which was at once openly manifested by strikes and street demonstrations in which even the Cairene ladies emerged from their seclusion to take part. Every effort was made to prevent Egyptians of note from coming into contact with the mission and those who did so were denounced in the local press. The headquarters of the mission were watched by pickets and the movements of individual members carefully followed, even into the provinces, with a view to preventing any contact with the people. Serious riots at Tanta followed a visit to that city, where military intervention became necessary.

During their stay in Cairo there was a series of attacks on British soldiers and no less than three attempts were made to assassinate Egyptian ministers by bomb-throwing. Soon after the arrival of the mission the chiefs of El Azhar University identified themselves with the Nationalists by a manifesto addressed to the High Commissioner, setting forth the claims of Egypt to complete independence and demanding the withdrawal of the British. A somewhat similar declaration signed by six princes of the khedivial family was sent in a letter to Lord Milner and simultaneously published in the press. The denunciation of the protectorate was the prevailing note.

The general hostility displayed was to some extent mitigated by a declaration issued on Dec. 20, in which the real aims of the mission were clearly stated. The belief that its object was to deprive Egypt of rights hitherto possessed was declared to be without foundation, and free expression of all opinion without limit to the field of discussion was invited. But the relations of the mission with the Egyptians were confined to informal discussion and conversations with individuals. These as time went on became so general that its members were able to thoroughly ascertain the current feeling of the country. A visit was paid by the mission to Alexandria, where its members were enabled to hear the views of the French, Italian and Greek as well as of the British Chamber of Commerce. An exhaustive inquiry was made into the working of every public department. The principal British officials were consulted, as well as the leading members of the non-official British community. Sir Cecil Hurst devoted a great part of his time to an investigation of the judicial system and the reforms which would become necessary to meet new conditions. Sir John Maxwell and Sir Owen Thomas also visited the Sudan. Before the departure of the mission in March 1920 a large volume of material had been collected, and certain propositions, on which remarkable unanimity was displayed, were provisionally drafted with a view to the preparation of a final report in England. While there had been no means of ascertaining how far a settlement on the lines contemplated would command general support in Egypt, it was clear that on certain points both extreme and moderate opinion were at one, and a solution on the basis of mutual agreement was obviously preferable to an imposed arrangement.

Milner-Zaghlul Agreement.—An opportunity presented itself in April, largely through the good offices of Adli Pasha, of which advantage was taken, to enter into relations with the Egyptian Delegation in Paris, who were now disposed to meet the mission in England. Meanwhile Wahba Pasha, whose health no longer permitted him to stand the strain of office, resigned on May 19 and was succeeded as Prime Minister by Tewfiq Nessim Pasha. Zaghlul with seven other delegates reached London on June 7 1920. Friendly relations were established with them and, after deliberations which extended to the middle of August, the general lines of an eventual settlement were drafted. But Zaghlul and his friends were not prepared to commit themselves to acceptance without reference to their supporters in Egypt, and four members of the delegation accordingly returned to Cairo with a memorandum outlining the bases on which an agreement

might subsequently be framed. This memorandum, which came to be known as the Milner-Zaghlul Agreement, was in general accordance with the conclusions adopted by the mission in Egypt, though it went somewhat further, especially as regards the right of Egypt to foreign representation. A letter handed to Adli Pasha together with the memorandum made it clear that the latter had no reference to the Sudan, which lay outside the scope of the suggested agreement.

The proposals embodied in the memorandum may be summarized as follows:—

In order to establish the independence of Egypt on a secure and lasting basis it is necessary to define precisely the relations between Great Britain and Egypt and to modify the privileges and immunities now enjoyed by capitulatory Powers. Negotiations between accredited representatives of the Governments should contemplate:—a Treaty of Alliance between Great Britain and Egypt under which Great Britain will recognize the independence of Egypt as a constitutional monarchy with representative institutions, and Egypt will confer upon Great Britain the rights necessary to safeguard her special interests and to enable her to give foreign Powers guarantees which will secure relinquishment of capitulatory rights; Great Britain will defend the integrity of Egyptian territory, and Egypt will, in case of war, render Great Britain all assistance in her power within her own borders. This Treaty will stipulate that Egypt will enjoy right of representation in foreign countries, and in absence of an accredited representative confide interests to the British representative; Egypt will not adopt an attitude inconsistent with the alliance, or enter into any agreement with a foreign Power prejudicial to British interests; Egypt will confer on Great Britain the right to maintain a military force on Egyptian soil for the protection of her Imperial communications; Egypt will appoint, with concurrence of H.M. Government, a financial adviser, who will take over powers now exercised by commissioners of debt and be generally available for consultation; Egypt will similarly appoint a British official in Ministry of Justice, with access to minister, to have cognizance of all matters affecting foreigners and be available for consultation regarding maintenance of law and order; Egypt will recognize right of Great Britain to intervene in case of legislation operating inequitably against foreigners; British representative will have a special position and precedence over other foreign representatives; engagements of British or other foreign officers and officials may be terminated by either party within two years after the Treaty comes into force, with pension or compensation to be therein determined.

Further provisions contemplate:—approval by a Constituent Assembly of the Treaty, which would only come into force after foreign Powers have agreed to close their consular courts; a new organic statute securing ministerial responsibility to legislature, religious toleration and protection of rights of foreigners; conclusion by Great Britain of agreements with capitulatory Powers, rendering possible the extension to foreigners of jurisdiction of mixed tribunals and of Egyptian legislation; transfer to H.M. Government of rights exercised by foreign Governments under capitulations; maintenance of existing treaties to which Egypt is a party on matters of commerce and navigation; liberty to maintain foreign schools and organize religious and charitable foundations; elimination of international element in Alexandria Board of Health; validation of all measures taken under martial law; reorganization of mixed tribunals to undertake all jurisdiction hitherto exercised by foreign consular courts; communication by Great Britain of terms of Treaty to foreign Powers and support of application by Egypt to be admitted as a member of the League of Nations.

The four delegates returned from Egypt in Oct. and accompanied Zaghlul and his colleagues to London. They reported that the proposed settlement had been well received by the Egyptian public and that any attempted opposition had met with complete failure. At the same time they had been urged to support modifications of certain specific points. These contemplated a limitation of the functions of the Financial Adviser and of the officer attached to the Ministry of Justice; abandonment of a provision postponing the coming into force of the contemplated Treaty until agreements had been concluded with the Powers for the modification of the Capitulations, and a formal abolition of the protectorate.

The mission adopted the view that no good purpose could be served by further discussion of details at that stage. These points, on which they preferred to express no opinion, as well as others, could be raised when negotiations were opened. Zaghlul Pasha stated that his efforts to create a favourable atmosphere for settlement would be weakened if he could give no undertaking with regard to these reservations and especially the abolition of the protectorate. The Egyptian delegates then

left England and the mission concluded their report, which was forwarded to the Secretary of State for Foreign Affairs on Dec. 9 1920 and presented to Parliament as Egypt. No. 1 (1921).

After the Milner Report.—A period of suspense ensued during which the report was translated into Arabic. Its recommendations reestablished the ascendancy of a moderate party in Egypt. After an effort to constitute a ministry representing a coalition of all parties, Adli Pasha accepted the task of forming an administration. His selection was in accord with the desire of the majority of the delegates who had visited London. It was then announced that "H.M. Government, after a study of the proposals made by Lord Milner, have arrived at the conclusion that the status of protectorate is not a satisfactory relation in which Egypt should continue to stand to Great Britain. While they have not reached final decisions with regard to Lord Milner's recommendations, they desire to confer with a delegation nominated by the Sultan with a view, if possible, to substitute for the protectorate a relationship which would, while securing the special interests of Great Britain and enabling her to offer adequate guarantees to foreign Powers, meet the legitimate aspirations of Egypt and the Egyptian people."

Zaghlul Pasha returned to Egypt from France on April 5 1921 and was received with great demonstrations of welcome. He at once took up a position of hostility to the new Government, and, though offered a place in the official delegation, was only willing to take part in it if he were himself appointed president. The majority of his former colleagues of the unofficial delegation then separated themselves from him. He declared the new Government not to be representative of opinion and a campaign of protest against the departure of the delegates was inaugurated. Moderate opinion in Egypt was unfavourable to his attitude and he only retained the support of the extremist and the turbulent elements in the country, who were, however, successful in producing demonstrations in Cairo and in Alexandria, in which city very serious riots took place on May 20, continuing through the two following days. They assumed the form of an anti-European outbreak, intensified by the nervousness of the European colonies and retaliation on their part against the demonstrators. The situation in Alexandria passed beyond the control of the Egyptian police and order had to be restored by British military intervention. Some 68 Egyptians and 19 Europeans were killed during the disturbances, and 162 Egyptians and 66 Europeans were wounded, the principal sufferers among the latter being Greeks. The effect of these riots, which were deplored by the majority of Egyptians, was to bring the question of the adequate protection of foreigners once more into prominence. Zaghlul Pasha indeed issued a manifesto deprecating attacks on foreigners and protested that the riots at Alexandria had nothing to do with politics. But the general tone of his subsequent utterances, his continued efforts to undermine the Ministry and to discredit the official delegation, only tended to bring home to him the responsibility for these unfortunate events. In the autumn of 1921 Adli Pasha visited London, where discussions took place between him and the Government as to the proposed new constitution; but an agreement was not reached, and he returned to Egypt without any further progress having been made.

Economic Situation 1900-21.—From the time of the economic crisis of 1907 the record of Egypt had been one of reviving and ever-increasing prosperity. The failure of the Bank of Egypt in 1911 and other failures about the same time were due to antecedent causes. The last of a succession of lean years with low Nile levels in 1910 was surmounted by the Government without recourse to a loan. The disabilities of the World War were more than compensated by the enormous prices realized for Egyptian cotton, which at one moment, in Feb. 1920, rose to 95d. per lb., ten times its pre-war price. The majority of Egyptian fortunes were invested in real estate and the competition for cotton land made £E400 a not uncommon price per feddan, while instances may be quoted of land which reached £E500 and even £E600. Previously to the war the Egyptian financial year ran from Jan. 1 to Dec. 31. It was then modified to bring it into conformity with the British financial year and has since run from April 1 to March 31 of the following year. In 1910 the budget figures were: revenue, £E17,177,107; expenditure, £E17,077,207. Five years later, for the financial

year 1915-6, the increase was not very marked, the figures being: revenue, £E17,759,418; expenditure, £E16,594,666. But subsequently they rose by leaps and bounds, until for 1920-1 revenue and expenditure were both estimated at £E40,271,000. On the revenue side of this total £E35,675,000 represented ordinary receipts, while the balance of extraordinary revenue anticipated was derived from the sale of land and profits from the control of cotton. On the expenditure side £E32,616,920 represented recurring obligations; £E5,654,080 was assigned to new works and £E2,000,000 to loss on the purchase and distribution of articles of prime necessity. Upwards of seven millions of the increased expenditure was accounted for by the higher scale of remuneration assigned to all classes of government officials and the enhanced cost of materials. The estimated increase on state railways and the expansion of the police forces accounted for nearly two millions more.

In the course of 1920 the universal crisis in production and the cessation of demand for Egyptian cotton caused its price to drop precipitously and in March 1921 it stood at only a little above the pre-war figure. In spite of the fall of price there were few buying orders, less than 50% of the crop was shipped, and serious economic disturbance ensued. Tenants were unable to pay rents which had soared up with the high price of cotton, and landowners who had speculatively increased their acreage had to mortgage their estates. Goods, which had in 1919-20 been imported on a scale unprecedented in Egypt's foreign trade record in anticipation of a continued high purchasing power, remained unsold, and the bonded warehouses were overstocked with uncleared merchandise. On the other hand the general drop in the price of commodities relieved the situation of the labouring population, and the position was rendered less acute by the large profits accumulated during the preceding period by the class most affected by the paralysis of the cotton market. It was calculated in 1920 that Egyptian savings invested abroad, largely in British Treasury bills, might be reckoned at £150,000,000, more than the whole public debt.

The break in cotton prices inevitably affected receipts from customs, sales of land and other sources. At the same time the reduction in the acreage devoted to cereals had entailed large purchases abroad, while the menace of a fuel famine had made it incumbent on the Government to ensure the coal supply in spite of the high prices prevailing. The result was that, while the financial year 1920-1 closed with a revenue somewhat short of that estimated, approximately £E40,100,000, expenditure rose to £E53,000,000, of which £E8,940,000 was due to food supplies and £E6,460,000 to purchases of coal. Egypt was thus faced with a deficit of £E12,900,000, to be met by a draft on the Reserve Fund, which had greatly increased in the prosperous years 1917-20, and amounted, after due deductions for depreciation of stock, to £E15,942,866, leaving some three millions in hand to face a deficit on the budget for 1921-2.

While Egypt was enabled to meet this formidable deficit thanks to the accumulations of former years, the expansion of revenue had for a long time past fallen far short of the legitimate capacity and requirements of the country. The Egyptian financial system was inequitable and remained inelastic, owing to the impossibility of imposing taxation in proportion to wealth and of making it incident on foreign as well as on local subjects. The land-tax, when reassessed under the scheme of 1895, was fixed for a period of 30 years from the date of valuation. It was then calculated to represent about 28% of the rental value. Before many years had passed it had ceased in any way to approximate to that figure, but it could not be altered until the prescribed term had expired. Egypt, one of the richest countries of the world, remained, owing to a combination of circumstances, one of the most lightly taxed. Limitations on local taxation have similarly arrested municipal development. These disabilities have indirectly contributed to the increase of criminality by restricting the extension of the police force, while expenditure on public health and education has been inadequate.

The Egyptian debt on Dec. 31 1919 stood at £93,299,640, distributed between the three categories as follows: guaranteed loan, £6,199,900; privileged debt, £31,127,780; unified debt, £55,971,960. The Government and the commissioners of the debt held £5,282,260. The amount held by the public was thus reduced to £88,017,380. (J. R. K.)

EHRlich, PAUL (1854-1915), German bacteriologist, was born in Silesia March 14 1854, of Jewish parentage. He was educated at Breslau and Strassburg, where he studied medicine. He was soon drawn towards research in chemistry, and in his earlier years carried out various important investigations in aniline dyes. He was at the same time winning fame as a bacteriologist, and in 1907 discovered a red dye, known as "trypan red," which effected the complete sterilization of animals infected with trypanosomes, a work of enormous importance for the treatment of diseases caused by these parasites. He considerably improved the technique of serum preparation, and also discovered a method by which the potency of the anti-diphtheria toxin could be tested. He also investigated the problems of cancer. Ehrlich's most famous dis-

covery, however, was made in connexion with his researches into venereal diseases. It was announced in 1910 that he had prepared an arsenical compound, known as salvarsan or "606," which was a cure for syphilis. He lectured in London in 1907, and in 1913 attended the medical congress held there. He received many honours from his Government and marks of distinction from almost every university and scientific society. He died at Homburg Aug. 20 1915.

See Paul Ehrlich: *eine Darstellung seines wissenschaftlichen Wirkens*, Festschrift zum 60. Geburtstage des Forschers (1914).

EICHHORN, HERMANN VON (1848-1918), German field-marshal, was born at Breslau Feb. 13 1848. He took part, as a young officer, in the campaigns of 1866 and 1870-1. In 1897 he was appointed chief of the staff of the VI. Army Corps at Breslau, in 1901 divisional and in 1907 corps commander. In 1905 he was promoted to the rank of general of the infantry and in 1913 to that of *Generaloberst*, while in the same year he was appointed inspector-general of the VII. Army Inspection at Saarbrücken. At the outbreak of the World War he was incapacitated in consequence of an accident, but was able to play a part in the battle of Soissons in Jan. 1915. In that month he was appointed to the command of the X. Army, which was engaged in the great battle of the Masurian Lakes in the following February. In Aug. he took Kovno and afterwards the fortresses of Grodno and Olita, and continued his victorious advance into Russia. From 1916-8 Eichhorn was in command of the army group known by his name in Courland. In Dec. 1917 he was raised to the rank of field-marshal and was sent to the Ukraine as chief-in-command of the German troops on the eastern front. He was assassinated at Kiev July 30 1918.

EINEM, KARL VON (1853-), Prussian general, was born at Hertzberg in the Harz Jan. 1 1853. He entered the Prussian army in 1870 and rose to the rank of major-general in 1900. In the same year he was entrusted with the organization of the German section of the international military expedition to Peking. In 1903 he was raised to the rank of lieutenant-general and appointed Minister of War, an office which he held till 1909. He had meanwhile been promoted to be a general of the cavalry, and in 1909 he was placed in command of the VII. Army Corps, which under Kluck he led in the advance through Belgium in 1914. In Sept. 1914 he was appointed to the command of the III. Army (the army of the Aisne), which he successfully handled throughout the heavy fighting in Champagne in Feb. 1915. He continued his defence of his section of the German position with this army throughout 1917 and the early months of 1918.

EINSTEIN, ALBERT (1879-), German-Swiss physicist, was born of Jewish parents at Ulm in the kingdom of Württemberg on May 14 1879. His boyhood was spent at Munich where his father, who owned electro-technical works, settled in the early 'eighties. The family migrated to Italy in 1894, whilst Albert Einstein went to the Cantonschule at Aarau in Switzerland, where he passed the *abiturienten* examination, the indispensable preliminary to any professional career in Central Europe, two years later. He attended lectures while supporting himself by teaching mathematics and physics at the polytechnic school at Zürich until 1900 and finally, after a year as tutor at Schaffhausen, was appointed examiner of patents at the patent office at Berne, where, having become a Swiss citizen, he remained until 1909. It was during this period that he took his Ph.D. degree at the university of Zürich and published his first papers on physical subjects. These were so highly thought of that in 1909 he was appointed extraordinary professor of theoretical physics at the university of Zürich. In 1911 he accepted the chair of physics in Prague, only to be induced to return to his own polytechnic school at Zürich as full professor in the following year. In 1914 his preëminence had become so evident that a special position was created for him in Berlin, where he was elected a member of the Royal Academy of Sciences and given a sufficient stipend to enable him to devote all his time to research without any restrictions or duties whatsoever. He was elected a foreign member of the Royal Society in 1921, having also been made previously a member of the Amsterdam and Copenhagen Academies, while

the universities of Geneva, Manchester, Rostock and Princeton conferred honorary degrees on him.

Einstein's work is so important and has proved fertile in so many various branches of physics that it is not possible to do more than enumerate a few of the most salient papers. The work by which he is best known, the theory of relativity, was begun in 1905 with the publication of the restricted principle with its consequences (*see RELATIVITY*). Though considered fantastic by many, it had secured fairly general acceptance in Germany in 1912, and was followed by the generalized theory in 1915. But Einstein's work has been by no means confined to such abstract questions. One of his earliest publications gave the complete theory and formulae of the phenomenon known as Brownian motion, which had puzzled physicists for nearly 80 years. He showed that the heat motion of particles, which is too small to be perceptible when these particles are large, and which cannot be observed in molecules since these themselves are too small, must be perceptible when the particles are just large enough to be visible and gave complete equations which enable the masses themselves to be deduced from the motions of these particles. Much of his time again was spent on the obscure problems usually combined under the heading "quantum theory." The importance of these has become more and more evident, and the difficulty of reconciling the apparently inevitable discontinuities of the product of energy and time which experiment indicates, with our accepted habits of mind, always had a peculiar fascination for Einstein. Sooner probably than anybody else he realized the far-reaching implications of the theory propounded by Planck. His paper on the variation of the specific heat with temperature, which appeared in 1907, was the first extension of Planck's fundamental hypothesis, and its verification in essentials is one of the most convincing arguments in its favour. Numerous other papers on molecular physics, including an experimental research on magnetism, appeared in the *Proceedings of the Russian Academy of Science*, the *Physikalische Zeitschrift*, the *Proceedings of the German Physical Society*, the *Annalen der Physik*, etc. (F. A. L.)

EISNER, KURT (1867-1919), Bavarian Socialist politician and author, was born in Berlin on May 14 1867. He became a journalist, and at an early stage of his career had the first of his many experiences of imprisonment for the subversive tendency of his writings. He was successively on the editorial staff of the *Vorwärts* in Berlin 1898-1905 and of other socialist newspapers at Nürnberg and Munich. On the outbreak of the World War he at first seemed to be going to side with the Government, but, after having obtained some private knowledge of the way in which German public opinion had been duped, he turned against his own party, the Social Democrats, and attacked them for supporting the war. In Jan. 1918 he was prosecuted at Munich on a charge of treason for inciting munition workers to strike. He was released from prison on the ground that he was a candidate for the Reichstag, and recovered his liberty in time to arrange the mass meeting on the Theresienwiese at Munich on Nov. 7 1918, which the same day led to the overthrow of the Bavarian monarchy, the flight of the King, and the institution of a Bavarian revolutionary Government under the presidency of Eisner. A red-haired Jew, he possessed a magnetic and artistic temperament, and had various special methods of arousing and restraining the revolutionary masses, including orchestral and vocal concerts of high excellence in the formerly royal theatres and the opera house of Munich. His policy followed extreme lines in the sense of furthering the Workmen's and Soldiers' Councils system, while at the same time he manifested a Bavarian particularism of his own in his efforts to maintain his conceptions of republican government in conjunction with the Councils in Bavaria as against the centralizing tendencies of the Berlin policy. It was with difficulty that he was induced to agree to the arrangements for reëstablishing the Federal system of the German Reich and for the election of a National Constituent Assembly. Meanwhile a Bavarian Assembly had been elected, and the Bavarian reactionaries feared that, when it assembled, Eisner's influence might continue to predominate or might even be fortified. He was, further, obnoxious to them on account of his revelations as to the origin of the war, and at an international Socialist conference at Berne he had urged the German delegates to make a clean breast of Germany's war guilt. He was on his way to open this Assembly, when he was shot dead in the street by a young Count Arco on Feb. 21 1919. This crime was speedily followed by the Bolshevist chaos into which Munich was for a brief period plunged in April.

Eisner was the author of various books and pamphlets, which display considerable literary faculty. They include *Psychopathia Spiritnalis* (1892); *Eine Junkerrevolte* (1899); *Wilhelm Liebknecht* (1900); *Feste der Festlosen* (1903), and *Die Neue Zeit* (1919).

(G. S.)

ELECTRICAL ENGINEERING (see 9.193).—In the articles on **ELECTRICITY SUPPLY**, **ELECTROMETALLURGY** AND **ELECTRO-CHEMISTRY**, **TELEGRAPHY** AND **TELEPHONY**, **PYROMETRY**, **ELECTRIC LIGHTING**, **WIRELESS TELEGRAPHY** AND **TELEPHONY**, various important applications of Electrical Engineering, as developed since 1910, are separately dealt with. This article deals with developments connected with the dynamo (see 8.764), and with progress as regards power stations and electric traction generally.

LARGE ELECTRIC SUPPLY STATIONS

Technical advances on the generation side of the electrical industry have been mainly in connexion with the wider use of the steam turbine on the one hand and with alternating-current transmission on the other. Thus the large turbo-alternator has become the standard machine for all important central stations dependent on steam. A further factor in this development has been the tendency towards the linking-up of supply stations in large areas in order to obtain increased economy—a matter which has so much importance for industry as to call for the appointment in Great Britain in 1919 of special Electricity Commissioners to deal with it. In other countries also the statutory regulation of electric supply has been seriously discussed and in Germany state control has been adopted.

Perhaps the most important feature which affects linking-up problems and standard lines of manufacture is the question of the system, or rather of the frequency, to be adopted. In the course of natural development, the 3-phase alternating current system at a frequency of 50 cycles per second has been more and more widely used until it can now be regarded as the standard throughout Europe. On the Continent, apart from traction work for which 50/3 or 15 cycles per second have been adopted, a few stations only still operate at 42 cycles per second. In Great Britain the chief exceptions are to be found in the use of 40 cycles in the N.E. coast area, and of 25 cycles in Birmingham and the Clyde valley, the 3-phase system being still retained. With 50 cycles as the standard the turbo speeds become fixed at 3,000 revolutions per minute (2-pole machines) and 1,500 revolutions per minute (4-pole machines). Units up to 20,000 kva. have been built at the former speed, and at the latter up to 40,000 kva. In the United States the standard frequencies are

60 and 25 cycles per second, the latter being essentially used for traction purposes. The higher frequency makes the construction of large 2-pole units more difficult, but nevertheless the successful development of high-speed machinery and of reduction gearing is having a marked influence towards the higher frequency. Even 60-cycle rotary converters for traction work are becoming common. Four-pole turbo-alternators running at 1,800 revolutions per minute to give a frequency of 60 have been built up to a capacity of 33,333 kva. Steam-turbine units of as much as 60,000 kw. are in use, but in this case the high-pressure and two low-pressure turbines each drive a separate 20,000 kw. generator at 1,500 revolutions per minute.

Thus the alternator has been able to keep pace with the demands of the steam turbine as regards large powers at high speeds with high thermal efficiencies for the combination. Even comparatively small units of 6,000 to 7,500 kw. have shown an efficiency from the thermal units of the coal to the net kilowatt-hour of 18 per cent. It is possible that the normal units of the future will be in the neighbourhood of 25,000 rather than of 50,000 kw. if an output of 100,000 to 150,000 kw. should come to be regarded as the maximum desirable for any one station.

A longitudinal section through a large 2-pole turbo-alternator of modern type is shown in fig. 1, wherein will be seen the channels provided for air to ventilate both rotor and stator. A fan is attached to each end of the rotor to blow air through the stator channels, and the heated air is discharged at the top of the outer casing.

The design of large turbo-alternators presents many difficult problems. The rotor (particularly at 3,000 revolutions per minute) is commonly of the cylindrical type made from a solid steel forging, the exciting winding being accommodated in slots and the coil ends secured by means of covers forged from special alloy steels. It is only by the most rigid construction that successful rotors can be made to withstand the enormous stresses set up at peripheral velocities in the neighbourhood of 25,000 ft. per minute. The adequate ventilation of such rotors is not easily obtained, and, while both air and water ducts are used, there is a strong tendency to dispense with ducts altogether and rely on non-combustible insulation (mica) for preventing injury from high temperature. The stator also needs especial care—not only is the cooling problem difficult, but the bracing of the coil ends has to be such that no movement of the conductors is possible even under conditions of sudden short circuit.

It has doubtless been due to the rapidly increasing demands for large powers and high speeds, and the success achieved therewith, that the frequency of 50 cycles has come to be more widely adopted

FIG. 1.—Longitudinal Section of Large 2-Pole Turbo-Alternator (Metropolitan-Vickers Electrical Co., Ltd.).

than the frequency of 25 cycles. Where the latter frequency has been retained it has been found preferable to use mechanical reduction gearing up to capacities of about 5,000 kw. Reduction gear may indeed be said to have revolutionized turbine driving for small outputs, the loss in the gearing being more than compensated by the increased efficiency of the high-speed steam turbine. It has further to be remarked that the application of reduction gearing to electrical work is still in its infancy. The greater expense of the geared drive is considered by many to be justifiable on account of its greater reliability and the higher efficiency of the plant.

The development of the continuous-current turbo-generator could not keep pace with the demand for increased output. Though satisfactory units up to 1,000 kw. were built, continuous-current turbo-generators are seldom built at the present day, except for installation on board ship. The demands of large users of continuous-current power, such as railways, chemical works, etc., are best met either by geared generators (steam turbines driving continuous-current generators through double helical reduction gearing) for moderate outputs, or by rotary converters for large outputs. Units of 2,000 to 5,000 kw. are not uncommon.

Both machines and transformers owe much of their development to the further utilization of the means for reducing the losses which occur in the iron and the copper. The use of silicon and other elements in alloy with steel in order to increase the resistance to the flow of eddy currents in iron is the factor which has been mainly responsible for the reduced weight per kva. of transformers, whilst the devices adopted for diminishing the unequal distribution of current in machines and transformers have rendered possible many modern designs.

As an instance of a modern power station may be cited that at Zachornowitz (Golpa), which at the present time (1921) is the largest steam-driven station in the world. This was erected in 1915 during the course of the war at the instance of the German Government for the supply of power for the production of nitrate of calcium in order to ensure a sufficient home supply of nitrates for agriculture and other necessary purposes. The engine-room contains 8 steam-turbine sets, each of 22,000 kva. capacity at 1,500 revolutions per minute, and the magnitude of the output may be judged from the daily consumption of about 7,000 tons of coal obtained from the lignite coal-field in the area of which the station is situated. There are 64 very large tubular boilers with 9 chimneys, each 328 ft. high, and 11 large cooling towers. Current is generated at 6,600 volts; of the total output 6,400 kw. are supplied at 6,000 volts to the nitrate works, while 33,000 kw. are supplied to Berlin, 95 m. distant, through a 100,000-volt double transmission line to a receiving station at Rummelsburg. The State is erecting at Friedrichsfelde a large distributing station for Berlin and adjoining districts, and at this station the combined outputs of the power stations at Lautz (40,000 kw.) and Spremberg (20,000 kw.) and from the Golpa transmission line be dealt with, while a third generating station in the Lausitzer lignite coal-field is in contemplation.

The lay-out of the plant in modern stations has been mainly governed by principles of economy. Larger boilers, higher steam pressures, greater superheat, the substitution of a small number of large turbine-driven sets for a large number of small slow-speed sets have all helped in this direction. The design and arrangement of the switch-gear have also been matters on which much care has been bestowed, particularly in countries where high transmission pressures up to 100,000 or even 150,000 volts have been adopted. In this connexion more efficient protection against lightning, pressure surges, short circuits, faults to earth, etc., may be particularly mentioned. The transformer is now built for such large powers and high pressures that, as with the switch-gear, separate housing is essential.

The cooling of the machinery and transformers calls for special consideration in the lay-out of large plants. Air is still the common cooling medium for machines, but the quantities needed by modern turbo-generators are so large that special intakes and outlets have to be provided. In addition, measures have to be taken for cleaning the air, particularly near towns or industrial centres. For this purpose dry filters were first tried, but were rapidly replaced by wet filters; that a completely satisfactory solution has not been attained thereby is evident from the experiments now being made to circulate the same air through the machine and a refrigerator. With transformers the case is somewhat different; oil is here the cooling medium, and air-blast transformers are now seldom called for. With natural oil-cooling no special provision has to be made, but in larger transformers usually the oil is water-cooled either by passing water through a cooling coil immersed in the upper part of the oil or by pumping the oil through a cooling chamber.

When continuous current is required it is often customary to generate 3-phase alternating current at the pressure required at the slip rings of the rotary converters, thereby dispensing with transformers. An important feature in connexion with modern switch-gear is the mistake-proof devices for preventing wrong connexions or danger to the operators.

RAILWAY ELECTRIFICATION

The valid reasons upon which the electrification of railways may be advocated have now become more clearly defined,

and progress has been made as these reasons have shown themselves to be applicable to specific cases. Before the World War there was a pronounced desire in certain countries to make themselves economically independent, and therefore to utilize available water-power rather than to import coal, although it was not always easy to show that any appreciable saving would accrue from electrifying railways under these conditions. The countries chiefly concerned in this way were Italy, Switzerland and Sweden. A great impetus, however, was given to this movement during the war on account of the scarcity and high price of coal, and a stage has now been reached when it is safe to say that whatever the cost of coal may be in the future, certain railway lines will no longer be worked by imported coal. Another great factor has been the difficulty of dealing with increased traffic. The introduction of the electric locomotive—by increasing the average speed, especially on inclines, and by rendering heavier train loads feasible—has in several cases proved a cheaper solution than doubling or quadrupling the track. The tunnel and terminal advantages will also be recognized.

As an indication of the importance that the electrification of main lines has assumed, reference may be made to the fact that in many countries the question has been taken up by the states concerned. The outstanding feature of all the reports and discussions that have appeared has been the debatable question of the best system. As far as can be seen at present, different countries will ultimately decide in favour of different systems.

The three systems which call for discussion are:—

- (a) The three-phase system;
- (b) the single-phase system;
- (c) the continuous-current system.

From a technical standpoint, all three systems may be said to be satisfactory. It will now be convenient to deal with the several countries separately.

Great Britain.—The general electrification of railways has been discussed, but has hardly received serious consideration. In 1920, a committee was appointed to advise the Ministry of Transport, and in its interim report advocated as the standard system the continuous-current system at 1,500 volts, the mode of generation of the power to be that prevailing in the district. Up to the present, practically the only lines that have been electrified have been city and suburban railways in and around London, Liverpool, Newcastle-upon-Tyne and Manchester. Until recently, the 600-volt continuous-current system, as used on tramways, was adopted for the railways, but with a third rail instead of an overhead conductor. There are now two exceptions—the Newport-Shilton mineral line 18 m. long at 1,500 volts with an overhead conductor, and the Manchester-Bury line 10 m. long with 1,200 volts and a third rail. There are only two examples of the single-phase system—the important electrification of the suburban system of the London, Brighton and South Coast railway, with an overhead conductor at 7,000 volts and a frequency of 25 cycles per second, and the small Morecambe-Heysham experimental line on the Midland railway. Extensions on the Brighton system were in progress before the World War, but these were not completed in 1921. With the exception of a few electric locomotives for hauling passenger coaches and goods trucks over the electrified sections, motor coaches are used entirely on the English electric railways. Amongst recent extensions of the 600-volt system in and around London may be mentioned the electrification of the suburban lines of the London and South-Western railway, the extension of the London and North-Western railway electrification to Watford, and the extension of the Central London railway on the Great Western railway from Shepherd's Bush to Ealing.

United States of America.—In the United States where so much has been done to develop both the continuous-current and the single-phase systems, many important electrifications have been carried out on both systems; but of late years, the leading firms, the General Electric Co. and the Westinghouse Co., appear to have favoured the continuous-current system. In America a break away from 600 volts was made long ago, and electrifications with 1,200 and 1,500 volts became quite common. Of recent years, the Butte-Anaconda mineral line was equipped on the continuous-current system at 2,400 volts, and served as an experiment for the electrification of the Chicago, Milwaukee and St. Paul railway at 3,000 volts. This line, over 655 m., was in 1921 the longest in existence, but conditions on this mountainous line through the Rockies differ considerably from conditions in densely populated areas. With the possibility of one train in about every two hours, it is hard to draw comparisons with the New York Central, the Pennsylvania and the New York, New Haven and Hartford lines.

The single-phase system has also been extensively applied in the United States, particularly on the Philadelphia section of the

operation. However, the system can also be used for the purpose of measuring the speed of the motor. In this case, the motor is connected to the system through a switch, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor.

Fig. 1. Singer Motor, Mechanical Testing Machine.

All other systems used for testing are capable of measuring the speed of the motor. In this case, the motor is connected to the system through a switch, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor.

When the motor is connected to the system, the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor.

The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor.

Measuring Motor Speed

Measuring the speed of the motor is a simple task, and it can be done by using a tachometer. The tachometer is a device that measures the speed of the motor by counting the number of revolutions per minute (RPM) of the motor. The tachometer is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor.

Table 1

Motor	Speed (RPM)	Power (W)	Efficiency (%)
1. 1/2 HP	1725	1100	85
2. 1/4 HP	1725	180	85
3. 1/8 HP	1725	90	85
4. 1/16 HP	1725	45	85
5. 1/32 HP	1725	22	85
6. 1/64 HP	1725	11	85
7. 1/128 HP	1725	5	85
8. 1/256 HP	1725	2	85
9. 1/512 HP	1725	1	85
10. 1/1024 HP	1725	0.5	85

The motor is connected to the system, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor.

The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor. The system is also used for the purpose of measuring the speed of the motor, and the speed is measured by the number of revolutions per minute (RPM) of the motor.

FIG. 3.—High-Pressure Turbine with Purifier and Governor

When steam enters it is so far from the atmosphere as to have lost all weight, leaving the only resistance, when it again reaches the turbine, the effect of the weight of the steam. The other problem is the design of a steam chest or separator which will collect the water, so that the turbine will operate free of it. In the turbine, water is a very serious enemy, and it is a very difficult problem to design a steam chest or separator which will collect the water, so that the turbine will operate free of it. In the turbine, water is a very serious enemy, and it is a very difficult problem to design a steam chest or separator which will collect the water, so that the turbine will operate free of it.

The steam chest or separator is a very important part of the turbine, and it is a very difficult problem to design a steam chest or separator which will collect the water, so that the turbine will operate free of it. In the turbine, water is a very serious enemy, and it is a very difficult problem to design a steam chest or separator which will collect the water, so that the turbine will operate free of it.

The steam chest or separator is a very important part of the turbine, and it is a very difficult problem to design a steam chest or separator which will collect the water, so that the turbine will operate free of it. In the turbine, water is a very serious enemy, and it is a very difficult problem to design a steam chest or separator which will collect the water, so that the turbine will operate free of it.

In many turbines, the steam chest is being designed to avoid any water entering, but in some cases, it is necessary to design a steam chest or separator which will collect the water, so that the turbine will operate free of it. In the turbine, water is a very serious enemy, and it is a very difficult problem to design a steam chest or separator which will collect the water, so that the turbine will operate free of it.

In the turbine, water is a very serious enemy, and it is a very difficult problem to design a steam chest or separator which will collect the water, so that the turbine will operate free of it.

Advantages of Turbine Motors

One of the main factors in the development of the turbine motor is the fact that it is a very efficient machine, and it is a very difficult problem to design a steam chest or separator which will collect the water, so that the turbine will operate free of it. In the turbine, water is a very serious enemy, and it is a very difficult problem to design a steam chest or separator which will collect the water, so that the turbine will operate free of it.

ing stations to its full capacity. The margin of power thus pressed into service was of great value in accelerating the output of munitions, and when the Ministry of Munitions was formed—in the spring of 1915—no special department to organize the supply of electric power was thought necessary. Within a few months evidence of the vital importance of electricity for almost every war demand had become so strong that a department was formed to deal with all electrical engineering questions. All proposals for the extension of generating stations and mains had to be brought before the Electric Power Supply Department of the Ministry, which issued priority certificates for those judged to be most urgent. The output of electrical manufacturing firms was likewise controlled, so that the production of both electric power and electric plant was centrally organized to meet the ever-increasing demand for current.

Between June 1914 and Oct. 31 1918 the plant capacity of 327 municipal undertakings rose from 705,000 kilowatts (K.W.) installed to 1,490,000 K.W. installed or on order, and of 230 company-owned power stations from 430,000 K.W. installed to 788,000 K.W. installed or on order. Thus the additional generating plant installed or on order during the war aggregated 1,143,000 K.W., and was almost exactly equal to the total plant capacity existing at the outbreak of war. Further, considerable orders were placed for private electric generating plants, particularly in connexion with the extension of iron and steel works, where waste heat was available. All of the additional power was required for power, smelting, and other industrial purposes. New connexions for domestic purposes were not made, and owing to military requirements, coal shortage, and other causes restrictions were placed on public and private lighting and on the general domestic consumption of electricity. Exact statistics of total domestic demand are not available, but in this direction there was a substantial diminution in output during the war.

The capital cost of these extensions, including mains and sub-stations, was about £23,000,000. They were financed, where necessary, by Treasury issues of interest-bearing loans, repayable by annual instalments over 15 years or so. Further, the Ministry of Munitions was empowered to guarantee to bear the difference between the cost of carrying out extensions during the war and the estimated cost of the same work if carried out at a period, generally one or two years, after the period of hostilities, and also to meet the cost of any portions of extensions found to be in excess of the post-war needs of the undertaking. The object of this arrangement was to put the undertakings in the position they would have occupied if they had not extended during the war, but had waited until their post-war requirements had to be met. About £3,150,000 out of the total of £23,000,000 was thus advanced by the Ministry of Munitions. Some applicants pressed for definite Government grants, but these were refused on the ground that electric supply undertakings enjoyed a monopoly with perpetual or lengthy powers for the supply of a commodity required after the war, and were therefore in a different position from manufacturers called upon to undertake a form of production not needed under peace conditions.

The general policy of the British Government was to encourage power users to take current from the public mains rather than to erect separate small generating stations. Even where private plants were sanctioned, as in the special cases mentioned above, linking-up with an adjacent public service undertaking was arranged wherever possible. Public supply undertakings were also in some cases linked together for mutual assistance.

During the war there was a marked increase in the average size of generating units, an improvement in load factor, and a reduction in the costs of generation. Before the war the average size of generating unit installed was 522 K.W., with 8,000 K.W. as the capacity of the largest unit. At the end of Oct. 1918 the average size was 7,044 K.W., and units of 25,000 K.W. and 30,000 K.W. were being built. In 1914 the coal consumption per unit sold was 4.1 lb.; in 1918 it fell to 3.75 lb. in spite of the very inferior fuel then in use—an improvement due to the larger and more efficient plant and the rise in load factor resulting from concentration of load.

Two special control orders were imposed on the industry by the Ministry of Munitions. The first—Converter Plant Control Order, 1918 (issued April 5 1918 and cancelled Feb. 28 1919)—was designed to reduce the demand for converter plant and to assist supply engineers in persuading customers (especially ship-building firms) that the alternating current available was quite suitable for their requirements. The second was the Electricity (Restriction of New Supply) Order, 1918, issued on Nov. 8. A shortage of coal had arisen in the early part of that year owing to large withdrawals of miners for active service, and from other causes; and the coal controller accordingly rationed the use of coal. As the Ministry of Munitions undertook to limit new electrical connexions to consumers wholly engaged on urgent munitions work the rationing was not applied to power stations. Concurrently with the issue of this order the coal controller rationed the use of both electricity and gas for domestic purposes. On Jan. 10 1919 the order was revoked.

In spite of the enormous increase in output, which made the four years of war equivalent in electrical growth to the previous 32 years of industry, the financial condition of the undertakings did not on the whole improve. Very few undertakings paid excess profits, and most of them had to raise their prices substantially in order to keep receipts above the rising tide of costs, due to increases in wages and the higher cost of coal, stores and repairs. The position of the smaller provincial undertakings, which had practically no industrial load, became especially difficult. Maximum prices are scheduled in every provisional order, and in many cases they proved too low in the abnormal circumstances created by the war. The Statutory Undertakings (Temporary Increase of Charges) Act, 1918, was passed to afford relief. The Board of Trade was empowered, after inquiry into applications for relief, to permit increases in maximum charges sufficient, in the case of companies, to enable three-quarters of the pre-war dividend to be paid, and, in the case of municipalities, to not more than 50% above the pre-war charges, or more than sufficient to enable the undertaking to be carried on without loss.

Committees on Electricity Supply.—The proof afforded early in the war of the great national importance of electricity supply led to a series of official investigations into the question of reorganizing the industry on broader and more efficient lines. The Reconstruction Committee (later the Ministry of Reconstruction) formed a Coal Conservation Sub-Committee which discussed the subject chiefly from the standpoint of the more economical use of fuel. The supply industry was also touched upon by the committee formed by the Board of Trade to consider the position of the electrical trades after the war. As the result of a recommendation by this committee a Departmental Committee of the Board of Trade on electric power supply was formed. A report on the same subject was prepared by the Committee of Chairmen of the Advisory Council of the Ministry of Reconstruction. These reports, particularly that of the Board of Trade Committee on electric power supply, led up to the appearance before the House of Commons in the 1919 session of the Electricity (Supply) bill. In its original form the bill provided for the appointment of electricity commissioners and for the constitution of district electricity boards to secure a cheap and abundant supply of electricity by: (a) the acquisition of generating stations, (b) the acquisition or use of main transmission lines of any authorized undertakers, (c) the supply of electricity within their district (including the construction of generating stations, main transmission lines, and other works required for the purpose), and (d) the acquisition of the undertakings or parts of the undertakings of authorized distributors and power companies. At dates to be specified all the public generating stations and main transmission lines in a district were to vest in the board subject to the payment of the "standard price." In the case of municipal undertakings the standard price was defined as one or more annuities sufficient to indemnify the local authority against their liabilities for interest and sinking fund. In the case of a company it was to be "the cost of and incidental to the construction of the generating station or main transmission line, and the acquisition of the site thereby, less depreciation." Boards were to be empowered to borrow for these purposes on terms to be fixed by the electricity commissioners, who were also to be empowered to lend to boards or authorized undertakers, subject to Treasury approval, money up to a total of £25,000,000, if they were satisfied that the boards or undertakers could not otherwise raise the money on reasonable terms. A sum of £20,000,000 was also to be made available out of the consolidated fund to enable the Board of Trade to construct interim works during the first two years.

Opposition to the bill was directed chiefly against the compulsory character and operation of joint electricity control, the magnitude

system, but during 1910-20 there was a marked tendency toward municipal ownership of the system. The energy is purchased at the substation in bulk.

The latest statistics available for Canada are as of Jan. 1 1910 and show 795 central electric power stations in which the capital invested was \$401,942,402. The total revenue from the sale of power was \$53,549,133, for lighting purposes \$16,952,512, and for all other purposes \$36,596,621. The generating capacity at that time was 1,433,722 kva.

In Canada private operation seemed to be gradually giving way to provincial operation. The largest single system was that of the Ontario Hydro Electric Power Commission which with its latest acquisitions supplied about 1,000,000 horse-power. In 1921 this, the largest single electrical system in the world, developed under the direction of Sir Adam Beck, was being copied in other parts of Canada and was finding admirers in different parts of the United States, particularly California, where a similar system was proposed. The provincial systems were equivalent in effect to municipal control. The domestic rates were very low and as a result electricity was used quite extensively in the homes. A rate as low as one cent a K.W.-hr. was charged for electric cooking. (S. B. W.)

ELECTROCHEMISTRY (see 9.208) and **ELECTROMETALLURGY** (see 9.232).—Although these subjects are essentially connected, it will be convenient here to group separately the principal headings in each case under which notable advances had been made during 1910-21.

I. ELECTROCHEMISTRY

Alkalies and Chlorine.—The electrolytic methods of producing alkalies and chlorine by the decomposition of brine made remarkable progress during the period 1911-20. Electrolytic alkali works are now being operated in all the leading manufacturing countries where the raw materials of the industry are found; and even those who control the operation of the old Le Blanc process of alkali manufacture in the United Kingdom have found themselves at last compelled, by the force of circumstances and by the changing conditions of the trade and industry, to adopt the newer method of decomposing salt.

The cells now being operated industrially may be classified as diaphragm and non-diaphragm cells. In the former class, a porous diaphragm, composed of cement, asbestos or other material unacted upon by the electrolyte (or by the ions produced by the electrolysis), is employed to separate the cell into two or more compartments, and in this way the chlorine liberated at the anode is to a large extent prevented from taking part in secondary reactions with the sodium or potassium hydrate formed at the cathode.

The "Elektron," Hargreaves-Bird, Outhenin-Chalandre, Basel, Billiter-Siemens, Nelson, Allen-Moore, Gibbs and Townsend cells are all of this type, the chief difference between them being in the construction or design of the diaphragm and in the arrangements made for withdrawing the sodium-hydrate solution from the cathode compartment of the cell, before it has had time to be decomposed by the electric current. The defects of all diaphragm cells are the higher voltage required per cell, and the increased costs of maintenance, due to the lack of durability on the part of the diaphragm.

For these reasons the other class—namely, non-diaphragm cells—always attracted the electro-chemist, and many of these have been patented and tried. Only two types have survived industrial trial—namely, (1) the Castner-Kellner, Whiting and Solvay cells, which employ a moving mercury electrode in the cathode compartment of the cell, and thus produce an amalgam of sodium which can be removed from the cell before it is decomposed; and (2) the "bell" type of gravity cell, which makes use of the different specific gravities of the brine, and of the newly-formed sodium or potassium hydrate solution, in order to effect a separation of the two. The Aussig "bell" cell and the Billiter-Leykam cell are the only two representatives of this class in actual operation; the Richardson and Holland cell, which was tried on a large scale at St. Helens in the years 1896-1900, having proved a failure.

The attempts to use molten lead in place of the more expensive mercury in the liquid or moving electrode cells have also failed, after trial upon an industrial scale; the wear and tear of the cell structure, and the fire dangers with this type of cell, having caused the suspension of operation of the Hulin cell at Les Clavaux in France, and of the Acker cell at Niagara Falls in America. The works where the latter cell and process were operated was, in fact, burnt down some few years ago, and has not been rebuilt.

The World War caused a considerable increase in the number and capacity of the works for the electrolytic decomposition of brine, liquid chlorine being required in very large amounts by the military authorities, not only for gas-warfare but also for sterilizing water supplies. The U.S. Government in 1918 planned and erected a large works of this type at the Edgewood Arsenal, equipping it with 3,552 cells of the Nelson (diaphragm) type in order to provide the army authorities with all the liquid chlorine they required. At the

date of the Armistice, this plant could have produced 100 tons of chlorine gas per day of 24 hours, if worked to the full.

The figures in Table I are drawn from the most reliable sources, and give a useful summary of the comparative efficiencies of the various cells as operated in 1921, and the strength of the caustic-soda solution they produce. It will be noticed that the cells with the highest current and energy efficiencies give the weakest solution of sodium hydrate at the cathode, and that in order to obtain a fairly concentrated cathode liquor, one must sacrifice to some extent the electrical efficiency of the process.

TABLE I.
Comparative Efficiencies of the Leading Types of Electrolytic Alkali and Chlorine Cells.

(Allmand's and Kershaw's Figures.)

Type of Cell	Cathode Efficiency %	Energy Efficiency %	Voltage	Concentration, Grammes per litre NaOH	K.W. hrs. per Kg. NaOH
Finlay	98	75	3.0	80	2.0
Billiter-Siemens	92	68	3.1	120	2.3

*This cell produces Na_2CO_3 —not NaOH.

To produce one ton of solid caustic soda from a solution containing only 80 grammes per litre of NaOH (the strength produced by the Finlay cell) means the evaporation of over 12 tons of water; whereas with a cathode liquor containing 240 grammes NaOH per litre (the strength produced by the mercury cell processes), only one-half this weight of water will have to be evaporated to obtain the solid product, and the fuel consumption will thus be reduced 50%.

The answer to the question which cell is the best for the production of solid caustic soda or potash depends, therefore, largely upon the relative costs of electric power and of solid fuel in the locality where the cell is to be operated. The Whiting, Castner-Kellner, and Wilderman mercury cells, as shown by the table, all yield cathode liquors of fairly high concentration—200 to 240 grammes NaOH per litre. If the cost of mercury were not so high, they would be generally adopted for the production of caustic hydrates and chlorine, in spite of their rather low energy efficiencies, since they also yield a specially pure product at both the anode and cathode.

Of the diaphragm types of cell, the Billiter-Siemens, Billiter-Leykam, Townsend and Nelson cells all yield a liquor containing 120-160 grammes NaOH per litre, and, therefore, come next to the mercury cells. No figures for the concentration of caustic liquor or the efficiency of the Gibbs cell are available.

The Aussig bell, Griesheim, and Outhenin-Chalandre cells, on the other hand, yield a liquor containing only 60-80 grammes NaOH (or under) per litre, and in view of the amount of fuel required to produce solid caustic from such weak liquor, it is surprising that these cells have attained so wide a use on the continent of Europe.

Chlorates, Perchlorates and Persalts generally.—The electrolytic method of manufacture of chlorates and perchlorates of potash and soda was in 1921 being worked in all countries where cheap electric power was available, the most notable works being that of Messrs. Corbin & Cie, at Chedde, in the Haute Savoie department of France, and at Trollhattan in Sweden. The cells used at Chedde are constructed of cement, and are arranged in terraces so that the electrolyte flows through them by gravity. Very thin sheets of platinum-foil fixed in ebonite frames act as bipolar electrodes in series, the number of electrodes per cell and of cells in a circuit being arranged to suit the voltage of the generators. The electrolyte used is a 25 to 30% solution of KCl or NaCl; a current density of 100 to 200 amperes per sq. ft. of anode surface is employed. This leads to a high E.M.F.

being required, even though the electrolyte is heated to 70° C. and the bipolar electrodes are only $\frac{1}{2}$ in. apart.

When potassium chloride is employed as electrolyte, the chlorate can be easily separated by crystallization on cooling from the mother-liquor containing the unaltered chloride; but when sodium chlorate is being produced, different treatment is required to obtain separation of the chloride and chlorate, since the sodium salt is much more soluble than potassium chlorate. The current efficiency when producing either sodium or potassium chlorate can be raised to 90% when the process is well-managed; and the conversion of chloride into chlorate is completed in one operation.

Were it not for the fact that no satisfactory substitute for platinum can be found as electrode material for chlorate cells, and that consequently the capital costs of the cell installation are very high, the electrolytic process of chlorate manufacture would before now have quite supplanted the older chemical process, which is still operated in the few places where the Le Blanc process survives.

The conditions required in order to obtain *perchlorates*, and other highly oxidized salts such as persulphates, in an electrolytic cell are:—(1) Insoluble electrodes; (2) a high current density at the anode; (3) the prevention of any reducing action by the hydrogen liberated at the cathode. This latter condition is obtained, either by the use of a diaphragm between the two compartments of the cell, or by the employment of salts, such as chromates or cyanides, which serve to suppress the cathodic reduction.

According to the most reliable information, perchlorates are now produced by electrolyzing a concentrated solution of sodium chlorate, containing 600–700 grammes per litre of this salt, at a temperature of 10° to 30° C. with a current density of 400–500 amperes per sq. foot. When the chlorate content of the electrolyte falls below 100 grammes per litre, the resistance of the bath increases considerably, and the temperature rises to 45° to 50° C. with a reduction of the current density to 270 amperes per sq. foot. If the chlorate concentration of the electrolyte falls below 10 grammes per litre, much ozone is given off, and the evolution of this gas may increase to such an extent that the workmen in the cell rooms are affected injuriously. Under normal conditions, however, the conversion of the chlorate into perchlorate proceeds without evolution of ozone, and with an average efficiency of 85%; the power required to produce 1 kgm. of sodium perchlorate from chlorate being 3½ K.W.-hrs. As the sodium salt is deliquescent it is not worked up as such, but the potassium salt is precipitated by adding potassium chloride. The ammonium salt is prepared similarly, by treating the sodium perchlorate solution with ammonium chloride; or the ammonium salt can be produced by starting with calcium chloride, and by converting this by successive stages of anodic oxidation into calcium perchlorate, which is finally decomposed by the ammonium chloride, to yield ammonium perchlorate.

Sodium perborate is produced in a similar manner, by electrolyzing solutions of sodium borate; and as this salt has found a wide application in the arts and industries, some further details of its method of manufacture may be given here. The process employed is based on the use of a mixed solution of sodium borate and an alkaline carbonate as electrolyte, with the addition of some substance which will coat the cathode with a colloidal or other deposit that lowers the reducing action of any hydrogen liberated at this point; chromic acid being most suitable for this purpose. During the electrolysis, the strength of the alkali carbonate solution must be maintained, preferably by the presence of the solid salt; but towards the end of the electrolysis this solid carbonate can be allowed to go into solution. Sodium borate must also be present in the solid state during the electrolysis, in order to keep up the concentration of the electrolyte. The presence of magnesium silicate, stannic acid and alkali bicarbonates is said to accelerate the conversion of the borate into the persalt. The latest theory of the conversion is, that percarbonate is first formed, and that this salt then reacts with the sodium borate to yield sodium perborate during the course of the electrolysis; in any case, for the success of this method of production, the presence of solid perborate in the cell appears to be necessary.

Persulphates and Hydrogen Peroxide.—Persulphates are another class of highly oxidized salts which are finding a wide application in the arts and industries, especially in photography, and here again the electrolytic method of production is the simplest and most efficient.

As a practical matter, in judging the comparative merits of the chemical and electrolytic methods for producing these persalts and compounds, it is necessary to note that the cost of the electric current, when producing pure chemicals of this type, is not a very serious item in the total cost of production. As a rule, the desired salt can be produced in a pure state by one simple operation in the electrolytic cell or bath; and this of course is a factor in the economy of the electrolytic methods which must not be overlooked in judging the comparative cost of electrolytic and chemical methods of manufacture of what are usually classed as "fine" chemicals.

The method of producing persulphates in the electrolytic cell is based upon the discharge of SO_4 ions at the anode of the cell. The conditions required to effect this discharge are the same as in the case of the production of perchlorates:—(a) A low temperature; (b) a high current density with a smooth platinum anode; (c) an acid solution, or one at least free from alkali.

When employing a diaphragm type of cell, a concentrated solution of ammonium sulphate is employed in the anode compartment of the cell and sulphuric acid of medium strength in the cathode compartment. Smooth platinum must be employed as anode material, but lead can be employed as cathode; and the cathodes may be of much larger surface area than the anode.

Two methods have been employed for the production of *hydrogen peroxide* by electrolysis; the one based upon the use of persulphuric acid as intermediate product, and the other upon the use of potassium or ammonium persulphate. The conditions which necessarily should be observed in the first method are as follows:—(1) The density of the sulphuric acid should be between 1.35 and 1.50; (2) the electrolysis should be carried out as rapidly as possible; (3) the current density should be high, about 950 amperes per sq. ft.; (4) the solution must be cooled, or a hollow anode may be used, cooled internally by the circulation of water at 15° to 20° C.

Hypochlorites.—It is noteworthy that Charles Watt, in his very remarkable patent No. 13,755 of 1851, clearly explained all the conditions which must be maintained in the cell in order to produce hypochlorites by the electrolytic decomposition of sodium or potassium chloride solutions. The advances that have been made since that year have been simply in the form and design of the apparatus used for carrying out the electrolytic method. The leading features of the modern cells, designed specially for hypochlorite production, are, however, very similar. They all possess graphite or platinum electrodes, placed close together so that the chlorine liberated at the anode reacts at once with the alkaline hydrate formed at the cathode; and they possess also some mechanism for promoting the rapid circulation and cooling of the electrolyte, in order to avoid the formation of chlorate. The three leading types of electrolyzer, for the production of bleaching solutions, are:—(1) the Haas and Oettel (or "Manchester," as it is now called), (2) the Kellner, and (3) the Mather and Platt.

The latest form of the Manchester electrolyzer, as operated in 1921, makes use of carbon as electrode material, and of the liberation of hydrogen at the cathode, to effect automatic circulation and mixing of the liquid. The inner or working cell is a rectangular stoneware tank, divided by the carbons into 30 narrow compartments or cells. The first and last carbons of the set form the main electrodes of the cell; the intervening carbons act as secondary electrodes, i.e. as anodes on the one face and cathodes on the other. This electrolyzer holds 750 litres of 15% brine, and takes 75 to 80 amperes at 110 volts. Its output in 10 hours equals 10.5 kgm. of active chlorine.

The Kellner electrolyzer consists of a shallow stoneware tank, divided into a large number of narrow cells by means of vertical glass plates, so arranged that the electrolyte is obliged to take a zig-zag course in its passage through the electrolyzer. The electrodes are formed of platinum-iridium gauze and are arranged horizontally, with the anodes below the cathodes, so that the chlorine liberated at the former may be absorbed by the supernatant liquid. This electrolyzer is constructed usually to take a current at 110 volts, and has only two terminal electrodes; all the intervening electrodes function as secondary electrodes. The Kellner electrolyzer holds 820 litres of brine testing 15%, and requires a 90-ampere current at 110 volts. Its output in 10 hours equals 15.0 kgm.

The Mather and Platt electrolyzer is constructed on the filterpress principle, with a trough for supply of the brine running along the top of the frame. The frame holds 22 separate cells fixed transversely, and the brine feeds these through a perforated tray in fine streams which break up into drops on falling and thus prevent current leakage. The 22 cells forming one electrolyzer are placed in one frame, and are connected in series. They take a current of 250 amperes at 110 volts. The salt consumption is 10.3 lb. salt, and the power consumption is 2½ K.W.-hrs. per lb. of available chlorine produced.

In recent years the direct production of hypochlorites and bleaching solutions by electrolysis has been curtailed. It has been found more economical to use the chlorine gas obtained from the electrolytic alkali cells for this purpose, and to absorb this either in the milk of lime, or in the hydrate solution produced at the cathode, the absorption taking place in a separate vessel outside the cell.

Oxygen and Hydrogen.—The electrolysis of acidulated water to show that it is composed of two gases, and the recombination of these gases by explosion to form drops of water, is one of the oldest of chemical lecture-table experiments; and it is not surprising, therefore, that cells for producing oxygen and hydrogen upon a commercial scale, by electrolytic methods, have been

patented and operated. The Schoop, Garuti, and Schukert cells were the best known of these. The first-named used sulphuric acid, while the remaining two employed caustic potash as electrolyte; the power consumption being 5.9 and 4.1 K.W.-hrs. respectively per cubic metre of the mixed gases.

In recent years, however, oxygen has been more economically obtained by the fractional distillation of liquid air, which can now be produced very cheaply; and hydrogen is obtained either from electrolytic alkali cells (as a waste product), or from blue water gas, by improvements of the old iron-contact process. By means of this, the carbon monoxide is first oxidized to CO_2 and is then removed from the gas mixture by absorption. The electrolytic production of hydrogen and oxygen is, therefore, now carried on in only a few localities, and for the few industries where both gases are required for immediate use in their relative combining proportions, as in the oxyhydrogen blowpipe.

Ozone.—Since most of the early patents for ozone apparatus have lapsed by efflux of time, the general type of apparatus for the production of ozonized air, as placed on the market in 1921 has been standardized.

Ozonizers now usually consist of an inner cylinder of sheet copper or aluminium, connected to the high-tension side of the transformer and well insulated, and an outer metal cylinder which is connected to the casing of the ozonizer, and is kept at zero or earth-potential. The two cylinders are separated by a glass tube through which the air is passed, and the silent discharge takes place in the annular air-space between the two metal sheets. The outer sheet of metal is water-cooled, and thick glass windows at each end of the ozonizer tube enable the operator to see if the discharge through the air-gap is occurring in a proper manner. Alternating currents with frequencies up to 60 cycles are employed for these installations; and the practical limit of E.M.F. has been found to be 10,000 to 12,000 volts.

Ozonized air has been employed for bleaching wax, textiles, paper-pulp and sponges; for the sterilization of air and food; and also for the acceleration of the drying and hardening processes in paints and varnishes, and for the rapid oxidation of oils.

Organic Products.—It is difficult to obtain any information as to the extent to which electrolytic methods have been and are being applied in 1921 outside the laboratory in the field of organic chemistry; but there is reason to believe that in Germany considerable progress had been made in this direction, and that not only *bromoform* and *iodoform* but also *anthraquinone* and other organic products have been produced electrolytically.

Phosphorus.—At one time the electrothermal process for the production of phosphorus from bone-ash was being employed at Oldbury, near Birmingham, and at Niagara Falls, and an output of 30 tons per month was reported to have been attained. The bone-ash was mixed with silicic acid (sand) and carbon, and the mixture was then heated to between 1300° and 1500°C . The phosphorus commenced to distil over at 1150°C . and was all expelled from the mixture before a temperature of 1450°C . was reached. According to Hempel, this method of manufacture had also been used in Germany, gas-tight iron cylinders lined with fire-clay being used as the furnaces in which the raw materials were heated. The use of silicic acid (or sand) to produce a calcium-silicate slag, it must be noted, is only practicable with methods of reducing calcium phosphate which render this slag quite fluid, a result that can be attained only by aid of electric heat. Molten calcium silicate is also very corrosive, and the advantage of the internal system of heating is that the outer walls of the furnace can be artificially cooled, and a layer of cold slag can be formed to protect the refractory lining from the action of the slag.

A process very similar to that described above, for the manufacture of phosphorus, was brought out in America and patented some years ago in the name of Machalske. The furnace used for operating this process possessed an internal chamber, measuring 12 in. x 18 in. and was provided with a carbon bottom, sides of calcined magnesite, and a cover of fire-clay and red brick. Two electrodes, each 8 ft. in length by 4 in. in diameter, passed through holes in the cover. With electric power at 3 cents per c.h.p.-hr., Machalske claimed that yellow phosphorus could be produced by this method at a total cost of 7 cents per pound.

From 80% to 92% of the phosphorus can be recovered by this method of manufacture; the balance remains in the furnace or retort as calcium silico-phosphate, and it cannot be expelled by any increase of the temperature.

II. ELECTROMETALLURGY

Aluminium.—There were no discoveries or marked advances during the period 1910–20 in the development of new sources of aluminium, and the mineral *bauxite* remains the chief raw material of the industry. The increased demand for bauxite, however, has led to several new deposits being opened up and worked, and although none of these equal in purity the French bauxite deposits, the mineral has been found to be much more widely distributed over the world than was at one time supposed. With the aim of reducing the cost, numerous attempts have been made to dispense with the preliminary purification of the alumina (see 1.767–770) and to operate the baths with the raw bauxite, but these so far have not proved successful. In time this improvement in the electrolytic process and reduction in cost of aluminium manufacture will no doubt be achieved.

The world's production of bauxite in recent years is given in Table I, which is taken from a pamphlet published in 1921 by the Imperial Resources Bureau. As regards alternative sources of supply, silicate of aluminium or clay is one of the most widely distributed materials which occur in the crust of the earth. Weaver, in a recent Canadian patent (No. 190,054 of 1919), proposes to open up this source of aluminium and its salts by treating the clay with chlorine in the presence of carbon. This leads to the formation of AlCl_3 , SiCl_4 and CO , and with cheap supplies of liquid chlorine the method might be practicable. The chlorides are separated, and the metal is extracted by the electrolytic method described below. Whether this suggested process of using AlCl_3 in place of Al_2O_3 as raw material for the aluminium industry will prove successful remains for the future to disclose.

Production and Output.—The electrolytic process by which aluminium is produced from alumina, as worked in 1921, differed but little from that by which Heroult, at Neuhausen in Switzerland, and Hall, at New Kensington in America, first started the manufacture upon an industrial scale in 1889. The production, however, is now concentrated in the hands of a small group of powerful companies.

As regards the growth of the industry, the figures in Table II, taken from the pamphlet already referred to, indicate very clearly the remarkable expansion which has occurred in the manufacture during the period 1910–20. Compared with the figures compiled by J. B. C. Kershaw some years previously for the period 1893–9, the expansion of the industry becomes even more striking:

	1893	1894	1895	1896	1897	1898	1899
Total World Output (tons)	713	1,057	1,129	1,755	3,327	3,953	5,459

In twenty years, therefore, the world's output of aluminium had increased from 5,000 to 150,000 tons, and the metal had come to rank 4th in the list of nonferrous metals, when judged by the standard of consumption; for only copper, zinc and lead are employed in larger amounts in the arts and industries. The remarkable increase in production which marked the war period was of course due to war requirements; aluminium being used in enormous amounts not only in the powdered form for paints, and as an ingredient of certain forms of explosive (such as "ammonal"), and of pyrotechnical materials, but also being employed, either as pure metal or in the alloyed state, for the construction of airships, aeroplanes, motor-cars, fuses, bombs, radiators and many forms of measuring instruments. The close of the war occasioned, therefore, a very considerable drop in the demand for the metal—but there was little doubt that later the demand for aluminium in the arts and industries would more than absorb the production of the increased plant.

As regards the localities and works where aluminium is now produced, these are in every case operated by water-power, and the names of the companies and locations of the works are as follows:—

United Kingdom.

British Aluminium Co.—Foyers and Kinlochleven, Scotland (Stangfjord, Vigeland, Norway).

Aluminium Corporation Ltd.—Dolgarrog, North Wales.

France.

Soc. Electrometallurgique française.—Le Praz, Gardanne.

Compagnie des Produits chimiques d'Alais.—Calypso, St. Jean de Maurienne, St. Felix.

Switzerland, Germany and Austria.

Aluminium Industrie Aktien-Gesellschaft.—Neuhausen, Rheinfelden, Lend Gastein.

United States of America and Canada.

Aluminium Co. of America.—Niagara Falls, Massena, Shawinigan Falls.

Italy and Norway also possess aluminium works, and during the war two or three factories were started in the highlands of Bavaria for the production of the metal, by the Allgemeine Elektrizitäts Gesellschaft, of Berlin. The figures given in Table I show that during the last year of the war Germany produced 25,000 tons of aluminium, and was second only to the United States in her output

of this metal; while Norway and Switzerland came next in producing capacity, with 15,000 tons to their credit.

As regards further development of the producing capacity of the works located in the United Kingdom, the British Aluminium Co., which had already developed 25,000 H.P. from water-power at Foyers and Kinlochleven in Scotland, was in 1921 seeking to obtain the necessary parliamentary sanction for developing the much greater water-power of the Lochaber district of Inverness-shire.

Concerning the use of aluminium chloride in place of the oxide for the electrolytic bath. Weaver, in U.S. patent No. 1,297,946 of March 1919, states that if aluminium chloride be fed into a bath containing sodium and aluminium chlorides in the molten condition, at such a rate that the molten chloride is replaced as fast as it is decomposed by the current, the process can be made a continuous one; and the aluminium and chlorine, which are the two products of the electrolysis, can be separately drawn off. An apparatus is described in the patent, by which this method can be carried out.

The application of aluminium has grown enormously in recent years. One very large and increasing field of the metal is in the electrical trade, in which it is used for transmission lines, bus bars, field coils and windings, etc., etc. Its applications in the motor-car industry are well known, for not only is it employed in sheet form for gear and crank cases and for body work, but it is also employed largely for engine castings. Aluminium is being used to an ever-increasing extent in the chemical, brewing, sugar-refining, margarine, dyeing and soap industries, and the manufacture of cooking utensils affords another large outlet for the metal.

carbide are recognized, and the attempts to apply carborundum wheels to the grinding and finishing of fine steel goods have ceased, the artificial abrasive industry is on a very sound footing.

Silicon carbide is intensely hard and very brittle, and it is most suitable for grinding and finishing similar materials such as cast iron and marble, and for the finishing of leather goods; while artificial corundum has taken the place of the natural variety (emery) where it has been found more suitable than carborundum.

Brass and Bronze.—There have been many attempts in the past to apply electric methods of heating and refining to the melting and casting of brass. Until recent years none of these attempts were successful, but during the World War a large amount of experimental work was carried out in America with various types of electric furnace, and the difficulties that surround the electric melting and refining of brass and bronze appeared in 1921 to have been overcome.

At the commencement of the World War, there were, according to H. W. Gillett of the U.S.A. Bureau of Mines, no electrically heated brass furnaces in commercial operation in the United States. By the end of 1919 there were 40 American firms using or installing such furnaces, and over 100 of these were in operation. One brass-rolling mill is stated to have installed 30 furnaces, though these were chiefly of small capacity; one smelting

*Official figures. 1919 figures estimated.

Artificial Abrasives—Carborundum and Corundum.—The manufacture of carborundum or silicon carbide (SiC) in the electric furnace did not undergo any particular change during the period 1910-20, although the industry had developed considerably.

The electrometallurgical manufacture of artificial corundum, i.e. impure fused alumina, is new, however, and has become one of great importance in Canada.

Bauxite and coke are smelted in an arc furnace, the proportions used being as follows:—Calcined bauxite 1,750 parts; coke 100 parts; iron borings 350 parts. The furnaces used for the manufacture are mounted on water-cooled tracks, and when one is full it is removed on the rails, and another is inserted in its place under the electrodes. The furnace body is merely a rectangular iron frame lined with fire-brick, with a hearth made from pitch and carbon. The furnaces operate at 100 volts and 5,500 amperes; about 18,000 K.W.-hrs. being required to produce an ingot of 4 to 5 tons in weight. The reduction must not be carried too far, otherwise the product will be too brittle; the presence of 1 to 2% of iron, silicon, and titanium oxides, as impurities, improves the toughness of the abrasive. Brockbank gives this typical analysis of a high-grade artificial corundum:—Al₂O₃ 97.40%; SiO₂ .90%; Fe₂O₃ .32%; TiO₂ 1.38%.

The manufacture of artificial abrasives is confined chiefly to North America. In the year 1918, Canada alone produced 70,000 tons of these materials; while the value of the total exports of the United States was \$1,000,000. Now that the limitations of silicon

and refining company was employing four 1-ton and four ½-ton furnaces, while another firm had four 1-ton furnaces, and batteries of two or three furnaces were quite common.

The following types of furnace were stated to be in successful use:—

1. The direct arc furnace, of which the *Snyder* is the only representative.
2. The indirect arc furnace, of which the *Rennerfelt* and the *Detroit* are the most successful examples.
3. The vertical ring induction furnace, of which the *Ajax-Wyall* is the best known and most successful.
4. The granular resistance furnace, of which the *Baily* is the only example.

For rolling-mills using yellow brass, the direct and indirect arc furnaces are quite unsuitable, since they would lead to high zinc losses. Likewise the induction type of furnace is unsuited for foundries where alloys high in lead are made, or where frequent changes in composition are necessary. The type of furnace to be installed, therefore, is determined largely by the alloy or metal which is to be produced, and each works will have to be guided by expert and skilled advice in the selection of the type of furnace best suited to its needs and requirements. The question of power-costs also enters into the matter, and where cheap power is available the granular resistance type may be chosen in preference to the more efficient arc type of furnace, because of the savings which follow from the absence of electrodes. Bronze manufacturers who take

power from some small central station plant may be compelled to select the two-phase Rennerfelt arc furnace instead of the single-phase Rocking Detroit furnace, because the latter type of current cannot be economically provided for one power user alone.

The figures in the accompanying table are given by Gillett for the output and power consumption of the various furnaces named above, when melting brass and bronze.

The electrolyte contains 30% free HCl and 80 to 85 grammes of gold per litre, with varying amounts of platinum and palladium. When the amount of these latter two metals in solution is sufficient to render it worth the expenditure of time and chemicals, a portion is withdrawn, and the platinum and palladium are then separated and can be refined by the appropriate chemical and metallurgical methods of treatment.

Type of Furnace	Power required K.W.	Charge of metal in lb.	Output per day in tons		Power consumption in K.W.-hrs. per ton	
			10 hrs.	24 hrs.		
1. Ajax-Wyatt (Yellow brass)	30 60	300 600	1-1½ 2½-3	3-3½ 6-7	325 275	267 218
2. Bailly (Yellow and red brass)	105	800 to 1500	2½-3½	6-10	475	338
3. Snyder (Leaded bearing bronze)	100 300	600 2000	1½ —	— 12-18	380 —	— 290
4. Rennerfelt (Red brass and bronze and bearing metal)	100 125 300	500 1000 2000	1½ 2-2½ —	— 7-10 10-16	475 400 —	— 350 325
5. Detroit rocking (Yellow and red brass)	40 225 300	125 1300 2000	— 3½ 6-7	— 8½ 16-20	400 332 287	— 262 237

Nos. 3, 4 and 5 use from 2½ lb. to 6 lb. of graphite electrodes per ton of metal charged.

Bullion.—"Bullion" is the technical term for the alloys of the precious metals silver and gold; the name is also applied to the bars or ingots in which these metals are sold (for coinage purposes) to the mint authorities of the various countries of the world. Although chemical and metallurgical methods are still employed for separating or "parting" the silver and gold in bullion from one another, and from the baser metals with which they are often associated, since the year 1895 electrolytic methods have been making steady progress, and at the present time a very large proportion of the silver output of the world is electrolytically refined by aid of the Moebius process. As regards gold, the electrolytic method is also making progress; and electrolytic refineries for treatment of gold bullion by the Wohlwill process have been operated at Frankfurt, Hamburg, Paris, New York, Philadelphia and San Francisco.

The chief disadvantages of the electrolytic methods of bullion-refining are those resulting from the value of the gold and silver locked up by the processes; and the latest improvements, therefore, are directed chiefly towards reducing the volume of the solutions in the tanks, and also the time required for the refining.

The Moebius process of silver-refining has already been fully described (see 25,115). The following description of one of the latest plants erected is of interest, since it shows that the horizontal system of travelling belts which act as cathodes has been dropped, and that the vertical type of anode, enclosed in bags, has been reintroduced. The plant is attached to the Amboy Refinery of the American Smelting & Refining Co., and consists of 144 stoneware tanks, grouped in 24 sections of 6 tanks each. The anodes weigh 100 oz. and are cast by hand in the lead refinery. The cathodes are made from cold-rolled silver sheets ⅜ in. thick. Each tank contains 4 anode bags and 5 cathodes, the bags each holding 4 anode bars. The electrolyte is a neutral nitrate solution, containing, per litre, 15 to 20 grammes silver and 30 to 40 grammes copper; 75% of the silver in the anode can be deposited in 24 hours. The deposit upon the cathodes is continuously removed by means of wooden sticks attached to a frame which has a reciprocating motion. A current density of 40 amperes per sq. ft. can be maintained under these conditions since no treeing of the silver can occur, owing to the continuous removal of the crystalline deposit.

The bags which surround the anodes receive all the slime, and are removed at regular intervals for recovery of the gold and other precious metals. The slimes are first boiled with sulphuric acid of 1.842 Sp. Gr. in order to remove copper and silver, the residue is then washed, dried, and cast into anodes for treatment by the Wohlwill process.

The gold-recovery installation at Perth Amboy is equipped with 5 earthenware cells, and a current density of 150 amperes per sq. ft. is employed. This density is considerably higher than that used in the early trials of the Wohlwill process, the object of the increase being, of course, to reduce the standing charges for interest per unit of output. One special feature of this installation is the use of mercury cups on the ends of the copper bus-bars. By aid of these cups, and cross bars of copper with bent ends to fit into these cups, any unit can be quickly cut in or cut out of the circuit. The cathodes are thin sheets, rolled from electrolytic gold, and are connected to the contact bars by bending one end of the sheet round them, and by fastening this down with a clip.

Cadmium.—This metal was produced during the World War period in America, by the electrolysis of acid solutions of the sulphate, freed from all impurities by chemical treatment.

The electrolysis was carried out in semi-circular lead-lined tanks, provided with rotating disc-shaped cathodes of aluminium sheet, ½ in. in thickness. Under these conditions, smooth coherent deposits of metallic cadmium could be obtained, when using a current density of 15 amperes per sq. ft. of immersed cathode area. The average weight of cadmium deposited per 24 hours in the plant referred to above was 113 lb. per tank, and the current efficiency was 85%.

As regards output in 1914, 91,000 lb. of metallic cadmium were produced in the United States, and the total had increased to 207,000 lb. in 1917. No figures were yet available in 1921 for the German output during the war years, but it was known that they also produced large amounts of cadmium and used it as a substitute for tin in the manufacture of solders. The low melting-point of cadmium renders it useful also in the manufacture of fusible plugs in sprinkler systems of fire protection; and it has also been employed in conjunction with lead for the manufacture of bearing metals.

Calcium.—The method of Rathenau and Suter for production of metallic calcium upon a commercial scale, by electrolysis of the fused chloride, has already been described (see 4,971).

Up to 1921 no important uses had been found for calcium; consequently there was little demand and the price of the metal remained comparatively high. Before the war calcium was quoted in Germany at M.5.50 per kgm., equivalent to a price of 3s. to 3s. 9d. per pound. It could still be produced at this price, if a large demand for the metal were created.

The only application so far suggested for calcium is as an absorbent for the occluded and trapped gases in molten metals; and in this direction it comes into competition with the cheaper and lighter metal aluminium. Soddy, in a Royal Society paper of 1906, referred to the use of calcium for removing the last traces of O. and N. from rarefied gases, and stated that by its use very high vacua could be obtained, but no practical industrial application of this suggestion appears to have been made.

Calcium Carbide and Calcium Cyanamide.—The manufacture and application of these two products of the electric furnace have been described (see 1,138). Whereas the use of calcium carbide for generating acetylene for domestic or public lighting purposes is not extending, its manufacture and use as an absorbent for nitrogen increased rapidly after 1910. The cyanamide process, in fact, when operated in favourable localities, seems likely to remain one of the chief competitors of the Haber and electric-arc processes for the fixation of atmospheric nitrogen. According to reliable authorities, the relative power consumption for the three processes is as follows:—

Haber (taken as unity)	1
Cyanamide	8 to 10
Arc processes	25 " 30

Regarding power considerations alone, therefore, and ignoring technical questions, it is clear that the Haber process is of universal application—while the cyanamide process will only

advantage over the arc processes if its greater complexity can be counterbalanced by its greater efficiency. There is good evidence, however, for the belief that cyanamide costs have been very substantially reduced recently, and whereas in 1908 about 0.75 E.H.P.-year was required to produce a ton of cyanamide, the present energy consumption at Odda is believed not to exceed 0.6 E.H.P.-year per ton.

As regards the progress of the three processes, Landis has published the following comparative figures for the years 1913 and 1916:

Installed Capacity for Nitrogen Fixation Throughout the World in Short Tons of Fixed Nitrogen		
	1913	1916
Cyanamide Process	65,590	209,510
Arc Processes	18,650	29,400
Synthetic Ammonia Processes	8,000	60,000
	92,240	298,910

Most of this increase was made in 1915, and 1,000,000 H.P. is now consumed in the three groups of processes.

Before the war, there were 16 calcium cyanamide factories in existence utilizing about 200,000 H.P. in the manufacture. Even at that time, however, the larger proportion of the calcium carbide manufactured was utilized in the cyanamide industry. According to official reports, Germany possessed in 1920 plant with an annual capacity of 600,000 tons of calcium cyanamide, equivalent to 120,000 tons of combined nitrogen. This plant was distributed among six firms, the largest works being that of the *Mitteldeutsche Stickstoffwerke A. G. Piesteritz*, with a tonnage of 175,000 per annum. Other large works for production of calcium carbide and cyanamide are located at Odda in Norway, where an annual output of 300,000 tons eventually will be realized; at Piano d'Orte in Italy, and at Niagara Falls, where the American Cyanamide Company is operating on the Canadian side of the Falls.

Copper.—The very remarkable growth of electrolytic methods in the copper industry is, of course, due to the presence of small amounts of silver, gold and other precious metals in the original copper ore. These "impurities" accumulate in the slime from the electrolytic vats, and in most cases the value of this mud more than covers the whole cost of the refining operations. In 1913, the last year for which reliable aggregate statistics were available in 1921, over 1,000,000 tons of copper were produced by the copper mines and smelters of the world; and of this total it is probable that from 70% to 80% had been electrolytically refined. In mere tonnage capacity and in the capital sunk in the industry, the electrolytic copper-refining industry, therefore, easily ranks first among electrometallurgical industries; for the refineries cover immense areas and many millions of pounds' worth of copper and precious metals are locked up in the vats during the refining process.

The greater number of the electrolytic refineries are located in the United States, because the States still produce between 50 and 60% of the world's output of copper. The largest refinery is that of the United Metals Selling Co. at Perth Amboy. At Port Kembla in New South Wales, a new refinery has been built to refine the metal produced by the Mt. Morgan and other copper-mining companies of the Australian continent; and a production of 44,000 tons per year had already been attained by 1921.

The improvements made in the electrolytic refining process since 1910 have been directed chiefly towards the reduction of refining costs; and the method of operation is so well established that the only improvements possible are those based upon the substitution of mechanical for hand labour. Travelling cranes, by aid of which the whole of the anodes can be charged and the cathodes removed at one operation, are now used in all up-to-date refineries; and casting machines are also employed for casting the anode plates from the blister copper which constitutes the raw material of the refining process.

Addicks, in a recently published article upon the design of copper refineries, discusses the size and capacity of the anode melting furnaces, and states that for smooth and safe operation there should be at least six furnaces (three for anodes and three for wirebar units), two of each set being in service and one out for repairs. The limit of size in the past has been the ability to charge, refine and cast the charge in 24 hours. With hand-charging and ladling, using the same men for both operations, 60,000 lb. is regarded as a large furnace. If a fresh set of men be used for charging, and as many ladlers employed as can be accommodated at the ladle door, 100,000 lb.

can be reached. With hand-charging but mechanical ladling 300,000 lb. is possible; and with full mechanical charging and ladling 500,000 lb. is easily reached. A furnace casting a charge of 300,000 lb. or more, according to Addicks, may be considered, however, a thoroughly economical unit; but he is insistent that all the impurities possible should be eliminated at this stage of the process, for it is much more costly, in practice, to throw this burden upon the tank-house and silver refinery. It is also important, he states, to do all that is possible to facilitate uniformity of operating conditions. As a general rule, anodes of constant composition, a uniform current density and a single electrolyte should be used throughout the tank-house.

Graphite.—The production of artificial graphite by the Acheson process has grown into one of the most flourishing of the electro-metallurgical manufactures. The original Acheson patent which protected the process was dated 1896, and as the 17-year period allowed by American patent law had elapsed, the process after 1913 could be employed in all countries without payment of patent royalties. Consequently, there was a great expansion of the industry in countries where the demand for artificial graphite existed; and the manufacture is now carried on in the United Kingdom. The method described by Acheson in his original patent has undergone little alteration or modification in its general features, since it was first worked upon an industrial scale at Niagara Falls, in the year 1897.

The growth of the industry is shown by the following comparative figures of output at Niagara, for the two periods 1898-1900, and 1915-17 respectively:—

1898	185,647 lb.	1915	5,084,000 lb.
1899	405,870 "	1916	8,397,681 "
1900	860,750 "	1917	10,474,649 "

These totals do not include graphite used for electrodes, but only the artificial graphite which comes into competition with the natural variety.

The artificial graphite can be employed for any of the purposes for which natural graphite is used, with the exception of the manufacture of crucibles, and it is of interest to note that a recent American patent covers its application to this purpose also. The chief application of artificial graphite, however, is its use for electrodes, for which its high electrical conductivity renders it specially suitable. Its further advantages are that it can be produced in large blocks which can be sawed, tapped or screwed, and turned in the lathe to any desired shape. Some of the artificial graphite electrodes manufactured for electric furnace work have been of enormous size, namely 24 in. in diameter and 72 in. in length; and these could not possibly have been produced from natural graphite.

The production of artificial graphite was greatly stimulated during the war period by the increase in the number and capacity of the electric furnaces used for steel production and in the number of new installations of electrolytic cells for decomposition of brine; and there was a notable falling-off in the demand for these two purposes after the Armistice. In other directions, however, the use of artificial graphite has been growing, and of these applications the most notable are its use for the manufacture of lubricants, paints, dry-batteries, engine-gland packings, and boiler-scale preventives.

Electric Steel Furnaces.—Since 1910 a very remarkable increase has been seen in the number and capacity of electric furnaces, both for the purpose of refining the higher grades of steel and for the production of ferro-alloys, in the leading industrial and manufacturing countries of the world. This increase, no doubt, has been due very largely to war conditions. Every country, engaged in the struggle, was thrown upon its own resources with regard to the production of iron and steel; and as electric heating offered the quickest and most efficient method of converting ordinary carbon steel and scrap from the shell factories into the special steels required for the manufacture of shell billets, guns, armour plates, etc., etc., as well as for various other military purposes, electric furnaces were installed in all centres of the steel industry.

Descriptions have been given (see 14.824) of the Heroult arc furnace, and of the Kjellin and Rochling-Rodenhauser types of induction furnace. The latter type of furnace has not survived in the iron and steel industry, for the temperature attained in it has been too low to effect any useful refining work, and as a simple melting furnace for production of special alloy steels it is handicapped by the fact that some portion of the last charge of metal must always be left in the furnace ring to maintain the current. The Kjellin type of induction furnace as modified by Hiorth, however, is now used for the production of a specially pure iron for dynamo construction, the principle being to encase the whole secondary of

the furnace in a gas-tight ring, and to melt and cool the metal in vacuo. In this way all occluded gases are removed, and the magnetic permeability of the metal is greatly increased. With this exception the successful electric steel melting and refining furnaces are now all of the arc, or combined arc and resistance heating type. Detailed figures for all countries are not available, but the following comparative figures for the United Kingdom are striking. In the year 1912, only nine electric furnaces were operating, or in course of erection, in the iron and steel works or foundries of Great Britain: Messrs. Edgar Allen & Co. of the Imperial Steel Works, Sheffield, being the pioneers in the introduction of electric steel refining into Sheffield. Six years later, in October 1918, when the Armistice was declared, the number had grown to 123 (see Table III).

TABLE III.

Electric Steel Furnaces in Operation or in Course of Erection in the United Kingdom in November 1918

Type of furnace	No.	Average capacity tons	Average monthly output	Average current consumption
1. Heroult	50	5	9595	992
2. Electrometals	26	2½	3097	1031
3. Greaves-Etchells	24	2	1109	1122
4. Stobie	8	10	1010	880
5. Snyder	6	1	918	787
6. Rennerfelt	5	1½	419	1495
7. Stassano	2	2	130	1770
8. "Special"	2	1	204	769
	123	4	16,488	1105

The average monthly output of these 123 furnaces was 16,500 tons of steel, in the form of ingot-metal, special alloys and castings. Further particulars of the types of furnaces installed, with figures for the average monthly output and current consumption, are given in the table. It must be pointed out here, however, that the figures for the average current consumption of each type of furnace cannot be used as the index of their respective thermal or electrical efficiencies, since, in the absence of information concerning the physical state and the chemical composition of the charge, and the amount of refining work carried out in the furnace, average figures of current consumption cannot be considered a safe guide to relative furnace efficiencies.

The largest number of furnaces at the end of 1918 were installed at the East Hecla Works, Sheffield, of Messrs. Hadfields, Ltd. These works were equipped with 11 Heroult arc-furnaces chiefly of 6 to 7 tons capacity. The largest furnaces erected in England were the 12- and 15-ton furnaces of the Stobie type at Dunston-on-Tyne, and at the Openshaw works of Armstrong Whitworth & Co.

As regards the lines along which progress occurred during 1911-20, the tendency in the United Kingdom was to increase the power of the transformers, rather than to follow the American plan of reducing costs by the erection of larger furnaces. When large tonnages of electrically refined steel have been required, it has been the custom to employ molten steel, which has been previously treated by the Bessemer or open-hearth process. This method of working is known technically as the "duplex" or "triplex" system, and it leads to a great reduction in the consumption of electric current per ton of metal refined. Three-phase current is also now generally employed for electric steel refining in place of single-phase current, since the use of three electrodes with the molten steel as the common neutral point of the system leads to much more uniform heating of the bath. As regards regulation of the load on the generators and transformers, the Thury system of automatic regulation of the arc gap is generally employed in the United Kingdom, and by an electrically operated device the total load of a battery of furnaces can be kept within any desired limits.

In the United States, for electric steel melting and refining, the tendency is to employ larger furnaces than in Great Britain, with improved mechanical equipment for charging and discharging the furnaces. Automatic apparatus for regulating the arc gap and power factor has also been coming into general use, the Thury system of current regulation being widely adopted. As regards electrode-holders and cooling-boxes, the tendency in American practice has been to substitute cast-steel holders and boxes for the bronze ones which have been hitherto used, since there is less risk of contamination of the charge with impurities, should there be a stoppage of the flow of cooling water and fusion of the metal. The mechanism for tilting the furnaces is also receiving attention: controllers of the reversing type now being employed with a motor brake to prevent "overtravel" of the furnace, and to hold it stationary in any position. The largest electric furnaces erected up to 1921 in America for steel melting and refining are the 25-ton Heroult three-phase arc-type furnaces at the South Chicago works of the Illinois Steel Company. In 1918 this company was stated to be producing electric steel at the rate of 16,500 tons per month, using the "triplex" system referred to above. The other types of electric furnace used in the American steel industry are:—Booth-Hall, Girod, Greaves-Etchells, Gronwall-Dixon, Ludlum, Snyder and Von Baur.

Ferro-Alloys.—Applications of ferro-alloys in the iron and steel industry have increased enormously since 1911, and in 1921 the Sheffield tool-steel trade was dependent for some of its most valuable products upon the ferro-alloys obtained by aid of electric heat. The discovery made many years earlier, that small percentages of chromium, nickel, manganese, vanadium and other rare metals, either separately or in combination, caused profound changes in the physical properties of steel, has in fact revolutionized modern steel manufacture; and the production of a rustless or "stainless" steel was one of the most notable advances of the war period. Molybdenum is the latest rare metal to be added to the list of those employed now in steel manufacture; and Prof. Arnold's molybdenum-vanadium steel was expected by some authorities in 1921 to have a great future.

The special steels are called binary, ternary or quaternary, according to the number of elements (other than impurities) which are present, and it is the quaternary steels, which contain carbon and two other elements, that are now finding the widest applications in the arts and industries. The ferro-alloys used in their manufacture have in the past been supplied chiefly from the large electrometallurgical works located in the French and Swiss Alps. The war showed, however, that dependence upon an overseas power for supplies of these essential raw materials for the steel industry was not a wise or safe arrangement. The production of ferro-alloys, therefore, was commenced in England at Widnes, Newcastle and other places, and has come to be regarded as a "key industry."

The furnaces used for the production of ferro-alloys are of the resistance type, and their design is based on that employed for the furnaces used in the manufacture of calcium carbide, but they have been modified considerably both in form and in other details of construction. The use of the electric arc for heating is not conducive to efficient working except in the steel and alloy refining processes, since the temperature required for reducing the ores lies between that of the ordinary metallurgical furnace and that produced by the electric arc. Furnaces working on the resistance principle have, therefore, been most successful in the manufacture of ferro-alloys, and arc furnaces are used only for refining. The ferro-alloys made in these furnaces in the early days of the manufacture were very impure, and the first ferro-chrome placed upon the market by a French firm contained from 7 to 9% carbon. Improvements in the design and method of working the furnaces, however, have led to the production of alloys containing a much lower percentage of this element; the percentage of carbon in some of the ferro-chrome now produced having been reduced to under two per cent. By treatment in a refining furnace this percentage can be still further reduced to under .50%, or to any lower limit demanded by the steel-maker, but this of course adds considerably to the cost of the ferro-alloy. The use of pure raw materials, the avoidance of excessive heating of the charge, and the prevention of contact between the molten ferro-alloys and the electrodes or the walls of the containing vessel are the means by which this improvement in the purity of the product has been attained.

Electric Iron Smelting.—Electric heat for smelting iron ore is now employed at various centres in Sweden, Norway, Italy, Japan and Brazil, where the local conditions favour the use of electrically generated heat for this purpose. The furnace employed is an improved type of the shaft-furnace originally tried in the year 1911 at Domnarfvet and Trollhättan in Sweden, by the Swedish Iron and Steel Makers' Institute.

Magnesium and Magnesium Alloys.—Magnesium and its alloys have come to the front as metals of considerable industrial value and importance in recent years, owing to the demands of the aeroplane and motor industries for a light metal which will combine with this quality strength, toughness and ability to resist the effects of vibration and shock. The alloys of magnesium and aluminium which contain from 5 to 30% of Al have approximately the same mechanical properties as brass, and can be employed for the manufacture of screws, nuts, wire, tubes and sheets. The hardness of these Al Mg alloys increases with the proportion of the latter metal present in the alloy, and with 70% Mg the hardness is equal to that of mild steel. An alloy containing 92% Mg and 8% Al has been patented by a German firm, and is stated to have a strength equal to that of gun metal, with a specific gravity of only 1.75. If its claims are substantiated, the demand from aeroplane and motor-car manufacturers ought to result in manufacture on a large scale.

In the manufacture of the Mg Al alloys it is of great importance that the metals should be pure. The aluminium is first melted in a graphite crucible, and a small amount of cryolite is added as a flux. The magnesium in the required amount is then introduced and in

order to prevent loss by oxidation is held beneath the surface of the molten aluminium by tongs until it is melted. As regards the best contents of Mg for alloys designed for various uses, Klaudy states that a 2 to 5% Mg alloy is best for wire-drawing; 5 to 8% for rolling; 12 to 15% for casting, and that the average strength of a cast 10% Mg alloy is 20,000 lb. per sq. inch. An alloy he recommends for aeroplane construction work has the following composition:—Al 80 parts; Mg 12 parts; Cd 8 parts.

The Al Mg Cu alloys are stated to be useful for chemical work, as for example the alloy containing 96% Al, 2% Cu and 2% Mg. This alloy is very dense, machines well, and has been used with success for the construction of a 3-in. flanged valve, designed for work with acetic acid.

As regards the methods of manufacture adopted for producing pure magnesium, it is known that before the war the Germans were manufacturing the metal by the electrolysis of fused "carnallite," a naturally occurring salt containing potassium and magnesium chlorides. The position at the commencement of the war was, therefore, that Germany had practically a monopoly of the manufacture of magnesium, and supplied the whole world with its requirements of the metal. It was only under the stress of war conditions that English and American manufacturers commenced to take an interest in this very interesting metal.

As regards America there were, in 1921, two plants at Niagara Falls producing magnesium, under the control of the American Magnesium Corporation, and there was also one at Rumford Falls, controlled by the Rumford Metal Co. The latter plant employed as raw material a pure magnesia obtained as by-product from some other process. The Dow Chemical Co. of Midland and the General Electric Co. of Schenectady are two other firms which produced magnesium in America during the war. Concerning the process of reduction or extraction used by the plants at Niagara Falls, very little information is available. There is no doubt, however, that the process used is an electrolytic one, and that the electrolysis takes place in a bath of fused chlorides with aluminium present when an alloy is desired. At Rumford Falls, where MgO is used as raw material, the method in fact is exactly similar to that used for the manufacture of aluminium.

Quartz-Glass and Fused Silica Ware.—This electric-furnace product has been manufactured since 1904 at Wallsend-on-Tyne by the Thermal Syndicate, and at Hanau in Germany by Heraeus. Quartz is an impure form of silicic acid (SiO_2); and quartz-glass is, therefore, a glass consisting chiefly of silicic acid, whereas ordinary glass contains silicic acid in combination with lime, soda, potash or lead. The great advantages of quartz-glass as compared with ordinary glass are that it has a much higher melting point and that it is not fractured by sudden changes of temperature. Other important properties are that it is neither hygroscopic nor soluble in acids, and that alkalis affect it less than ordinary glass except at the higher temperatures. It is, therefore, of great value for chemical and research work.

In the early days of the manufacture only tubes were made. The method of production was to embed a graphite rod in sand, and to heat this with a current of high amperage. A white opaque tube of quartz was obtained in this way, of much greater diameter than the graphite core. The opacity was due to the air entangled in the raw material, this air being imprisoned as minute air bubbles in the pasty mass when it softened under the application of heat. The latest method of overcoming this defect is to heat the fused tube a second time quickly up to 1800°C . by aid either of an oxyhydrogen flame or of the electric arc. The cellular structure then collapses, and a semi-transparent tube is obtained which is not only stronger but is a better conductor of heat than the original opaque tube. The highest grade of glass-sand and modern methods of blown-glass manufacture are now employed, with the aid of iron moulds similar in construction to those used for glass bottles, to produce any hollow kind of fused silica ware.

Sodium.—The Castner cell and process for the production of metallic sodium by the electrolysis of fused sodium hydrate has been generally adopted.

In a recent American patent, No. 1,334,179 of March 1920, and assigned to the Dow Chemical Co., A. W. Smith and W. R. Veazey, of Cleveland, proposed to substitute a mixture of 35.6 parts of sodium chloride and 64.4 parts of sodium carbonate for the more expensive sodium hydrate. This mixture melts at 600°C . and yields a product equal in quality and purity to the present commercial sodium.

Tin.—The application of electrolytic or electrothermal methods in connexion with the tin industry has been confined to the recovery of the metal from tin scrap and from the old tin cans found in the refuse of all large towns. At one time the electrolytic recovery of tin from these two sources became a branch industry of some importance; but these electrolytic methods of treating tin-scrap metal and refuse had in many places

been displaced by 1921 by newer methods, depending upon the use of liquid or gaseous chlorine. The electrolytic methods, however, continued to be carried on by some municipalities.

The alkaline process of electrolytic tin-stripping was patented first in the United Kingdom, by an Englishman named Beaton; but the German firm, Th. Goldschmidt & Cie., of Essen, Germany, was the first to see and to turn to good account the possibilities of the process. This firm, by organizing the collection of the waste scrap in all countries and its transport on a large scale to their works at Essen, obtained at one time almost a monopoly of the raw material of the industry. The scrap, after cleaning and freeing from grease and fat, was employed as anode material in baths which contained a 10% sodium-hydrate solution as electrolyte. Under the influence of the current the tin was dissolved as sodium stannate, and was deposited at the cathode as metallic tin, with reformation of the sodium hydrate. The chief chemical, therefore, was continuously regenerated, and the only drawback of the process was that the solution of the tin was not quite complete, and the iron-tin alloy, which existed on the plate under the coating of tin, was not dissolved by the sodium salt. The residual iron left in the vats still carried, therefore, measurable and variable amounts of tin, which diminished its value from the steel-melters' point of view.

At one time before the war, the alkali process of tin-stripping was being worked at seven different centres in Europe and at one or two in America, and over 40,000 tons of tin scrap was treated annually by the process. A plant which operated in Limehouse, London, was reported to be using the same process.

Electrolytic tin-stripping methods, which are based upon the use of ferric and stannic chlorides as solvent for the tin, have been patented and tried also upon a commercial scale. Their great advantage is that the solder and hard-alloy of iron and tin, under the tin coating, is removed by the chloride treatment; and that only one-half the electric current required by the alkali process suffices to deposit the tin from the chloride electrolyte. The Bergsøe and Browne & Neil processes of tin-scrap treatment were the most notable examples of this method in the past. More recently, Walter and Lodge have patented the use of a stripping solution consisting of a 7% solution of caustic soda or potash, with 1% of stannous chloride, heated to 180°F . The scrap is placed in bags in a perforated revolving drum, which is rotated or oscillated within the vat, and is divided into longitudinal compartments by the cathode plates which project into it internally. The method is protected by British patents Nos. 122,025 and 122,618 of 1918, and is reported to have been operated in Birmingham.

Zinc.—The many different processes which had been patented or experimented with, up to the year 1910, for the electric deposition of zinc from sulphate or chloride solutions of the metal paved the way for the improved methods and processes of the later period, and there were in 1921 many large plants in operation in America and Australia, producing electrolytic zinc upon an industrial scale. Success depends upon freeing the electrolyte supplied to the depositing vats from all impurities more electro-negative than zinc—copper, cadmium, lead, antimony and arsenic. The presence of even very minute amounts of the two last-named impurities (arsenic and antimony) is found, in fact, to lead to low-current efficiencies. The non-recognition of this fact led to the failure of many of the electrolytic processes that were tried upon an industrial scale in the past. The other essential of success is to prevent "treeing" of the deposited zinc, since this leads to short-circuiting in the vats; and "treeing" has been overcome by stripping the cathodes every 48 hours, and by not attempting to form thick sheets of zinc.

The most modern and largest plant in which electrolytic zinc was being produced in 1921 was that erected in 1918 by the Anaconda Copper Co. at Great Falls, Mont., for recovery of the zinc from the complex zinc-lead ores of the Butte district, by a sulphate leaching process. The tank-house of this plant contains 864 vats, each 10 ft. long by 3 ft. wide by 5 ft. deep; and each vat will hold 28 anodes and 27 cathodes. The latter are of rolled sheet aluminium from which the deposited zinc can be stripped easily. The anodes are of chemical lead. The current for each unit of 144 cells is supplied by a rotary converter of 5,800 K.W. output, 10,000 amperes at 580 volts being required to run this number of cells. At full load the current density employed is 30 amp. per sq. ft. of cathode area, but 23 to 25 amp. yields the most satisfactory deposit.

Similar plants have been erected and operated at Park City, Utah, by the Judge Mining and Smelting Co. for treatment of the concentrates from a sulphide ore containing zinc, lead and silver; and at Trail, B.C., by the Consolidated Mining & Smelting Co. of Canada. This latter company claims to have been the first to put electrolytic slab zinc on the market at a cost which left a profit to the producer. The average composition produced at Trail, B.C., is Zn, 99.93%; FeO, .005%; Pb, .038%; Cd, .027%.

Electroplating.—The electrolytic deposition of a coating of zinc, from sulphate solutions, upon iron articles is now a well-established industry in all the leading manufacturing countries.

Rodenhäuser and I. Schwonawa, *Electric Furnaces in the Iron and Steel Industry*. (J. B. C. K.)

ELGAR, SIR EDWARD (1857–), English composer (see 9.266), received the O.M. in 1911. His first symphony, produced at Manchester 1908, created a furore and was played upwards of 100 times in a twelvemonth. It was followed by the violin concerto; *Falstaff* (Leeds); the 2nd symphony in E flat; and all these by a wonderful series of compositions written during the World War. The *Spirit of England* (poems by Lawrence Binyon), *Carillons*, a pianoforte quintet, a string quartet in A minor and a 'cello concerto were produced between 1914 and 1920.

His wife, Caroline Alice Roberts, the daughter of Maj.-Gen. Sir Henry Roberts, whom he married in 1889, was herself an accomplished musician and linguist. She was the author of various poems, including *In Haven*, set to music by her husband in *Sea Pictures*. She died at Hampstead April 7 1920.

ELGIN, VICTOR ALEXANDER BRUCE, 9TH EARL OF (1840–1917), British statesman (see 9.268), died at Broomhall, Fife, Jan. 18 1917.

ELIOT, CHARLES WILLIAM (1834–), American educationist (see 9.274), was offered the post of ambassador to England by President Taft in 1909, but preferred to serve his country in a private capacity at home. The same position was tendered him in 1913 by President Wilson and again declined. He continued to take an active part, by writing and speaking, on all the important public questions of the day. His theories as to needed changes in education toward the concrete and practical had great influence upon American schools. The vocational movement, so marked after 1910, was without doubt accelerated by his continued insistence upon the training of the senses of sight, hearing and touch, as being the sources of the best part of knowledge. In 1914 he was elected president of the American Association for the Advancement of Science. In his educational writings he maintained that the traditional systems had dealt too exclusively with language and literature. In 1916, however, he was awarded a gold medal by the American Academy of Arts and Letters for his literary influence in his educational work. In the field of religion he was an authoritative spokesman on the Unitarian faith. In his later books, *The Religion of the Future* and *Twentieth Century Christianity*, he rejected obscure dogma, emphasized freedom in place of authority, and held that the teaching of Jesus had been "the undying root of all the best in human history since He lived," and that He would be the supreme teacher in the new religion, the outcome of which would be the brotherhood of man. Dr. Eliot gave much attention to labour problems and declared that "profit-sharing, combined with cooperative management, in which the employees take active and reasonable part, with cooperative care of health, education and happiness of employees, and with full knowledge by employees of the employers' account, is the only road to industrial peace." He condemned limited output by labour as well as uniform hours and wages. The settling of industrial strife he considered the next important thing after the establishment of a league of nations. He was a strong supporter of President Wilson's administration, and approved his personal appeal to the country in 1918 to return a Democratic Congress. He favoured prohibition as a war measure, and later as an amendment to the Constitution. He wrote in favour of military training after the Swiss method, but maintained that, after a league of nations was formed, no country should be allowed to have an army "whose officers have entered for life the profession of soldier." In 1920 he was an active worker for the Democratic party because he regarded

the immediate adoption of the Covenant of the League of Nations as a moral obligation. He was the author of *The Conflict Between Individualism and Collectivism in a Democracy* (1910, lectures delivered at the university of Virginia); *Some Roads Towards Peace* (1914) and numerous articles on educational, religious, political and social questions.

ELLIOTT, HOWARD (1860–), American railway manager, was born in New York Dec. 6 1860. After graduating from the Lawrence Scientific School, Harvard (C.E. 1881), he was for several years a clerk in various offices of the Chicago, Burlington & Quincy railway. Later he was appointed general freight agent and then general manager of several lines belonging to the Burlington system. In 1902 he became second vice-president of the company and the following year president of the Northern Pacific. In 1913 he was made president of the New York, New Haven & Hartford railway and at the same time chairman of its board of directors. In 1917 he resigned and was made chairman of the committee on intercorporate relations of the New Haven system. The same year he was named by the American Railway Association as one of the six members of the Railroads War Board. He was again president of the Northern Pacific 1919–20, and then became chairman of its board of directors. He opposed the eight-hour law, urged higher freight rates, and suggested the creation of a department of transportation, with a secretary in the Cabinet.

ELLIS, ROBINSON (1834–1913), English scholar (see 9.294), died at Oxford Oct. 9 1913. Among his later publications were editions of the *Amores* of Ovid (1912) and the second book of Ovid's *Tristia* (1913).

ELWES, GERVASE CARY (1866–1921), English vocalist, son of Valentine Cary Elwes, of Billing Hall, Northants., and Brigg, Lincs., was born at Billing Nov. 15 1866. Educated at the Oratory school, Edgbaston, and at Christ Church, Oxford. Gervase Elwes married Lady Winifride Feikling, daughter of the 8th Earl of Denbigh, in 1889, and two years later, on appointment to the diplomatic service, he became honorary attaché at Munich, then at Vienna and finally at Brussels. Possessed of a charming tenor voice, he became known as an amateur singer of exceptional ability, and in the three cities named he studied music assiduously, in Vienna under Mandy-czewski and in Brussels under Demest, while he also paid frequent visits to Paris from Brussels in order further to study under Bouhy. He entered the musical profession while still in the diplomatic service, which he finally abandoned in 1895. As a professional singer he made his first public appearance at the Westmorland Festival in 1903, and in London at a concert of the Handel Society. In London he continued his studies under Victor Beigel, sang with conspicuous success at the Monday "Pops," at the Kruse festival and at provincial festivals. His first representative festival engagement was at Leeds in 1904. In 1907 he toured Germany with Fanny Davies; two years later he sang with the Oratorio Society of New York in Bach's *St. Matthew Passion* and *The Dream of Gerontius*, the latter a work with which his name became indissolubly associated. He took part in upwards of 150 performances of it. His intensely deep religious convictions undoubtedly aided him in this work, for he was a very devout Catholic, and in Bach's *Passion* his performance was exalted. As singer of songs Elwes held an unique position. He excelled in the *lieder* of Brahms; and to him such English composers as Roger Quilter and Vaughan Williams owed a fair proportion of their success, at least in the beginning. Elwes left England late in 1920 for a long-promised tour of the United States, and he was accidentally killed at the railway station at Boston on Jan. 12 1921.

EMBRYOLOGY.—In the earlier article (see 9.314) the growth of the science of embryology was traced from the period of the Renaissance until the beginning of the 20th century. It remains here to deal with the more recent discoveries as to the nature and meaning of the developmental process.

The Cell.—We take for granted (see CYTOLOGY) a general acquaintance with the structure of the bodies of adult animals. It is now a matter of universal agreement to conceive the active

living parts of these bodies, which are included under the general name protoplasm, as built up of a series of units termed cells, each normally containing a single nucleus and separated from one another by quasi-solid membranes termed cell-walls.

The doubts as to the validity of the concept of the cell, which were raised in the later years of the 19th century, have not been sustained by later discoveries. A more refined technique has enabled us to demonstrate a cell-wall in cases where it was supposed to be absent; and where it really is absent, as for instance in the ectoderm of the Nematode worms, it has been proved that this is a secondary state of affairs, due to the degeneration of a well-developed layer of cells, which in younger stages of the life-history are clearly and sharply delimited from each other. It is true that in many, perhaps in most, cases the cell-walls are perforated so that adjacent cells are connected by bars of protoplasm, but this circumstance in no way invalidates the idea of the cell as the unit of structure.

Scope of Embryology.—The lowest grade of animals, termed the Protozoa, do not exhibit cellular structure. Either their bodies are so small that they possess only one nucleus, and in this case they may be regarded as free-living cells; or they contain more than one nucleus and attain a greater size, and then their protoplasm is not divided into compartments in accordance with the distribution of these nuclei.

Some of the largest of the Protozoa such as the extinct genus *Nammosites* were disc-like in form and attained a size of an inch in diameter; the bodies of these animals were divided into thousands of compartments by calcareous septa. To judge from what we know of the structure of their nearest living representatives they must have possessed numerous nuclei; but these nuclei were not distributed in accordance with the divisions of the protoplasm. Some compartments contained several nuclei, some one nucleus only and many none; so that true all-structure was absent.

In other cases the protozoön may be described as a colony of small uninucleate forms, connected together either by strings of protoplasm or by stalks springing from a common base. But all these more complex Protozoa are distinguished from the true higher animals or Metazoa by the fact that when reproduction takes place the whole body of the parent breaks up into germs, each containing a single nucleus, whereas in true Metazoa small portions only of the parent's body are set aside for reproductive purposes; in other words, in the Metazoa there is a persistent "soma," or body distinct from the germ-cells. Now of course the development of the Protozoa ought to form part of the subject matter of embryology, but in the case of the smaller species it is exceedingly difficult to say which stage corresponds to the adult condition of Metazoa, since reproduction by the division of the mother's body into two, can take place at various periods in the life-cycle, and therefore purely as a matter of convenience it is customary to confine the subject matter of embryology to the study of the life histories of the higher animals which exhibit definite cellular structure, in a word to the Metazoa.

Metazoa.—If we now examine the development of the Metazoa we find a few cases where, side by side with other methods, reproduction by *fission*, that is by the division of the mother's body, does actually take place.

Thus in the marine annelid *Procerastes* described by Allen¹ the mother worm breaks up into groups of one, two or three segments and each of these groups regenerates the missing parts and thus constitutes a new worm. In much more numerous cases an outgrowth of the mother's body, termed a "bud," is produced. The bud consists from the beginning of several tissues, and is slowly moulded into the likeness of the parent and when fully grown separates from it, or in the case of a colonial animal remains connected with it and helps to build up a compound organism. Such compound creatures are found amongst the sponges, the Coelenterata, the Polyzoa, and the Aseidians, the last-named group being degenerate allies of the Vertebrata.

The laws of bud-development have not been as clearly elucidated as those of the germ-cells. Development by germ-cells is universal amongst the Metazoa; and in all but two phyla the form in which they appear is remarkably constant. They are of two kinds, viz. male and female, and are normally incapable of development unless they have previously united in pairs to form what are called "zygotes" (Gr. *zygon*, a yoke).

The male cell or spermatozoon consists of a head which is a condensed nucleus made up of a compact mass of chromatin, and a tail

which is a vibratile filament. Amongst the nematode worms, however, the male cells are devoid of filaments and appear under the form of small amoeboid cells, whilst amongst the higher Crustacea (i.e. the shrimps, lobsters and crabs) the tail is replaced by a peculiar vesicle, which under certain circumstances absorbs water and explodes, thus propelling the head forwards and in this way bringing about the union of the two germ-cells.

The Germ-cells.—The female cell or ovum (egg) is typically rounded and motionless but it is of very different sizes in different species of animals. These differences in size depend entirely on the varying amounts of food-yolk—i.e. reserve material—deposited in the cytoplasm; that is to say, in the extra-nuclear protoplasm. The food-yolk in turn differs in amount according to the extent to which the young organism must grow before it can obtain nourishment for itself. Thus the human egg is only about 0.1 mm. in diameter since at a very early period of its development it becomes attached to the wall of the womb and subsequently draws all its nourishment from that source. The egg of the ostrich on the contrary is one of the largest known, being about 15 cm. in diameter, since it has to provide all the food necessary to build up a good-sized chick.

Eggs which have a very small amount of yolk and in which this is evenly distributed throughout the cytoplasm are termed "alecithal"; such are the eggs of Hydrozoa, Echinodermata, Brachiopoda and of Amphioxus and Mammalia amongst Vertebrata. Eggs in which the yolk is concentrated at one pole of the egg are termed "telolecithal"; this pole is termed the "vegetative pole," whilst the opposite pole where the bulk of the cytoplasm is concentrated and where the polar bodies (see below) are given off is termed the "animal pole." The eggs of most Annelida and Mollusca and of Pisces, Amphibia, Reptilia and Aves amongst Vertebrata are telolecithal. Eggs in which the yolk is massed in the central part of the egg and is surrounded by a layer of cytoplasm almost free from yolk are termed "centrolecithal." To this class belong the eggs of nearly all Arthropoda.

Both types of germ-cell before attaining maturity undergo two ripening (*maturation*) divisions, so that in each case four daughter cells are produced. Whereas in the case of the male germ-cell all four daughters become fully formed *spermatozoa*, in the case of the female germ-cell only one daughter is converted into the ripe egg; the remaining three are small vestigial cells destined to perish, which are termed the "polar bodies." During the maturation divisions the number of chromosomes in the nuclei of both male and female germ-cells is reduced by one-half (for details of this process see CYTOLOGY). When the spermatozoon enters the egg, the head, which is a condensed nucleus, swells up and assumes the ordinary nuclear structure and is termed the "male pronucleus"; behind it is situated a very active centrosome (see CYTOLOGY) which produces a series of radiating rays termed the "spermaster." The nucleus of the ripe egg is termed the "female pronucleus." The male pronucleus approaches the female pronucleus, and the spermaster constitutes the groundwork of the first mitotic spindle by becoming divided into two asters connected with one another by longitudinal fibres; this spindle initiates the development of the egg by bringing about the first division of the combined male and female pronuclei and of the fertilized egg (zygote) itself. The tail of the spermatozoon is either left outside when the head penetrates the egg, or if it penetrates the cytoplasm it degenerates there; its remnants can sometimes be detected in one cell of the embryo, up till the stage of 32 cells has been attained, but it takes no part in cell-division and no portion of it is transmitted to any other cell, the conclusion being that it plays no part in the transmission of hereditary qualities.

The nucleus of the zygote, as we have just seen, has double the number of chromosomes which are present in the nucleus of the ripe egg but half of these are of male origin. Every nucleus of the developing embryo therefore inherits from the zygote nucleus an equal number of male and female chromosomes, so that the body of the embryo has with justice been likened to a tissue of which the warp is paternal and the woof maternal.

Parthenogenesis.—In the earlier article it was pointed out that the unfertilized egg could be induced to develop by a variety of agencies varying from the addition of a small quantity of butyric acid to the sea-water in which it is placed, followed by exposure to the action of hypertonic (i.e. over-salted) sea-water in the case of echinoderm eggs, to the prick of a pin in the case of the eggs of Amphibia. This is termed *artificial parthenogenesis*.

In the case of the eggs of the sea-urchin (*Echinus*) parthenogenesis has been minutely studied by Loeb² who has put forward various theories as to the action of the agents which he employed. He imagined that the action of the butyric acid was to start cytolysis, one result of which was the formation of a definite egg membrane, but which if unchecked destroyed the egg, which became resolved into a mass of globules. The exposure to hypertonic sea-water was supposed to arrest this injurious action. This explanation was obviously not applicable to the parthenogenesis of the frog's egg.

¹ E. J. Allen, "An Autotomy and Regeneration in the syllid worm *Procerastes*," *Proc. Roy. Soc. Lond.*, Series B, vol. xcii., 1921.

² J. Loeb. Numerous papers summarized in his book *Die chemische Entwicklung des tierischen Eies* (1909).

The whole subject has been attacked from a new point of view by Herlant¹ and Brachet² who have pointed out that the agent employed to provoke parthenogenesis does not exercise a specific chemical action on the egg but merely acts as a stimulus to which the egg as a living organism responds. Whether butyric acid or a needle be employed the response is the same; the egg "wakes up" so to speak, the nucleus emits something which acts as a centrosome and from this is developed a great series of radiating rays traversing the cytoplasm, a huge "monaster" in fact. The chromatin of the nucleus becomes resolved into chromosomes which are split longitudinally and which become adherent to the rays of the "monaster." In the case of the egg of the sea-urchin it is only extremely rarely that the monaster becomes changed into an ordinary mitotic spindle by the division of the centrosome. In most cases after persisting for about an hour the monaster disappears; the nucleus returns to the resting condition and then after a short interval it passes through the same phases, a monaster being again formed. After this process has been repeated about six times over a period lasting twelve hours the egg dies and cytolysis supervenes. If, however, after the egg has been exposed to the action of the butyric acid and then washed in sea-water it is placed in hypertonic sea-water, and then after a limited period of immersion in this fluid replaced in ordinary sea-water, additional asters are formed in the cytoplasm. When the egg forms a monaster this becomes connected with these other asters by longitudinal fibres so as to form a complex spindle. By properly choosing the period of immersion in hypertonic water it is possible to arrange that only one additional aster should be formed; this then joins with the monaster to form a normal mitotic spindle on to which the egg chromosomes migrate; a regular division of the nucleus follows and thereafter a division of the whole egg into two cells and so parthenogenetic development is initiated.

The course of events in the frog's egg is fundamentally similar to the process which we have just described, although there are differences in detail. A prick with a sterilized needle induces the formation of a huge monaster, which then divides into two forming a short mitotic spindle on to which the chromosomes of the egg migrate. Since, however, the length of the spindle stands in relation to the number of chromosomes in the nucleus and as these chromosomes are only present in half the number found in the nucleus of the fertilized egg, the spindle which is formed is only four-fifths of the length of the first spindle formed in the fertilized egg. The length of spindle in turn determines the length of the actual rays from its poles, and if these are too short to reach the periphery of the egg the spindle is unable to bring about the division of the egg into two cells. This is the case with the spindle formed in the parthenogenetic egg, and although abortive and transitory furrows on the egg's surface are formed no division into cells results; the nucleus, it is true, divides and a multiplication of nuclei follows in which the numerous short spindles formed interfere with one another and make orderly development impossible and so after a short time the egg dies.

If, however, the needle be "infected" by being dipped into frog's blood before being used to prick the egg, then the foreign substance thus introduced produces additional asters in the cytoplasm just as did the hypertonic water in the sea-urchin's egg. These asters have a tendency, as their rays develop, to repel one another, and they push the mitotic spindle developed around the egg nucleus over to the one side. If this side happens to be the side of the egg at which the cytoplasm is concentrated, then the spindle is able to start the formation of a furrow which cuts right through the egg and divides it into two cells, and so parthenogenetic development is begun. We see then that the difficulty of initiating parthenogenesis depends on two factors, viz. (1) the quiescent condition of the egg and (2) the small amount of chromatin present in the nucleus. If we choose the unripe eggs of the sea-urchin as the subjects of our experiment then it is sometimes possible to induce them to develop by the use of one reagent alone, such as hypertonic sea-water; since in these eggs the "reducing" division of the nucleus has not occurred (see CYTOLOGY) and the chromatin is consequently present in undiminished quantity.

Parthenogenetic development is closely related to the problem of heterogeneous fertilization. It has been shown that under certain circumstances it is possible to fertilize the eggs of the sea-urchin with the sperm of creatures so diverse in zoological affinity as the annelid worm (*Chaetopterus*) and the sea-mussel (*Mytilus*). In the first case the male and female pronuclei fuse but the male chromatin falls out of the zygote nucleus before the first division takes place. In the second case the male pronucleus refuses to enter into union with the female pronucleus at all, but the sperm-aster brings about the division of the egg. When the eggs of the sea-urchin (*Echinus*) are fertilized with the sperm of the

heart-urchin (*Echinocardium*), in the vast majority of cases cytolysis results exactly as it does after the exposure of the echinus eggs to the action of butyric acid, but in some few cases the egg develops and produces a hybrid. We conclude that in most cases the sperm of *Echinocardium* is so alien to the cytoplasm of the egg of *Echinus* that it is not even able to bring about the formation of a spermaster.

Under certain circumstances (slight staleness of the egg, excess of sperm, etc.) more than one spermatozoon may enter the egg. In large eggs such as those of cephalopoda, reptiles and birds this seems to be a normal occurrence; only one of these nuclei unites with the female pronucleus and forms the zygote nucleus from which begins the cell-division which initiates development; but the other spermatozoa also form centres for cell-division which gives rise to the so-called free cells which are characteristic of these eggs. These free cells are gradually crushed out and destroyed by the developing cells produced by the activity of the zygote nucleus.

Brachet, however, has shown³ that when the frog's egg is entered by spermatozoa in moderate numbers, whereas only one fuses with the female pronucleus, the others form centres for the formation of cells which are built up into the body of the embryo. As these sperm-heads, however, contain only half the quantity of chromatin contained in the zygote nucleus, the cells to which they give rise are markedly smaller than those which contain nuclei descended from the zygote nucleus, and so it is possible to distinguish in the growing tadpole the regions which contain cells which have nuclei derived from the zygote nucleus from those which contain cells having nuclei derived from the supernumerary spermatozoa.

Brachet's observations prove in the clearest manner that the differentiation of organs in the frog's egg is due to the differentiation of regions in the cytoplasm and not to the differentiation of the nuclei produced by the division of the zygote nucleus as Weismann⁴ had supposed, for some of these nuclei can be replaced by sperm-nuclei each of which carries in it the potentiality of producing the whole organism—not a mere region of it—and yet no dislocation of development results.

The entry of two or more spermatozoa into small eggs such as those of the sea-urchin usually produces abnormal development followed by early death. The reason is that the centrosomes which are carried into the egg by these spermatozoa are so near each other that instead of leading to the formation of separate spindles they give rise to three- (traster) or four-poled (tetraster) spindles along which the chromosomes are arranged in an irregular manner. This causes the formation of abnormal nuclei incapable of properly fulfilling their functions and the embryo dies.

Development of the Egg.—If we now turn to consider the normal development of the egg we find that this can be divided into three stages which in primitive forms are sharply delimited, but which in more modified forms tend to overlap one another. These stages are (1) segmentation, or the division of the egg into a number of indifferent cells or blastomeres; (2) the formation of the so-called germ layers, i.e. the differentiation of the blastomeres into the primitive organs—viz: (a) the ectoderm (or epiblast) which is the primitive skin, (b) the endoderm (or hypoblast) which is the primitive lining of the gut, and (c) the mesoderm (or mesoblast) which is the primitive peritoneum or lining of the body-cavity; (3) organogeny, i.e. the formation of the separate organs of the body, such as brain, liver, kidneys, etc., from the germ-layers.

Segmentation of the Egg.—Considering first the process of segmentation, we find, as Balfour⁵ pointed out long ago, that the effect of the accumulation of yolk in the egg is to impede cell-division. It acts exactly as if it were a dilutant of the cytoplasm in lowering surface tension. Cell-division is accompanied by a great increase in surface tension as is obvious from the way each daughter cell rounds itself off from its sister. This is particularly evident in the segmentation of alecithal eggs, for in them, in the early stages of segmentation, all the blastomeres divide simultaneously, and just after each period of division these take on the appearance of a pile of balls only touching each other in points; whereas during the interval between two such periods the surface tension diminishes and the blastomeres become flattened out against each other.

In all alecithal and telolecithal eggs there is a pole (see above) from which the polar bodies are given off which is termed the animal pole of the egg. This pole is the region of the egg which contains least yolk; here cell-division is most rapid and the smallest blastomeres are produced, whereas as we pass towards the vegetative pole of the egg, where the yolk is concentrated, the blastomeres become fewer and larger.

When the yolk is very much increased in amount, the nuclei produced by the division of the zygote nucleus are unable to bring about a surface tension sufficient to divide the cytoplasm, and so we get a multiplication of nuclei without the formation of blastomeres. When this happens segmentation is confined to the animal pole of the egg and results in the formation of a thin disc of blastomeres termed the "blastoderm," resting on an unsegmented "yolk." Such eggs (for instance the hen's egg) are termed "meroblastic" (gr. *meros*, a part) in contradistinction to eggs, like those of the frog, which are completely divided and are termed "holoblastic."

In centrolecithal eggs, like those of the crayfish, the egg appears to be completely divided into cells, but although division may at first be complete, the lowered surface tension of the inner yolk ends of the blastomeres is unable to keep them apart and they flow together so as to form a common inner yolk mass. Such eggs are said to exhibit *superficial segmentation*. Later, the outer protoplasmic ends of these incomplete blastomeres become completely cut off, so as to form a skin of cells of blastoderm surrounding a central "yolk." A still further modification of this type is found in the eggs of insects in which the yolk is so abundant as to prevent all segmentation. The zygote nucleus alone divides and gives rise to daughter nuclei each surrounded by an island of protoplasm; these are at first dispersed throughout the "yolk" but they gradually migrate to the surface and here form a blastoderm.

In primitive alecithal eggs segmentation results in the formation of a hollow ball of cells one layer thick. This ball is termed the "blastula" and its cavity the "blastocoel," "segmentation-cavity" or "primary body-cavity." The formation of the blastula marks the accomplishment of an important step in development. Although typically formed only in alecithal eggs, it appears in a modified form in telolecithal eggs, even in those in which there is so much yolk that they have meroblastic segmentation. Thus in the case of the frog the blastula is a hollow ball of which the roof is two cells thick and the floor is many cells thick, whilst in the case of the pigeon the blastula is represented by a stage in which the blastoderm is one layer thick and forms the roof and is separated by a slit-like cavity from the immense mass of the unsegmented yolk forming the floor in the uppermost layer of which are a few nuclei. These nuclei are representatives of the cells which should constitute the vegetative pole of the blastula but they are utterly unable to cut the yolk up into cells.

Formation of Germ Layers.—As soon as the blastula stage has been attained, the "formation of layers" begins. The cells at the vegetative pole become turned inwards, forming a tube-like structure which projects into the blastocoel and partially obliterates it. This tube is the primitive gut or "archenteron" and the cells forming it are termed "endoderm," whereas the cells forming the outer wall of the blastula give rise to the primitive skin and are termed "ectoderm." Driesch¹ has shown that until the archenteron begins to be formed all the cells of the blastula of *Echinus* are alike in their potencies; any sufficiently large piece of it, if cut off, will round itself off and form a blastula and ultimately a perfect larva of diminished size; after a region has been delimited as the centre of the formation of the endoderm the rest of the blastula wall, if cut off, can no longer form an archenteron and so it follows that when the endoderm is differentiated at one place, the rest of the blastular wall becomes changed into definitive ectoderm.

When the archenteron has been formed the developing egg has assumed the shape of a double-walled cup, the opening into which is termed the "blastopore." This stage is clearly and sharply marked in the development of almost all eggs in which the yolk is small in amount, and it can be recognized in an obscured and altered form in the development of large yolk eggs. It is of equal importance to the blastula stage, and it is termed the "gastrula."

The primary body-cavity has now become reduced to the slit intervening between the wall of the archenteron and the outer wall of the gastrula and this slit becomes largely filled up by the development of the third germ layer, the "mesoderm." We have defined this layer as the primitive peritoneum or lining of the body-cavity, but the body-cavity now indicated is termed the "coelom" or "secondary body-cavity" in order to distinguish it from the primary body-cavity. In the eggs of primitive animals, where the yolk is small in amount, the coelom is always formed as a series of pouch-like outgrowths of the archenteron which become cut off from this tube. It follows that the mesoderm is differentiated from the primary endoderm. Driesch² has shown that if the front half of the gastrula of the starfish which includes the apex of the archenteron be cut off, the hinder half will heal up and will form a perfect larva, forming, of course, the coelom in the normal way. If, however, this operation be performed after a swelling of the tip of the archenteron—the first rudiment of the coelom—has appeared, then, although the hinder half will heal up and form a larva, it never forms a coelom. Driesch concludes from this experiment that at first all parts of the archenteric wall have the power of giving rise to a coelom, that is of forming mesoderm, but that later a definite portion of this wall becomes set aside as the rudiment of the coelom and that then

the rest of it becomes the definitive endoderm devoid of this coelom-forming power. In Echinodermata the coelom arises as a single pouch from the apex of the archenteron; in primitive Vertebrata it originates as five pouches of which one is apical and four are paired and lateral; in Chaetognatha and Brachiopoda as a lateral pair of pouches. The remnant of the primary body-cavity becomes almost filled up with cells budded from the wall of the coelom which are termed "mesenchyme." These cells may become joined to one another by their processes and thus constitute a network which becomes converted into connective tissue by the secretion of fibres; or they may remain separate from one another, and then they become developed into blood and lymph cells, the remnants of the primary body-cavity constituting the blood-spaces. In the Coelenterata, in which no coelom is formed, similar cells are budded from both ectoderm and endoderm; in Annelida and Mollusca, in addition to the mesenchyme given off from the coelomic wall, some is likewise budded from the ectoderm, and to this the name "mesectoderm" has been given. In Vertebrata the most recent research indicates that no mesenchyme is given off from the ectoderm.

Organogeny.—Turning now to the third stage of development, viz. the formation of special organs, we find that from the ectoderm are derived the central nervous system and the sense organs, and also the lining of the mouth-cavity and of the terminal portion of the alimentary canal near the anus. The endoderm gives rise to the middle portion of the gut and to the glands which are developed from it, and in Vertebrata to the primitive elastic axis of the back-bone or "notochord." From the mesoderm arise the majority of the muscles, the connective tissue, and, in Vertebrata and Echinodermata, the internal calcareous skeleton which is derived from the connective tissue. The mesoderm also gives rise to the genital organs and their ducts in all Metazoa above the rank of Coelenterata and in Mollusca and Vertebrata to the kidney tubules.

Now we have pointed out that, in telolecithal eggs, segmentation proceeds most rapidly at the animal pole; here the second stage of development rapidly supervenes, and the archenteron is begun before segmentation is even initiated at the vegetative pole. In meroblastic eggs the upper pole of the egg may become converted into an embryo in which all the important organs of the adult are mapped out before the lower pole is even invested with cells. Finally in Amniota (reptiles, birds, and mammals) the lower pole of the egg, after all the yolk has been absorbed from it, is torn from the rest of the embryo at birth and cast off as a useless embryonic membrane.

In the earlier article a strong attempt was made to show that the primitive germ-layers do not correspond to one another in different eggs; in a word, that the same name has been given to different things.

Some of the arguments adduced are the diverse origins of the mesoderm in various animals, and the alleged origin of the epithelium of the alimentary canal of insects and some other Arthropoda from the ectoderm. The result of the labours of embryologists during the last 15 years has been to establish the universal homology of the germ-layers on an ever firmer basis, and to show that the difficulties alluded to were based on faulty observations.

If, for instance, we define the mesoderm as the wall of the coelom then it is found that this organ originates in one of two ways, viz.: either as a pouch or a mass of cells. The pouch (recognizable in Chaetognatha, Brachiopoda, Echinodermata, Enteropneusta and the lowest Vertebrata) quite clearly originates as an outgrowth from the endoderm; the mass of cells can be traced back to its source in one large cell, the mother mesoderm-cell. This cell, as was first shown by Shearer³ in the annelid *Hydroides* and by Conklin⁴ in the mollusc *Crepidula*, originally forms part of the wall of the archenteron and its ejection from this wall is evidently a modification of the more primitive method of coelom-formation by the outgrowth of a gut-pouch. Attempts which have been made by Meissenheimer⁵ and Harms⁶ to show that in Mollusca the coelom originates from cells budded from the ectoderm are based on obvious blunders in missing out stages in reconstructing the life-history—that most fertile source of error in embryology. Later workers have exposed this error and have shown that in the Mollusca, with which Meissenheimer and Harms dealt, the mother mesoderm cell gives rise to the pericardium which is representative of the coelom in these animals. We have already alluded to the presence of mesectoderm in Annelida and Mollusca; this gives rise to some superficial muscles, but to confound this with the coelomic wall and its derivatives by calling both mesoderm and then to complain that the mesoderm is not an homologous structure in various groups of animals is to introduce a perfectly gratuitous confusion.

We may now turn to the alleged origin of the gut epithelium of certain Arthropoda from the ectoderm. In the earlier article the statement was made that in the embryo of that most primitive of all land Arthropoda *Peripatus* there is a large slit-like blastopore which later

becomes divided by a constriction into mouth and anus, and that a portion of the gut epithelium, viz. that forming the midventral portion, is formed from ectoderm turned in round the edges of the slit. It is practically certain that this last statement also rests on an error of observation. In the primitive annelid *Polygordius*, Woltereck¹ has described a similar slit-like blastopore and he has followed the process of its closure in great detail describing the division of every cell involved. In this case the midventral epithelium of the gut is formed by the union of endoderm cells lying at the sides of the blastopore—whilst the ectoderm cells lying in the blastopore lips by their union reconstitute the midventral skin. No reasonable doubt can be entertained that a renewed investigation with a more modern technique would show that this is also true of *Peripatus*.

It must never be forgotten that embryological research is based on a comparison of embryos of different ages with one another—not, as would be the ideal method, on a continuous observation of the progress of one and the same embryo. It follows that too large an age-difference between the embryos examined may give rise to a totally wrong conception of the process which is taking place. So are to be explained the statements which crop up from time to time, such as those of Heymons² that the mid-gut of the higher insects is entirely formed from ectoderm, and of Watase³ who made a similar assertion about the mid-gut of the cephalopod *Loligo*. Hirschler⁴ has shown how the error of Heymons originated, and Watase has been corrected by Faussek⁵; and should further statements of this kind occur in the literature the strong presumption is that they also are founded on mistakes.

Organ-forming Substances.—We have arrived at the conclusion that the establishment of the validity of the germ-layer theory is one of the great achievements of embryological research, and we now turn to the question of how the differences which distinguish the layers from one another are brought about. We have learnt that in primitive alecithal eggs like those of Echinodermata all portions of the blastula wall are alike in their potencies and that the differentiation of ectoderm from endoderm only begins when the first traces of gut-formation are visible. We have likewise learnt that all parts of the primitive gut or archenteron are alike in their powers, and that the separation of endoderm from mesoderm only becomes apparent when the first indication of the coelom appears. But this progressive differentiation of the embryo might be due to a differentiation of the nuclei of various regions or of the cytoplasm or of both. We have, however, learnt from the development of the polyspermic frog's egg that there is a strong presumption that the nuclei of the embryo are alike in their nature and that the differentiation of the layers must be due to the separation of organ-forming cytoplasmic substances from one another. This conclusion is confirmed by a large number of observations on many different kinds of eggs; a few of the more striking may be given here.

Hertwig⁶ allowed frogs' eggs to develop under pressure between glass plates and in capillary tubes. Under these circumstances the divisions took place by planes normal to the pressure and flat plates and rows of cells were produced. When the pressure was removed, however, these deformed embryos recovered, multiplication of cells took place and the normal form was regained and normal development proceeded. It was easy to show that nuclei which under undisturbed conditions would have occupied certain definite regions of the embryo had been forced into quite other regions, and yet perfectly normal embryos resulted. Hertwig concludes that the nuclei could be juggled about like a handful of balls without affecting the formation of the embryo.

In many eggs the differentiation of the layers is indicated at a far earlier period than that at which it occurs in the eggs of the Echinodermata or even of the lower Vertebrata like the frog. The egg of the ascidian *Cynthia portula* which has been studied in great detail by Conklin⁷ may be adduced as an example. This egg when it develops becomes converted into an elongated blastula consisting

of few cells; this blastula changes into a gastrula in the typical way, and though no distinct coelomic pouches are formed large portions of the archenteric wall are directly converted into muscles which lie at the sides of the tail of the tadpole-like larva. In this species the nucleus of the unripe egg is as usual a vesicle filled with fluid (the so-called germinal vesicle). The cytoplasm contains numerous yolk globules of a slaty-blue colour and also larger yellowish globules which are concentrated in its superficial layer. When the maturation divisions of the nucleus occur the nuclear wall is dissolved and the fluid contents escape and form a cap of clear material at the animal pole of the egg. When fertilization takes place profound rearrangements of the substances in the cytoplasm are effected. The yellow globules stream downwards to meet the spermatozoon which enters at the vegetative pole, and they finally form a crescentic layer of yellow material round the lower pole of the egg. As the egg develops first into a blastula and then into a gastrula, and finally into the characteristic ascidian tadpole, it becomes evident that the clear substance forms the ectoderm, the slaty-blue material the endoderm, whilst the yellow material forms the masses of mesoderm which give rise to the tail muscles. When the egg is in the four-cell stage the yellow material is confined to the two posterior cells; if one of these be killed the remainder of the egg will give rise to a larva with muscles only on one side of the tail. That the nuclei have nothing to do with this separation of substances is shown by what occurs at the lip of the blastopore. Here we find an arc of what Conklin calls "neurochordal" cells. Each of these has of course a single nucleus, but the cytoplasm of each consists of two zones, one clear and one slaty-blue. At the next division two daughter cells are produced from each neurochordal cell; one of these contains the clear substance and is added to the nerve plate which is a part of the ectoderm; the other is composed of the blue substance and forms part of the notochord which in *Cynthia* as in other Vertebrata is a derivative of the endoderm.

From this development we conclude that the germinal layers owe their origin to the segregation of cytoplasmic substances in the growing egg; that these substances assume their final arrangement under the influence of the spermatozoon, which thus on its path to meet the female pronucleus determines the symmetry of the embryo. Brachet⁸ has shown that this is also true of the frog's egg. It was for long a puzzle why competent observers like Roux⁹ and Hertwig¹⁰ should differ so profoundly on the results of killing one of the first two blastomeres of the frog's egg. Roux asserted that the surviving blastomere gave rise to a half blastula which developed into a half tadpole, whilst Hertwig maintained that it tended to form a normal tadpole, being only impeded in its development by the mass of dead material constituted by the other blastomere. Brachet has shown that both are right, for the plane separating the first two blastomeres need not by any means coincide with the future median plane of the embryo, but may make any angle up to a right angle with it. If it coincides with this plane by killing one blastomere Roux's result is obtained; if it is oblique the result accords with Hertwig's researches.

Thus the potency of each of the first two blastomeres of the frog's egg depends entirely on the cytoplasm it happens to include and in no way on the nucleus. Brachet¹¹ has shown that the fixing of the median plane of symmetry in the frog's tadpole, as in the ascidian tadpole, is effected by the spermatozoon. As the spermatozoon penetrates the egg in its path towards the female pronucleus, it leaves behind a trail of pigment which persists for a considerable time and can be detected at a much later period in the development of the egg. It is found that on the opposite surface of the egg to that at which the spermatozoon enters it, there is formed the so-called "grey crescent." This is in reality the upper lip of the blastopore; it is here that the differentiation of ectoderm from endoderm begins. Therefore we conclude that the arrangement of the organ-forming substances in the frog's egg is caused by the spermatozoon.

In the mollusc *Dentalium* when the egg has reached the four-cell stage one of the blastomeres emits a protuberance termed the "yolk-lobe" or "polar lobe." This lobe is devoid of a nucleus and before the attainment of the eight-cell stage is reabsorbed into the blastomere. Nevertheless, if this lobe be cut off, the remainder of the egg develops into a larva which is fatally devoid of mesoderm.

That the materials which form the basis of the different substances embodied in the germinal layers are formed in the growing egg under the influence of emissions from the nucleus is rendered certain first by the close relationship of the nucleus to assimilation and secondly by the fact (see CYTOLOGY) that the nucleolus of the unripe egg breaks up into fragments and is extruded into the cytoplasm. It is, however, a surprising fact that the nuclei of the segmenting egg are alike and apparently without influence on the differentiation of the primary organs. In fertilization a second nucleus of alien origin is introduced and portions of this nucleus, as we have already seen, are

shall be used to build up one embryo or two depends on the special relations which these primary cytoplasmic substances sustain to one another.

If the eggs of a frog be placed dry on the surface of a slide with their animal poles uppermost and fertilized in that position by the addition of small quantities of the fluid extracted from the seminal vesicles of a male; if then another slide be placed on top of them and the two slides clamped together by rubber bands; if when the eggs have divided into two blastomeres the whole preparation be inverted and left in water in a shallow dish for five or six days tadpoles with two heads or two tails will be developed. The materials in the unsegmented egg are of different specific gravities; the first furrow often (see above) divides them into two symmetrical halves; when the two-cell stage is inverted they tend to rearrange themselves in each cell in the same manner as they would have in the whole egg had it been inverted. Nothing has been added or taken away, yet the altered position of the materials in each cell has led to the formation of two organs where normally only one would have been formed. In the case of the newt's egg a similar procedure leads to the formation of two complete embryos, whilst if the blastula of the newt be constricted longitudinally by a hair a two-headed monster is formed. When a lizard's tail is broken off, if the little regenerating bud which forms at the wounded surface be indented the animal will regenerate two tails instead of one.

Internal Environment.—When the higher organs begin to develop we can in many cases prove that the whole course of their growth is governed by what may be called their internal environment, i.e. by influences emitted by other organs.

This may be clearly seen in the development of the common sea-urchin *Echinus miliaris*. The "echinopluteus" larva of this species is a transparent bilaterally symmetrical free-swimming creature. It is provided with a complete alimentary canal consisting of oesophagus, stomach and rectum, and at the sides of the oesophagus are situated two flattened coelomic sacs. As development proceeds each sac becomes divided into anterior and posterior portions, and the latter move backwards so as to be pressed against the stomach. Still later from the posterior end of the left anterior sac a little bud termed the "hydrocoele" grows out. This is the rudiment of the water vascular system of tubes in the adult. The ectoderm lying over this bud becomes depressed so as to form a sac (the "amniotic cavity") from the floor of which grow up the spines which will cover the test of the future sea-urchin.

The hydrocoele bud overlaps the front end of the left posterior sac, and from this part of the sac there grow out five pockets from which will be developed the dental apparatus—the so-called "Aristotle's lantern." From the outer wall of the right posterior coelomic sac cells are given off from which are developed a pair of "pedicellariæ" (pincer-organs) which will be situated on the upper surface of the future urchin. If we now allow¹ the young larvae at the time the coelom is being formed to grow in hypertonic water, then many of them will develop from the right anterior coelom a second hydrocoele bud. If this bud develops—and it does so if plentiful nourishment be supplied to the larva—then a right amniotic cavity is formed from the overlying ectoderm, whilst the right posterior coelom gives rise to a second Aristotle's lantern. If the development of the second hydrocoele bud be slow then one or even two pedicellariæ may be formed on the right side as in normal larvae, but if it be rapid the formation of pedicellariæ may be inhibited altogether. If after the bud has appeared the larva is nearly starved for a time, both this abnormal bud and the normal hydrocoele may remain small and undeveloped and then pedicellariæ may be formed on the left side as well as on the right.

We conclude from these facts that the hydrocoele bud tends to inhibit the formation of pedicellariæ on its own side of the larva but to cause their production on the opposite side, and we see further that the right hydrocoele bud can totally alter the development of the right side of the larva, forcing the right ectoderm to form an amniotic cavity and the right posterior coelom a dental apparatus.

Another still more striking case of the influence of the internal environment is afforded by the results of experiments performed on the tadpole of the frog.² The vertebrate eye consists of two main parts, viz.: (a) the retina, formed as an outgrowth from the brain; and (b) the lens, formed as a thickening of the ectoderm of the side of the head. If before the lens is formed the skin of the head of a tadpole be slit open and the retina cut off from the brain and pushed back till it occupies a position in the region of the shoulder or even farther back, and the slit in the skin sewn up, then the tadpole will recover; the cut-off retina will continue to live and grow in its new position, and it will force the ectoderm covering it to form a lens—although never in the history of the race has a lens been normally formed in this position. Numerous other similar instances could be

adduced—did our space permit of it—suggesting the conclusion that in many embryos the primary organs are indifferent material and that the manner in which the secondary organs will develop out of them is fundamentally a matter of their spatial relations.

External Environment.—We now approach the subject of the possible influence of the external environment on the course of development. In the earlier article the attention of the reader was called to the fact that development presents itself under two principal aspects, viz. the embryonic and the larval. In the embryonic phase the young organism is sheltered from the external world, either within an egg-shell or in the mother's womb, whereas in the larval phase it leads a free life, using its larval organs to seek its own food and escape its enemies.

It was further pointed out that if we compare two nearly allied animals such as *Salamandra atra* and *Salamandra maculosa*, in the first of which development is mainly embryonic whereas in the second it is largely larval, we arrive at the conclusion that the embryonic phase is secondarily derived from the larval phase, since the organs such as gills which are functionless in the embryo are functional in the larva. It was also pointed out that larval organs frequently resemble the adult organs of other animals of simpler and more primitive structure.

On these facts was founded the celebrated biogenetic law first enunciated by Haeckel³ which affirms that "the embryo in its development recapitulates the ancestral history of the race." It is the law which provides a large part of the fascination of embryological research, but it was vigorously attacked in the earlier article and an effort was then made to show that it is not valid, since it was maintained that whilst it is true that larvae retain ancestral characters, the same is true of adults, and that larvae in their structure are not more reminiscent of the former history of the race than are adults.

Now the outcome of recent investigation has in large measure tended to reinstate the doctrine of recapitulation in its former position of preëminence, to show in fact that recapitulation forms the central thread in every life history, although it has been blurred and deflected by secondary influences, as indeed all believers in the biogenetic law have from the first admitted.

The first point to which we wish to direct the reader's attention is that larval and embryonic phases occur in all life histories. Every animal begins its existence as an egg which is quite incapable of feeding or of defending itself and this egg is always protected by an egg-shell although this shell may be very thin, and no animal upon leaving its early shelter and beginning to seek its own food attains at once the structure of the sexually ripe adult. Hence every animal in the course of its development may be said to pass first through an embryonic and then through a larval phase, although the latter phase may be very short and the difference in structure between the larva and the adult inconsiderable. Now, the larval phase being the later is the most recent addition to the life history and therefore the least likely to be modified by secondary factors; if therefore the biogenetic law be valid, it is the larval phase which will possess most ancestral significance. But in the earlier article attention is called to the fact that the identification of a larva as the representative of an ancestor must always be hypothetical because we have no direct knowledge of what the ancestor of any living animal was like. It behooves us therefore to look a little more closely at the reasons which actually do induce us to regard a given stage as ancestral.

First, it has been claimed quite recently that direct experimental proof of the validity of the biogenetic law has been obtained. Kammerer⁴ placed young specimens of *Salamandra maculosa* which had just completed their metamorphosis in cages the floors and walls of which were coloured differently in different cases. The larva of this species has a skin of a uniform dark-greyish tint, but the skin of the adult is gaily coloured with bright yellow patches on a black background. The salamanders which were confined in cages having a floor of moist yellow loam and walls coloured yellow became yellow as they grew to maturity—a process which occupies between three and four years. The yellow patches, in a word, increased in number and size and tended to become joined together in bands. Those confined in cages with blackened walls and a floor of black garden earth became darker since the yellow patches dwindled in size. When the salamanders had attained sexual maturity and were allowed to pair, it was found that the offspring of two which had been reared in yellow surroundings, if they continued to live in the

which fed on the debris of both animal and vegetable nature in the undergrowth of primeval forests. Such is in fact the life of the lowest insects known to-day, some of which, such as *Machilis*, nourish themselves on the decaying sea-weed on the sea-shore, and retain throughout life vestigial limbs attached to the abdominal segments which aid them in their crawling movements. Now the myriapod or poly-pod larva survives as the caterpillar of the Lepidoptera and the primitive Hymenoptera. It is also found amongst the primitive Neuroptera and amongst the may-flies (*Ephemeroptera*). These last-named insects were supposed to possess a larva showing great secondary modifications, for it is provided with leaf-like gills attached to its abdominal segments; but Heymons¹ has shown that these gills are nothing but modified abdominal legs. It is a curious fact that amongst the lower insects, such as the cockroach, this poly-pod stage is passed through during the embryonic phase of development. The reason for this change is that these insects lay their eggs in situations where a grub-like larva would perish, whereas the higher insects, in which the stage is larval, are gifted with instincts which lead them to lay their eggs in situations where an abundance of easily procured and easily masticated food is available and a scavenging existence like that of the ancestor is possible.

A fourth factor which modifies development, and which is potent in its effect although it is usually overlooked, is *loss of size in the larva as compared with the ancestor which it represents*. As conditions change and the larval life becomes more dangerous there arises a tendency in which we may trace the influence of tachygenesis to pass quickly through the larval stage and to metamorphose at as early a period of growth as possible into the adult condition. A consequence of this change is that the larva assumes a new relation to its environment, for many qualities of the surrounding medium, such as the viscosity and supporting-power of water, acquire an altered importance as the organism decreases in size. If the ancestral organs were reduced in the same scale as is the whole body of the larva, this would in many cases result in their becoming incapable of being used. As a consequence we find that in many cases where the ancestor had a series of organs, this series is represented in the larva by fewer members or only one member of larger relative size, and that where in the ancestor there was a pair of organs there is frequently only one in the larva, but this is on a larger scale than the rest of the body. If we now select a few examples to illustrate this principle, we may consider the free-swimming larva of that most primitive of all vertebrates *Amphioxus*. This larva has only a single series of gill-slits which are so enlarged as to occupy the whole ventral surface of the body. If the double series of slits, which the ancestor in common with all other fish possessed, had been developed in the larva, they would necessarily have been of such minute size that the capillarity of the water would have prevented them from being functional. Similarly there is no doubt that the eyes of vertebrates were from the beginning paired structures, but they are represented in the ascidian tadpole by a cup-like outgrowth of one side of the brain. Again no serious doubt can be entertained that the primitive arthropod was evolved from a long many-segmented annelid with flexible parapodia. But the most primitive larval form of the Crustacea is the nauplius which is a little, oval, unsegmented creature with but three pairs of legs. The existence of this larva was a great stumbling-block to the earlier embryologists. It seemed to indicate that the Crustacea must have been derived from an unsegmented animal totally distinct from the ancestor of other Arthropoda, for the progenitor of these must have been long and segmented since the embryos of all these Arthropoda have many segments. But if we look at the nauplius larva from the standpoint of function rather than of structure we have no difficulty in seeing in it the recapitulation of the first step in the "arthropodization" of the annelid. This step was a change of habits which consisted in using the foremost parapodia as oars to propel the animal and as organs to seize food. As a consequence in the front of the body the cuticle was thickened and the "arthropodous" type of limb produced, whilst in the rest of the body the annelid condition of affairs persisted as indeed it may be almost said to do in the posterior portions of the bodies of this most primitive of Crustacea, the long-bodied Phyllopoda such as *Artemia*. Once begun in front, this "arthropodous" modification was gradually propagated backwards so as to involve the hinder segments of the body and in this way the higher Crustacea were evolved. In the nauplius larva, the anterior arthropodized portion of the ancestor with its appendages is alone represented; the hinder annelid portion in which function was less intense and less important is not developed.

One last instance of the principle may be adduced which we select from the embryology of the higher vertebrates. In the development of those types of Vertebrata in the life history of which there is a long larval phase (Cyclostomata, dipnoan, "ganoid" and teleostean fish, Amphibia), a larval excretory organ termed the *pronephros* makes its appearance. Its duct later becomes the duct of the permanent kidney, but the pronephros itself consists of very few tubules and these originate from the wall of the general body cavity and not, as do the tubules of the permanent kidney, from special sacs

(the malpighian capsules). The earlier workers regarded the pronephros as a last trace of a primeval excretory organ of quite different structure to the permanent kidney by which it is later superseded. The works of Hatta² on the development of the lamprey and of Kerr³ on the development of the Polypterus have proved that the pronephros is nothing more than the foremost section of the permanent kidney, early called into action and enlarged whilst the hinder section of the metamerically repeated series of tubes of which the kidney consists remains undeveloped. These investigators have further proved that the portion of the general body cavity from which the pronephric tubules arise consists of several malpighian capsules fused together and secondarily communicating with the general body cavity.

Life History of Animals.—It might be supposed that with so many modifying factors at work it would be a hopeless task to attempt to disentangle the recapitulatory element from them, and that therefore the ancestral history of animals except in its latest and least modified chapters would remain a closed book. But when we recollect that the life history of every species constitutes a separate edition of this history, and that the modifying factors have affected no two of them to the same extent, it becomes evident that comparative embryology built on a broad basis can attack the problem with a fair prospect of success.

Bearing in mind the priority of the larval over the embryonic phase, and beginning therefore our survey with the larvae of the simplest metazoa, we are able to recognize the first step in the evolution of the metazoön from the protozoa in the blastula, the hollow ball of cells which may be regarded as representing a colonial protozoön like the living *Volvox*. This stage was followed by the formation of a gut by the intucking of one side of the ball; and this second step is represented in the life histories of all the lower and simpler animals by the gastrula stage. Following on this stage came the formation of the coelom as a series of pouch-like outgrowths of the gut, and the change of the single opening of the gastrula, the blastopore, into two openings which became the mouth and the anus by the constriction of its middle portion.

It has been possible to show that two groups so utterly diverse in appearance as the Annelida and the Mollusca have originated from a single group of free-swimming ancestors represented by the trochophore larva, and since Arthropoda are admitted by all to be descended from Annelida this conclusion involves the ancestry of four-fifths of the animal kingdom.

We can form a very plausible guess as to the nature of the divergence of habits which led to the differentiation of the Annelida and Mollusca from one another. The original stock was free-swimming but both groups derived from it are typically bottom-dwellers. Two modes of seeking their food were open to them; they could either glide over the bottom by means of their cilia as young Gastropoda and Lamelli branchiata still do, or they could burrow into it. The first led to the evolution of Mollusca, the second to that of Annelida.

Two other groups of very diverse structure, which embryology has given strong reasons for believing to have been derived from a single race, are the Echinodermata and the Vertebrata. The lowest form which gives distinct evidence of the vertebrate affinities is the worm-like creature *Balanoglossus*. The larval form of *Balanoglossus* is a free-swimming organism called *toraria* which shows the closest resemblance to the typical larva of Echinodermata, the *dipleurula*. The recognition of this affinity has assisted in the elucidation of a difficult subject to which considerable space was devoted in the 11th ed., viz. the origin of the central nervous system.

It is characteristic of the most primitive Annelida and Arthropoda that this system develops as a ring round the blastopore and an endeavour was made in the 11th ed. to prove that this was originally true of vertebrate embryos also. But it is a peculiarity of the vertebrate-echinoderm alliance which is still unexplained that in them the blastopore gives rise to the anus alone, whilst the mouth is formed as an apparently independent perforation at a considerably later period of development. A long succession of embryologists, with their eyes fixed only on the embryos of Annelida, Arthropoda and the higher vertebrates, have held that the vertebrate mouth is a new structure formed by the fusion of a pair of gill-slits and have prosecuted vain searches for traces of the old mouth. Others have imagined that the mid-dorsal line of the vertebrate embryo along which the nerve-cord develops corresponds to the line joining mouth and anus in the arthropod, the line in fact which is occupied by the slit-like blastopore in *Peripatus*. They hold that the nervous system of the vertebrate originally extended round the front end of

the embryo so as to include the mouth. But the independent and late development of the mouth is as marked a feature in the echinoderm larva as in the vertebrate embryo and there are no gill pouches in the echinoderm on which we could fall back to explain the phenomenon. Further, in the adult echinoderm the whole of the ectoderm is underlain by a nervous plexus of which the central nervous system is only a specialized and intensified portion, and the same thing is true of the anterior region of *Balanoglossus*. It is therefore futile to look for exact correspondence between the central nervous systems of two stocks which diverged from one another at such a primitive level as did the Vertebrata and the Annelida. In fact the descendants of the trochophore stock (Annelida, Arthropoda and Mollusca) on the one hand and the original Vertebrata on the other seem to have adopted two different modes of life which led to concentrations of the nervous system in different parts of the body. The trochophore stock took to crawling on their ventral surfaces and their locomotor organs were developed in this region of the body and in connexion with them the motor ganglia which make up the ventral nerve-cord; whereas the vertebrate stock took to swimming by lateral blows of their blade-like bodies and this led to the concentration of the central nervous system in the mid-dorsal line.

Enough has been said to give evidence for our belief that the most recent research has tended to reestablish the recapitulatory element as the fundamental factor in life-history, and if this be admitted the study of comparative embryology opens up a means of investigating the early history of life at a stage long before it left evidence of its existence in the stratified rocks; and, further, the acceptance of recapitulation involves a conception of the laws of heredity entirely distinct from and supplementary to that suggested by Gregor Mendel and his followers.

ENCEPHALITIS LETHARGICA (from Gk. ἐγκέφαλον, a portion of the brain, and λήθαργος, forgetful), a specific infectious disease of the nervous system, of which the most frequent, though by no means invariable, symptom is drowsiness or lethargy, often associated with paralysis of the muscles of the eye, producing diplopia or double vision.

In recent years this disease first appeared in epidemic form in Austria in the winter of 1916, and was described and named by C. von Economo in Vienna in 1917. It reappeared in the following winter, and was recorded in France in March 1918 by A. Netter. In England it was first recorded in April 1918, independently by Wilfred Harris and A. J. Hall. These earlier epidemics were all recognized by the combination of lethargy and diplopia. Subsequently the same seasonal incidence has prevailed, the number of cases diminishing in summer and increasing in winter and spring. In the United States it was reported in March 1919, the epidemic having spread from east to west.

The literature of medicine has been ransacked to ascertain whether or not previous records exist of the occurrence of the characteristic combination of symptoms. In 1890 a small epidemic occurred in North Italy, and later in Austria and other countries, which may be accepted as Encephalitis Lethargica. At the time it was known as Noma. It attracted little attention. The evidence for sporadic cases since then is doubtful.

Previous records are all doubtful. Hippocrates, Sydenham and other less-known authorities have described conditions which may or may not have been Encephalitis Lethargica. Stahl in 1779 recorded more fully an outbreak characterized both by lethargy and diplopia, and with other very suggestive symptoms. Franck in 1837 divided Encephalitis into various types, including a lethargic form which he stated occurred frequently as a result of epidemics of influenza.

Whether or not the observed combinations of symptoms have ever occurred before, the question early arose whether the syndrome should be regarded as a clinical entity or as a special manifestation of some disease previously known in other forms. The three diseases with which its relations have been more particularly considered are botulism, influenza and acute poliomyelitis or Heine-Medin's disease. Botulism results from the consumption of infected meat or other food, usually ham, and is especially characterized by paralysis of the eye muscles. The disease is due to infection with a specific bacterium—the bacillus botulinus. Since the most careful search has invariably failed to detect the presence of this bacillus in Encephalitis Lethargica botulism can be finally excluded. With regard to influenza, the appearance of Encephalitis Lethargica, including Noma as such, has approximately coincided with epidemics of influenza in 1889 and at the present time. On the other hand, there is considerable evidence against their identity. Influenza is highly contagious, while the clinical appearance of Encephalitis Lethargica occurs in an irregular manner and has not attained any great magnitude as an epidemic. When Encephalitis Lethargica commenced in Austria influenza had not yet appeared. There are also histological differences, since in influenzal encephalitis there is marked oedema of the brain and an absence of the two special characteristics of Encephalitis Lethargica—vascular congestion and infiltration of the perivascular lymph spaces. Pfeiffer's bacillus, the so-called influenza bacillus, is not found in Encephalitis Lethargica.

The relations of Encephalitis Lethargica to Heine-Medin's disease have led to much discussion. Unusual forms unquestionably occur in which the diagnosis is doubtful, both on clinical and pathological grounds, but, considering typical forms, there are striking differences between the two diseases. Heine-Medin's disease particularly attacks persons under 20 years of age, and tends to increase in frequency in summer. The onset of the general symptoms and of the paralysis is acute, the course is brief and the spinal cord is mainly affected. In Encephalitis Lethargica, on the other hand, persons of all ages are liable to attack, and the frequency is greatest in winter and spring. The onset is usually insidious, the course is lengthy, and the mid-brain is especially affected. Histologically there are also important differences. Microscopic hæmorrhages are constant in Heine-Medin's disease, while perivascular infiltration is slight, the reverse being true of Encephalitis Lethargica.

Symptoms.—Encephalitis Lethargica was primarily recognized by the occurrence of the combination of lethargy and double vision, the latter being due to paralysis of the muscle of the eye. While pathological drowsiness in varying degrees is probably present in 70 to 80 per cent of cases at some stage of their course, further observation has revealed the occurrence of numerous other manifestations. The disease is widespread through the nervous system, and the complexity of the structure of the nervous tissues, together with the high degree of specialization of the functions of its various parts, explains the protean nature of its symptoms. Numerous "types" have been described, but the value of these is slight, as a single patient in the course of a few days often exhibits the characteristics of many such types. The clinical manifestations are probably best classified as Walshe suggested, according to the broad scheme proposed for other nervous diseases many years ago by Hughlings Jackson. In the following description based on this system, "positive" symptoms denote exaltation of function, which may be due either to irritation of nervous tissue or to a loss of the control exercised normally by the higher centres of the brain, while "negative" symptoms denote depression or loss of function principally due to destruction of nervous tissue.

A. General Symptoms Due to Toxic Infection.—These include weakness, headache, often occipital with some stiffness of the neck, shivering, vertigo, muscular pains and vomiting or other gastro-intestinal disturbances. The pulse may be rapid and eruptions, usually resembling measles, occasionally occur. The temperature is variable, and it has no characteristic course. It often rises after some days from 101° to 105° F. for a short period, but may be more prolonged, or pyrexia may be absent throughout.

B. Nervous Symptoms.—These are general and focal, the latter being due to affection of highly specialized portions of the brain.

(1) General Nervous Symptoms.—Positive symptoms are delirium, mania, restlessness and various degrees of excitement, while the more common negative manifestation is the characteristic lethargy, in all grades from simple apathy to complete coma. Innumerable degrees occur of these two extremes, or even combinations. The

patient may slowly drift into a somnolent state or may not uncommonly combine somnolence by day with insomnia or restlessness by night. Rarely an attack commences suddenly with the wildest delirium or mania.

(11) *Focal Nervous Symptoms*.—The positive symptoms include the following:—

(1) *Convulsions*, which are occasionally generalized, resembling the epileptiform fit.

(2) *Involuntary movements*. These may develop during the attack or several months later in the course of convalescence. Numerous forms occur. The "myoclonic" type is characterized by short, rapid, rhythmic contractions of muscles, especially affecting the abdominal muscles and also the diaphragm, but the entire musculature or any group of muscles, or even a part of a single muscle may be affected. The contractions are 30 or 40 to the minute. Epidemic hiccough is possibly a variety of this type. Tremors, choreiform, athetoid and other movements of muscles may develop after the attack, some causing coarse spontaneous movements of large amplitude.

(3) *Rigidity*. This group includes the "Parkinsonian mask" and catalepsy, the latter being a condition of rigidity in which the limbs are retained for long periods in the position in which they are placed by an observer. The Parkinsonian mask, an expressionless facies, is common, and combined with rigidity produces the appearance of acute paralysis agitans, or Parkinson's disease.

(4) *Muscular pains*. These may be severe.

The negative symptoms are represented by paralyses. The commonest of these is the characteristic affection of the muscles of the eye, especially those innervated by the third pair of cranial nerves. The principal clinical symptoms are ptosis or drooping of the eyelids, double vision and paralysis of the muscles of accommodation. The pupils are often unequal and their reaction altered, the most common change being loss of reaction to accommodation while still reacting to light; but in rare instances the Argyle-Robertson reaction may be present. Optic neuritis is extremely rare, and never advanced. Less common are affections of the remaining cranial nerves, producing facial paralysis, difficulty in swallowing or in production of speech, etc. No portion of the nervous system is immune, and instances occur with paralysis of limbs and other parts, producing monoplegia, hemiplegia, diplegia, or aphasia. The sensory system is much less frequently affected. The deep reflexes are commonly but not invariably absent.

Morbid Anatomy.—The small vessels of the brain and meninges are dilated, the congestion often being visible both to the eye and under the microscope, but the most characteristic change is infiltration with small round cells of the perivascular lymph spaces, surrounding the capillaries. Other less constant and less conspicuous changes include degeneration of the nerve cells and destruction of neurons, proliferation of the mesoblastic cells lining the vessel walls and of the glial cells, and the occasional occurrence of haemorrhages and of thrombosis of veins. The lesions are most common in the mid-brain and basal ganglia, but any portion of the nervous system or meninges may be affected.

Prognosis.—Excluding mild and abortive cases, and the so-called *formes frustes*, the mortality is about 33 per cent. Including all cases it is under 20 %, but the exact figure is doubtful. Deaths usually occur within three weeks from onset. The duration may be many weeks or even months. Alteration of the mental functions may be prolonged, and paralyses, aphasia and other changes have persisted long enough in some instances to be regarded as permanent, but when recovery takes place, it usually becomes complete.

Treatment.—This is on the general lines of treatment of acute febrile disease. Hexamine is usually administered. Netter strongly advocates the production of a local abscess by the injection of turpentine, 1-2 cc., into the thigh, but the value of this is not yet confirmed.

(H. L. T.)

ENGINEERS, MILITARY (*see* 9.406*).—In the earlier article it was pointed out that in the early days of warfare, and in Great Britain up to the wars of Marlborough, the engineers of an army were the builders of fortifications, and also the manufacturers and directors of engines of war. In 1716 the first separation of specialists occurred when the Royal Artillery was definitely formed into a separate regiment. British engineer officers, left to their more specific duties of defensive works and of military surveys, were, until 1757, frequently holders of commissions in the infantry, and it was not until the siege of Gibraltar, towards the end of the 18th century, that any nucleus of enlisted rank and file was added to the corps of officers, who by that time were called Royal Engineers. This creation of specialist branches of military engineers naturally continued with the progress of engineering in civil life, and its application to military needs. Thus, after the experience of the American Civil War in 1861-5, had brought to light the extreme value of the electric telegraph in military operations, a telegraph troop was added to the Royal

Engineers in 1870. This unit was shortly afterwards utilized by the British Post Office in connexion with civil telegraph duties, and for many years afterwards the connexion between the army and the civil department concerned was maintained in Great Britain to the great advantage of the military engineers, who by constant practice in the working of civil lines of telegraph were being prepared for this task in war. Gradually, however, the military specialties tended to develop, and the units concerned came to have a somewhat special equipment and to be divided into air-line companies (where the wires are carried on light poles rapidly erected), cable companies (where insulated cable is laid in any ground in any convenient way), and wireless.

Prior to the outbreak of the World War the signal service in the British regular army consisted of one signal squadron, 5 signal troops (for one cavalry division and 5 cavalry brigades), 6 divisional signal companies, and 4 other units. Some 20 more units were formed on mobilization, the total establishment for the Expeditionary Force being 78 officers and 2,367 other ranks. In the Territorial Force there were 5 army troops and 14 divisional signal companies, the former units being subdivided into wireless, air-line and cable companies. In 1918 the total numbers had increased to 2,499 officers and 69,264 other ranks, exclusive of Dominion forces and those on the Indian establishment. The number of units was upwards of 400, operating at home and in practically all the theatres of war, and including despatch riders, messenger dog service, carrier pigeons, wireless motor sections, and subsections attached to field and garrison artillery. The materials were partly obtained from the G.P.O. in England, but also from sources under the direct control of the director of fortifications and works who had under him five factories for the manufacture of special wireless sets, telephones and cables. The scale of supply may be inferred from one item alone, viz. insulated cable, of which enough was sent to France in one year of the war to go 10 times round the globe. Such an immense development as this, however successfully it was carried out (and there is no doubt on this point), evidently demanded an organization of its own, and consequently, after the war, a new branch was formed called "The Royal Corps of Signals."

In like manner the British Air Service, in 1912, was separated from the Royal Engineers. The first steps to form an aerial observation corps were taken about 1878, although individual officers had taken up the subject at a much earlier period. Aerial observations and photography from balloons were carried out on active service in the Sudan and Bechuanaland in 1884-5 and throughout the South African War 1899-1902. The development of the internal combustion engine, however, in the early part of the present century, made the dirigible balloon possible, and the application of this engine to heavier-than-air machines in 1907 introduced into war a new factor of the utmost importance. The Air Battalion of the R.E., which in 1911 was mainly occupied with balloons, kites and airships, and had made some progress in developing the new inventions, became early in the following year the military wing of the Royal Flying Corps.

To some extent the work of submarine mining, brought to great perfection by the R.E. in connexion with coast defence, in the closest coöperation with garrison artillery and defence electric lights, belongs also to this category. It was abolished, in so far as its connexion with the army is concerned, in 1905, its work being handed over to the Royal Navy. In this transfer, however, the coöperation between guns, lights and mines could not be carried out as before, and the reason for the change is not that of the two other instances, viz. the great growth and importance of the branch of engineering concerned.

While, however, the growth of special branches necessitated their severance from the parent corps, the exigencies of war brought into being other branches of a nature previously unforeseen. Besides signal units, the normal composition of the R.E. before the World War included field, fortress and railway companies, with field squadrons for the cavalry, and bridging trains with armies. Although these still continued, with numbers enormously increased, other special branches soon began to be formed. Army troops companies (formed out of the fortress

* These figures indicate the volume and page number of the previous article.

whereas in 1914 the entire staff of engineer officers at G.H.Q. was one brigadier-general, in 1918 this staff was one major-general, two brigadiers and 19 other officers. Similarly the engineer staff of each army was increased from one to 11 officers—one for water supply, another for bridging, others for mining, camouflage, stores and so on.

The field companies, whose losses in the first few weeks of the war were very great, were increased at once from two to three per division, and a pioneer battalion in addition gave each divisional-general a sufficient supply of both skilled and unskilled labour for him to make tactical use of engineering works. It was not intended that these troops should be used as infantry except in the gravest emergency, although in some cases this was not borne in mind, and the casualties which resulted made the want of such technical troops more acutely felt than ever.

Under the direct orders of the chief engineer of an army corps there were two or three army troops companies R.E., two or three tunnelling companies, a company or two of a labour battalion, and miscellaneous working parties and transport lorries.

Field Companies.—As the field companies were the most numerous of all the R.E. units (there were some 160 of them in France in 1918) as well as being the normal organization of military engineers—corresponding to a battalion of infantry, a squadron of cavalry and a field battery of artillery—it may be as well here to say a little about their organization. The field companies of the regular army (of which there were 13 in 1914) were formed about 1879 by adding to a few selected fortress companies a section of mounted drivers with transport to carry ordinary entrenching tools, and the special tools needed for the various tradesmen of which the company was composed. At that time the companies were almost exclusively employed on barrack maintenance, and, while subject to military discipline and trained as infantry in drill and musketry, they were given little or no special training as field engineers. But from the experience of the Egyptian and Sudanese campaigns of 1882–5 there began a steady improvement in their rôle as a valuable tactical arm. About 1885 each company was taken off the works annually for a course of field work instruction. In 1889 continuous engineer's pay, instead of working pay for actual hours spent on works, was introduced, a matter of the utmost importance, for it enabled men to be taken for military training without penalizing them in respect of pay, while their trade skill could still be economically utilized on works when they were not otherwise employed. The gradual improvement in the military training of this arm, and its co-operation with other arms, was, after the S. African War, still further developed by having the companies posted to army divisions under the direct responsibility of division headquarters, and by the participation, by all ranks, in the divisional training schemes. Further, young civil engineers were, by arrangement with the Institution of Civil Engineers, given commissions in the R.E. Special Reserve, and after some preliminary training were attached to field companies.

Each company consisted of six officers, all mounted, with about 220 other ranks, of whom about 75% (dismounted) were tradesmen, the remainder being drivers. There were some 60 horses and mules, with the following vehicles:—four double tool carts for tools and equipment, three pontoon and trestle wagons for bridging plant, and a special vehicle for explosives, sandbags, cordage, etc., with the general transport vehicles appropriate to a unit of this size and composition. The company was organized in four sections, each under a subaltern, so that each section could be detached, with its own tools, for some specific task. There were also some pack animals to take tools, etc., to places where wheeled vehicles could not go. A certain number of the dismounted men were cyclists whose business it was to reconnoitre ahead and bring in information.

Although the greater part of the sappers (dismounted men) were skilled tradesmen, there was introduced, shortly before the outbreak of war, a certain dilution of skilled labour in the form of "pioneers," men who were trained in ordinary field work, but had not been taught a trade before entering the army. Whether this dilution was on the whole satisfactory is a matter on which there is difference of opinion. There is, however, no doubt that as regards the officers, the greater their knowledge and experience of engineering work the better, owing to the variety of the work that falls on a field company in war. Moreover, the development of weapons and the weight of guns, tanks, etc., which came to be used in the war revolutionized much of the previous practice. No longer were combinations of timber, brushwood and earth sufficient for field defences, nor pontoons and spar bridges sufficient to cross rivers. Concrete and steel had come into the field, and the engineers accustomed to use these in peace had to take them in hand for war, and to see that rapidity of construction was combined with stability and strength.

Broadly speaking, the duties of the field companies were field defences, mining, demolitions, water supply and distribution, and temporary roads and bridges, in the fighting zone. Behind these came the army troops companies R.E. and the many special units whose duties are indicated by their nomenclature.

The School of Military Engineering.—It is evident that to train officers and men—the former especially—for the varied tasks that lie before them in war, some very special instruction is needed in peace. This is supplied by the School of Military Engineering at Chatham, to which every R.E. officer after receiving his first commission is sent for a course of instruction, lasting normally two years.

This school owes its origin to the Peninsular War. In that campaign at first there were no trained sappers, and the officers of the R.E. were woefully ignorant of such military subjects as the demolition of bridges. As a result of Lord Wellington's representations, and the advocacy of an able engineer-officer, Col. Pasley, a school of instruction in siege works was begun in 1812 at Brompton barracks, Chatham. In course of time instruction in other branches, e.g. construction, surveying, electrical and mechanical engineering, chemistry, astronomy, etc., was added; and in spite of certain disadvantages, e.g. the growth of houses and establishments round the school, and the absence of troops of other arms with whom combined training could be carried out, the work done at this school has been of the utmost value both in war and in peace, for officers and men trained there have gone to all parts of the Empire and made their mark in works of public utility and permanent value.

The training in the pre-war period was as follows:—The two years' course is approximately divided into four equal parts under each of the chief instructors, in field fortification, construction, surveying and electricity. The officers are attached to depot companies in one or other of the battalions of R.E. under training, and thus, concurrently with their technical training, they learn the routine of military administration, discipline and drill. As regards the four main courses of instruction it is evident that in the short time available only the rudiments of each subject can be taught. In a profession which admits of so many different avenues of service to the country it is evident that the preliminary course of instruction should include that which is likely to be of value in each and every capacity. There must be a difficulty in arranging such a course when it is borne in mind that one officer may devote his life to purely military studies, another to the scientific work of, say, the Survey of India, another to railway constructions, another to electric developments and so on. Yet there is doubtless some common ground in which all must be trained before diverging, and this is the object of the Chatham training. In field fortification, besides the principles of defence, already learned by the officers in the cadet stage of their career, there is the practice of entrenchments, redoubts, military mining and demolition; there is, further, construction of light railways and of field shelters, water-supply expedients, and other miscellaneous subjects. This course is largely out of doors, and is specially valuable in teaching young men how to organize and handle skilled and unskilled labour. The survey course includes instruction in all surveying instruments and in the practice both of large survey operations and of the rapid operations frequently necessary in military exploration, and in combining the work of several observers in an unknown country. In the construction course lectures are given on building materials and builders' trades, on applied mechanics and hydraulics, on water supply, sanitary engineering, roads and railways, the design of structures, including bridges, reservoir walls, etc., and the ordinary methods of execution. Visits to engineering works in progress are included in the course.

Theory and practice are combined in this as well as in the mechanical and electrical engineering courses, the details of which are on similar lines. Care is taken to keep in close touch with the best civil-engineering practice in the country: eminent civil engineers are invited every winter to deliver lectures, and after the completion of the course selected officers are sent to work for six or eight months on one of the great railway lines, either to learn traffic control, or to be more thoroughly equipped in mechanical engineering in the railway workshops. Other officers go to the electric light school at Portsmouth for special training. (G. K. S.-M.)

United States.—The army which in its circumstances bears the closest resemblance to the English is that of the United States. Both countries recruit their armies by voluntary enlistment, and both use to some extent their military engineers, after completion of their training at a military school, in some form of civil-engineering service in peace.

From 1901 to 1916, the maximum authorized strength of the Corps of Engineers was 248 officers of all ranks, and 1,968 enlisted men forming 3 battalions of 4 companies each. The officers not needed for service with the troop units were employed on civil public works, inasmuch as the Corps of Engineers is charged with the improvement of harbours and rivers, both coastal and inland. As in the case of English officers in the civil-engineering departments in India and the colonies, this employment proved to be of great value in war in that it had trained them "to take heavy responsibilities; in the habit of making weighty decisions; meeting sudden emergencies; in the organization, operation and care of large bodies of men; and working with men not familiar with or subject to [army] discipline."

In the United States, officers for the Corps of Engineers are obtained from two principal sources, namely, the U.S. Military Academy at West Point, and the leading civilian engineering colleges. The Military Academy is not an engineering school, and, although the course furnishes a good foundation for an

engineering education, its graduates appointed to the Corps of Engineers nevertheless require additional instruction in engineering subjects. To that end they are detailed as special students for about a year at the more advanced civilian engineering schools.

Graduate engineers appointed from civil life need military instruction and are sent to the Engineer School of the U.S. army immediately upon being commissioned. Subalterns of both classes, after completing their basic military education, are assigned alternately to duty with troops and on civil construction, where their training is continued for several years in accordance with a scheme formulated by the chief of engineers. This whole procedure, which is possibly more formal than that prevailing in the British service, has the same end in view, namely, to give the officer a "well-rounded mental and professional development" which fits him for any service that war may entail. Selected officers of more mature age pursue advanced courses at the Engineer School and become eligible for the School of the Line, the General Staff School, and the Army War College, where they are instructed in the combined use of all arms of the service and the various duties of the general staff and the high command.

Under legislation effective June 3 1916, the Regular Army of the United States was reorganized and expanded. Provision was also made for a reserve to be composed of (a) local forces in each state, and (b) a reserve corps of officers and of enlisted men. The former were the state National Guards, but in an emergency were subject to service under the Federal Government. The Reserve Corps was answerable directly to the Federal Government. Under this Act the Corps of Engineers of the regular establishment was to consist of 505 officers of all ranks, and one band; 7 regiments (foot), and 2 battalions (mounted) of enlisted men. The increase was to be made by five successive increments, so that on April 6 1917, when the United States declared the existence of a state of war, the Corps of Engineers numbered only 256 officers and 2,228 enlisted men, the latter being organized in 3 regiments and one mounted company. There were, in addition, a few engineer troops organized as components of the National Guard.

During the World War, Congress passed a series of Acts affecting the military establishment and created a fourth element called the National Army, which name was applied to the organizations raised especially for the emergency, partly by voluntary enlistment and partly by the selective service law. In Aug. 1918, the distinctive appellations were discontinued and the 4 elements, viz.: the Regular Army, the National Guard, the Reserve Corps and the National Army, were merged and the single term "The United States Army" was applied to the entire military force.

At the time of the Armistice, Nov. 11 1918, the standard combat regiment with its train had a strength of 49 officers and 1,695 enlisted men. At that time the engineer establishment consisted of 7 regiments (foot), 2 battalions (mounted), and 8 engineer trains derived from the regular establishment; 17 regiments with trains derived from the National Guard, and 31 regiments derived from the National Army, a total of 55 regiments, all assigned to divisions. There were also 6 regiments assigned directly, one to each corps headquarters. These 61 regiments were all of the pioneer-sapper type; but there were also special engineer troops allocated to various headquarters, both at the front and on the lines of communication, for the construction, maintenance and operation of railways; for the assemblage and maintenance of railway equipment; for the construction, operation and maintenance of light railways; for the construction and maintenance of highways; for the construction of barracks, quarters, storehouses, wharves and other miscellaneous structures; for the production of lumber and timber products; for camouflage; for flash- and sound-ranging; for water supply, mining, quarrying, electrical and mechanical installations and operations; for surveying, printing, and the reproduction of maps and charts; for the operation of port facilities; for the operation of searchlights; for motor transport, chemical warfare, and "general service."

The "general service" force was composed of whites and corresponded to the British labour battalions. There were in addition certain labour units, called Pioneer Infantry, composed of negroes officered by whites. The special engineer troops were variously organized into regiments, independent battalions or independent companies, the strength of which was that of corresponding units of the standard Pioneer-Sapper regiments. The labour battalions usually consisted of 1,000 men with a proper complement of officers. Though originally organized under the Engineer establishment, the Motor Transport Corps, the Chemical Warfare Service and the Armoured Tank Corps later became separate organizations. The Railway Transport Corps was established as a separate service in France, but in America this branch remained under the general supervision of the chief of engineers.

During the war 13,527 commissions were issued to officers of engineers, and on Nov. 11 1918 there were 10,886 officers holding such commissions. The approximate total enlisted strength of engineer units was 285,000, of whom 233,000 were overseas, and 52,000 were in the United States and its insular possessions. Comparing this with the British strength it must be remembered that,

on the one hand, in the American army the signal service is entirely distinct from the engineers; on the other hand, a certain amount of mechanical transportation is included, and the Americans made early provision for a large number of navvies for general engineering operations. The strength of the latter are included in the figures given for the American engineering service. The Quartermaster Corps of the American army, which constitutes its general supply service, had also a large number of labour units, generally composed of negroes with white officers.

The training of officers and enlisted men at temporary instruction camps was simplified by the fact that the officers were, in general, drawn from the engineering professions, and the enlisted men were drawn from various classes of artisans. The compulsory selective service law facilitated the assignment of each individual to that place in the military establishment for which he was best fitted by his peace-time occupation. The training in the instruction camps was therefore largely military, qualifying the personnel to apply to their military tasks the knowledge they had acquired as civilians in their peace-time vocations. As in England, the voluntary-enlistment principle permitted a number of well-qualified engineers and technicians to join, early in the war, the infantry, artillery and other combat units where their special training did not come into play. Their services would have been of far more value in the engineering or other specialist units. (G. A. Y.)

Lessons from the War.—It is possible to sum up a few of the lessons which the experience of the World War has taught.

There must be on the one hand the closest connexion and co-operation between the general staff and the engineers. The intentions of the commander must dominate the situation, and the engineering work must be co-ordinated so as to further such intentions, assist and develop them as far as possible. There must therefore be, on the part of the general staff, such early information on the subject to the chief engineer that he may not only work out his technical plans, but may consider whether the possibilities of engineering science may not be used to forward the end in view to an extent hitherto unsuspected by the general staff.

There must be constant co-operation with other arms, especially infantry, and this must form part of the training in peace.

There must also be close touch with the great civil-engineering institutions of the country. Apart from their great knowledge and experience of the developments of the profession of engineering they are in touch, in a way that can hardly be expected from military engineers, with the very latest developments of technical science, and with the ablest practical exponents of it on a large scale.

There must be the recognition that field defences, as such, are not the monopoly of the engineers. It is the business of the general in command, through his general staff, to decide when and where such defences should be constructed, and the senior officer of engineers should have a voice in the matter, but only in respect of technical matters involved. The training and duties of modern infantry enable that arm to carry out much of the required defensive work entirely without any engineer supervision or assistance, and they should be held responsible for such work. There is sure to be some work which is beyond the scope of infantry training, such as reinforced concrete, or the construction of "dug-outs," and this is clearly the business of the engineers, but in ordinary entrenchments, wiring and other obstacles, revetments, and light bridging, infantry must be trusted to do their own work.

The supply of engineering plant and stores must be under the engineers, and other arms should draw on them as required.

There should be both at the War Office and in the field a branch of the Intelligence Department dealing specially with engineering information. While there must be co-operation between the general staff, other arms and engineers in the fighting line, there must be the closest co-operation between the engineers there and the higher engineering authorities immediately in rear, i.e. the corps and army chief engineers, whose business it is to co-ordinate all technical operations.

As regards execution of work, whether by engineers or infantry, there must be (1) a carefully prepared scheme to ensure that each unit receives in good time clear instructions as to the nature and scope of work devolving on it; (2) rendezvous points must be carefully selected, notified to all concerned, and reliable guides told off to lead the working parties to the proper place by the best routes; (3) a proper scheme for issue of tools and plant, with definite responsibility for the return of tools in due course.

As regards the tactical employment of engineers the following points are worth noting:

In the encounter battle it may be advisable to attach either an entire field company, or a large portion of one, to the troops making the attack, just as some engineers are always told off to accompany an advanced guard on the march, in order to clear away obstacles and to ensure that, while progress is not arrested, important tactical points gained are consolidated. But, inasmuch as once an engineer unit begins a work, it should not hand it over to another unit while under construction, it is best that as further engineer assistance is required, it should be done by engineer units being pushed forward, "leap frog" fashion, from reserves. Close watching of the tactical situation by the commanding engineer is a vital necessity.

In the deliberate attack, as in trench warfare, there are the three

phases—preparation, assault, and following up. In the preparation the works are so numerous that the utmost care must be taken by the commanding engineer and the general staff that the engineer resources are devoted to the most important objects. Then in the assault, the engineers should never be sent with attacking infantry except with specific instructions for definite work for which they can prepare beforehand, e.g. the consolidation of tactical points or opening up a forward communication. Even then they should not follow the leading waves of attack too closely, as they get mixed up with the fighting line, and do not accomplish their actual work. The engineer-commander should retain within his immediate control as much of the personnel as possible for the all-important work of rapidly opening up forward communication during the attack, and also for the disposition of the engineers in the phase following up a successful attack, when the work is similar to that of the encounter battle, viz. securing the fresh objectives gained.

As regards defence there are (1) advanced works in close contact with the enemy—the "outpost zone"; (2) the main position of resistance; (3) one or more rear systems. The first of these will ordinarily be carried out by infantry, with possibly some engineer assistance. The main position will be developed by the divisional engineers, with such additional labour from other arms as may be possible to allot. Rear defensive positions will be undertaken, usually, under the orders of corps and army commanders.

In position warfare the engineer duties also include preparation for attack, arrangements for the comfort, security, and efficiency of the troops behind the line, development of communications, and duties in connexion with raids. It is essential that all the engineer units should be under the control of the commanding engineer, and that he should maintain a programme of the necessary works to be carried out, and obtain the orders of the divisional general as to the order of urgency. It must, however, be always borne in mind in this as well as in other defensive work that the responsibility for construction and maintenance of works on any sector of the system rests with the commander of the troops in that sector.

In the case of a forced retreat in the presence of a pursuing enemy the work of the engineers will be mainly the delay of the pursuit by demolitions, and the erection of obstacles, but will include also the preparation of successive defensive positions, and the construction of special communications to allow the withdrawal of troops and guns. The work requires careful coordination and control under great difficulties. As the movements of the engineer-units depend on the localities where the works are required, they will not usually correspond with the movements of infantry in touch with the enemy. The officers of engineers must keep in close touch with the situation, act with initiative and readily assume responsibility, keep their superior engineer-commanders informed of the situation and progress of work, and be ready to respond to any call for assistance, provided they are satisfied that such a call is warranted and is relatively more important than other orders.

Efficient liaison is of the utmost importance.

In all operations of war it is imperative that the engineers should have:—(1) A close and accurate knowledge of all developments of the tactical situation; (2) a thorough comprehension of the needs of the other arms; (3) definite schemes and estimates of men, time and materials, sufficiently accurate for practical purposes; (4) well-prepared arrangements for materials and for passing information to other divisions or corps adjutant or in rear. Having developed these, an engineer-commander should be able to furnish the general staff with sound and competent advice on the engineering aspect of the operations, and should be able to utilize to the best advantage the available resources.

(G. K. S.-M.)

ENGLISH FINANCE (see 9.458).—In the period from 1910 to 1921 English national finance underwent changes of a very far-reaching character.

Pre-War Period.—When Mr. Asquith succeeded to the Chancellorship of the Exchequer under Sir H. Campbell-Bannerman's administration in 1906 he found that public expenditure had increased rapidly in the previous decade. In 1895-6 the total was £97,700,000; in 1905-6 it had risen to £150,400,000. Mr. Asquith was responsible for the Budgets for the three years ended 1908-9. His policy was one of consolidation and retrenchment, which was necessary in view of the costly character of the S. African War and the gradual rise of expenditure generally. On the whole his record at the Treasury during his period of office was good. He managed to check the growth of expenditure, but his work was chiefly distinguished by successful efforts to reduce the National Debt. In the three years ended 1908-9, he reduced the dead-weight debt by £43,500,000 to £711,400,000.

The social reform programme initiated by Mr. Asquith in the Old Age Pension scheme was greatly developed by Mr. Lloyd George when he took over the reins of finance, and its effects were so stupendous that it affected in profound degree the national finances for the ensuing decade. Mr. Lloyd George's first

measure of expenditure was the National Insurance Act of 1911. In 1911-2 the total expenditure rose to £178,545,000, and in 1912-3 to £188,622,000 or £90,922,000 more than in 1908-9, when Mr. Lloyd George assumed office. The great increase in the Post Office estimates at this period was due to the acquisition of the National Telephone Company's undertaking.

The policy of the Liberal administration, which at first was economy, was turned by the pressure of political events into a policy of growing expenditure and taxation. In the period from 1909-10 to 1913-4, the expenditure on the navy rose from £35,807,000 to £48,833,000, on the army from £27,236,000 to £28,346,000, while that of the Civil Service jumped up from £40,010,000 to £53,901,000. Original estimates of the cost of Old Age Pensions were hopelessly wrong, and the total in 1913-4 had risen to £12,600,000 or double the cost as estimated in 1908. About £2,500,000 of the increase was due to the amendment of the law in 1911. Part of the excessive outlays on pensions was attributed to absence of compulsory registration in the first half of the 19th century. A large number of people in the rural districts were able successfully to claim the right to the pension, not because the claim was correct, but because the pension officers were unable effectually to contest the claim.

The policy of social reform to which the Liberal administration was committed produced, in 1909, a Budget, which will rank as famous in English financial history on account of the constitutional changes which it produced, and because events showed that Mr. Lloyd George's programme of land taxation, based upon an alleged appreciation of Henry George's theories, proved to be unworkable and fallacious. The Finance bill of 1909-10 was read a third time in the House of Commons on Nov. 4 1909, and was rejected by the House of Lords on the 30th of the same month. The Budget statement anticipated a revenue of £162,500,000, or about £11,000,000 more than in the previous year. It actually produced £131,606,000, largely because on the Lords' rejection of the bill the collection of income tax and tea duty was suspended. After the general election in Jan. 1910 which kept the Government in office, the Finance bill of 1909-10 was reintroduced on April 20 1910, and the Lords passed it on April 29.

The principal features of this Act were that it made the estate and inheritance duties much heavier, that it raised income tax from 1s. to 1s. 2d. in the £, abolished the abatements granted to those resident out of the country and imposed a super-tax (an additional rate of income tax) of 6d. in the £ on incomes over £5,000, the first £3,000 being excluded from the assessment to this duty. But the big novelty of the Budget was the land value duties, which were chiefly responsible for the conflict with the second chamber. Four duties were imposed: the increment value duty of 20% on the increase in the value of land sites payable on land changing hands, the undeveloped land duty of 3d. in the pound on capital value; the reversion duty of 10% on benefits accruing from the termination of a lease of land; and the mineral rights duty of 1s. in the £ on mineral royalties, way leaves, etc. Agricultural land was excluded from the land value duties. The bill naturally involved a valuation of all land in the United Kingdom.

In the end the land duties were found to be very difficult to collect, and the advanced political assumption that there was something wrong about profits derived from the appreciation of the value of land had some extraordinary consequences. It certainly led to the break-up of big estates, but it wholly failed to produce revenue. The land value duties were originally estimated to yield £600,000 in the first year and a great deal more in future years. But these forecasts were woefully wrong. In 1910-1 the yield was £520,000; in 1911-2 £481,000; in 1912-3 £455,000; in 1913-4 £715,000; in 1914-5 £112,000; in 1915-6 £363,000; in 1916-7 £521,000; in 1917-8 £685,000; in 1918-9 £664,000; in 1919-20 £663,000; and in 1920-1 £20,000. Their abandonment in 1920 was the inevitable result of their disappointing yield. Of course the yield of the duties depended a great deal upon the valuation of land establishing a datum line for the duties, and that could not be completed for many years. In 1920-1 it had not been finished. Meanwhile the larger proportion of the land value duties was derived from the mineral rights duty. The growth of mechanical transport, following the introduction of the internal combustion engine, led to the imposition of duties on motor vehicles, a part of the proceeds of which was allocated to a Road Development Fund, established in 1909. At the same time a development fund was set up for the purpose of promoting, by Government Departments, colleges, institutions, or persons not trading for profit, by means of loans or grants, agriculture, forestry, drainage, harbours, fisheries, transport by experimental work.

The National Debt, which had been reduced from £762,463,000 in 1909-10 to £707,654,000 in 1913-4, was destined to grow at an enormous rate during the European War. Figures showing the form of the debt are set out below:—

The average British National Expenditure in 1914-5 was £1,500,000 a day; it grew to £3,750,000 in 1915-6, to £6,587,000 in 1916-7, and to £6,986,000 in 1917-8. A rule was laid down by Mr. Reginald McKenna, who succeeded Mr. Lloyd George as

British National Debt in million £.

War Period.—The outbreak of war in Aug. 1914 was followed by a number of emergency regulations which were destined to have a profound effect upon the national finances during the war period. The Government decreed a general moratorium, and agreed to advance currency notes to bankers at Bank Rate to the extent of 20% of their deposits. At first the banks availed themselves of this facility to relieve the shortage of cash to the amount of £13,000,000, but by the end of Nov. 1914, when the moratorium expired, this amount had virtually been repaid. The banks found that Government expenditure provided them indirectly, with all the currency they required, this of course being the inevitable effect of inflation. On Aug. 1 1914, the Government gave the Bank of England authority to suspend the Bank Act of 1844, but it was never acted upon, because the passage of the Currency and Bank Notes Act on Aug. 6 1914 rendered the suspension of the Bank Act unnecessary. The excess fiduciary issue was always turned into the currency note issue. The next step was the undertaking of the Government to discount at 2% above Bank Rate all pre-moratorium bills of exchange. The amount discounted was nearly £200,000,000, of which about £15,000,000 remained in cold storage until after the war.

The war was financed by means of Votes of Credit. There were 15 Votes of Credit, as set out below:—

Votes of Credit in the War.

1st—Aug. 6 1914	£100,000,000
2nd—Nov. 15 1914	225,000,000
3rd—March 1 1915	37,000,000
	(Financial year) £362,000,000
4th—March 1 1915	£250,000,000
5th—June 15 1915	250,000,000
6th—July 20 1915	150,000,000
7th—Sept. 15 1915	250,000,000
8th—Nov. 11 1915	400,000,000
9th—Feb. 21 1916	120,000,000
	(Financial year) £1,420,000,000
10th—Feb. 21 1916	£300,000,000
11th—May 23 1916	300,000,000
12th—July 24 1916	450,000,000
13th—Oct. 11 1916	300,000,000
14th—Dec. 14 1916	400,000,000
15th—Feb. 12 1917	200,000,000
16th—March 15 1917	60,000,000
	(Financial year) £2,010,000,000
17th—March 15 1917	£350,000,000
18th—May 9 1917	500,000,000
19th—July 24 1917	650,000,000
20th—Oct. 30 1917	400,000,000
21st—Dec. 12 1917	550,000,000
	(Financial year) £2,450,000,000
22nd—March 7 1918	£600,000,000
23rd—June 18 1918	500,000,000
24th—Aug. 1 1918	700,000,000
25th—Nov. 1918	700,000,000
	(Financial year) £2,500,000,000
Total (1914-8).	£8,742,000,000

Chancellor of the Exchequer in 1916, that the Budget should provide for all normal expenditure and the war debt charge. This standard of finance was high—higher than that aimed at by any other belligerent. Thus in the year 1915-6, expenditure amounted to £1,559,188,000, of which £336,737,000 was provided by revenue. Tax revenue amounted to £190,088,000 or 18.6% of the expenditure. In 1916-7, £573,428,000 was raised by revenue, or 26% of the total expenditure, tax revenue being £514,105,000, or 25.3 per cent. In 1917-8 tax revenue contributed 27.7% to the expenditure, the total revenue being 26.7 per cent. In 1918-9 tax revenue yielded 29.7 per cent.

Increased taxation was imposed in each War Budget. As far as possible the Government relied upon screwing up existing taxation, and avoided as far as possible the imposition of new taxes. The only new tax of any great importance was the Excess Profits Duty. This duty (see EXCESS PROFITS) was extraordinarily prolific and ranks as one of the most skilfully devised fiscal measures of the war; it was largely imitated abroad. It sought to appropriate for national purposes a large slice of the exceptional profits secured by those engaged in business, and at the same time to provide a big new additional source of revenue. The duty was first imposed in 1915, and was applied for a period of seven years to all businesses. At first the rate was 50%; it was increased to 60% in April 1916, and from 60 to 80% in May 1917. No change was made in 1918, but in 1919 the rate was reduced to 40%; and raised again to 60% in 1920. In the budget of 1921 it was brought to an end.

Income Tax (see INCOME TAX) was doubled in the first War Budget introduced on Nov. 17 1914 by Mr. Lloyd George. It was raised from 1s. 3d. to 2s. 6d., and the rate for earned income was hoisted up from 0d. to 1s. 6d. in the pound. Super Tax was also doubled. In the third War Budget introduced in Sept. 1915 (the second was in May, 1915), 40% was added to income tax, the exemption limit was reduced from £160 to £130, and abatement limits from £160 and £120 to £130 and £100 respectively. The reduction made in Sept. 1915 in the limit of exemption to incomes below £130 increased the number of taxpayers by a very large figure, practically every working man being rendered liable to the tax. To meet the convenience of the working class taxpayers' quarterly assessments were introduced. These classes insisted upon a differentiation between married men and bachelors. This was made in 1918-9 and subsequent Budgets, the differentiation taking the form of an abatement in income of £25 in respect of a wife living with her husband.

An "entertainments tax" was introduced in the Budget for 1916-7, the tax ranging from 3d. on a 2d. ticket to 1s. on a 12s. 6d. ticket, with an extra shilling for every 10s. over 12s. 6d. In the following year this tax, which proved successful, was increased by 50 per cent. Other new taxes imposed in 1916

Liabilities and Credit (000's omitted).

Year ended March 31.	Gross Liabilities of State.	Assets Estimate.		Loans to Allies.	Loans to Dominions.	Loans for Relief to European Countries.
		Suez Canal Shares Market Value.	Other Assets.

1921	7,619,000	—	—	1,786,900	144,000	16,700

*Figures not available.

earned income of £2,000 was entitled to deduct £200, but if the earned income exceeded £2,000 not more than £200 was deductible. On the first £225 of taxable income arrived at after deducting the various allowances provided for—such as one-tenth in respect of earned income, wife and child allowances, insurance premium, dependent relief, etc.—tax was imposed at half the standard rate; namely 3s. in the pound and at 6s. on each pound in excess of £225. Thus the various rates of tax previously in use were abandoned and two rates of tax put in their place. Super-tax was stiffened and regraduated.

The table above shows the aggregate gross liabilities of the State on March 31 in each of the years 1910–21, together with figures of assets, loans to countries allied to Great Britain during the war, and also to the Dominions, and advances for European relief granted after the termination of the hostilities:—

To sum up, the World War cost Great Britain over £10,000,000,000, while if allowance be made for the expenditure of the Dominions the total would be very much greater. An analysis of the expenditure of the United Kingdom from 1688 to 1920 disclosed the fact that in the six financial years from March 31 1914 to March 31 1920, Government expenditure exceeded the total expenditure for the 2½ centuries preceding 1914. The figures are: for the 226 years 1688 to 1914, £10,944,000,000; for the six years 1914–20, £11,268,000,000. Thirty-six per cent. of this latter sum was paid in revenue, and the remaining 64% was borrowed. The British people provided about £9,900,000,000 out of their own resources towards the six years' expenditure, or £215 per head. Though this vast expenditure was really the outcome of inflationary methods of finance, the system of inflation was not the same as that practised on the continent of Europe but was based on Treasury Bills or Ways and Means advances. These credit instruments were based not upon gold but upon currency notes. Inflation had the effect of reducing the pre-war unit of value: before the war the unit of value was the sovereign containing 123.274 grains troy of gold; in 1920 the unit of value was a paper pound representing no definite weight in gold, but varying in gold value from day to day. (C. J. M.)

ENGLISH HISTORY, 1910–1921. (see 9.466–582).—I. BEFORE THE WAR, 1910–12.—At the death of Edward VII. on May 6 1910, he was succeeded on the throne by his only surviving son as George V. (see GEORGE V.). The coronation at Westminster Abbey took place on June 22 1911, and was followed by State visits to Ireland, Wales, and Scotland; but an even more important act in the public assumption of Imperial authority was undertaken during the winter of 1911–2 in the visit paid by the King and Queen to India. At the Delhi Durbar (Dec. 12 1912), at which the King was crowned as Emperor of India, His Majesty announced that in future Delhi would replace Calcutta as the capital, and that Lord Curzon's unpopular partition of Bengal would be annulled. No hint of such an impending *coup d'état* as was represented by the latter announcement had previously leaked out, and no single act of Government in the history of the British constitutional monarchy had ever exhibited so strikingly the latent resources of the Throne as an extra-parliamentary factor in Imperial administration.

Without sending any communication to Parliament, the home Government had deliberately utilized the King-Emperor's authority to carry out an autocratic act of State policy in India, which otherwise could not have been accomplished without considerable friction.

(For a full account of the action here involved, see INDIA.)

It is only right to emphasize the interest attaching, at the opening of the new reign, to the position of the British Throne, as such. In the varied and exacting functions which it is expected to perform, much inevitably depends on the extent to which popular respect and affection surround the royal family. King George was able to benefit, in this respect, from a long growth of public confidence, and from the general acceptance of the theory that, so far as possible, the Crown should be kept out of politics in the party sense. It was all the more important, at King George's accession, that the personal popularity of the royal family should have been unquestionable, because of the political crisis amid which King Edward's death had occurred. Since the Lords' rejection of the budget in 1909 the whole course of domestic politics had been quasi-revolutionary; as between the contending political parties the *impasse* had become complete when the conference of 1910 broke down, and when immediately afterwards the second general election of that year gave the Liberal Government once more a majority. But the Crown remained by universal consent an imperial and social factor of all the more potential value as a moderating influence because of the warring of political factions.

"English" history to-day cannot indeed be written without reference to the British Empire, as a unit greater than is represented by "home" (i.e. English, Welsh, Scottish and Irish) politics (see BRITISH EMPIRE). The Imperial "idea," to which Mr. Chamberlain's administration of the Colonial Office and the emergency of the Boer War had given such a pronounced impetus, was already progressing with rapid strides at the opening of the new reign both in Great Britain and the Dominions. After 1900, moreover, the question of Imperial Defence had become acute, in consequence of the rapid increase of the German navy and its manifest challenge to British sea-power. The most remarkable incident during the Imperial Conference of 1911 was the confidential discussion of British international policy, at which the Colonial representatives were addressed by Sir Edward Grey with a detailed account of the situation in foreign affairs. For the first time, it was felt, the Empire as a whole had been taken into the counsels of the statesmen of the mother country. A naval defence scheme was adopted: providing for the maintenance of the various naval services and forces under the control of their respective Governments, but for making the training and discipline uniform with those of the fleet of the United Kingdom and for arranging an interchange of officers and men, while in war-time the Colonial ships placed at the disposal of the Crown would be under the British Admiralty. The movement for increasing the Colonial naval forces, as part of an Imperial navy acting as a single unit, was also notably forwarded by the visit to England of the Canadian Premier, Mr. Borden, with other Canadian ministers, in 1912,

for the purpose of discussing the whole subject with the home Government and the Committee of Imperial Defence.

In connexion with the Imperial Conference of 1911 it may also be noted that resolutions were adopted by it in favour of: (1) an Imperial Naturalization Act, based on a scheme to be agreed upon, but still undefined, for conferring an uniform British citizenship throughout the Empire; (2) the appointment (carried out in 1912) of a royal commission, representing the whole Empire, to investigate and report on its natural resources, and the possibility of their development; (3) the establishment of a chain of British State-owned wireless telegraphic stations within the Empire (under the Marconi agreement of 1912).

The history of domestic British politics up to the outbreak of war in 1914 continued to be dominated by the state of the parties resulting from the general election which was precipitated in Dec. 1910 when the private conference between the Liberal and Unionist leaders on the constitutional crisis broke down (see 20.846, 847). The result of this second appeal to the constituencies showed that the short interval since the general election of Jan. 1910 had made practically no difference in the balance of party power.

The new Parliament opened in Feb. 1911 with a ministerial majority of 122, the combined forces of the Liberals under the leadership of Mr. Asquith as Prime Minister (370), with the Labour party (42) and the Irish Nationalists (84), numbering 396, while the Unionists numbered 274. In the Cabinet, Mr. Asquith, Mr. Lloyd George (Chancellor of the Exchequer), Mr. Winston Churchill (Home Secretary from Feb. 1910 till Oct. 1911 and then First Lord of the Admiralty), Sir E. Grey (Foreign Secretary), and Mr. R. B. Haldane, who was created a peer as Viscount Haldane in March 1911 (War Minister till July 1912, and then Lord Chancellor), stood foremost in dominating the manoeuvres of the Liberal party. Behind them in the House of Commons the most prominent members of the Ministry holding major offices were: Mr. Birrell (Irish Secretary since 1907); Mr. John Burns (President Local Government Board since 1905); Mr. Sydney Buxton (President Board of Trade since Feb. 1910); Mr. L. V. Harcourt (Colonial Secretary since Nov. 1910); Mr. Reginald McKenna (First Lord of the Admiralty from 1908 till Oct. 1911, and then Home Secretary); Mr. J. A. Pease (Chancellor of the Duchy of Lancaster from 1910 till Oct. 1911, then Education Minister); Mr. Walter Runciman (Education Minister from 1908 till Oct. 1911, then President Board of Agriculture); Mr. Herbert Samuel (Postmaster-General); Sir Rufus Isaacs (Attorney-General since March 1910) and Sir John Simon (Solicitor-General since March 1910). The Labour party was led by Mr. J. Ramsay Macdonald, and the Irish Nationalists by Mr. John Redmond.

In the Upper House Liberalism had but a small following, under the leadership of Lord Crewe (Sec. of State for India Nov. 1910), but it included Lord Morley (Lord President of the Council, Nov. 1910) and Lord Loreburn (Lord Chancellor since 1905). Lord Rosebery continued to plough a lonely furrow, and Lord Courtney of Penwith to play the part of a political Aristides.

On the Unionist side, Mr. Joseph Chamberlain being physically incapacitated and now only an abiding inspiration to his political followers, Mr. Balfour had no rival as a parliamentary figure. He was loyally supported in the House of Commons by ex-Ministers in Mr. Austen Chamberlain, Mr. Walter Long, Mr. Bonar Law, Mr. H. Chaplin, Mr. G. Wyndham, Mr. A. Lyttelton, Sir R. B. Finlay and Sir E. Carson (leader of the Irish Unionists). In Mr. F. E. Smith, K.C. (afterwards Lord Birkenhead), who had made a rapid and brilliant success both at the bar and in politics, the party had an indefatigable worker and an audacious orator,—a good foil to Mr. Churchill.

In the House of Lords Lord Lansdowne was the recognized Unionist leader, actively supported by such ex-Ministers as Lord Halsbury, Lord Londonderry, Lord Curzon, Lord Middleton, Lord Selborne, Lord Cawdor, Lord Salisbury, Lord St. Aldwyn; and the Duke of Norfolk, Lord Cromer and Lord Milner were other important figures on the same side.

The Unionists were now united by the common bond of resistance to the Radical-Socialist programme of their opponents. The precise form which the tariff-reform policy would take if the party were returned to power was debated according to varieties of opinion on electioneering tactics; but it was sufficient for the moment for those Unionist politicians who had opposed it altogether, or still wavered as to details, to await events. While a protective national economic policy was advocated by the Tariff Reformers as an essential condition of the improvement of industrial and social conditions at home, the Unionist leaders were looking anxiously to the wider Imperial issues beyond the solution of immediate domestic problems. Hopes were still entertained that, either by agreement between the parties or through the failure of the Ministry to obtain the King's consent to actual coercion of the House of Lords, the immediate constitutional crisis might be solved or the Government forced to resign or once more dissolve in circumstances more favourable than before to a Unionist success at the polls.

It was clear from the first that the Government could rely on the support of the Irish Nationalist party. The passing of the Parliament bill was an essential preliminary to the successful accomplishment of Home Rule, and it had been Mr. Redmond's policy ever since the elections of Jan. 1910 to press the destruction of the peers' veto to its final issue for that purpose. The only doubtful element in the situation was the Labour party. Its parliamentary programme included a "Right to Work" bill which the Liberal party could no more support than the Unionist; and having successfully extorted the Trade Disputes Act from Parliament in 1906, it was set on obtaining from the Government a bill for reversing the "Osborne Judgment" and freeing the employment of trade-union funds for political purposes. The fact, however, that the "independence" of the Labour party was dominated by reluctance to put Liberalism in a minority, is so far as it stood for causes with which the Labour party also identified itself, made its parliamentary position one over the manoeuvring of which the Government's Whips had the upper hand.

On Feb. 6 1911, the first Parliament of George V. was opened. On Feb. 21, the Parliament bill was reintroduced in the House of Commons, and had a first-reading majority of 124 next day; the second reading was carried on March 2; and on the 15th the third reading was carried by a majority of 362 to 241, and the bill was sent up to the House of Lords. A few trivial changes had been accepted in its wording, but all the substantial amendments proposed by the Opposition had been negatived. A Labour party amendment to omit the words in the preamble, pledging the Government to set up a reformed Second Chamber, was rejected (May 2) by 218 to 47, Mr. Asquith declaring that the Government regarded it as an obligation, if time permitted, to propose a scheme for reconstituting the Upper House within the lifetime of the existing Parliament.

Every attempt of the Opposition to modify the operation of the Parliament bill was met by dogged resistance. The principal demand of the Opposition, that important constitutional changes should not become law, if rejected by the House of Lords, until they had been submitted to the judgment of the country, was of no avail. The Government's reply was that the country, in giving them a majority, knew quite well what the Parliament bill would be used for, and that the two years' interval it allowed for delay was an ample safeguard against legislation to which the people were opposed.

Meanwhile the alternative policy of the Unionist party was being made clearer in the more congenial atmosphere of the Upper House. A bill proposed by Lord Lansdowne for reforming its constitution was read a second time on May 22. The whole principle of this scheme of reform was that, while the composition of the Upper House would be changed and put on a representative basis, in accordance with the policy of Lord Rosebery's resolutions in 1910 (see 20.847), its powers would remain as they

Parties in Parliament, 1910.

The Position of the Government.

The Parliament Bill.

The Action of the House of Lords.

were. Under it, the reconstituted House would consist (except for royal princes) of "Lords of Parliament," summoned as such and not because of any hereditary title; 100 would be elected by the hereditary peers from such among their number as were qualified, under a schedule to the bill, by having held various public positions or ranks in the public services; 120 would be elected to represent different districts of the United Kingdom by colleges of electors consisting of the members of the House of Commons for the constituencies within those districts; 100 would be appointed by the Crown (i.e. the Ministry) so as to represent the proportional strength of parties in the House of Commons; seven would be "spiritual lords," i.e. the two archbishops and five bishops to be elected by the Anglican Episcopate; and 16 would be peers who had held high judicial office. Except for the law lords, who would sit for life, and the spiritual lords, who would sit while they occupied their sees, the lords of Parliament would sit for 12 years, subject to one-fourth in each class (selected by ballot) retiring every third year. Peers who were not "Lords of Parliament" would be eligible for the House of Commons, but the creation of new hereditary peerages for commoners other than past or present Cabinet ministers was to be limited to five a year. In Lord Lansdowne's view, such a reform of the constitution of the Upper House, which followed on the lines of suggestions already thrown out by Lord Curzon and Lord Selborne, would provide a representative Senate, of which the existing Unionist party preponderance would no longer be characteristic.

So long, however, as the Government flatly declined to accept any reconstruction of the Upper House as a substitute for the Parliament bill, any such proposals were mere beating of the air. The actual scheme excited no particular interest on the Unionist side, and was assailed by Liberals on the ground that, according to their calculations, while pretending to be representative, it would simply stereotype a Tory majority. On the day after it was read a second time, the second reading of the Parliament bill was taken (May 23), and the real issue had to be faced; but the approach of the coronation, and the prevalence of a feeling that, in spite of bellicose utterances in the Liberal press as to the creation of 500 new peers for swamping opposition, the Government might still be forced to a compromise, made the debate still only a manoeuvre for position, and Lord Lansdowne decided not to divide against the bill but to propose amendments in committee.

The real fight only began when the coronation was over. The committee stage of the Parliament bill lasted from June 28 to July 6, and, in spite of warnings from Lord Morley that the Government would refuse, in the House of Commons, to accept them, Lord Cromer's amendment (June 28), substituting a joint committee for the Speaker in deciding what a "Money bill" was, and Lord Lansdowne's amendment (July 5), providing for a referendum in specific cases of measures attacking the existence of the Crown, the Protestant succession, or the establishment of national parliaments with legislative powers in Ireland, Scotland, Wales or England, were carried by large majorities. On July 20 the bill, so amended, was read a third time without a division, Lord Lansdowne declaring that the principal amendments were "so essential that we should certainly not be prepared to recede from them so long as we remain free agents." Lord Halsbury went still further: "but for the existence of the amendments, he would have himself moved the rejection of the bill on the third reading, and unless those amendments were accepted in substance, in meaning, and in operation, he would never consent without a division to the passing of the bill."

The next day the Government exploded their bombshell. It had been a mystery up to this moment whether Mr. Asquith

had obtained from the King a definite assent to the use of the royal prerogative for creating peers, and the question whether such a course could possibly be resorted to had been freely discussed from the time when the Parliament bill was first proposed. All doubts were now set at rest. On July 21, a letter from Mr. Asquith

to Mr. Balfour in the following terms, written the day before, was published:—

I think it courteous and right, before any public decisions are announced, to let you know how we regard the political situation. When the Parliament bill, in the form which it has now assumed, returns to the House of Commons, we shall be compelled to ask that House to disagree with the Lords' amendments. In the circumstances, should the necessity arise, the Government will advise the King to exercise his prerogative to secure the passing into law of the bill in substantially the same form in which it left the House of Commons, and His Majesty has been pleased to signify that he will consider it his duty to accept and act on that advice.

In the subsequent debates in both Houses of Parliament (Aug. 7 and 8) on votes of censure moved by the Unionist leaders, the course taken by the Government was more fully explained. It appeared that the Cabinet had presented a memorandum to the King on Nov. 15 1910, before the general election, as follows:—

His Majesty's ministers cannot take the responsibility of advising a dissolution unless they may understand that in the event of the policy of the Government being approved by an adequate majority in the new House of Commons, His Majesty will be ready to exercise his constitutional powers, which may involve the prerogative of creating peers, if needed, to secure that effect shall be given to the decision of the country. His Majesty's ministers are fully alive to the importance of keeping the name of the King out of the sphere of party and electoral controversy. They take upon themselves, as is their duty, the entire and exclusive responsibility for the policy which they will place before the electorate. His Majesty will doubtless agree that it would be inadvisable in the interests of the State that any communication of the intentions of the Crown should be made public unless and until the actual occasion should arise.

The King had felt that he had no alternative except to assent, though he did so, as Lord Crewe now stated, "with natural and legitimate reluctance." The Government had hoped that, as the result of the general election, the Parliament bill would be allowed to pass without amendments which would be fatal to its purpose, and therefore without a disclosure of the confidential understanding which all the time existed as to the use of the prerogative, but this was no longer possible; the only question now was whether the threat was to be sufficient.

It was clear that, in the House of Commons, the Lords' amendments would be summarily rejected by the Government majority. The further developments of the political crisis depended, therefore, on what would happen in the House of Lords when the bill was sent back to it. A hurried meeting of Unionist peers was held (July 21) at Lansdowne House, at which Lord Lansdowne informed them that the Government had told the Opposition leaders that their intention was not to send the bill up from the House of Commons unless an assurance was given that it would be passed, the assumption being that, in the absence of this assurance, peers would at once be created in sufficient numbers for the purpose; and it was freely stated in the Liberal press that the Government Whips had a list ready of persons who were prepared to accept peerages on condition that they voted for the Liberal programme. A state of extreme exasperation prevailed, but a considerable majority of Unionist peers agreed with Lord Lansdowne's view that, if this creation of peers were proceeded with, not only would the Parliament bill be passed, but even such opportunities as it left open for subsequent resistance to Home Rule and similar measures would be nullified; the only prudent course, in the interest either of the Unionist party or of the peerage, was to sink further opposition, now that they were no longer "free agents." On the other hand a minority, whose view was strongly expressed by Lord Halsbury, bitterly opposed such a surrender; in their view they did not cease to be "free agents" until they were actually out-voted. It was in this sense that they had understood Lord Lansdowne's use of the phrase on the third reading and it was only on that condition that they had not rejected the bill then. They still regarded the Government threat as a piece of bluff. It was asked whether it could be regarded as certain that, when the 500 eligible magnates who were willing to take Liberal peerages had voted for the Parliament bill, they would not take a more independent view of their position

The Use of the Royal Prerogative.

so far as Home Rule and other measures were concerned. The class of men whom Mr. Asquith was prepared to nominate for the purpose would hardly be different from those who in recent years had been added, quite acceptably, to the House of Lords by Liberal initiation in considerable numbers, and who had in many cases come round there to a different way of thinking.¹ A further argument was that if a creation of peers was avoided now, it would not prevent its being resorted to if the House of Lords subsequently rejected the Home Rule bill.

Between these opposing views of the situation, a cleavage in the Unionist ranks was at once manifest. Mr. Balfour decided to "stand or fall" with Lord Lansdowne's advice, and they were followed by much the larger numbers; but public interest centred in what was known as the "Die-Hard" movement, which was actively organized under Lord Halsbury's leadership and initiated at a largely attended and enthusiastic dinner in his honour at the Hotel Cecil on July 26, at which Lord Selborne presided, supported by Lord Salisbury, Lord Milner, the Dukes of Northumberland, Marlborough, Bedford and Somerset, Mr. Austen Chamberlain, Mr. George Wyndham, Sir Edward Carson, Lord Hugh Cecil, Mr. F. E. Smith, Lord Willoughby de Broke, and other prominent men. How many peers would follow the lead given by Lord Halsbury and vote against the unamended bill when it was again sent up was still uncertain, but as Lord Lansdowne and the bulk of those who accepted his advice were only prepared to desist from further opposition, and would not assist the Government affirmatively by voting for a measure they detested just as much as the "die-hards," it was impossible for him to give Mr. Asquith the assurance he had demanded. A period of extreme tension and uncertainty followed. On July 24, when Mr. Asquith was to move in the House of Commons that the Lords' amendments be disagreed with, he was howled down from the Unionist benches, amid a scene of great disorder, which was repeated next day, and it was not till Aug. 8 that the motion for disagreeing with the Lords' amendments was carried by 321 to 215, after the Government had agreed to introduce a few minor changes. Meanwhile Mr. Balfour had endeavoured to placate the whole of the Unionist party by moving a vote of censure (Aug. 7), which was rejected by 365 to 246, and in the House of Lords a similar vote of censure moved by Lord Curzon (Aug. 8) was carried by 282 to 68.

The Parliament bill was sent up again to the Lords for their acquiescence in the striking-out of their amendments, and the crucial debate there took place on Aug. 9 and 10. In answer to Lord Rosebery, Lord Morley made the precise statement that if the bill was defeated "His Majesty would assent to a creation of peers sufficient in number to guard against any combination of the different parties in Opposition by which the Parliament bill might again be exposed to defeat." This declaration had a marked effect on the result. Up to the last moment the figures on the two sides were in doubt, but the division showed 131 in favour of passing the bill, and only 114 for insisting on the amendments. The Government had won the day by the help of enough votes from peers who usually acted with the Opposition to counterbalance the "die-hards." Thirty-seven Unionist peers, the two archbishops, and 11 bishops voted with the Liberals; but Lord Halsbury's followers were more than had been expected, several peers, including the Duke of Norfolk, joining them in protest against the action of the Unionists who helped to carry the bill. Lord Cromer, who had been active in getting Unionist peers to support the bill on the ground that only in this way could the damage likely to accrue from a creation of new peerages be avoided, was absent through illness; and Lord Curzon's was eventually the most powerful influence exerted in this direction, his action being all the more hateful

to the "die-hards" because earlier he had been specially prominent in counselling resistance to the bill at all costs.

The Parliament bill thus became an Act and duly received the royal assent; and a statutory enactment defining the relations between the two Houses of Parliament was substituted for an unwritten British constitution. *The bill as passed.* As compared with the original form in which it was introduced (see 20.846, 847), various small drafting alterations were made, including an improved definition of a "money bill," and a more definite exclusion of private bills from the scope of the measure; but the only changes of any substantial importance were the following. (1) A provision by which the Speaker, before giving his certificate (to be endorsed on every money bill sent up to the House of Lords) that a bill is a money bill, "shall consult, if practicable, two members to be appointed from the chairman's panel at the beginning of such session by the committee of selection." (2) Provisions excluding from any public bills, as to which the Lords' consent would not be required after being sent up in three successive sessions, "a bill containing any provision to extend the maximum duration of Parliament beyond five years," and also "any bill for confirming a provisional order." (3) A provision altering the limits of the two years which must have elapsed during the three successive sessions to "between the date of the second reading in the first of those sessions of the bill in the House of Commons and the date on which it passes the House of Commons in the third of those sessions." (4) A provision requiring a certificate signed by the Speaker, stating that the provisions of the Act in this respect had been complied with, to be endorsed on any bill so presented to the King for his assent notwithstanding the opposition of the House of Lords. (5) A provision that "in every bill so presented to the King, the words of the enactment shall be as follows:—'Be it enacted by the King's most excellent Majesty, by and with the advice and consent of the Commons of this present Parliament assembled, in accordance with the provisions of the Parliament Act, and by authority of the same as follows.'"

In all vital respects the Parliament Act remained as originally introduced in 1910. Though its preamble declared that reform of the House of Lords itself still remained a task for the future, the supremacy of the House of Commons, both for purposes of finance and for public legislation, was definitely enacted. While the Act, however, on the face of it, made the Government masters of the situation, it was recognized by people who looked a little ahead that in practice it might not work quite as its authors contemplated. In order that its provisions should apply, to the extent of bills becoming law over the resistance of the Lords, these bills had to be sent up in time for two years to elapse during the same Parliament, and during these two years they had to be sent up again and again without being changed from their original form. As the duration of Parliament was cut down to five (practically four) years, this meant that nothing not sent up in the first year or two would benefit by the Act; and apart from that, it would be difficult to avoid changes in bills sent up year after year. Even as regards "money bills," which the House of Lords was now to have no power of rejecting at all, the prospect was uncertain. The Budget of 1909, the rejection of which was the cause of the whole revolution, was probably considered a money bill by most Radical politicians; but the Speaker (Mr. J. W. Lowther) upset any such calculations in Dec. 1911 by ruling, in answer to a question, that the Budget of that year was not a money bill within the Parliament Act—a *fortiori*, therefore, neither was that of 1909.

On the very day that saw the triumph of the Parliament bill (Aug. 10) yet another great alteration was being made in the essential conditions of parliamentary life. Following an invitation already given by Mr. Lloyd George, a resolution was carried in the House of Commons by 236 votes to 158, providing "for the payment of a salary at the rate of £400 a year to every member of the House, ex-

¹ It is worth noting in this connexion that between 1868 (when modern Liberalism and Conservatism practically started as organized parties) and Oct. 1912, the new peerages created by Liberal Governments numbered 164 and those created by Conservative Governments 149. Mr. Asquith alone had created 52 new peers up to Oct. 1912 since he became Premier in 1908.

cluding any member who is for the time being in receipt of a salary as an officer of the House or as a minister, or as an officer of His Majesty's Household." Most of the Unionists were opposed to the proposal, and a good many Liberals did not like it, but the Government had determined to introduce payment of members as a way out of the difficulty they had with the Labour party, owing to the Osborne Judgment having made illegal the payment of salaries to working-class members out of trade-union funds (*see* 27.143). To legislate in the way the Labour party demanded, so as directly to reverse the Osborne Judgment, was impossible, though the Government were prepared with a bill—unsatisfactory to the Labour party and not proceeded with, a second edition being introduced in 1912—for enabling trade unions to make special provision for voluntary political funds, separately from the general funds to which every member of the union had to contribute; but it was hoped that payment of all M.P.'s out of public money would do away with the particular grievance of the Labour members. In the country generally a good deal of disgust was felt at the calm way in which M.P.'s had voted themselves £400 a year, and some members who were too well-off to want the subsidy declined to take it.

Further complications with Labour were being threatened all this time outside Parliament. Industrial unrest was taking a peculiarly acute and dangerous form. Though trade **Labour** generally was busy, and "unemployment" steadily **"Unrest."** diminished,¹ the demand of the wage-earning classes for a proportionately larger share of the good things of life—better pay and less work for it—had become more articulate and better organized. Socialist—and particularly "Syndicalist"—theories had for some time been getting a strong hold of the younger generation of trade unionists; and a growing sense of the impotence of the Labour members in Parliament, added to increasing suspicion that Liberals and Tories alike were in league with the "money power," encouraged the idea that "direct action" by means of strikes was the only way of successfully asserting the claims of the operatives to a larger share of the profits of industry. The fact that wages, under existing agreements, practically remained stationary, while the cost of living, owing to higher prices, was going up, gave a solid basis for discontent. The result was seen, not only in numerous local conflicts between Capital and Labour, but in the threat of more extended "general" strikes, which aimed at holding up whole industries throughout the country and compelling parliamentary intervention.

For the first time in the history of English labour troubles a "national" strike was precipitated in 1911, and private war was made on the whole community by the members **Railway** of the railway unions. Since 1907 there had been a **Strike, 1911.** continual agitation among members of the Amalgamated Society of Railway Servants for better wages and shorter hours, and for "recognition" of their trade union by the railway companies, which had been steadily refused by all except the North Eastern Company (after an arbitration in 1897). A general railway strike was only averted in 1907, as the result of negotiations carried on by Mr. Lloyd George as president of the Board of Trade, by an agreement between both sides to accept a scheme of conciliation and arbitration proposed by him. But the actual working of the conciliation boards then set up proved very disappointing to the railwaymen; and the movement came to a head again in Aug. 1911. Strikes had been going on in Liverpool, Manchester, London and elsewhere, among various other classes of transport workers—seamen, dockers and carters. In London a violent dock strike was only terminated early in Aug. by an award of Sir Albert Rollit, increasing wages; and a carmen's strike, which had been accompanied by serious disorder and had driven the Government to order troops from Aldershot, was brought to an end with considerable difficulty

¹ The only official figures for "unemployed" issued by the Board of Trade were for the trade unions. In these the percentage, which was 9 in 1908 and 1909, fell to 5 in 1910 and 3 in 1911.

at the same time by the intervention of the Board of Trade, the men securing concessions both as to hours and wages. At Liverpool a protracted dock strike had driven the ship-owners on Aug. 3 to agree to "recognize" the Dockers' Union and make other concessions; but a number of strikers refused to go back to work; and the ship-owners then announced a general lock-out to begin on Aug. 14. The answer of the dockers' strike committee, led by Mr. Tom Mann, was to call on all transport workers to assist them by striking in sympathy, and wild scenes of rioting resulted, requiring the introduction of troops to help the Liverpool police. The general unrest now spread in an active form to the railwaymen too. At Liverpool the goods porters at the Lancs. & Yorks. stations struck on Aug. 5 because of the delay in dealing with their grievances, and at other stations the men came out in sympathy. On Aug. 15 the joint executives of the four railwaymen's unions—Amalgamated Society of Railway Servants, Associated Society of Locomotive Engineers and Firemen, General Railway Workers' Union, and Signalmen's and Pointsmen's Union—decided to order a general strike unless in 24 hours the companies agreed to meet them and discuss terms. The companies at once refused to do so, or to admit that the conciliation scheme of 1907 could be thrown over in this way. The leaders of the men on the other hand contended that the spirit, if not the letter, of the agreement of 1907 had never been carried out, and that they must have direct recognition of their unions. The machinery of the Board of Trade was set to work to try to delay a rupture, but meanwhile the companies were guaranteed military protection, and preparations were made for placing soldiers along the lines.

On Aug. 17 Mr. Asquith had an interview with the men's representatives, and offered a royal commission to inquire into the working of the conciliation scheme, but at the same time he warned them gravely and firmly that the Government could not allow the railway service of the country to be paralyzed. Resenting the tone of his speech, and suspicious of a royal commission as simply a means of shelving the whole matter, they refused this offer and ordered the strike, which began next day in spite of continued efforts by Mr. Lloyd George (Mr. Asquith having left further action to him) to overcome what seemed to be a misunderstanding. As the result of his explanations to the men's leaders negotiations still went on; a vote of censure on the Government which the Labour party at first decided to move in the House of Commons was not proceeded with; and instead of Parliament being adjourned on Aug. 18 until the autumn session, as had been arranged, it was decided to meet again on Aug. 22 in order to deal with the situation. The strike was in actual operation for practically two whole days and did not terminate till Aug. 20. On the 19th, however, a settlement was effected. It was agreed that a special commission should at once investigate the working of the conciliation scheme and report quickly what changes were desirable, and that the trade-union leaders should persuade the men to return to work, the strikers being reinstated. The special commission started work on Aug. 23 and took evidence from both sides up to Oct. 3, its report being issued on Oct. 20. It was unanimously recommended that the conciliation scheme should be amended in various ways, the central board being abolished and any differences within the sectional boards being settled by an independent chairman chosen from a panel drawn up by the Board of Trade; trade-union "recognition" by the companies was not directly conceded—the commissioners pointed out that the companies could not permit intervention on the subject of discipline and management—but some satisfaction was given in this direction by a recommendation that the men should have anybody they wanted (e.g. a trade-union official and not actually an employee) on the sectional boards as their secretary and advocate. The Labour party and trade-union leaders were by no means satisfied, however, with the result of the commission. The union leaders decided to take a ballot in Dec. on the question whether the findings of the commission should be accepted or another strike for "recognition"

started; and when the report of the commission came up for discussion in the House of Commons on Nov. 22 the situation was still a very difficult one. A resolution was moved by Mr. Lloyd George asking the Government to bring about a further meeting between the representatives to the agreement of Aug. 19; but this was only carried after a contentious debate displaying obstinacy on both sides, Mr. Ramsay MacDonald insisting that the men had not agreed to accept the report and that "recognition" was indispensable, while the view of the companies was that the Government ought to hold the report as binding on both parties. It was not till Dec. 11 that, after a good deal of diplomacy on the part of the Board of Trade officials, a compromise was arrived at. Both parties agreed to accept the report of the commission as a basis for modifying the future working of the conciliation scheme, "recognition" being accepted to the extent of allowing the men to have their trade-union secretary as adviser. Various concessions as to wages and hours were also made by the companies.

As regards the strike itself, while in actual operation, the state of the railways during those two or three days was unprecedented. Some 220,000 men altogether, about a third of the workers, were out, and traffic was much restricted, the worst dislocation being in the N. of England, round Liverpool and Manchester. Troops were employed freely to guard the lines and give protection against violence, and in consequence there were only certain particularly disturbed districts where serious mischief occurred. On Aug. 19 an attack was made by rioters on a train at Llanelly, and the soldiers had to shoot, two men being killed, while an explosion due to the mob setting fire to some trucks containing gunpowder resulted in five more deaths; and at Liverpool, on the 15th, two men were shot in a riot. The employment of the military was furiously denounced by the Labour agitators, but the intimidation practised against non-unionists and the danger of extended sabotage were such that, on the whole, the comparative peaceableness of the stoppage, which occurred in a summer of unexampled heat, was rather remarkable. To a great extent, and particularly on the lines nearer London, this was due to the fact that a large proportion of the union men who went out (a certain number remaining loyal to the companies) only did so because they dared not disobey the union orders. One outcome of the railway strike, and of the general unrest of which it was a symptom, was an addition made by the Government to the official machinery applicable at the Board of Trade to the working of the Conciliation Act of 1906. In Oct. 1911 an Industrial Council, representative of employers and workmen, was instituted as a permanent body for considering and inquiring into matters referred to them concerning trade disputes, and for taking suitable action (but without any compulsory powers) on the same lines as the conciliation boards already adopted in particular industries. As chairman of this Industrial Council and "Chief Industrial Commissioner," the Government chose Sir George Asquith (b. 1861), head of the Labour Department of the Board of Trade, who had just been knighted in recognition of the valuable work he had done in recent industrial conflicts.

Meanwhile the National Insurance bill, introduced into the House of Commons by Mr. Lloyd George on May 4 1911, had brought new issues into the parliamentary conflict. This elaborate measure covered two distinct subjects, one being national health insurance, under newly constituted insurance commissioners for England, Wales, Scotland and Ireland (with a joint committee, formed from among them, for adjusting common affairs), assisted in each case by an advisory committee, with county and county borough committees for local administration, and the other unemployment insurance, directly under the Board of Trade.

(1) Unemployment insurance, administered largely through the labour exchanges, was applied to certain trades—building, construction of works (railways, docks, etc.), shipbuilding, mechanical engineering, iron-founding, construction of vehicles and saw-milling—with power for the Board of Trade to extend the scheme to others. Workmen in these trades (others than foremen, clerks, indentured apprentices, and persons under 16) would be entitled under various

restrictions to unemployment benefit (up to a standard of 7s. a week for not more than 15 weeks a year, starting at the second week of unemployment), out of an unemployment fund formed by each workman compulsorily contributing 2½d. a week (paid by employer and deducted from wages), employers 2½d. a week per man, and the State adding an amount equal to a third of their total contribution.

(2) For national health purposes, compulsory insurance was imposed on all persons (between 16 and 70) under contracts of service, with certain exceptions (including those employed otherwise than in manual labour, and paid over £160 a year, or possessing £26 a year from property), provision being also made for certain classes of employed persons to come into the scheme as voluntary contributors. Under the compulsory insurance (except for certain lower rates) male contributors were to pay 4d. a week, female 3d. (employers making the payments and deducting them from wages), and employers 3d. for each male or female employed (special stamps for each amount having to be affixed to cards for this purpose), the State adding to the National Health Insurance Fund an amount (two-ninths in the case of men, and one-fourth in the case of women, of the cost of benefits and administration) reckoned at 2d. a week per head. The benefits primarily secured were (i.) free medical treatment at home; (ii.) sanatorium treatment for tuberculosis and other diseases specified by the Local Government Board, the Government allocating £1,500,000 for the building of sanatoria; (iii.) payment during sickness of 10s. a week for men and 7s. 6d. for women up to 26 weeks; (iv.) subsequent payment during disablement of 5s. a week, and (v.) maternity bonus of 30s. to women (including wives of insured persons) on confinement; provisions being made for granting these benefits (medical attendance, sickness, and maternity benefits not till six months, disablement not till two years after payments started) or modifying and extending them as funds permitted. The agencies for administering the benefits were made (i.) "approved societies," i.e. the Friendly Societies, trade unions and such similar bodies as the insurance commissioners approved, the intention of the Government being to have as many as possible of the insured included as members of "approved societies"; (ii.) the post-offices, which would deal with those who would not join societies or whom societies would not admit, and who thus became "deposit contributors." The local health committees, among their other duties (including the administration of sanatorium benefit), were left to arrange for the service of medical practitioners for insured persons, preparing lists of doctors from among whom the patients were to have their own choice, payment to the doctors from the general fund being estimated for at the rate of 6s. (including cost of drugs) per head per annum. This feature of the bill, as explained by Mr. Lloyd George, quickly aroused the opposition of the doctors, who were organized under the British Medical Association to refuse their services unless a larger payment was made; and as a body the doctors stood out for better terms. As medical "benefits" under the Act became due on Jan. 15 1913, it became a question for the Government whether, if no terms could be arranged, a regular State medical service would not have to be started. On Oct. 23 1912 Mr. Lloyd George announced the Government's "final" offer to increase the capitation fee to 9s. (including drugs and extras); but on Nov. 19 the offer was rejected by an overwhelming majority of the profession at a representative meeting of the British Medical Association.

The second reading of the Insurance bill was carried without a division on May 29, and the committee stage went on intermittently from July 5 to Aug. 4, when, with the discussion on the 17th clause finished, Mr. Lloyd George was still able to regard the Opposition as favourably disposed towards the bill. Its remaining stages were then left over for the autumn session, which began on Oct. 24. But in the interval opposition had been growing, and the political situation in other respects was such that genuine coöperation with anything proposed by the Government was hardly possible if party capital could be made for the Unionists by what was unpopular in its programme. Not only were the doctors in full revolt against the terms proposed for their remuneration, but the working classes themselves were found to dislike exceedingly being taxed for benefits they were not able to appreciate. Mr. Lloyd George, ever an ardent electioneer, exasperated the Unionist party by his description of the bill as giving the working classes "ninepence for fourpence." Among domestic servants the scheme was cordially disliked. Though the bill was planned so as to involve financial coöperation between the State and the Friendly Societies, there was considerable uncertainty, moreover, as to how far a great many of the latter, especially the smaller local societies, would reap advantage rather than loss. Public discussion concentrated on the difficulties and objections. It was inevitable therefore that, so far as the political aspects of the bill were concerned, the attitude of the Opposition should be affected by the discovery of its wide unpopularity.

The result was unfortunate for a scheme which aimed at accomplishing so important a work of social reform. The Government had its programme for 1912 full, subject to the way being cleared by the Parliament Act, by the political necessity of proceeding with Home Rule and Welsh Disestablishment; and Mr. Lloyd George, whose influence on the parliamentary tactics of the Coalition was now supreme, determined to force the Insurance bill through before 1911 ended. When the House of Commons resumed on Oct. 24 Mr. Asquith carried a time-table resolution for closing the remainder of its stages; and by this drastic method the bill passed through committee on Nov. 21 and was read a third time on Dec. 6. Under such conditions the opportunity for effective Opposition criticism and amendment was so limited that very little was possible, in spite of the activity of Mr. Worthington Evans and other Unionist members, and towards the end it became a question whether the Unionist leaders would actually divide against the third reading, a course to which they were openly challenged by Mr. Lloyd George. Instead of this, an Opposition front bench amendment was moved by Mr. H. W. Forster, proposing that the bill should be postponed for further discussion, and this was defeated by 320 to 223, the third reading then being carried in a division in which the Opposition as a whole took no part, 21 members recording their votes against it. On Dec. 11 the bill was read a second time in the House of Lords, and, after various Government amendments had been inserted in committee on Dec. 14, it was passed and received the royal assent next day, when Parliament was prorogued.

During all this time, both inside and outside Parliament, opinion as to the scheme and its prospects had become more clearly crystallized. While Mr. Lloyd George and his supporters proclaimed it to be the most beneficial reform ever conceived in the interest of the working-classes, and taunted the Opposition with attempting to destroy it, the Unionists dwelt on the injury done by forcing through a measure which ought to have been more carefully considered before it became law, and threw the responsibility on the Liberal party for everything that was objectionable and unworkable in it. The by-elections showed that its unpopularity was continually growing; and under the arrangement made in the Act, that the insurance commissioners should during 1912 make regulations as to details, nobody knew yet what procedure would be adopted to overcome countless points of difficulty which under the Act itself remained quite unsettled. The medical profession, without whose co-operation, so far as could be seen, the Act would not work at all, continued to refuse it unless they were given better terms, to which Mr. Lloyd George was still unable to agree; and "passive resistance" was organized on their behalf by the British Medical Association.

It was, however, not only the stimulus given by the antagonism to the Insurance Act that was causing a revival of Unionist confidence after the defeat over the Parliament Act. During the autumn session of 1911 the Unionist party had started afresh under a new leader in the House of Commons. The "die-hard" revolt had been a final illustration of the dissatisfaction within the party at the way it had been led by Mr. Balfour for some time past. Had the Parliament bill been defeated in the House of Lords by the "die-hards," it was an open secret that both Lord Lansdowne and Mr. Balfour intended to retire from their positions at the head of the party, and it was largely the dislike of acting disloyally by them that confined the open revolt to a comparatively small section. Exasperation at the result, however, was general. Mr. Balfour himself did his best to smooth matters over, declaring in a public speech (Haddington, Oct. 7) that the question of the peers' tactics was now a dead issue, of no more practical importance than the controversy as to the identity of Junius; and the "die-hards," though they started a Halsbury Club and kept their organization in being, protested at the same time that the

differences within the party were ended with the cause of them, and that they only meant to work for the common good. But after some weeks of reflection, when the hubbub was all over, Mr. Balfour made up his mind that the right moment had arrived for him to retire from the leadership, though not from Parliament, in view of the arduous political struggles still impending, and the unlikelihood of his being strong enough in health, should the Unionists again return to power, to conduct a ministry. His announcement to this effect was made on Nov. 8, at a hastily convened meeting in the City of London. For a few days the question of who would succeed him was uncertain. Mr. Austen Chamberlain, not only as principal leader of the Tariff Reformers and one whose very name would, on his father's account, be most representative of the Imperialist movement, but as ex-Chancellor of the Exchequer and officially Mr. Balfour's deputy on the Opposition front bench, had apparently the strongest claim; but, as a Liberal Unionist, his selection was opposed by many Conservatives, who considered Mr. Walter Long a better choice; and Mr. Long's great popularity among all sections was much in his favour. It became clear to the partisans of both that if either were proposed, and votes were taken, it would only emphasize the division of opinion and create friction between their supporters.

It was found that Mr. Austen Chamberlain and Mr. Long were both prepared to stand aside in favour of Mr. Bonar Law, nominally a Conservative and at the same time a strong Tariff Reformer; and on their joint proposal he was quickly adopted as leader in the House of Commons (Lord Lansdowne continuing to be leader in the House of Lords), at a party meeting on Nov. 13. Their sacrifice of personal ambition set an example which did much to promote fresh confidence within the party; and Mr. Bonar Law had no sooner become leader than there were signs of improved Unionist prospects in the constituencies. In intellectual range, subtlety of exposition and criticism, and political experience, Mr. Balfour had, admittedly, no rival on either side, but he still remained in the fighting ranks, ready to devote himself to the Unionist cause as much as anybody. His retirement from the formal responsibilities of leadership gave freer play to the respect and admiration felt for him personally as a public man, while relieving the party of the accumulation of doubt as to his policy and tactics, which, rightly or wrongly, had led to undercurrents of dissension. To the plain man his detached and philosophical outlook on public affairs had been rather too lofty; to be "had" or tricked, as the party was openly taunted with being by its opponents, over the Budget of 1909 or the Parliament bill of 1911, simply meant that its leader had failed in astuteness; ardent Tariff Reformers, enthusiastic for Mr. Chamberlain's policy and pining for Mr. Chamberlain's aggressive tactics, felt that Mr. Balfour's balancing support of their proposals was unpractical and was confined to economic generalities. He was perhaps "too much of a gentleman" as well as "too little of a business man" for the situation. Mr. Bonar Law, on the other hand, was more of the Chamberlain type—a successful man of business, the clearest and most convincing platform exponent of Tariff Reform, a speaker who was accustomed to calling a spade a spade.

It so happened that the result of the Canadian elections at the end of Sept., and the defeat of Sir Wilfrid Laurier's American Reciprocity proposals, had delighted the Unionists and given them fresh confidence for the future of Imperialism. Canada had shown that she meant to keep her place in the Empire, and that antagonism to the prospect of becoming simply an annexe to the United States was more powerful than the temptation to secure immediate commercial advantages from reciprocity. Up to the last the result of the Canadian elections had been very uncertain, and the Tariff Reformers in England, who had been thoroughly depressed and disheartened by the idea that, if reciprocity between Canada and the United States were established, their hopes for Imperial commercial union would be frustrated, had in Mr. Borden's success a legitimate

Insurance Act passed.

Public discontent.

Mr. Balfour's resignation.

Reciprocity in Canada.

triumph for their own views of Imperial policy. Imperial patriotism in Canada had averted the greatest danger yet threatened, in spite of the support given by the Liberal Government at home and the British Ambassador at Washington. Every platform rang with Unionist rejoicings, and the Canadian victory put new heart into the Tariff Reform propaganda.

On yet another question of Imperial moment a rebuff was given to the ministerial policy. Throughout 1911 the decision of the Government to ratify the Declaration of London

had led to a prolonged agitation. Most of the Unionist party, together with a strong body of naval opinion, were actively opposed to it, their argument being that under its provisions the advantages of British supremacy at sea in war time would be seriously diminished. The Government succeeded, however (June 1 1911), in obtaining the support of the Imperial Conference, considerable weight attaching to Sir E. Grey's view that adhesion to the Declaration would be advantageous in Great Britain's foreign relations and to the cause of peace. As Parliament had no direct control over the action of the Government in the matter of ratification, political opposition centred on the Naval Prize bill which was introduced to carry out the provisions of the Declaration of London, the second reading being taken on July 3. So much headway was made in arousing antagonism to the Declaration itself that when the third reading of the Naval Prize bill came on in the House of Commons on Dec. 7 the Government only managed to get a majority of 47; and the House of Lords promptly rejected the bill.

The Government were meanwhile being perpetually worn and worried by the militant agitation for women's suffrage and by the difficulty of dealing with any legislation on the subject when the Cabinet was divided. The Prime Minister himself was avowedly opposed to women's suffrage altogether. On the other hand, Mr. Lloyd George, while professing himself a strong supporter of the cause, which was also advocated by Sir E. Grey and Lord Haldane, objected to any bill which was not thoroughly "democratic"; and because the "militants" regarded his attitude as obstructing the particular measure which they had in view, and held him responsible for a Government bill not being introduced as they desired, he was pestered as much as if he had actually been an open opponent like Mr. Asquith. The so-called "Conciliation" bill, introduced by Sir G. Kemp, which assimilated the parliamentary to the municipal

franchise for women and would give votes to about a million, had been read a second time in the House of Commons on May 5 1911, Mr. Asquith himself pairing against it while Mr. Lloyd George and other ministers supported it; and as there was no time for proceeding with the bill in 1911 the Government promised to give it "facilities" in the following year. But while the various sections of supporters of women's suffrage disputed about its prospects, and the "militants" raged together, Mr. Asquith suddenly made a new turn on Nov. 7 by announcing the intention of the Government to add to its programme a Franchise Reform bill on the lines of Manhood Suffrage. In answer to a deputation of woman suffragists on Nov. 17 he declared that, while he was personally opposed to women's suffrage altogether, this bill would be so drawn as to admit of amendment to include women on certain terms; and if an amendment, which the Government as such would not oppose, were carried, the Government would then adopt it. They would also, as had been promised, give facilities for the Conciliation bill.

It had been generally supposed that the Government would take advantage of the passing of the Parliament Act to reintroduce the bill against plural voting which the Lords had rejected in 1906, but this larger measure was totally unexpected, and the announcement was widely construed simply as a device for "dishing" women's suffrage. It was at once denounced for that reason by the "militants" who began to make more trouble than ever. From this moment the internal divisions within the Cabinet on the subject of women's suffrage, and the necessity of taking administrative action against "militant"

violence, remained a source of constant difficulty. When eventually, on March 28 1912, the Conciliation bill was rejected by 222 to 208, owing to disgust at "militant" tactics, the prospect of legislative action rested entirely with the question of an amendment of the Government Franchise bill, which was read a first time on June 17 1912, by 274 to 50, and a second time on July 12, by 290 to 218. In other respects this bill, which abolished plural voting and university representation, made six months' residence by adult males the only qualification for votes, and did away with existing restrictions as to registration, handing it over for automatic action by the municipal authorities, excited comparatively little public interest. There did not seem likely to be time, even if there were inclination, to pass it into law before the session ended. The Unionists, while objecting to details, opposed it mainly on the old ground that redistribution should accompany reform; while the Liberal rank and file, who for their own electioneering purposes were principally anxious to destroy the plural vote, felt that a simpler measure with that object would have sufficed. A bill to abolish plural voting, introduced by a private member, Mr. Baker, was read a second time on March 1 1912.

The main problem, however, before the Government when Parliament met on Feb. 14 1912, was Irish Home Rule, with Welsh Disestablishment and Disendowment in a secondary place. The main interest of the latter measure, keenly as it was opposed in the interests of the Church of England, lay naturally in the financial provisions. The income of the Welsh dioceses in 1906 was £556,000 (£296,000 representing voluntary contributions which would be unaffected), and of the £260,000 derived from endowments the bill would take away £172,500, representing (according to the Liberal view) national property; but this reduction would only be gradually effected in about 40 years by the Welsh commissioners appointed to manage the transfer—existing interest being maintained and existing incumbents being paid their present stipends—so that in that time the Church would have the chance of making good the loss of income by increased voluntary contributions. The disestablished Church was given power to set up a representative body; and to this body the Welsh commissioners would hand over the cathedrals, episcopal palaces, churches and parsonages, and also the modern endowments—and such part of the glebe as was not considered to be part of the ancient endowments—to which the Church as such was strictly entitled; as a dividing line the date of 1662 was taken as that after which property of uncertain origin now owned by the Church might be regarded as her own. The funds which by degrees would be taken from the Church were to be applied partly to charitable and public purposes by being handed over to the county councils and partly to the university of Wales (library, etc.).

The rather moderate extent of the disendowment thus proposed was somewhat of a surprise. Extreme Liberationists had to console themselves with the prospect of a success for the principle of disestablishment rather than any considerable acquisition of Church property for secular purposes. On the other hand, from a Church point of view, the smallness of the operation on its financial side made the whole transaction seem one of peculiar meanness; for a paltry result, the work of the Church—admittedly now well done, as had been proved before the Welsh Church Commission, whatever its shortcomings in the past—was to be crippled and hampered. Defenders of the Church could point to the fact that it was the largest single religious body in Wales, and the only one which was represented in every parish by a regular organization. The ecclesiastical indivisibility of Wales and England was a more fundamental objection, the Welsh dioceses being from the Church point of view an integral part of the Church of England. The case for the Government, granted the principle of disestablishment at all, was, however, fairly simple. Their precedent was the case of the Irish Church in 1869: it was equally a part of the Church of England, and disestablishment and disendowment had done it good rather than harm. The answer to those who con-

tended that the Church really was the national Church of Wales was that the Welsh people thought otherwise; at election after election, almost unanimously so far as political representation showed, they demanded the change as an act of justice. On the first reading of the bill (April 25), which was carried by means of the closure by 331 to 253, Mr. Lloyd George emphasized this point in a somewhat rhetorical plea for the right of his own nationality to have the religion it chose and not to be nationally misrepresented by a Church which, however well it worked, was English and not Welsh. On May 13 the second reading opened with a slashing criticism from Mr. F. E. Smith, but on the 16th it was carried by the closure by 348 to 267, and the bill was then hung up till the late autumn. Its introduction satisfied the Welsh party, but otherwise it excited no real parliamentary enthusiasm. In recent years disestablishment had ceased to interest any large section of Liberal politicians; and the bill, while alienating many Liberal churchmen and rallying to defence of the Church numbers of voters who are normally indifferent to political issues, was not of a nature to help Liberal or Labour electioneering outside Wales itself.

In making an Irish Home Rule bill their chief measure in 1912 the Government were more fortunate in one respect than Mr. Gladstone had been in 1886 and 1893, when the whole Irish question was still associated in Great Britain with the prejudice and hostility aroused by the agrarian war, with all its incidents of cattle-maiming and boycotting, the "plan of campaign," the Phoenix Park murders and dynamiting outrages, the downfall of Parnell and the split in the Nationalist ranks (see IRELAND). A new generation had grown up, to whom

Home Rule.

all this was ancient history, with no special application to the existing conditions. Ireland for years had been peaceful and growing in prosperity; the Unionist Government had given her both local government and the Land Purchase Act; and the idea of Home Rule (as apart from the forgotten Home Rule bills) was now familiar simply as one of the standing issues of party politics. Lord Rosebery's defection had not prevented Sir Henry Campbell-Bannerman from inscribing it again in 1905 on the banner of the Liberal party; and though the Liberals then came into power, independently of the Nationalist vote, under a pledge not to introduce a Home Rule bill during the 1905-10 Parliament, Mr. Asquith had been quite explicit in saying, when the elections of Jan. 1910 were taken, that if he got a majority this self-denying ordinance would be at an end. It was true that at the elections of Dec. 1910 neither Mr. Asquith nor his colleagues in the Cabinet made Home Rule a direct issue either in their election addresses or in their speeches. On the contrary, when the Unionists warned the electorate that in voting for the Parliament bill they were voting also for Home Rule, they were constantly told that this was only a "bogey." But the fact remained that Home Rule was an integral part of the Liberal programme, and within the Government forces returned as supporters of the Parliament bill the Irish Nationalists held the balance of power. Mr. Redmond, for his part, had been perfectly frank about the conditions of his support; on Sept. 27, 1910, for example (to give only one instance out of many), at a moment when it was still uncertain to what lengths the Liberal Cabinet would go in framing a Home Rule bill, he was reported as saying in a speech at Buffalo, U.S., "I believe the leaders of the Liberals are sincerely friendly to Home Rule, but, sincere or not, we have the power and will make them toe the line." The real strength of his position for making a good bargain over the terms of the bill was based, however, on the willingness of the Liberal and Labour parties to concede, in all essentials, the Nationalist demand, representing as it did not only a solid vote from three-quarters of Ireland but also an important body of Irish opinion in America and the British colonies. Apart altogether from the older arguments for Home Rule, the Liberals justified their policy by the success attending their grant of self-government to the Transvaal, and by the congestion of business in the Imperial Parliament, which in any case made it desirable to move in the

direction of devolution. An Irish Parliament and executive of the colonial type for purely Irish affairs, subordinate to the Imperial Parliament, would not only satisfy the Irish claim, but might be the beginning of a federal scheme for the whole of the United Kingdom. Arguing on these lines,—and Mr. Redmond carefully put the Irish case no higher in his speeches before British audiences—it was much easier in 1910 and 1911 for supporters of the Government than it was in 1886 and 1893 to scout Unionist objections to the principle of Home Rule; they could even appeal to Unionist arguments in favour of an Imperial federal constitution. English Liberal Nonconformists were not now so much agitated about Home Rule meaning Rome Rule; and public opinion in Great Britain generally had become rather apathetic about Ireland altogether, being to a large extent out of touch with its problems. It was only in Ulster that passionate resistance was as yet reawakened.

Mr. Asquith introduced the Government of Ireland bill in the House of Commons on April 11 1912. He laid particular stress on its being intended to be the first step towards parliamentary devolution and a system of federalised parliaments within the British Isles, and on its maintaining the supremacy of the Imperial Parliament at Westminster over the new Irish Parliament equally with any that might later be set up in other divisions of the kingdom. The essence of the bill was that in Ireland an Irish Parliament and Irish executive should be responsible for exclusively Irish affairs. Instead of saying precisely what these affairs were, the bill specified what were the Imperial affairs which the Irish Government could not deal with, including certain Irish matters (Clause 2) "reserved" to the Imperial Government. There would be two Houses—an elected House of Representatives of 164 members (of whom, on the existing basis, 39 would probably be Unionists); and a nominated Senate of 40 members, on which Mr. Redmond's view was that there would thus be the opportunity to secure the inclusion of Irish public men of eminence, without reference to their party colour. In case of a conflict between the two Houses they would sit and vote together. For Imperial purposes Ireland would still be represented at Westminster, but only by 42 members, subject to a special provision (Clause 26) for increasing this number in case the question of altering the financial relations should arise at some future time and purely for that purpose. The acts of the Irish Parliament would be subject to veto or postponement by the Imperial executive or Parliament, disputes as to their validity being adjudicated on first by the Irish Court of Appeal and secondly by the Privy Council. It might not enact privilege or disability, endowment or deprivation, for any form of religion, or make any religious belief or ceremony necessary to the validity of marriage. Irish taxes would be settled by the Irish Parliament but would continue to be collected (together with such Imperial taxes as remained) by the Imperial Government, and an annual sum corresponding to the cost of Irish services at the time of the passing of the Act would be "transferred" to the Irish Exchequer under the administration of a Joint Exchequer Committee, together with a grant, beginning at £500,000, to be reduced as circumstances permitted; practically this meant an annual subsidy of £2,000,000 from the Imperial Exchequer. The "transferred sum" would provide a security on which the Irish Government could raise loans. The financing of Old Age Pensions, National Insurance, the Post Office Savings Bank, and the Royal Irish Constabulary, was reserved temporarily to the Imperial Exchequer, but the Irish Post Office (with the patronage attaching to it) was made a separate service under Irish administration. The powers given to the Irish Parliament to deal with Customs and Excise as well as other taxation contemplated the setting-up of Irish custom-houses independently of Great Britain, and (within certain limits) the possibility of varying duties as between goods imported into Ireland or into Great Britain; and as the collection was to be made by the Imperial Government, and allowance for the Irish levy to be made to the Irish by the Imperial Exchequer,

Home Rule bill, 1912.

the procedure was necessarily rather complicated. The finance of the bill was indeed admittedly and necessarily provisional, complete data being unavailable, in spite of the Government's having had the advice of a committee of financial experts, whose report, however, was not disclosed. For 1912-3 it was estimated that the revenue derived from Ireland was £10,830,000, and the expenditure there £12,354,000, showing a deficit of £1,515,000. In the next ten or fifteen years a further increase in the deficit was contemplated, bringing it up to over £2,000,000. The subsidy now proposed was estimated accordingly.

Even before the introduction of the bill it had been seen that the greatest practical difficulty in the way of Home Rule, irrespective of controversy over particular details in the scheme, would be the attitude of Unionist Ulster. Under Sir Edward Carson's leadership, opposition was already being organized in 1911, on behalf of the N. of Ireland Protestants and Orangemen, which, it was openly avowed, would if necessary go to extreme lengths, even to a refusal to recognise a Parliament in Dublin¹ and to the setting-up of a separate "provisional government."² The anxiety of the Government to counter this movement as far as possible had been shown early in the session by the announcement that Mr. Winston Churchill was going over to Belfast to speak on Feb. 8 in the Ulster Hall, and violent opposition to the proceeding was at once taken in hand there. It was considered on the Unionist side that for the son of Lord Randolph Churchill, who had said that "Ulster would fight and Ulster would be right," to preach Home Rule in a place associated with the campaign against it, was an outrage; and the leaders of the Ulster Unionist Council took steps to make the delivery of the speech in the Ulster Hall impossible. Eventually its engagement for the purpose was cancelled, and it seemed for the moment that the prospects of rioting and bloodshed if Mr. Churchill appeared in Belfast at all were so serious that the Government would be obliged to keep him away. Mr. Churchill, however, was not to be daunted. Arrangements were made for the speech to be delivered in a pavilion in a field outside the city, and for troops to be drafted there in large numbers for the maintenance of order. The apparent denial of free speech at all on the Ulster Unionist side was severely commented upon elsewhere, and justified with some misgivings by English sympathizers, but when the leaders had been successful in defeating the plan for holding a Home Rule meeting in the Ulster Hall they went no further. Mr. Churchill duly arrived and made his speech, dwelling particularly on the safeguards which the Home Rule bill would contain against anything to which Ulster could object; but the city was in a ferment of dangerous antagonism and he had to be smuggled away afterwards to avoid the hostility of the crowd. Actual rioting was avoided, and peace was kept between Nationalists and Loyalists, at the cost of £2,730 for the expense of the troops engaged, the Ulster leaders having eventually devoted themselves to keeping their supporters well in hand; but the whole incident was an unpleasant revelation of the rebellious spirit that was being aroused. A little later (April 9) Mr. Bonar Law was present at a great demonstration at Belfast, the special note of which was a solemn pledge of Loyalist resistance.

The Liberal press in England made light of these warnings, but the organization of opposition in Ulster went steadily on.

As controlled by the Irish Unionist leaders it was formally independent of actual parliamentary tactics, and therefore of the action of the Unionist party under Mr. Bonar Law's guidance; but Unionist opposition in Parliament and in the constituencies was inevitably concerned with what might take place in Ulster. Mr. Bonar Law, at Blenheim on July 27 and in the House of Commons on Aug. 5, took his side openly with the Unionists of Ulster. If, he said, the Ulstermen were forced into defiance of a measure passed under the Parliament Act without further appeal

to the electorate, and by the dictation of a Nationalist vote which had in their view always been disloyal to the Empire, any attempt to coerce Ulster could only mean civil war, and this could not be confined to Ireland; it was incredible that the Government should contemplate the coercion of Ulster by British bayonets, but if they went to that length the situation would be intolerable,—ministers would be "lynched in London." Many Liberals hoped to find relief by proposing to leave Ulster out of the Home Rule bill, at least temporarily, altogether; but an independent Liberal amendment to this effect in Committee (July 18), after some ambiguous inquiries from the Government whether Ulster would be satisfied if it were adopted, was rejected by 320 to 252.

Meanwhile, on April 23 an Irish National Convention in Dublin, with Mr. Redmond presiding, accepted the bill, and the doubts as to whether Irish Nationalists might disagree over it and it might be snuffed out like the Irish Councils bill in 1907, were dissipated. On July 19 Mr. Asquith addressed an enthusiastic meeting in Dublin, and was received with fervour as the first English Prime Minister who had had a welcome there in Nationalist circles. The first reading of the bill was carried in the House of Commons on April 16 by 360 votes to 266, and the second reading (April 30) on May 4 by 372 to 271. The Committee stage began on June 11, and on July 3 the first clause had gone through; discussion was then suspended till the autumn. On the Unionist side the objections to any scheme for a separate Irish Parliament and executive were fortified by criticisms of special features in the new bill itself—the finance, the proposal for Irish representatives to remain at Westminster, the separation of post-offices and custom-houses—but these subjects had still to be further discussed when Parliament adjourned in August. On the Liberal side a good many members disliked the provision for the nomination of an Irish Senate, and this question arose in Committee on Clause 1, but an amendment to exclude it was rejected (June 19) by 288 to 199.

Effective opposition was in Ulster, not in Parliament. Serious rioting between Protestants and Catholics in the Belfast shipyards during July showed the tension there; and on Sept. 14 a free fight between partisans of both sides, in the course of a football match at Belfast at which 10,000 people were present, resulted in injuries to about 100, revolvers and knives being used. Active preparations were on foot for a series of Unionist demonstrations in Ulster, leading up to the signing on Sept. 28 of a Solemn Covenant, pledging resistance to Home Rule. The perplexity on the Liberal side in face of Ulster's determination was shown by a speech of Mr. Churchill's at Dundee on Sept. 12, in which he suggested, purely on his own account, that, to secure a federal system of government for the United Kingdom,—to which Home Rule for Ireland, however, was an essential preliminary,—it might be desirable to grant separate legislatures to large homogeneous areas in England like Lancs., Yorks., the Midlands, and London; he would not shrink from the creation of 10 or 12 such English bodies, all subordinate to the Imperial Parliament. Mr. Churchill's speculation was effectively criticized by Mr. Balfour at Haddington on Oct. 9, the scheme being described as "the application of decimal fractions to the United Kingdom." What Unionist Ulster demanded was to remain under the Imperial Parliament and not be at the mercy of a parliament in Dublin.

The text of the Solemn Covenant, promulgated by the Ulster Unionist Council, was as follows:—

Being convinced in our consciences that Home Rule would be disastrous to the material well-being of Ulster as well as of the whole of Ireland, subversive of our civil and religious freedom, destructive of our citizenship, and perilous to the unity of the Empire, we, whose names are underwritten, men of Ulster, loyal subjects of His Gracious Majesty King George V., humbly relying on the God Whom our fathers in days of stress and trial confidently trusted, hereby pledge ourselves in Solemn Covenant throughout this our time of threatened calamity to stand by one another in defending, for ourselves and our children, our cherished position of equal citizenship in the United Kingdom, and in using all means which may be found necessary to

¹ The anniversary of "Craigavon Day," Sept. 23, 1911, when Sir E. Carson was acclaimed the Ulster leader, and the Declaration of Ulster was published to the above effect, was celebrated in 1912.

defeat the present conspiracy to set up a Home Rule Parliament in Ireland; and, in the event of such a Parliament being forced upon us, we further solemnly and mutually pledge ourselves to refuse to recognize its authority. In sure confidence that God will defend the right, we hereto subscribe our names, and, further, we individually declare that we have not already signed this Covenant.

Sir Edward Carson signed first, on Sept. 28, at the head of a great gathering in Belfast. And when, just afterwards, he crossed with Mr. F. E. Smith to Liverpool, he had a remarkable ovation, violent speeches being made by sympathizers with the cause of Ulster,¹ in favour of supporting her resistance by force of arms. It was announced later that the total signatures to the Covenant were:—*Ulster*, men 228,206, women 228,991; *Outside Ulster*, men 19,162, women 5,055.

Reference must now be interposed to the progress of the industrial unrest in England, culminating during 1912 in the

National Coal Strike, 1912. general strikes of coal-miners and transport workers. For some time past trouble had been brewing in the coal industry. In Dec. 1910 a strike had begun at the Cambrian Combine Collieries (of which Mr. D. A. Thomas, afterwards Lord Rhondda, was managing director), owing to the failure of the two referees (representing owners and men) appointed by the South Wales Conciliation Board to agree upon a tonnage price for the working of a seam at the Ely Pit, which had till then been worked on day-work. The rates offered by the owners were denounced by the strike committee as a "starvation" wage; but the strike was really a forward move on the part of the younger extremists among the men, who had obtained the upper hand and were influenced by socialistic doctrines. A general lockout of the men working in other seams in the Ely Pit was the masters' reply. The Welsh Socialists then sent delegates to enlist sympathy among the English and Scottish miners elsewhere, and to try to bring about a general strike; but the leaders of the Miners' Federation of Great Britain were not prepared to support the action of the Ely Pit strike committee, and financial support was withdrawn, so that the strike collapsed.

The Miners' Federation next put a claim before the owners in the federated area for the fixing of definite rates of payment in the case of "abnormal places" where the men were unable to earn an average day's wage for no fault of their own. At the Southport conference of miners' delegates in Oct. 1912 the following resolution, proposed by the executive, was unanimously passed:—

That the federation take immediate steps to secure an individual minimum wage for all men and boys working in mines in the area of the federation, without any reference to the working places being abnormal. In the event of the employers refusing to agree to this, the 21st rule to be put into operation to demand assent.

At a second conference on Nov. 14, at which the refusal of the employees to accept the minimum wage was reported, an adjournment was resolved on (by 336,000 votes to 238,000) for future negotiations; and on Dec. 21, the situation remaining the same, it was resolved that a ballot should be taken on Jan. 20-12 1912 on the question: "Are you in favour of giving notice to establish the principle of a minimum wage for every man and boy working in the mines of Great Britain?" A resolution was also passed "that each district send to Mr. Ashton (general secretary of the Miners' Federation) a tabulated statement of what it desires to be its minimum wage, and that the executive committee of the Federation meet to consider the statements and report to a national conference in Birmingham on Jan. 18 1912." The result of the ballot showed 445,801 votes for giving notice, 115,721 against,—majority 330,080.

¹ It must be remembered, of course, that "Ulster," as an Irish political unit, did not mean the whole province, but only the N.E. portion, comprising the five counties of Antrim, Armagh, Down, Londonderry and Tyrone, with the cities of Belfast and Londonderry. As a geographical unit Ulster had a pop. (1911) of 1,581,696, but the N.E. portion by itself had 1,188,695. Out of the latter total, those of 16 years old and over were 387,241 males and 438,774 females. As the census classification showed that 33.1% of the pop. in this N.E. area was Roman Catholic, the number of adult male Protestants in Ulster who might be expected to sign the Covenant was not much in excess of those who actually did so.

South Wales alone giving a majority of 85,107 for stopping work. And on Feb. 2 1912 a definite schedule of the minimum rates asked for was approved.

The coal-owners met on Feb. 7, and the Welsh owners then refused to discuss any minimum wage and retired from the conference. This made a strike inevitable, since the miners were not prepared to settle with any but the whole federated area. Notices were given accordingly, the public being faced with a prospect of a complete cessation of coal supplies. The Prime Minister on Feb. 20 invited both sides to meet him to discuss means of averting a national stoppage, and their representatives met him on Feb. 22, but to no purpose; and on Feb. 26 the first miners went on strike at Alfreton, the rest soon following, in spite of the announcement that the principle of a minimum wage was now adopted by the Government and that they would take steps to give it parliamentary sanction unless an agreement were arrived at. On this point a split occurred between the coal-owners, those of Durham and the federated districts being prepared to fall in with the proposal of the Government, and the others refusing. On March 1 over 2 million coal-miners were out (Yorks. and N. Midlands 235,000; S. Wales 220,000; Scotland 130,000; Northumberland 120,000; Durham 110,000; Midlands and South 105,000; N. Wales 70,000; N. and E. Lancs. 45,000), and during the whole month the country was convulsed by the calamity.

At last, after the Government had made a further unsuccessful attempt, by a conference, to bring owners and miners to agreement, on March 19 1912 Mr. Asquith introduced in the House of Commons a Minimum Wage *Minimum Wage Bill* bill as their last resort. It provided that, in the coal industry, every contract for employment should involve the payment of a minimum rate, to be settled for each district by a joint board set up under the auspices of the Board of Trade. The bill was read a second time on March 21, after a motion for its rejection by Mr. Balfour, on behalf of the Opposition, had been defeated by 348 votes to 225, and it had passed both Houses on March 28. Having made their protest against a piece of revolutionary legislation which introduced so novel and far-reaching a principle into industrial economics, the Unionists left the responsibility to the Government, and the only parliamentary difficulty was caused by the Labour party, who fought for the inclusion of a precise definition of the minimum in the shape of 5s. a day for adults and 2s. for boys; as the Government refused this and insisted on the rates being fixed by the district boards, the Labour party opposed the third reading, which, however, was carried by 213 to 48. There was acute dissatisfaction among the miners at the failure of the Labour party to get their own minimum schedule of rates adopted, and for a time the result was doubtful; but it was decided to take a ballot (April 1) on the question of returning to work, and though a majority still voted for staying out (244,011 to 201,013) it was not large enough (two-thirds being required by the rules).

The fact was, the funds were exhausted and the men had had enough of the struggle. The conclusion of Sir A. Markham, the Liberal M.P. and coal-owner, writing in the *Quarterly Review* for April 1912, is probably the verdict of history; he considered that "the ground of attack was ill-chosen; the men should have stood to their original demand, the payment on account of abnormal places or losses due to bad management. If in addition they had asked for an increase of wages equivalent to 10% on the basis rates, to meet the increased cost of living, they would have occupied strong ground. The great mass of men came out to obtain higher wages, and for no other reason; and when they voted for the formula 'minimum wage' nine-tenths did not know what they were voting for." The result, as the year went on and the minimum rates were settled, not without friction, was a profound disgust among the coal-miners generally with the operation of the new Act, which was found to do very little to increase the amount paid in wages; but it had done its work for the moment, the crisis being over. In Oct., moreover, an agreement was arrived at between repre-

representatives of miners and coal-owners of the English federated area, by which about 400,000 workers would at once receive an advance of a shilling a week in wages. This was the outcome of discussions before a Conciliation Board, which had been in existence for some years and was now renewed for a further period; and this addition of about £1,000,000 a year was worth more than all the haggling about minimum rates.

In connexion with the opening phases of the railway strike of 1911, allusion has already been made to the sporadic strikes of other sections of "transport workers" earlier in the year; and the general dock strike, which began in London on May 20 1912, was really the concluding phase of the unrest which had been only partially quieted during the previous August. First the lightermen came out, and then a "sympathetic" strike involved all the other unions of transport workers connected with the Port of London. The nominal reason for the lightermen ceasing work was their objection to one man employed as a watchman having no "federation ticket"; he belonged to the Foremen's Society, a union not affiliated to the Transport Workers' Federation, but refused to join the Lightermen's Society, which was so affiliated, and when the lightermen demanded his dismissal, on the ground that they would work only with men who belonged to the federation, his employers naturally refused. This was, however, in reality only the culmination of a number of "grievances" put forward by the men, who complained of being victimized under the terms of the existing agreements. Unsuccessful negotiations had for some time been going on between their secretary, Mr. Gosling (himself actually a member of the Port of London Authority), and the Board of Trade, with a view to pressure being put on the employers; and the declaration of a strike on May 20 for the reason given was prompted by the hope that the hands of the Government would be forced. In taking this step the lightermen relied on their privileged position in the Port of London. Their Society held an old licence from the Watermen's Company, whose functions were transferred in 1908 to the new Port of London Authority, and the law was that unlicensed men should not be employed so long as licensed men were available, so that, apart from the difficulty of obtaining substitutes in an emergency, the employers, as they knew, would have to reinstate them when the strike was over. (One result of the strike was that the Port of London Authority took steps to get this law altered.)

The Federation of Transport Workers now took up the lightermen's cause, and in doing so put forward a further grievance on behalf of the Carters' Union, by whom an agreement had been made with the Master Carters' Association when the strike of the previous August was settled. The complaint was that one firm which had joined the association had dismissed their union men, contrary to the terms accepted, and had resigned from the association when it called them to account, so that the agreement was useless. The union demanded accordingly that all employers in the Port should be obliged to belong to a masters' federation, which would have power to guarantee the carrying-out of agreements. As no concession on this point was forthcoming, notice of a general strike of all members of the Transport Workers' Federation was given.

The Government at once took action by appointing Sir Edward Clarke, K.C., to hold an inquiry on May 24. He made his report on May 28 to the effect that, while the lightermen were wrong in supposing that the award of the previous Aug. meant that none but members of their federation should be employed, and they themselves had broken their agreement by striking without recourse to arbitration, still there were several points on which the transport workers had legitimate grievances, owing to the employers not having carried out certain terms of their agreements also. The Government on May 29 suggested a conference between the two sides, which was, however, declined by the ship-owners, who insisted that the only point really at issue was the lightermen's breach of agreement in

suspending work and thus dislocating the whole business of the Port. Meanwhile a general strike of transport workers was in progress at the docks, some 80,000 men being affected, and the whole food supply of London was threatened; but the ship-owners actively engaged "free" labourers in spite of trade-union picketing and intimidation, and day by day managed more efficiently to get their ships unloaded. Public discussion, influenced by Sir Edward Clarke's report, and its criticism of both sides, centred round the apparent necessity of providing, alike for masters and men, some guarantee against breaches of agreements; and Mr. Lloyd George, who in Mr. Asquith's temporary absence in the Mediterranean dominated the Government policy, made proposals, which he explained in the House of Commons on June 5, for a Joint Conciliation Board, combined with pecuniary guarantees on both sides. Mr. Gosling, on behalf of the transport workers, gave a general assent to this suggestion, but the employers and the Port of London Authority (with Lord Devonport—formerly Mr. Hudson Kearsley, a well-known Liberal M.P.—as chairman), after careful consideration, rejected it on June 10. It was pointed out by them that there was no proper basis, under the conditions prevailing at the docks, for such a board, the trades concerned being very different and the employers (some of whom were foreign firms) themselves being competitors; the Port of London Authority moreover was a statutory body, with distinct obligations and responsibilities, and could not well enter into such an arrangement, any more than a Government department could—the Post Office, for instance—with the men in its employment. This was not a case of a strike against some individual firm which had given legitimate cause of offence, but a general strike against the whole Port, defying all agreements.

Negotiations now broke down altogether, and the leaders of the Transport Workers' Federation declared a "national" strike and tried to call out all its allied members at other ports as well as London. But though some 30,000 men responded altogether at Manchester, Southampton, Bristol, Plymouth and Swansea, this appeal for a "national" strike was a thorough failure; the railway unions had had enough fighting the year before and the seamen and firemen, as a body, were not prepared to come out. Scenes of violence were of daily occurrence between unionists and free labourers at the London docks; but by June 18 it was clear that the Port of London Authority and the employers, aided by police protection (which Mr. McKenna, the Home Secretary, provided, though somewhat grudgingly), had the strikers well beaten, having obtained a sufficient supply of labour for the handling of cargo. From this point, the strike degenerated into sheer anarchism. Serious conflicts occurred, in which revolvers were used in self-defence by the free labourers, notably on July 24 and on July 31, but by degrees the strike committee realized that their efforts were in vain. They recommended a return to work on July 27, but a mass-meeting in Hyde Park next day refused to comply with this advice, and it was not till a week later that all pretence of continuing the strike was abandoned. On July 31 the lightermen decided to give in, and the riot among the dockers that day was mainly due to their finding that their old places had been filled up and that it no longer rested with them to say whether they were wanted any more or not. On behalf of the employers, however, and of Lord Devonport, a general assurance had been given that, if the strike were abandoned unconditionally, any outstanding grievances under the old agreements would be inquired into and reinstatement effected as soon as possible for men who had formerly been in regular employment; and, as the strike committee and the leaders could hold out no longer, further resistance came to an end.

The real object of the strike, in so far as it aimed at being a "national" one, was to compel Parliament to legislate; as it had done for the coal-miners. In this case, however, the Labour politicians and their sympathizers were impotent. The discussions in the House of Commons turned mainly on Unionist criticism of the Home Secretary for the apparent disinclination he showed for using

Attempts
at Settlement.

Neutral-
ity "in Par-
liament."

force to preserve order and protect the free labourers. On June 12 Mr. Austen Chamberlain moved a vote of censure on Mr. McKenna, which was rejected, however, by 337 to 260. On July 1 Mr. O'Grady (Labour M.P. for E. Leeds) moved a resolution "that it was expedient that the representatives of the employers and working men's organizations involved in the dispute should meet with a view of arriving at a settlement," and Mr. Asquith left the matter to the House, saying that he himself would not vote on it, as he did not think Government intervention would be justifiable or expedient. Mr. Bonar Law, for the Unionists, having expressed his surprise that in those circumstances Mr. Asquith did not oppose the resolution, moved as an amendment, "that this House regrets the continuance of the strike and the consequent suffering, and approves of the declaration of the Prime Minister that the constitutional and normal attitude of the Government should be one of complete detachment and neutrality, and is of opinion that the intervention of this House in this instance can serve no useful purpose." The amendment was rejected by 260 to 215, and the resolution was carried by 254 to 188. This was the end, however, of any parliamentary action. The strike was already collapsing, and its only political result was to focus public opinion on the desirability of compulsory arbitration, or at any rate some improved machinery for making agreements, once entered into, binding on both sides.

Parliament met again for the autumn session of 1912 on Oct. 7, and the political conflict was once more renewed in the House of Commons. The effect of the Ulster demonstrations on the Government, up to this point, had not been specially terrifying; and Mr. Asquith, speaking at Ladybank on Oct. 5, dealt somewhat scornfully with Sir Edward Carson's movement and the Unionist attitude towards it. The Government, he intimated, were ready to consider any proposals for safeguarding Ulster, but Ulster had nothing to suggest—she simply would not allow Ireland to have what the other four-fifths of Ireland demanded. It was impossible for the Government to give way to intimidation, prompted by the spirit of Orange ascendancy; they meant to go on with their bill. On Oct. 10 he introduced in the House of Commons a series of resolutions for completing the various stages of discussion on it by Christmas under the closure. Including the time already occupied, 50 days (to which two were added a few days later) were, on this scheme, to be devoted to debate. An Opposition amendment, proposed by Mr. Bonar Law, was defeated by 323 to 232. The operation of the guillotine, combined with the "Kangaroo" system by which the chairman of committees was left to choose which among the various amendments proposed should be discussed in the time available, made the resumption of the committee stage simply a question of whether the Government could maintain their majorities; any effective debate was obviously impossible, and Mr. Bonar Law bluntly declared that the Government might just as well have moved that the bill should be passed without further delay. On the other hand it was equally true that, without such a time-limit, the Opposition would have protracted the debates indefinitely; the Government had no option in the matter if they were to send the bill up to the House of Lords during that session, as they must, in order to obtain the benefit of the terms of the Parliament Act. Even if the Home Rule bill were to be passed through the House of Commons by Jan., the Government programme was overloaded, for they had announced their intention also to pass the Welsh Disestablishment bill, the Franchise bill and other measures, before the session ended.

At the same time, with Mr. Lloyd George's active encouragement, yet another political issue was being made prominent throughout the constituencies, in the shape of an organized agitation for land-tenure reform and increased taxation of land-owners, promoted more particularly by a section of the Radical party who had long been advocates of the single-tax theory on Henry George's lines. The Budget of 1909 (as incorporated and passed in the Finance Act of 1910), with its provisions for effecting a complete valuation of the land,

paved the way for such a movement, and the land-reformers saw their opportunity now for pushing their views and preparing for legislation. The fact, indeed, that the yield of the new land-value duties in 1911 and 1912 proved disappointingly meagre had even driven them to seek this extension of policy. For, with the comparatively humdrum budgets of those years, the critics of "Lloyd George finance" in that respect were already taunting it with utter failure. The unpopularity of the Insurance Act made it opportune, moreover, for Mr. Lloyd George's section of the party to try to divert electioneering attention on the Radical side to something more attractive, and at the summer and autumn by-elections the new land campaign was made a leading feature by Radical candidates. Intense exasperation was created on the Conservative side, representing as it did to so large an extent the landed interests of the country, by the organization of an unofficial committee of inquiry under Mr. Lloyd George's auspices, with the authority of the Cabinet, in order to obtain evidence of various sorts of agrarian grievances in furtherance of a new Radical policy.

An important change in the Home Rule bill was made when on Oct. 30 the discussion in committee reached clause 8, concerning the composition of the Irish Senate. It was suddenly announced by Mr. Asquith that, while the proposed nomination of the first senators by the Imperial Government would be adhered to, the Government had decided to abandon the idea of their successors being nominated by the Irish Government. Instead of this, the method would be substituted of election by the voters in the four Irish provinces, taken as units, on a plan of proportional representation, each elector having a "transferable" vote (see 23.115). The term of office for senators would be five years, and all would retire together at the end of the fifth year so that the elections might then be taken. The next day (Oct. 31) the revised clause was introduced and carried. Mr. Asquith insisted that it would be an additional safeguard for the Unionist and Protestant minority in Ireland, but Mr. Bonar Law regarded it as worthless for any such purpose, and Mr. Healy frankly declared that in his opinion the Irish Unionists would have been better off with the method of nomination. Mr. Redmond, while accepting the Government's decision, expressed much the same view. The fact was that the whole idea of a nominated Senate was distasteful to most of the Liberal party, and it seemed a favourable opportunity for putting the experiment of proportional representation, which had recently made many converts, into practice.

On Nov. 8 Mr. Asquith introduced a "guillotine" timetable for the Welsh Church bill, allocating 14 days to the committee stage, two to report, and one to third reading. So short a shift excited much bitterness on the Opposition benches, the discussion that day being adjourned; and on Nov. 11 the situation in the House of Commons was changed by an unforeseen event. On a resolution required as a preliminary to discussion of the financial clauses of the Home Rule bill Sir F. Banbury moved an amendment without notice, providing that the total payment from the Imperial to the Irish exchequer in any one year should not exceed £2,500,000. It was early in the afternoon, when the Unionists were in unaccustomed force, and the Government was defeated by 228 to 206. Mr. Asquith immediately moved the adjournment of the House; and next day it was announced that the Cabinet had decided to move a resolution rescinding the vote and providing (so as to regularize further proceedings under the time-table, which was entirely upset by the incident) that the next day on which business was taken on the Home Rule bill should count as the "16th allotted day," though, as previously fixed, the 16th day was Nov. 11; when this had been done, they proposed to reintroduce their financial resolution and proceed as though nothing had happened. On the 13th Mr. Asquith accordingly moved to this effect. This proposal to rescind the vote and set up the resolution afresh was, however, as the Speaker agreed in reply to Unionist objections, absolutely unprecedented in parliamentary procedure.

The Proposed Irish Senate.

Government Defeat and its Result.

Land Agitation.

It had always been held, and was laid down by Erskine May, that no question or bill could be brought up in the House that was substantially the same as one on which judgment had already been expressed in the current session; and when the Speaker nevertheless ruled that Mr. Asquith's motion, though unprecedented, was in order, Opposition exasperation became intensified to a point beyond control. After Mr. Bonar Law had argued the case at length, and had moved the adjournment of the debate, which Mr. Asquith curtly declined to accept, a state of organized disorder prevented any further proceedings. The Speaker at last took the only course open to him, and adjourned the House. There seemed likely to be renewal of the same scene next day, but calmer counsels prevailed. At the opening of the sitting the Speaker suggested that, if more time were given for reflection, a less objectionable way might be found for regularizing the proceedings. Mr. Asquith promptly accepted this suggestion, and moved that the House should adjourn for the purpose till Monday the 18th. As Mr. Bonar Law concurred, this course was adopted, and the anticipated storm was avoided. The air had previously been cleared to some extent by amends being made by Mr. Ronald McNeill for the most violent incident in the disorder of the previous evening. In the heat of the moment he had thrown a book at Mr. Winston Churchill which struck him a severe blow on the face; but he now offered a handsome apology.

The Liberal press was inclined to treat the opposition to Mr. Asquith's motion as purely factious, and the organized disorder as a further mark of deterioration in parliamentary manners. But the historian cannot well take this simple view. The defeat of the Government was certainly an accident, but it was the sort of accident that happens when a number of nominal supporters are not personally enthusiastic for the particular cause involved, or are being tired out by excessive demands on their attendance. The opinion of a high independent Liberal authority on procedure, Mr. James Caldwell, ex-M.P. and formerly chairman of committees, was moreover that Mr. Asquith's proposal for meeting the new situation was "clearly out of order" (*The Times*, Nov. 16), although not so ruled by the Speaker. Owing to the critical state of foreign affairs, consequent on the situation in the Balkan War, a change of government, as Mr. Bonar Law frankly admitted, was not at this moment desirable; and if the Government chose to ignore what was formally a parliamentary defeat their normal majority was still available. But the Opposition were naturally not prepared to forgo what, according to the practice and precedent of Parliament, was a legitimate opportunity for impeding the execution of the Government's programme of legislation for the session; and they gained their point. On Nov. 18 Mr. Asquith made an amended proposal, which was agreed to without further discussion, that the financial resolution should simply be negatived that day and the committee stage on the financial clauses of the Home Rule bill set up afresh on the 19th by the introduction of an amended resolution, the report stage of which would be taken on the 20th, so that the next "allotted day" (the 17th day under the time-table) would be on Thursday Nov. 21. This course was accordingly pursued.

After the scare in the Government ranks caused by the misadventure of Nov. 11 and its immediate consequences, the resumption of proceedings on the financial clauses of the Home Rule bill saw their normal majority well kept up, and the guillotine fell with merciless regularity. Faced with a hostile and unreformed House of Lords, whose certain antagonism could only be defeated by sending the bill up in time to obtain the benefit of the Parliament Act, the Coalition were compelled to restrict discussion in the House of Commons; and it might well be thought on their side that at this stage, since in any case the Parliament Act involved nearly two years' delay, it was futile to attempt to examine every detail in a scheme which was approved in principle, but which still had a long fight before it. On the other hand it was incontestable that, for a measure of such profound importance, supposing it to be one that might come

into operation as it left the House of Commons, the discussion of the various difficult and obscure aspects of the new financial relations proposed between Ireland and Great Britain was entirely inadequate. Clause after clause was carried, undiscussed, under the closure, full of complicated provisions, the working of which very few of the rank and file in Parliament even pretended to understand. For judicial examination in debate, reflecting the careful conclusions of the House of Commons, was substituted the opinion of the ministers in charge of the bill, alike as to the powers it gave and the way those powers were likely to be used. Just as the Insurance Act had left all sorts of obscure questions to be settled by the commissioners, so the Home Rule bill left some of the thorniest problems of the financial relations with Ireland to be solved by the proposed Joint Exchequer Board, an entirely new official body, whose real status was highly questionable; and clause 22 providing for this, with the remaining financial clauses, 23, 24 and 25, were duly guillotined on Nov. 27. Eventually, under the guillotine, the bill passed its third reading on Jan. 17 1913. The committee stage had ended on Dec. 12, clauses 26-48 and the final schedules having been carried since Dec. 2 by the operation of the guillotine without any concession to Unionist criticisms. The committee stage had lasted altogether 36 days, including the 25 provided under the time-table; two clauses (1 and 37) had been fully discussed, and 22 partly discussed, while 24 had received no discussion at all.

For the Welsh Church bill the time-table resolution had similarly been carried on Nov. 28, at the end of an all-night sitting, though the Government agreed to give 16 days, instead of the 14 originally proposed, to the committee stage, which began on Dec. 5; and by Christmas 1912 this bill too was well on its way through the House of Commons. The discussions were marked throughout by much bitterness of feeling on the part of the defenders of the Church, among whom Lord Robert Cecil was specially prominent, but they were notable also for some important expressions of the desire of Liberal churchmen to make the disendowment proposals less harsh than what the Welsh Non-conformists considered to be in accordance with their rightful demands. A concession was made on clause 8, the Government accepting (Dec. 18) amendments proposed by Sir Ryland Adkins and Mr. Atherley Jones (both Liberals), by which, much to the disgust of the Welsh members, the Church would retain possession of the Queen Anne's Bounty funds and property. On another amendment, proposed by Mr. Ormsby Gore (Conservative), for keeping all the glebe as church property, the Government majority fell (Dec. 19) to 55, the figures being 277 to 222; and clause 8 was only carried by 284 to 221. The fact that the majorities in both these cases were smaller than the number of Irish Nationalists voting with the Government showed that there was a good deal of sympathy with the opposition among some sections of Liberals.

The actual proceedings in the House of Commons were being followed, however, with marked apathy in the country. Everybody felt that the real struggle had to come during 1913. During the past month the critical state of European affairs monopolized public interest; and the party conflict took a secondary place when larger issues were at stake. Mr. Asquith and Sir Edward Grey, by common consent, were making British influence a powerful factor for peace in the settlement of the Balkan crisis. The administration was strengthened for the moment simply by the fact that it represented the whole nation in the councils of Europe. Meanwhile trade was booming, and in some other respects also the position of the Government was more favourable than it had seemed likely to be a few months earlier. At Bolton, when there was a by-election on Nov. 23, the Liberal candidate surprised his own party by retaining the seat with only a slightly diminished majority. Moreover, the Unionists were again in the throes of further discussions over their Tariff Reform policy. Since Mr. Bonar Law had become the Unionist leader little had been heard of any waver-

Guillotine.*

ing as to the principle of low taxes on foreign wheat and other foodstuffs so as to give a preference to colonial imports. But the question of going to another election at all on a programme including food-taxes was now raised again on what started purely as a side issue. It was thought by the leaders of the party that the time had come when an explicit declaration should be made that Mr. Balfour's proposal, before the general election of Dec. 1910, to submit the first Tariff Reform Budget after the Unionists returned to office to a referendum, was no longer the party policy; and Lord Lansdowne accordingly made a statement to that effect at the Albert Hall on Nov. 14 1912. No sooner had it been made than an agitation arose in certain Unionist quarters, especially in Lancs., where it was contended that harm would be done to their electoral prospects by dropping the proposal; and the cry was taken up in circles where the food-taxes had always been disliked, with the result that pressure was put on Mr. Bonar Law to make a definite pronouncement on the whole scheme of Imperial Preference. This he did at Ashton-under-Lyne on Dec. 16, but without the effect that was presumably intended.

A large part of Mr. Bonar Law's speech was devoted to combating the claims of the Radical party that they were the peculiar friends of the working classes; on the contrary he insisted that the party now in power were occupied mainly in work of destruction, and that the real social needs of the community could only be met by a Unionist government. He repudiated the allegation that Tariff Reform was simply old-fashioned Protectionism. It was not proposed to bolster up industries which were not naturally suited to the country, or to enable manufacturers to secure an artificial monopoly. Tariff Reform involved the imposition of duties smaller than in any other country, and its object was to give British workmen a preference in the home market over their foreign competitors. Similarly, the object of Imperial Preference was to unite the Empire on lines of trade, and to secure for the United Kingdom the largest possible advantage in the British oversea markets. It was in connexion simply with colonial preference that food duties were included in the Unionist programme, and he adhered to that policy in spite of all the misrepresentations to which it lent itself. But here he announced a new departure:—

"If our countrymen entrust us with power, we do not intend to impose food duties. What we intend to do is to call a conference of the colonies to consider the whole question of preferential trade, and the question whether or not food duties will be imposed will not arise until those negotiations are completed. . . . Unless the colonies regard them as essential for preference the food duties will not be imposed. All that we ask is that our countrymen should give us authority to enter into that negotiation. If the colonies do think them necessary, then I for one do not believe that the people of this country would not be ready to make that readjustment which is necessary to effect the purpose."

As regards the referendum, Mr. Law repeated Lord Lansdowne's declaration, and justified it on the ground that a pledge to submit the result of the negotiations with the colonies to a referendum would not be fair to the colonies.

Next morning this speech had a "mixed" reception both in the Unionist press and in the party. In some quarters strong objection was taken to making the taxation of the United Kingdom appear in any shape to depend on the decision of the colonies; the responsibility must be with the electors of the United Kingdom. In Lancs. and Yorks., and also in Ireland and Scotland, some important Unionist papers openly mutinied against the abandonment of the referendum. Uncertainty as to what Mr. Law really meant—an unusual thing in his case—led to a revival, in the clubs and in the House of Commons, as well as in the press, of the same sort of expression of hostile sectional views that had made Mr. Balfour's leadership so difficult between 1903 and 1906. There were "alarums and excursions" for several days. As consideration became cooler, it was recognized, however, that nobody wanted to do anything that was not in the interest of a united party. Mr. F. E. Smith,

speaking at Dudley on Dec. 20, declared that the whole Unionist front bench in the House of Commons adopted the views expressed by Mr. Law, and that he had never meant that the decision as to food duties would be left to the colonies; all that he meant was that the decision must depend on what the colonies wanted. Mr. Austen Chamberlain also wrote a letter to a correspondent on Dec. 23, agreeing with Mr. Bonar Law.¹

While this lively interlude was providing sport for the Free Trade party, the penultimate act of another drama, of more direct import to Liberalism, was also drawing to its close. On Dec. 19 the result of the poll was published which had been taken among the medical profession, as to whether they would accept Mr. Lloyd George's latest terms for ordinary medical service under the Insurance Act. Out of a total vote of 13,731, 11,309 were for rejection. On Dec. 20 the representative meeting of the British Medical Association was held, and by 182 votes to 21 a resolution was passed rejecting the Government proposal and advising the profession to decline service under the Act. In the previous Feb. practically the whole profession—at all events 27,400 doctors—had signed an undertaking to stand together by the policy to be decided upon by the British Medical Association, and if they held to their pledge this meant a complete breakdown in the provisions of the National Insurance Act for medical benefit, which were to become operative on Jan. 15 1913. On the other hand, a scheme for an alternative policy was coupled with this flat refusal of Mr. Lloyd George's own proposals. It was recommended that the profession should express its willingness to treat insured persons, under arrangements to be made between local committees of doctors and the insured or their representatives (*i.e.* the approved societies) for a minimum capitation rate of 8s. 6d., inclusive of drugs, or a minimum fee of 2s. 6d. a visit, on condition that each insured person should have free choice of doctor and that the doctor should consent to act. Under this plan the doctors would not be dictated to by the lay insurance committees, but the financial terms would be practically the same that Mr. Lloyd George had last offered. It was promptly announced that the Government could not fall in with this proposal, which would involve handing over public money without public control; and the question now was whether there would be sufficient breaking-away from the pledges given to the British Medical Association for the insurance committees to be able to secure their panels of doctors in accordance with the regulations under the Act. Only about half of the 27,000 doctors who had ranged themselves with the Association in Feb. had actually taken the trouble to go to the poll in Dec., and though this was generally believed not to indicate in itself any corresponding failure in the solidarity of the profession, there were now signs of a good deal of independent action in certain localities, and notably in Scotland. Already in Nov. a few doctors who thought it a public duty to fall in with the Government scheme had started a new organization in opposition to the British Medical Association, called the National Insurance Practitioners Association; and its influence, backed by Government support, was being exerted in the same direction. On Jan. 2 1912 Mr. Lloyd George, addressing the Advisory Committee, took a sanguine view of this situation, and declared that some 8,000 doctors were available. Nevertheless the strike now proclaimed against the Insurance Act by the recognized leaders of the medical profession was a very awkward fact for the Liberal party.

The year thus ended with the promise of a full crop of domestic political difficulties to be harvested in 1913. (H. CH.)

II. FROM JAN. 1913 TO JULY 1914

The political difficulties bequeathed by 1912 to 1913 were still unsolved 19 months later, at the outbreak of the World War in Aug. 1914. The medical opposition to the National Insur-

¹ Eventually, as the result of a memorial from the bulk of the Unionist M.P.s, Mr. Bonar Law, on Jan. 14 1913, stated in a letter that he and Lord Lansdowne, while remaining leaders of the party, were willing to agree that food duties should not be imposed without the approval of the electorate at a subsequent general election.

The Doctors and the Insurance Act.

Mr. Law's Ashton Speech.

Unionist Internal Dissensions.

ance Act did indeed melt rapidly away in 1913. In spite of a vehement professional meeting of protest on Jan. 7, the British Medical Association found itself forced by the independent action of doctors in all parts of the country to release its members from their pledge not to serve on the panels; and, though the Act remained for long unpopular, medical benefit was brought generally into operation, as arranged, on Jan. 15. At first the panel doctors were greatly overworked, and there were many hitches in administration. To obviate these, and to meet objections raised by the great Friendly Societies and by the trade unions, a substantial amending bill, involving a further charge on the State of £200,000 per annum, was introduced and carried by the Government. The Opposition did not fail to point out that this immediate necessity for amendment proved their charge that the provisions of the original Act were hasty and ill-considered; but Mr. Lloyd George was able to claim in Aug. that there were 18,000 doctors and 9,000 chemists working under the Act and prospering through it; that 270,000 workers were receiving sickness benefit, and that 20,000 consumptives—13,000 in sanatoria—had been already treated. In Feb. of the following year he boasted that there were over 20,000 general practitioners on the panels out of 22,500 in Great Britain; that nearly £4,500,000 had been distributed among them, besides £933,000 for drugs and an unallotted balance between doctors and chemists of £310,000.

The internal controversy among the Unionist party about Tariff Reform was also settled, at any rate temporarily, at the beginning of 1913. Mr. Bonar Law's Ashton declaration did not satisfy the opponents of food taxes, who were strongly supported by important organs of the Unionist press, and early in Jan. a memorial was presented to him signed by almost the whole body of Unionist M.P.'s, advocating a further modification of the proposed procedure but strongly deprecating any consequential change of leadership. The leaders acceded to their followers' wishes. After stating that the Unionist policy would be not to impose new duties on food, in order to secure the most effective system of preference, until they had been submitted to the people at a general election, Mr. Law added that he and Lord Lansdowne would have preferred that this change of method should be accompanied by a change of leaders, but in deference to the expression of opinion in the memorial they would remain. In a speech at Edinburgh on Jan. 24, Mr. Law claimed that, in spite of the modification, the flag of imperial preference was still flying, and the Unionist policy remained perfectly definite. They would impose a lower tariff than that of any industrial country on manufactured goods; they would give the Dominions the largest preference possible without food duties; and they would try to establish coöperation throughout the Empire in trade as well as in defence. They would work out with the Dominions the best scheme to this end, and put it before the electors for their assent. The solution was welcomed by the bulk of the Unionist party, and was accepted by Mr. Austen Chamberlain, though he said in Dec. that his submission to the conditions laid down at Edinburgh was the bitterest sacrifice he had ever made. There were protests in extreme Tariff Reform circles, but these did not seriously impair the regained unity of the party.

But no solution was found, before the war broke out, of the franchise question, of the grave problems of industrial unrest, or of those involved in the two great measures going forward under the provisions of the Parliament Act—the Welsh Disestablishment bill and the Irish Home Rule bill. The Franchise bill which the Government had introduced was to serve two main purposes: to abolish plural voting, and to afford a means, by way of amendment, of testing the opinion of the House of Commons on women's suffrage. The abolition of plural voting was strongly resented in the City of London, the most famous constituency in the country, as thereby an electorate containing the principal bankers and merchants of the Empire would be transformed into one consisting of a small number of resident caretakers and messengers. But it was the proposal to enlarge the bill by including women's

suffrage in it that proved fatal. On Jan. 27 the Speaker ruled, as a matter of order, that, if any amendments of the kind were inserted, the bill would become a new bill and would therefore have to be withdrawn. The Reform bills of 1832, 1867, and 1884 had been designed to enfranchise new classes of the people: this bill was not, and therefore could not properly be amended in the sense desired by the advocates of women's suffrage. The Government accordingly withdrew the measure, promising, however, to give facilities for a private member's suffrage bill in the next session. This *contretemps* was a blow both to the prestige of the Government and to the suffragist cause. Militancy was at once resumed and was rampant throughout the year; Mrs. Pankhurst, the leader of the movement, announced that she would hold nothing sacred except human life. *Militancy.* Shop-windows were smashed; golf links were defaced; telegraph wires were cut; church services and public meetings were interrupted; a woman lost her life in attempting to interfere with the race for the Derby. But arson was the principal weapon of the extremists, and during the year many railway stations, grand stands, boat-houses, pavilions, unoccupied country-houses, and even churches were by them wholly or partially burnt down. Popular feeling, in consequence, ran high against the militants; their meetings in London were broken up and had to be prohibited by the police. A large proportion of the women who were convicted of committing outrages and sent to prison started a hunger-strike. This move was met by forcible feeding—a practice against which public opinion revolted, and for which was substituted, under an Act passed *ad hoc* and nicknamed the "Cat and Mouse" Act, a system of releasing prisoners on licence. The atmosphere produced by these events was not favourable to the Women's Suffrage bill, which was rejected on May 6 by 267 votes to 210, all parties being divided except the Labour members who solidly supported the bill. The "Cat and Mouse" Act proved a failure. The women released under it qualified for prison once more, directly their strength was restored, by committing fresh outrages, and the authorities, who could not let their prisoners die on their hands, resorted again to forcible feeding in spite of the protests of many clergy and humanitarians. Meanwhile the non-militants, who formed the great majority of the supporters of the women's suffrage movement, were not inactive. Under Mrs. Fawcett's leadership they constantly pressed ministers to introduce a Government bill; and they advertised their cause by promoting a pilgrimage of women who perambulated the length and breadth of England at the height of summer in eight separate contingents, uniting at the end in a great demonstration in Hyde Park on July 26. In spite of the efforts of both sections, the Government maintained its neutral position. But it introduced a simple Plural Voting bill in April, with a view to passing it ultimately into law under the Parliament Act. It was carried through Committee in the House of Commons, in *Plural Voting Bill.* spite of Opposition protests, by the "Kangaroo" closure, and was rejected, because it was unaccompanied by a measure of redistribution, on second reading by the House of Lords. There was a repetition of this process in the session of 1914; but, owing to the outbreak of war, the bill was not introduced in 1915, and so failed. A compromise was arranged on another measure, the Temperance (Scotland) bill, to which it had been intended to apply the Parliament Act. In the shape in which the House of Lords passed the bill, it provided for local option on the question of liquor licenses in certain areas in Scotland; the popular vote, however, was postponed until 1920—when, it may be added, the Prohibitionists met with a severe defeat.

Militancy was continued and intensified in the first half of 1914. Outrage so frequently took the form of wanton damage to valuable pictures in the National Gallery, Royal Academy, and other exhibitions that public galleries had to be closed. Arson was rampant. Bombs were exploded in well-known churches, the coronation chair in Westminster Abbey having a narrow escape from serious injury by this method. An unsuccessful attempt

*Renewed
Militancy
in 1914.*

was made to force a way into Buckingham Palace to petition the King in person; and His Majesty was subjected, on several public occasions, to rude interruption. The number of militants actually committing crimes was small, but they had a large number of enthusiastic sympathizers who kept them well supplied with funds. Formal protests and condemnation by the non-militant section of suffragists had no effect on the campaign, which was only terminated by the coming of war.

Although the labour conflicts of 1913 and the first seven months of 1914 were not on the scale of the great strikes of 1912,

Labour Unrest.

there was constant unrest, and many signs that serious trouble was brewing. The Labour party in Parliament marked their increasing divergence from the principles accepted by both the historical parties by moving, at the beginning of the session of 1913, an amendment to the Address, which was of course easily defeated, in favour of a general system of nationalization. While there were sporadic strikes in various parts of Great Britain in the autumn and winter of that year, the principal disturbance was in Dublin and the neighbourhood, where, under the leadership of James Larkin, of the Irish Transport-Workers' Union, a series of strikes was organized, which lasted, despite official and other efforts at settlement, from Aug. to the close of the year, and which, during part of that time, brought the trade of the port of Dublin to a standstill. Larkin conducted his campaign with violence, was more than once arrested, was convicted of using seditious language, imprisoned, and then after a fortnight released. At first there was much sympathy from the Trades Union Congress and other representatives of English labour; the Dublin strikers were supplied with funds from England, and there were some half-hearted attempts at sympathetic strikes. But Larkin's revolutionary attitude, which had already antagonized moderate Irish Nationalists, eventually alienated British labour leaders, and left him only the support of the extremists, who held the first Syndicalist congress in Great Britain that autumn and declared in favour of "direct action." Early in 1914 there was great indignation in British labour circles over the deportation by the South African Government of the labour leaders concerned in strike disturbances in Johannesburg. They were received, on their arrival in England, with great demonstrations at the London Opera House and in Hyde Park; and an unsuccessful attempt was made by the Labour party in Parliament to interfere with the discretion of a self-governing dominion. The irritation caused by this deportation was symptomatic of the general labour unrest, which in the first half of 1914 affected miners, engineers, gas-workers, char-workers, municipal employees, dockers, transport-workers, coal-porters and many other groups of artisans. The absolute refusal to work with a non-unionist had so disorganized the London building trade that a stubborn struggle, which lasted for months, was begun by a general lockout in January. In May the railway servants decided to demand the recognition of their trade union, a 48 hours' week, and an increase of wages by 5s. weekly; and in June they gave a final approval to the "Triple Alliance" of their union with the Miners' Federation and the Transport Workers' Federation. The industrial prospect was dark.

The opening of the year 1913 found Parliament still in session, and engaged in completing the final stages of the Home Rule and Welsh Disestablishment bills. The report stage of the Home Rule bill did not produce any serious amendment except the introduction of proportional representation in the nine proposed Irish constituencies returning three or four members. There was a notable debate on New Year's Day on Sir Edward Carson's motion to exclude the province of Ulster from the operation of the measure. Mr. Asquith, while expressing his readiness to consider additional safeguards, denounced the proposal as a claim by Ulster to veto Home Rule. Mr. Bonar Law solemnly promised support by the Unionist party to Ulster if the bill were forced on her and she resisted. The Government had its normal majority of about 100. The third reading debate on Jan. 15 and 16 did not reveal any new arguments, but Mr. Redmond stated

that the Nationalists accepted the bill as a final settlement. In spite of Unionist predictions of immeasurable calamity, the third reading was carried by 367 to 257. The Lords debated the bill on second reading for four days (Jan. 27, 28, 29 and 30) before rejecting it by 326 to 60. The impossibility of working the scheme in face of the resistance of Ulster was the main ground put forward by the Unionists for rejection. But the most interesting feature of the debate was the strong advocacy by Lord Grey, ex-Governor-General of Canada, of a solution on federal lines—a proposal supported in a striking speech by the Archbishop of York (Dr. Lang). Neither the passing of the bill by the Commons, nor its rejection by the Lords, evoked any serious popular excitement.

Before the Welsh bill left the Commons its provisions were further mitigated in some slight degree. An amendment was adopted, favoured by Liberal churchmen, giving the Church body the option of commuting the life interests of the clergy on a 3% basis. There was a strong attempt made by the Unionists to confine the purposes to which the confiscated Church property should be applied to the advancement of the Christian religion by grants to Nonconformist churches. But, as the spokesmen of the Nonconformists repudiated the idea of concurrent endowment, the amendment was rejected by 273 to 200, though the Government agreed to limitation to charitable and eleemosynary purposes. The third reading was carried on Feb. 5 by the usual Government majority, after an eloquent exposition by Mr. Lloyd George of the sentiments of the Welsh people. The measure was debated on second reading by the Lords on Feb. 11, 12 and 13, and rejected by 252 to 51. Sixteen bishops voted in the majority; those of Hereford (Percival) and Oxford (Gore) in the minority.

Welsh Bill rejected by Lords.

The rejection of these two bills by the Lords, and the determination of ministers and of their majority in the Commons to override the veto of the Upper House through the use of the powers conferred by the Parliament Act, were the considerations governing the whole course of politics down to the outbreak of war. The main purpose of the sessions of 1913 and 1914 was to carry the two measures through the Commons a second and third time, so as to qualify them for passage into law in spite of the Lords. Feeling was naturally exacerbated by so high-handed a policy; especially as both bills, though apparently supported by the bulk of opinion in Ireland and Wales respectively, were strongly resisted by a majority of the parliamentary representatives of England, the predominant partner in each case. A recess of only three days separated the prorogation of the prolonged session of 1912 from the opening of the session of 1913 on March 10. The Opposition immediately joined issue on the Address by an amendment which asserted that the Irish and Welsh bills ought not to be proceeded with while the constitution of Parliament was still incomplete and without reference to the electors; but they were defeated by 262 to 169. The two controversial bills were carried for a second time through the Commons by the normal Government majority. As the Opposition resisted both measures in principle, no use was made of the limited opportunity for "suggestion" of amendments in Committee permitted by the Parliament Act. When the two bills came up to the House of Lords they were both met with identical resolutions that "this House declines to proceed with the consideration of the bill until it has been submitted to the judgment of the country." This was carried in the case of the Irish bill by 302 to 64; in that of the Welsh bill by 242 to 88. Thus the second stage for both under the Parliament Act was duly completed.

Second Stage of the Two Bills.

In all the debates on the Home Rule bill the Unionist leaders dwelt with insistence on the serious prospect before the country. We were "on the verge of a great national tragedy," said Mr. Balfour. The Liberals were crying peace where there was no peace, said Sir Edward Carson; Ulster had behind her in her resistance the whole force of the Conservative and Unionist party. The Liberals and Nationalists, however, still maintained that the Ulster attitude

The Menace of Ulster.

was largely bluff. Mr. Redmond on behalf of his party disclaimed any desire to establish ascendancy, and averred that Ulster would not be attacked. But the Unionists relied more on speeches in the great towns and on events in Ulster than on Parliament for the enlightenment of the country. Immediately after the division on the second reading, in June, Sir Edward Carson started on a political tour in Great Britain, making eloquent speeches in Glasgow, Edinburgh, Norwich, and Bristol—a demonstration which Mr. Redmond and his friends endeavoured to neutralize by following in the Ulster leader's footsteps. In July Sir Edward Carson spent several weeks in organization and speech-making in Belfast and the neighbourhood. He foreshadowed the establishment of a Provisional Government for Ulster, and assured his hearers that the Cabinet could not rely upon the army in forcing Home Rule upon them. Volunteers continued to drill, and provided themselves with the usual accompaniments of a modern army. More definite steps were taken in the autumn. On Sept. 25 the Ulster Unionist Council formally organized itself into a Provisional Government with a central authority whose chairman was Sir Edward Carson, and a guarantee fund intended to reach £1,000,000, to which the leader contributed £10,000. He formally reviewed the Volunteers, who then numbered 60,000 and increased to nearly 100,000 by the winter. On Nov. 3 there was a great demonstration in Belfast in favour of his policy by Ulster men of business, presided over by the president of the Belfast Chamber of Commerce. And on the 28th there was an enthusiastic meeting in his support in Dublin, where Mr. Law repeated his pledges to Ulster.

The Liberals retorted to these proceedings with jeers at "King Carson," and suggestions, which the Cabinet were too wise to accept, for his arrest. But many of them began to realize that there was a substantial difficulty in Ulster which could not be any longer ignored. Suggestions for a conference to arrange a compromise were thrown out in the Lords debate in July, and became more definite as the year drew towards a close.

Mr. O'Brien, for the Independent Nationalists, pleaded for some such course; Lord Loreburn, the Liberal ex-Lord Chancellor, proposed it in *The Times* of Sept. 11; Lord Grey urged the advantages of a federal solution; and on Oct. 9, Mr. Churchill, an important member of the Cabinet, advocated at Dundee a solution by agreement. Though Mr. Redmond, on Oct. 12, refused to contemplate anything beyond an increase in the safeguards for the minority, Mr. Asquith, in his annual address to his constituents at Ladybank on Oct. 25, said that the Government were prepared to consider proposals within the scope of the bill; that they were anxious for a settlement by consent, not through a conference, but through a free and frank exchange of views. Two days later Sir Edward Grey, at Berwick, suggested that there might be a Home Rule for Ulster within Home Rule for Ireland. Mr. Law replied at Wallsend on Oct. 29 that he would consider any proposals with a real desire to find a solution, and Sir Edward Carson, who was present, expressed his agreement, but the offer must be consistent with the Covenant. A fortnight later, at Norwich, Mr. Law said it was the duty of the Government to submit their proposals to the judgment of the people either at a general election or by a referendum. Mr. Redmond, speaking at Newcastle-on-Tyne next day, described the Unionists as trying to intimidate the people of England. Still he expressed a preference for a settlement by consent, but it must be based on national self-government for Ireland. Mr. Lloyd George on Nov. 29 treated Unionist demonstrations against Home Rule as a red herring drawn across his campaign for social reform. There was much speaking on both sides during the last weeks of the year, but apparently no advance towards an agreement. Mr. Law said the sands were running out and nothing had been done, but Sir Edward Grey replied that there were still some months to spare. In the beginning of the new year Lord Curzon intimated at Manchester that the conversations between leaders had had no result. Sir Edward Carson went to Belfast and advised "peace but preparation," and Mr. Redmond assured his constituents at Waterford that the bill

would that year automatically become law. The Unionists were strengthened in their resistance by some gains in by-elections during 1913 and early in 1914; but perhaps the most striking feature in the polls was the increasing support given to Labour at the expense of the Liberals.

It was in these conditions of doubt and apprehension that Parliament reassembled on Feb. 10 1914. The King's speech, while admitting that efforts at solution had so far failed, expressed a hope that they would yet succeed. *Government Concessions.* Mr. Asquith laid stress upon these words in the debate on the Address. Sir Edward Carson said that, if the Government were in earnest, there must be an amending bill—a suggestion which Mr. Redmond ridiculed. No move was, however, made by the Government in the next week or two, and the organization of public opinion in England in support of Ulster was rapidly proceeded with. A British Covenant, similar to the Ulster Covenant, was promulgated on March 3, headed by the signatures of influential men, not closely identified with political party, such as Lord Roberts, Lord Halifax, Lord Milner, Prof. Dicey, Dean Wace, and Mr. Rudyard Kipling. A Woman's Covenant followed; and both documents were eagerly signed, an appreciable proportion of the signatures being professing Liberals. On March 9 Mr. Asquith, in moving for the third and last time the second reading of the Home Rule bill, announced the projected concessions. The Government would propose that any county in Ulster, including the county boroughs of Belfast and Londonderry, might vote itself out of the jurisdiction of the Irish Parliament for a term of six years, after which it would automatically come within that jurisdiction. The Prime Minister pointed out that, under the Parliament Act, there would necessarily be two general elections in Great Britain before the six years expired. This scheme of provisional exclusion entirely failed to satisfy either the Opposition or Ulster. Mr. Law said that, if this was the last word of the Government, the position was very grave; Ulster was asked to destroy her future. Mr. Redmond insisted that this was the extreme limit of concession; and the Independent Nationalists protested vehemently against partition. Sir Edward Carson took note of the gain involved in admitting the principle of exclusion, but said emphatically "We don't want sentence of death with a stay of execution for six years." The situation became sensibly graver when Mr. Churchill at Bradford, on March 14, said that the Prime Minister's offer appeared to him to be final, reproached the Unionists and Ulster for not being satisfied with it, and maintained that, in the event of violence, the larger issue, between parliamentary government and armed force, once fought out at Marston Moor, would become dominant. If there was any attempt in action to subvert parliamentary government there was no lawful measure from which the Cabinet would shrink. They had sent out soldiers during the railway strike with Unionist approval. If the British civil and parliamentary systems were to be brought to the challenge of force, he could only say "Let us go forward together and put these grave matters to the proof." This utterance, which was endorsed a few days later by Mr. Lloyd George, and the refusal of the Prime Minister to give details of his proposals unless the general principle were adopted, led to an Opposition motion of censure on March 19. In the debate Mr. Law made a formal offer: if the new suggestions were put into the Home Rule bill and accepted by the country on a referendum, he had Lord Lansdowne's authority to say that, so far as his influence in the House of Lords went, he would not oppose the will of the people. This Mr. Asquith would not accept. Sir Edward Carson then left the House, amid a great Unionist demonstration, and, accompanied by eight Irish Unionist members, proceeded to Ulster.

An explosion in some form seemed to be imminent. Mr. Law had said in the censure debate that, in a case merely of disorder, the army would and ought to obey; if it were a question of civil war, "soldiers are citizens like the rest of us." This was speedily proved. It was determined to protect certain military stores in the N. of Ireland from possible raids by Ulster Volunteers, and a considerable

force was ordered on March 20 to move N. from Dublin with naval support. To the officers on duty at the Curragh this appeared to be the beginning of a movement to coerce Ulster by the army—an impression which was confirmed by certain questions asked them and alternatives put before them; and Gen. Sir Hubert Gough, in command of the cavalry brigade, with many of his subordinate officers, preferred to accept dismissal rather than initiate active military operations against Ulster. They were informed by the General Officer Commanding that it was merely a measure of precaution, and the senior officers concerned were ordered to report themselves at the War Office. There, in answer to a letter in which Gen. Gough asked the Adjutant-General to make clear whether, if the Home Rule bill became law, the officers "could be called upon to enforce it in Ulster under the expression of maintaining law and order," the following minute (dated March 23 1914) was written in reply, initialled by the Secretary of State, the Chief of the General Staff (Sir John French), and the Adjutant-General:—

You are authorized by the Army Council to inform the officers of the 3rd Cavalry Brigade, that the Army Council are satisfied that the incident which has arisen in regard to their resignations has been due to a misunderstanding. It is the duty of all soldiers to obey lawful commands given to them through the proper channel by the Army Council, either for the protection of public property and the support of the civil power in the event of disturbances or for the protection of the lives and property of the inhabitants. This is the only point it was intended to be put to the officers in the questions of the General Officer Commanding, and the Army Council have been glad to learn from you that there never has been and never will be in the Brigade any question of disobeying such lawful orders. His Majesty's Government must retain their right to use all the forces of the Crown in Ireland, or elsewhere, to maintain law and order and to support the civil power in the ordinary execution of its duty. But they have no intention whatever of taking advantage of this right to crush political opposition to the policy or principles of the Home Rule bill.

On receiving this document Gen. Gough asked Sir John French if it meant that he would not be called on to order his brigade to assist in coercing Ulster to submit to Home Rule, and Sir John French wrote across it, "I should read it so." The precautionary movements were carried out and all orders were duly obeyed.

These facts came out gradually in the week following Sir Edward Carson's removal from Westminster to Belfast, and there were many scenes and much recrimination in the House of Commons. On hearing the news of the officers' action, the Unionists asserted that there was obviously a plot to provoke Ulster, which the reluctance of the officers had defeated; the Prime Minister replied that the movement of troops was purely protective, and that, if officers and soldiers were to discriminate between the validity of different laws, the fabric of society would crumble; while the Labour party claimed that, as any option given to officers must logically be extended to men, the army could no longer be used in labour troubles. When the minute of the Army Council was published the Liberals were dismayed, while the Unionists accepted it as making the coercion of Ulster impossible. Ministers explained to their bewildered followers that the first three paragraphs were settled by the Cabinet, but that the last two, which, in connexion with Gen. Gough's letter, seemed to constitute a bargain with the officers in regard to a hypothetical contingency, had been added by the War Secretary without Cabinet authority. Amid prolonged Liberal and Labour cheers Mr. Asquith repudiated any bargain of the kind, and caused a new army order to be issued, under the heading "Discipline," as follows:—

1. No officer or soldier should in future be questioned by his superior officer as to the attitude he will adopt or as to his action in the event of his being required to obey orders dependent on future or hypothetical contingencies.

2. An officer or soldier is forbidden in future to ask for assurances as to orders which he may be required to obey.

3. In particular it is the duty of every officer and soldier to obey all lawful commands given to them through the proper channel, either for the safeguarding of public property, or the support of the civil power in the ordinary execution of its duty, or for the protection of the lives and property of the inhabitants in the case of disturbance of the peace.

Ministers did not seem to be prepared for the natural result of these proceedings, the resignation of the three members of the Army Council who had initialled the minute of March 23—Col. Seely (the War Minister), Sir John French, and Sir Spencer Ewart. The Prime Minister endeavoured to persuade all three to reconsider their determination, as there was, in his view, no difference of opinion amongst them; but, having failed, he assumed himself the office of Secretary of State for War in addition to that of First Lord of the Treasury. In an address to his constituents on seeking reelection, he illustrated the spirit in which he proposed to act by quoting the words of Chatham: "The army will hear nothing of politics from me, and in return I expect to hear nothing of politics from the army." The Unionists noted with satisfaction that both Col. Seely himself, and Lord Morley who assisted in drafting the peccant paragraphs, stated that they did not see that these differed in spirit and substance from the three preceding paragraphs. The conclusion seemed to be that the Government repudiated the intention to make use of the army "to crush political opposition to the policy or principles of the Home Rule bill." A gigantic demonstration of protest against the coercion of Ulster was held on April 4 in Hyde Park; there were 22 separate processions and 24 platforms, and men of the public eminence of Mr. Balfour, Sir Edward Carson, and Lord Milner attended and spoke. The gravity of the situation led to many expressions in the Home Rule debate of a desire for an agreed settlement. Sir Edward Carson said there was only one policy possible: "Leave Ulster out until you have won her consent to come in." But ministers would not advance beyond their previous proposals, and the second reading was carried by 80 votes, as compared with majorities of 110 and 100 in the previous year. There was a similar decline in the majority for the second reading of the Welsh bill.

Meanwhile events were moving in Ireland. Easter week saw a series of reviews by Sir Edward Carson of large bodies of Ulster Volunteers; and on the night of April 24-25 some 35,000 rifles and 3,000,000 cartridges were landed at Larne and distributed throughout the Protestant north. This successful feat of gun-running, and the publication of papers with regard to the alleged military "plot," produced heated debates in Parliament, followed, however, by further private negotiations between leaders. Before the third reading of the Home Rule bill, the Prime Minister gave notice that the Government would introduce—in the House of Lords—an Amending bill, which might pass simultaneously with the Home Rule bill. It was only, however, after a scene of disorder in the House of Commons that he disclosed its nature: it would give effect to the terms of agreement if arrived at, and, if not, to the proposals outlined on March 9. This was far from satisfying the Opposition, and the third reading of the Home Rule bill was only carried by 351 to 274, that of the Welsh bill having been secured by 328 to 251.

The two bills left the Commons before the Whitsuntide recess, which was spent by Sir Edward Carson in Ulster in making "preparations for the final scene." While there was every sign of resolute determination about Ulster and her Volunteers, Nationalist Ireland had retorted by enrolling Volunteers of her own, who were estimated to exceed 100,000 men. This force was started independently of the official Nationalists, and it was only with some difficulty that Mr. Redmond obtained control by the end of June. There were thus two armed bodies of many thousands of men facing each other in Ireland in a state of what Lord Milner called "smouldering war." In these alarming circumstances the Amending bill, introduced in the Lords on June 23, which merely offered option of exclusion by counties for six years, seemed inadequate. It was read a second time in the beginning of July, after a prolonged debate, in the course of which Lord Roberts warned the Government that any attempt to use the military forces of the nation to coerce Ulster would break and ruin the army. In committee the Unionist majority transformed the measure by amendments

Mr. Asquith as War Secretary.

Determination of Ulster.

Approach of Civil War.

The Amending Bill.

permanently excluding the whole province of Ulster. Nationalist counties no less than Unionist, from the operation of the Home Rule bill. It was certain that the Liberal and Nationalist majority in the Commons would indignantly reject this solution. At the same time the urgency of the Ulster problem was again enforced by enormous demonstrations on the Boyne anniversary, emphasizing Sir Edward Carson's words: "Give us a clear cut or come and fight us."

The Amending bill was to be taken in the Commons on Monday July 20; but the King and the wiser heads in the Cabinet were determined to make a further effort for peace; and on that morning *The Times* announced that the King had issued invitations to a conference on the Ulster question at Buckingham Palace, consisting of two members each from the Government, the Opposition, the Nationalists and the Ulster Covenanters. Moderate men in all parties hailed the announcement with relief; but keen partisans were suspicious and critical. The conference met on Tuesday under the chairmanship of the Speaker. The Government were represented by Mr. Asquith and Mr. Lloyd George; the Opposition by Lord Lansdowne and Mr. Bonar Law; the Nationalists by Mr. Redmond and Mr. Dillon; and the Ulstermen by Sir Edward Carson and Capt. Craig. The King opened the proceedings in a brief but weighty speech. He said:

"My intervention at this moment may be regarded as a new departure. But the exceptional circumstances under which you are brought together justify my action. For months we have watched with deep misgivings the course of events in Ireland. The trend has been surely and steadily towards an appeal to force, and to-day the cry of civil war is on the lips of the most responsible and sober-minded of my people."

His Majesty urged on the conference "a spirit of generous compromise," reminded them that the time was short, and expressed his confidence that they would be patient, earnest and conciliatory. In spite of a considerable display of these qualities, the conference failed. The members met on four days, from Tuesday to Friday, and at the close the Speaker announced that they had been unable to agree, either in principle or in detail, on the area to be excluded from the operation of the Home Rule bill. It was understood that the deadlock arose over the question of the exclusion of Fermanagh and Tyrone, both of them counties greatly divided in political opinion. The position seemed to be desperate, and passions were once more fiercely excited by a fatal affray in Dublin on the following Sunday between British soldiers and the populace—an affray which followed on a successful gun-running on a considerable scale by the National Volunteers. The Amending bill was put down for July 30, and a great Liberal meeting in the London Opera House on the previous day urged the Government to go forward with their programme. But already the international crisis precipitated by Austria's attack on Serbia had become too serious to admit of the continuance of domestic strife. The Amending bill was indefinitely postponed, and civil war was averted by a gigantic European conflict.

The bitterness introduced into politics by the Parliament Act led, during the last years of peace, to frequent rumours and accusations of irregular if not corrupt dealings by individual ministers in regard, now to silver, now to oil, now to wireless telegraphy. Only, however, one instance did there appear to be any foundation for the suggestions of improper action. In April 1912, after the Postmaster-General had accepted a tender for the erection of wireless stations by the Marconi Co., the Attorney-General (Sir Rufus Isaacs, afterwards Lord Reading) bought 10,000 shares in the American Marconi Co., a separate company which, it was contended, did not benefit by the contract, and sold 1,000 each to two friends in the Government—the Chancellor of the Exchequer (Mr. Lloyd George) and the Chief Whip (Lord Murray of Elibank). Some of these shares were resold by their purchasers in the next few days at a profit, but the total net result of the transaction after a year was a loss. The advice to purchase had been given to Sir Rufus by his brother Mr. Godfrey Isaacs, managing director of the American company, and also of the English company. These facts were not told

to the House of Commons when in the previous autumn the Marconi contract was discussed and a committee was appointed to inquire into it. They only came out in March 1913 during the trial of an action for libel against a French newspaper which had given currency to the rumours of corruption that were rife throughout the winter. Thereupon the Attorney-General and the Chancellor of the Exchequer appeared before the committee and explained what they had done. Lord Murray, who had bought further shares in the company on behalf of the Liberal party fund, was abroad. The committee found that the gross charges of corruption were unfounded, but could not agree upon a united report. The majority, consisting of Liberal, Labour, and Nationalist members, awarded no blame to any one except those who circulated the charges of corruption, thereby setting aside their Liberal chairman's draft report, which concluded that ministers had been ill-advised both in their purchase of shares and in their delay in disclosing the facts. The minority, consisting of Unionist members only, found that ministers had acted with grave impropriety. In the debate which followed in the House of Commons on June 18 and 19, both the Attorney-General and the Chancellor of the Exchequer, while protesting their good faith throughout the transaction, admitted that the original purchase was indiscreet, and that the delay in disclosure was a mistake of judgment. After a heated discussion, during which the Unionists vainly endeavoured to secure the passing of some amendment expressing the regret of Parliament for what ministers admitted to be indiscretions, a motion was carried by 346 to 268 accepting the two ministers' statements and reprobating the charges of corruption. Public opinion was more severe than Parliament. It was shocked that important ministers, and especially the guardian of the Treasury, should show themselves so wanting in delicacy and prudence in pecuniary matters. Subsequently in the House of Lords Lord Murray admitted that his action had not been wise or correct, but a committee of that House unanimously found that he had done nothing that reflected on his personal honour.

Mr. Lloyd George at once endeavoured to divert attention from his own indiscretions to the shortcomings of the landlords. What humbug it was for Conservatives, he said, in a speech on July 1 at a luncheon given to himself and the Attorney-General at the National Liberal Club, to set up an ideal standard for Liberal ministers; when it was notorious that parliaments of landlords in the past had been guided in their legislation by their private interests! The Radical land campaign, started in the previous year, was pushed on, and the subject formed the staple of Mr. Lloyd George's numerous speeches in the country in the autumn of 1913. The Unionists countered the movement by a programme of their own (explained by Lord Lansdowne at Matlock on June 21), which involved the encouragement of small ownership, and the provision of advances by the State to assist the building of cottages and the purchase by tenants of their holdings. At Swindon, on Oct. 22, Mr. Lloyd George announced the ministerial scheme. The Government proposed to set up a Ministry of Lands to take over the functions of the Board of Agriculture, together with registration of title, settled estates, and land valuation—in short to have a general supervision of land and of all dealings with it of whatever kind. Commissioners, having a judicial character, would be appointed, who would be given large compulsory powers in respect of rent, eviction, compensation for improvements, and wages. Tenants would be protected against damage by game. The new ministry would have power to acquire at a reasonable price all waste, derelict, and neglected lands, and to afforest, reclaim, equip, and cultivate them. Housing and cheap transit were also to be provided. While Unionists denounced the extravagance of the scheme, and the "horde of officials" with despotic powers which it proposed to set up, they did not take it very seriously. The event proved them to be right. But Mr. Lloyd George took advantage of his budget for the next year, 1914, to advance his programme of social reform in other ways. He made provision for an extended series of grants to local authorities.

The Budget of 1914.

clothing, and knit socks for sailors and soldiers; and *The Times* accepted, with unprecedented success, the office of organ for collecting money for the British Red Cross and Order of St. John for the benefit of the wounded. Yet in spite of the various drains on manhood, time and purse, and of the cruel anxieties, as the tale of losses came in, in every house in the country, the public adopted as its motto "Business as usual," and carried on, so far as practicable, as if the nation were at peace. There was some, but comparatively little, panic at the outbreak of war as to food-stuffs, and a certain amount of hoarding, but no serious shortage.

The abandonment of party strife entailed upon the Ministry one difficult decision. Were the Home Rule bill and the Welsh

*Fate of
Home Rule
Bill.*

Disestablishment bill, which had passed in three successive sessions through all their stages in the Commons, but which had been vehemently opposed by the

Unionists, and rejected by the Lords, to be allowed to become law automatically under the Parliament Act? Ministers, influenced no doubt largely by the desire to meet Mr. Redmond's magnanimous attitude at the outset of the war, determined to submit them to the King for signature, with the reservation that neither should be put into operation during the war, and that special arrangements should be made to meet the case of Ulster. The Opposition protested that this decision was a breach of faith, and denounced the Suspensory bill which the Government introduced and passed; but they maintained their patriotic attitude unchanged. Their leaders generally had placed themselves at the disposal of the Government, and the services of Mr. Austen Chamberlain, Mr. (afterwards Lord) Long, and Mr. F. E. Smith (afterwards Lord Birkenhead) had been accepted. Mr. Smith was made head of the Press Bureau, in order to give out "a steady stream of information." The press had shown as a body remarkable discretion about naval and military secrets, so that the arrival of the Expeditionary Force in France was a complete surprise to the Germans. But the secrecy necessarily observed gave rise to extraordinary rumours which were widely accepted as fact. The most notorious was the story, for which there was no foundation whatever, that trainloads of Russian troops, arrived from Archangel, had passed through England to aid the French in their fight against the German invaders.

Internal strife came to an end, not merely between parties in the House of Commons, but throughout the country. Political

*Cessation
of Internal
Strife.*

propaganda ceased. All strikes were promptly settled, including the great building strike in London. A general amnesty was proclaimed for offences in connexion with industrial disturbances and for suffragist

prisoners. The women's agitation for the suffrage was suspended; "militancy" on their part was dropped; suffrage societies organized themselves for the relief of women and children who suffered by the war; many of the leading militants diverted their oratorical talents to the promotion of recruiting. The nation was at one. The Churches impressed upon their adherents the need for endurance and sacrifice, and upheld the righteousness of the national cause. Friday Aug. 21 was appointed as a special day of intercession for soldiers and sailors, and crowded services were held all over the land, the King and Queen attending at Westminster Abbey.

There was considerable alarm in the country, for a long time, in regard to German spies. Railways, bridges, and waterworks

*Spies and
Aliens.*

were in consequence guarded by Territorial troops and Boy Scouts. Aliens were registered, and restricted in their freedom of movement and residence. The outcry

against aliens led Adml. Prince Louis of Battenberg, the First Sea Lord, to retire owing to his German origin. Several spies were arrested and tried, and a certain number shot.

The control of the war, as of all other portions of British policy, rested with the Cabinet. It was assisted by the Com-

*War
Council.*

mittee of Imperial Defence, and the War Office and Admiralty acted as executive agents. But a Cabinet

of over 20 members, a large proportion of whom were immersed in details of internal policy, was obviously unfitted for the duties of superintendence of naval and military operations. On Nov. 25 a War Council was constituted, consisting mainly of

the members of the Committee of Imperial Defence, to whom the Cabinet delegated (subject to ultimate reference to itself) the ordinary management of the war. While Mr. Lloyd George, Sir Edward Grey, Lord Haldane, and Lord Crewe had seats and influence on the Council, the principal responsibility lay with the Prime Minister, Lord Kitchener, and Mr. Churchill; indeed, as was afterwards revealed, the meetings of the War Council were so intermittent that the authority of these three was but little controlled. The public gained its authentic knowledge of military progress mainly from Lord Kitchener's statements in the Lords, and similar statements about naval operations by Mr. Churchill in the Commons.

The varying fortunes of the early weeks of the war—the German check at Liège, the retreat from Mons, the burning of Louvain, and the outrageous conduct of the Germans in Belgium and France, the escape of the "Goeben," the exploits of the "Arethusa" at sea, the advance of the Russians in East Prussia and their expulsion by Hindenburg, the brave resistance of Serbia to the

in Parlia-
ment.*

Austrian attack, the threat to Paris and the removal of the French Government to Bordeaux, the victory of the Marne, the German stand on the Aisne, the torpedoing of three British cruisers in the North Sea, the death of the veteran Lord Roberts when on a visit to the army in France—were all, in one way or another, calculated to stiffen the resolution of the nation. The session of Parliament was brought to a close on Sept. 10 amid unprecedented scenes. Cheers greeted the announcement that the Home Rule and Welsh Church bills had been duly passed under the Parliament Act. The King's Speech struck a lofty note. "I address you," His Majesty began, "in circumstances that call for action rather than speech. After every endeavour had been made by my Government to preserve the peace of the world, I was compelled, in the assertion of treaty obligations deliberately set at naught, and for the protection of the public law of Europe and the vital interests of my Empire, to go to war." And he summarized British policy when he declared: "We are fighting for a worthy purpose, and we shall not lay down our arms until that purpose is fully achieved." Mr. Crooks, of the Labour party, before the members separated, started singing, "God save the King," in which all present joined upstanding; and then he exclaimed, "God save Ireland," to which Mr. Redmond responded, "God save England."

The Prime Minister had already, before the close of the session, started, with the coöperation of leading men of all parties, a great educational campaign, by means of meetings throughout the United Kingdom, to vindicate the justice of the British cause and to organize public opinion and effort. The first meeting was at the Guildhall on Sept. 4, and was addressed by Mr. Asquith, Mr. Bonar Law, Mr. Balfour, and Mr. Churchill. Others were held in rapid succession in different parts of the country, the Prime Minister speaking himself not only in London but in Edinburgh, Cardiff, and Dublin. In Dublin the Lord Mayor was in the chair, and the speakers included (besides the Prime Minister) the Lord Lieutenant, the Chief Secretary, Mr. Redmond, Mr. Dillon, and Mr. Devlin. Mr. Redmond said that Ireland, which was profoundly moved by the sufferings of Belgium, would feel bound in honour to take her place beside the other autonomous portions of the King's Dominions. At a meeting in the London Opera House Mr. Crooks said that the fight was for liberty and home; he would rather see every living soul blotted off the face of the earth than see the Kaiser supreme anywhere. One of the most striking speeches was delivered by Mr. Lloyd George to a meeting of Welshmen in the Queen's Hall in London. The German Chancellor, he said, has called treaties "scraps of paper." So were bank-notes; so were bills of exchange. Treaties were the currency of international statesmanship. It was a great opportunity, and a new and more exalted patriotism was emerging. Britain had been living, he said, in a sheltered valley; the stern hand of fate had scourged her to an elevation whence the great peaks of honour were visible—Duty, Patriotism, Sacrifice. The Prime Minister summed up the position of the

*The
Country
and the
War.*

country in his speech at the Guildhall on Lord Mayor's Day. Britain, he said, would not sheathe the sword until Belgium had recovered all and more than all that she had sacrificed, until France was adequately secured against the menace of aggression, until the rights of the smaller nationalities were placed on an unassailable foundation, until the military dominion of Prussia was fully and finally destroyed.

Meanwhile England was feeling day by day more and more what it meant to be at war. On the coasts, and especially the east coast, houses were destroyed which might either obstruct the British line of fire or serve as landmarks for a hostile fleet; lamps were extinguished on the sea front and all streets leading to it; no lights were allowed to be shown from private houses; and lighthouses and lightships were temporarily extinguished. The development of air warfare shortly caused the streets of London and all towns accessible from the east to be darkened, and searchlights, special guns, and an increasing number of air machines to be held in readiness against attack; while all trains in the south-eastern quarter of England had to have their blinds drawn after nightfall. The fall of Antwerp and the loss of the Belgian coast to the enemy brought the imminence of the danger home. These events in Belgium brought also a great accession to the number of Belgian refugees who had already sought shelter in England, and a vast organization of public and private benevolence catered for their needs. On the other hand, public opinion in England was cheered about this time by the arrival of the first contingent of Canadian troops, the forerunner of a mighty force from all the Dominions; and by the appearance in the battle line in France of native troops from India. This was unfortunately succeeded by the news of the defeat of Adml. Craddock at Coronel.

The new parliamentary session, which opened on Nov. 11, followed immediately upon a serious development of the conflict—the entry of Turkey into the war as an ally of the Central Powers (which had as one result the proclamation of Egypt as a British Protectorate). The King, in his Speech, said that “the only measures which will be submitted to you, at this stage of the session, are such as seem necessary to my advisers for the attainment of the great purpose upon which the efforts of the Empire are set.” The most burning question of the moment was the scale of pensions and disablement allowances for sailors and soldiers and their dependents. Mr. Asquith welcomed a suggestion made by Mr. Law that it should be referred for decision to a small committee of all parties. Mr. Arthur Henderson, who had succeeded the pacifist Mr. Ramsay MacDonald as chairman of the Labour party, promised the full support of organized labour in maintaining unity.

The finance of the war claimed the immediate attention of Parliament. The Prime Minister moved a Vote of Credit for £225,000,000, and a further addition of a million men to the army. On Nov. 17 the Chancellor of the Exchequer explained how it was proposed to raise the money. He had to provide for a deficit of nearly 340 millions. Following the precedents of Pitt in the French War and Gladstone in the Crimean War, a substantial part of this must be obtained by increased taxation levied on all classes. He proposed to double the income-tax (bringing it up to 2s. 6d.), and super-tax, to add the equivalent of a halfpenny a half-pint to the taxation of beer, and to raise the duty on tea from 5d. to 8d. In a full year, he calculated that these increases would bring in over 65 millions. He further announced the immediate issue of a loan of £350,000,000, at 3½%, at 95, which was promptly subscribed. He calculated the cost of the first full year of war as at least £450,000,000. Other important war measures taken at this time were the purchase by Government of £18,000,000 worth of sugar—a foretaste of the coming control of food supplies, not yet expected; a scheme for the manufacture of aniline dyes, hitherto made exclusively in Germany—the consumers to subscribe three millions, and the Government to guarantee debenture interest on another million and a half; the setting up by statute of a custodian of enemy property in the person of the Public Trustee.

At the end of November the King crossed to France, and spent a week with his army in the field. The visit, which was repeated in subsequent years of war, greatly cheered and sustained the troops. Almost immediately afterwards came the news of Adml. Sturdee's victory off the Falkland Isles. But this was succeeded by evidence that, even though invasion of England in force might be too hazardous to be attempted, the country was exposed to harassing and destructive attacks by sea and air. On the morning of Dec. 16 German warships appeared off Hartlepool, a great business port, and Scarborough and Whitby, two much-frequented watering-places, and bombarded all three towns, doing considerable damage, and killing some 140 people, and wounding many others, mostly civilians, including women and children. The ships only remained for half an hour and then disappeared in the mist, before any portion of the British fleet, save patrol boats, could come up. On Christmas Eve a German aeroplane dropped a bomb in a bed of cabbages near Dover Castle, and at midday on Christmas Day another got up the Thames as far as Eritb, but was then chased off. These events produced no panic, but stimulated recruiting, which remained brisk in England, though in Ireland Mr. Redmond's efforts were only moderately successful.

Speaking in December, Mr. Bonar Law, while rightfully claiming that the Opposition had distinguished itself from previous war-time oppositions by its patriotic reticence, remarked that perhaps, indeed, they had not criticized the Government enough. The early months of 1915 witnessed a change. It was clear that the war, which in the west had settled down into trench-fighting, would last for a considerable time, even assuming that the “steam-roller” of the Russian advance would eventually cause the German strangle-hold on north-eastern France to relax; it was not so clear that all that the Government had done and left undone was judicious. Criticism therefore awoke, and became steadily more insistent till the formation of the first Coalition Ministry. But it was criticism, not on party lines, directed to the more efficient conduct of the war; the criticism from the pacifist side was negligible. It was urged that voluntary enlistment, though hitherto fairly adequate, could not possibly give the army all the men it would want; that the half-hearted British policy of search and blockade, though it provoked reasoned objections from the American Government, failed to do any serious harm to Germany; that steps should at once be taken to regulate the price of food, which was steadily mounting; that the Press Bureau, under Sir Stanley (afterwards Lord) Buckmaster, was unduly harassing; that quite undue mildness was shown in the treatment accorded to enemy aliens, who should all be interned; that insufficient attention was paid to the development of the air force; and, above all, that the Government had entirely failed to meet the requirements for munitions of war.

Feeling in England was hardened by the German proclamation of Feb. 4, declaring a blockade of Great Britain from Feb. 18, claiming the right in the war-region to destroy British ships without providing means of escape for passengers and crew, and warning neutral ships that they might incur the same fate. “This,” as Mr. Asquith said, “is in effect a claim to torpedo at sight, without regard to the safety of crew and passengers, any merchant vessel under any flag.” It was resolved, in consequence, to detain, and take into port, ships carrying goods of presumed enemy destination, ownership or origin; and also to discriminate against submarine prisoners, as having disregarded the laws of war. The sinking of the “Lusitania,” in accordance with this proclamation, by the Germans on May 7, with a great loss of life among innocent passengers, largely American, brought the aliens question in England to a head, as it produced violent anti-German riots and demonstrations all over the country. It was decided to intern or deport all enemy aliens, and to scrutinize carefully the cases of naturalized Germans. Widespread indignation had already been aroused this spring by the

ment of
Aliens.

reports of American agents about the treatment meted out to British prisoners in Germany; and this was increased in May by the publication of the report of a committee, presided over by Lord Bryce, confirming the stories of outrage committed by the Germans in Belgium and France. The Prime Minister had no difficulty in obtaining a supplementary Vote of Credit for £37,000,000, and a fresh Vote of Credit for £250,000,000, the cost of the war having already reached two millions a day.

The great difficulty with which the Government had to cope this spring was the insufficient supply of munitions of war, due

Strikes. mainly to strikes, to trade-union practices favouring slow production, and to drink. Appeals were made to the working men by Lord Kitchener; and on March 9 Mr. Lloyd George introduced a new Defence of the Realm bill, giving the Government wide powers of mobilizing industry. On March 17 the Chancellor of the Exchequer met the representatives of 35 trade unions, and pointed out to them that the duration of the war depended on the rate at which munitions could be turned out. Ultimately an agreement was reached under which there was to be in no case any stoppage of work upon munitions and equipments of war; all differences were to be the subject of conference between the parties and in case of disagreement to be referred to arbitration; trade practices were to be relaxed during the war period. In harmony with the spirit of this agreement there was enrolled at Liverpool, under Lord Derby's command, a Dockers' Battalion. With regard to drink Mr. Lloyd George told a deputation of shipowners which advocated total prohibition during the war: "We are fighting Germany, Austria, and drink; and, as far as I can see, the greatest of these three deadly foes is drink." In order to set a good example

The Drink Question. the King announced that he would give up all alcoholic liquor till after the war, and issued orders against its consumption in the Royal Household. Lord Kitchener, and a considerable number of loyal subjects, followed His Majesty's example. On April 29 Mr. Lloyd George introduced the ministerial proposals which increased enormously the taxation on all alcoholic liquors, and included powers to close and control public-houses in munition areas. But public opinion was not ripe for so stringent a measure, and compelled the withdrawal of these proposals; and the Government contented themselves with setting up a Liquor Control Board with Lord D'Abernon (formerly Sir Edgar Vincent) as chairman, which drastically reduced the alcoholic strength of beer and spirits, in munition or populous areas, and the hours during which public-houses might be open and liquor sold. Only for some two hours in the middle of the day and for some three hours in the evening could drink be procured; and the arrangement worked well.

The question of munitions became critical in April and May. The battle of Neuve Chapelle in March had been indecisive owing to a deficiency of ammunition, which was revealed to the people of England by a dispatch from the Military Correspondent of *The Times* (Col. Repington). Mr. Asquith indeed, in a speech at New-

Deficiency of Munitions.

castle-on-Tyne mainly devoted to encouraging munition workers to deliver the goods "more promptly and more effectively," amazed and angered the public by denying that operations in the field had been crippled through lack of ammunition. But Lord Kitchener confessed that "the output is not equal to our needs"; and Mr. Lloyd George dwelt in the House of Commons on the unprecedented expenditure of artillery ammunition and the new importance given to high explosives. The problem, he said, was to produce munitions not only on a much larger scale than ever before but of a different kind. To the anxieties caused by the deficiency of munitions were added those due to the desperate resistance with which the troops, just landed with high hopes on Gallipoli, had been met. Disagreement about the Dardanelles operations between Mr. Churchill, the First Lord of the Admiralty, and Lord Fisher, the First Sea Lord, came to a head; and the Prime Minister, who had on May 12 contradicted the current rumours of coalition, formally told the House a week later that the Government was to be reconstructed "on a broader personal and political basis."

The reconstruction took place during the Whitsuntide recess, it being carefully explained by Mr. Asquith that there was no change of policy and no sacrifice by any minister of his political ideals. The Coalition was "for the purpose of the war alone." Mr. Asquith, Sir Edward Grey and Lord Kitchener retained their respective offices, and Lord Crewe remained Lord President and leader in the Lords; Lord Lansdowne joined the Ministry without portfolio; Mr. Bonar Law became Colonial Secretary; Mr. Balfour took over the Admiralty from Mr. Churchill, who became Chancellor of the Duchy; Mr. Austen Chamberlain went to the India Office; and Lord Curzon, Mr. (afterwards Lord) Long, and Lord Selborne also entered the Cabinet. Mr. Asquith sought the coöperation of both the Irish leaders in his Cabinet; but, while Sir Edward Carson accepted the Attorney-Generalship (having Mr. F. E. Smith as Solicitor-General), Mr. Redmond declined to enter. Mr. Henderson, the leader of the Labour party, became President of the Board of Education. Public opinion would not tolerate the retention of Lord Haldane, with his German associations, as Lord Chancellor. The post was declined by the Attorney-General, Sir John Simon, and he became Home Secretary. The Solicitor-General, Sir Stanley Buckmaster, was accordingly promoted to the woolsack as Lord Buckmaster. The vital importance of guns and ammunition was recognized by the creation of a new Ministry of Munitions, at the head of which was placed the most energetic member of the late Ministry, already rivalling Mr. Asquith in reputation, Mr. Lloyd George. Mr. McKenna succeeded to the Chancellorship of the Exchequer, and Mr. Runciman, Mr. Birrell, Mr. McKinnon Wood and Mr. Harcourt remained in the Cabinet. The Liberal ministers who retired, besides Lord Haldane, were Lord Beauchamp, Mr. Hobhouse, Mr. Pease, Lord Lucas and Lord Emmott; Mr. Herbert Samuel became Postmaster-General, but was excluded from the Cabinet; and Mr. Montagu became Financial Secretary to the Treasury, Lord Robert Cecil Under-Secretary for Foreign Affairs and the Duke of Devonshire Civil Lord of the Admiralty; Mr. Brace, the Labour member, was appointed Under-Secretary for Home Affairs.

First Coalition Ministry.

The country, which was cheered this May by the entry of Italy into the war on the side of the Allies, welcomed the new Ministry as giving promise of a more strenuous conduct of hostilities. Mr. Lloyd George threw himself with ardour into his new work, enlisted the aid of business and practical men and men of science in its organization, and made a personal appeal to the great towns, Manchester, Liverpool and Cardiff, to concentrate on enlarging the output, and to consent to the modification of such trade-union rules as conflicted with rapid and efficient production. It was in the workshops of the country, he said, that success must be sought. He urged the conversion of workshops engaged in the arts of peace into factories for turning out munitions of war. Mr. Lloyd George got at once to work on the lines he had laid down. He brought in on June 23 a Munitions of War bill, embodying his plans for increasing output. They were based on a system of decentralization. There were to be 10 munition areas, managed by local business men. There must be no strikes or lockouts; disputes must be referred to arbitration. Skilled men must be brought back from the army; Munition Courts appointed, representative of Government, employers and workmen; trade-union regulations restricting output must be suspended; and employers' profits limited. These proposals, with some modifications, were accepted by the Labour leaders; and the bill promptly became law.

But the Act by no means put a complete stop to labour troubles. In July the South Wales miners suddenly demanded a new minimum rate of wages higher than the previous maximum. Mr. Runciman, President of the Board of Trade, in vain endeavoured to compose the quarrel. The Government applied the provisions of the Munitions Act with no result, and a card vote gave a majority for a strike. Mr. Lloyd George went down to Cardiff and effected a settlement by an advance on

Mr. Lloyd George as Minister of Munitions.

Strike of South Wales Miners.

Mr. Runciman's conditions, after a week's strike had cost the country £1,500,000. The continued increase in the price of coal consequent on these events caused the Government to pass a Price of Coal (Limitation) bill, which was only accepted by Parliament with reluctance. The King made in July a tour of the munition centres in the Midlands to thank and hearten the workers of both sexes. Mr. Lloyd George was able in the debate on adjournment on July 28 to give a reassuring account of the success of his department, which had enrolled nearly 100,000 volunteers, had brought back thousands of qualified engineers from the ranks, and had set up some 20 national factories. But, as a result of a recent conference at Boulogne, it had been decided to embark on a new programme of great proportions which would necessitate 10 new establishments and need further volunteers, and especially the assistance of women.

Trade-Union Practices and Menaces.

Once more he appealed to trade-union leaders to bring pressure upon their men to suspend trade-union practices restricting output, and he attended a conference in the London Opera House on the following day with representatives of the coal-mines industry, in which there was a general disposition to meet his views. But these practices continued; and yet once again Mr. Lloyd George, addressing on Sept. 21, by invitation, the Trade Union Congress at Bristol, pointed out that, while the Government had kept its promises, intercepted war profits, and taken control of the whole of the engineering works of the country for the benefit of the State, labour had failed in too many instances to reciprocate. Objections were raised to semi-skilled and unskilled labour in place of skilled; to women replacing men; to night work; to artisans working their hardest. It was a war, he explained, of material, and the Russian retreat of that autumn threw a heavier burden on England. "I beg you, do not set the sympathy of the country against Labour by holding back its might with the fetters of regulation and custom." The speech produced a great effect on the Congress and materially improved the conditions prevailing in the workshops.

War Loan of 1915.

The finance of the war was the next most urgent question for the Coalition to tackle. The Prime Minister moved on June 14 a supplementary Vote of Credit for £250,000,000, and anticipated a war expenditure of three millions a day. The new Chancellor of the Exchequer, Mr. McKenna, presently obtained Parliamentary sanction for a fresh War Loan, to be issued at 4½%, at par, with special arrangements, through the post-offices, trade unions, friendly societies, and factories, for the encouragement of the small investor, who could obtain bonds of £5 or vouchers for 5s. A great campaign was at once started in support of the loan and of war economy, beginning with a meeting of bankers, merchants, manufacturers and shopkeepers of the City of London in the Guildhall. Mr. Asquith and Mr. Bonar Law were the principal speakers. The Prime Minister commended the loan as the first great democratic loan in British history, and he urged the imperative necessity of reducing all expenditure on luxuries. The loan was a great success, and realized nearly £600,000,000, including 200 millions from the big banks. At the end of July the Prime Minister had to apply for a further Vote of Credit amounting to £150,000,000. A Retrenchment Committee, with Mr. McKenna as chairman, was appointed to inquire into civil expenditure.

The formation of the Coalition Ministry did not abate the movement for compulsory military service, a movement which was met by strong demonstrations in favour of retaining the voluntary system, including a pronouncement in that sense by the Trade Union Congress in the autumn. The Government adopted the intermediate measure of introducing a National Registration bill—applicable to all persons between 15 (eventually changed to 16) and 65. This, though resisted by some Radicals and Labour men, was carried into law without much difficulty. They also passed an Elections Registration bill, postponing local elections and suspending registration of voters. But they could not bring themselves to take strong steps to secure the production of food, declining to accept the recommendation of a committee

of agricultural experts over whom Lord Milner presided, that there should be a guaranteed minimum price of wheat for the four years following the 1916 harvest.

The agitation for compulsory service increased in the autumn, and dominated the internal politics of the country and the proceedings of Parliament. Lord Kitchener, who had hitherto resisted the movement, confessed that the provision of adequate forces in the field caused him anxious thought. Independent members of Parliament pressed the compulsory solution upon the Government. While Radicals and Labour men and Irish Nationalist politicians deprecated the trend of public opinion, the unsatisfactory course of the war spoke loudly. Zeppelin raids had brought home the hard facts of war both to the Londoner and to the countryman; and the defence was clearly inadequate. Russia, on whose early successes optimism had fastened, had been driven back by the Germans. Before the autumn was far advanced, it was evident that some decisive action must be taken in regard to the gallant, but fruitless, Gallipoli adventure. Bulgaria, on a shrewd, but shortsighted, appreciation of the situation, came into the war on the German side. Greece, put to the test, declined, under the influence of her King, to honour her pledge to aid Serbia, which was in consequence heavily defeated and overrun. In France the British offensive at Loos, and the French in Champagne, had seemed to promise well, but no real progress had been made; and Sir John French, after 14 months' incessant strain, gave up in October the command of the British forces, and was succeeded by Sir Douglas Haig. In the effort to stave off a decision on compulsory service Lord Derby was asked, and consented, in October to assume the direction of recruiting. He inaugurated a most strenuous campaign, ushered in by a spirited letter from the King. Men were divided into various groups, and the unmarried men were to be taken in preference to the married men. Lord Derby spent himself without stint, and there was a great rush of recruits; but before the end of December it was clear that an adequate number of unmarried men would not be obtained. In November Mr. Asquith had said that, if Lord Derby's scheme were not a success, he would, "without the faintest hesitation or doubt," ask the House to sanction some form of legal obligation. The time had come. Mr. Asquith moved on Dec. 21 for an addition of a million men to the previous three millions voted for the army, and the Cabinet accepted the principle of compulsion, at the cost of losing Sir John Simon, the Home Secretary.

Agitation for Conscription.

Lord Derby's Recruiting Campaign.

In the press the principal demand for compulsion came from *The Times*, which had throughout been a strong advocate for more strenuous prosecution of the war. Another vital matter, to which it called attention again and again this autumn, was the necessity of entrusting the uncontrolled conduct of the war to a very small Cabinet. This demand was echoed in the House of Lords on Oct. 26 by Lord Cromer, who said that what the public wanted to see was a small, strong, executive body chosen from men representing the best talent in the country; and on Nov. 2 by Sir Edward Carson, who had resigned office owing to dissatisfaction with the Balkan policy of the Government, and who said that responsibility could only properly be concentrated by the reduction of the Cabinet to five or six members. Mr. Asquith endeavoured to meet this demand by promising to commit the strategic conduct of the war to a committee of not less than three and not more than five members, having elastic relations with the Cabinet. Apparently the old War Council had been allowed to become obsolete. Mr. Asquith announced, on Nov. 11, that, in the absence of Lord Kitchener, who went in that month to Gallipoli to acquaint himself with the situation, the new War Committee would consist of himself, Mr. Balfour, Mr. Lloyd George, Mr. Bonar Law, and Mr. McKenna. The exclusion of Mr. Churchill from the conduct of the war brought about his resignation from the Cabinet and his departure for the western front as a British military officer.

Demand for a Small War Cabinet.

National Registration Bill.

The secrecy enforced upon the press produced many protests, until the Press Bureau was placed under the competent leadership of an able journalist, Sir Edward Cook, and a leading ex-colonial administrator, Sir Frank Swettenham. One urgent matter dealt with by Parliament (which sat continuously, with short intervals of prorogation or adjournment, throughout the war) was the question of its own existence, which under the Parliament Act should terminate in December of this year, but which was prolonged by statute this autumn, and by subsequent statutes in subsequent years, till after the conclusion of the war. Further powers were given to the Munitions Ministry by a bill passed in December; and Mr. Lloyd George, while claiming that the output of munitions had been prodigiously increased, urged the imperative need of further efforts, especially by the method of "diluting" skilled labour by the introduction of women. The footsteps of the Allies, he warned Parliament, had been dogged by the spectre of "Too late."

One vitally important matter, the finance of the war, was resolutely grappled with this autumn by the Coalition Government, and by Mr. McKenna, its Chancellor of the Exchequer. The cost of hostilities was rapidly mounting. In moving a Vote of Credit in Sept. for £250,000,000, the Prime Minister said that it had risen in the past half year from £2,700,000 to over £3,500,000 a day; in moving a similar Vote for £400,000,000 in November, he estimated for an expenditure of £5,000,000 a day. In these circumstances a strenuous effort was made in the third war budget in September to raise a large portion of the outlay by taxation. In the previous year Mr. Lloyd George had doubled the income-tax and super-tax, and greatly increased the taxes on beer and tea. Beer, which was now severely limited by the Board of Control, Mr. McKenna left alone. But he increased the income-tax once more by 40%, and reduced the exemption limit, while permitting payment in half-yearly instalments. Super-tax was also increased. He imposed a new excess-profits tax—to tap the lucrative gains of war manufacture—of 50 per cent. He increased the taxation on sugar enormously; added 50% more in duties on tea, tobacco, cocoa, coffee, chicory and dried fruits; raised the duty on motor spirits by 3d. a gallon, and doubled the patent-medicine duty. He abolished the halfpenny post, increased the 6d. telegram to 9d., and made the press telegraph charges self-supporting. He undertook an entirely new departure by taxing foreign luxuries, putting a 33½% *ad valorem* duty on imported motor-cars and cycles, cinema films, clocks, watches, musical instruments, plate-glass and hats. These new taxes were estimated to bring in £107,000,000; but he placed the expenditure at £1,500,000,000, and the revenue, on the basis of existing taxation, at £272,110,000, so that there was a wide margin still to be filled by borrowing. There was some attempt to raise in debate the issue of Free Trade and Protection; but with the exception of the plate-glass and hat taxes, which were abandoned, the budget had an easy passage through Parliament.

When the year 1916 opened there was a general agreement that the war had become to an enormous extent a war of attrition, and the Cabinet therefore proceeded at once to bring in the Compulsory Service bill, to which circumstances had, however reluctantly, driven them. It was far from being universal. It merely treated unattested single men and childless widowers between the ages of 18 and 40 as if they had attested under Lord Derby's group system. Ireland was excluded from the bill, and exemptions were allowed for ministers of religion, men medically rejected or physically unfit, those employed in necessary national work, those who were the sole support of dependents, and "conscientious objectors" to combatant service. Tribunals were set up to deal with claims for exemption. Sir John Simon led a small and dwindling opposition; but many of the Labour members, including Mr. Henderson, the leader of the party, supported the bill; Mr. Redmond, who led 60 Nationalists into the lobby against the first reading, withdrew Nationalist opposition on perceiving the united demand in Great Britain in its favour; and the second

reading was carried by 431 votes against 39. No hostile amendment received any serious support in committee, and the bill was read a third time by 383 votes against 36. In the Lords the measure was passed without a division, Lord Derby explaining that there were at least 650,000 unattested single men who would be affected by it. There was some fear that the labour organizations, who suspected the possibility of industrial conscription, would place serious difficulties in the way of enforcing its provisions. They did indeed condemn it by a considerable majority at a labour conference held while it was passing through Parliament; but they decided not to agitate against it. Little practical effect was given to their condemnation save in the Clyde district, where in March and April strikes were organized in munition works with a view to getting this Act, and the Munitions Act facilitating dilution of labour, repealed. The ringleaders, however, were arrested and deported.

The local tribunals, which were set up, proved to be, on the whole, generous in continuing the exemptions; and there was in consequence strong criticism, in the press and in Parliament, both on behalf of the married men, who considered that the pledges of comparative immunity made to them were imperilled, and on behalf of those who were eager for the efficient conduct of the war, and who held that the purpose of the Act was being defeated.

There had been organized in the House of Commons, in each of the two great parties which supported the Coalition, a War Committee, having for its sole concern the strenuous prosecution of the war. On March 31 the Liberal War Committee passed a resolution approving the extension of the principle of compulsion to married men; and powerful organs of the press, notably *The Times* and other journals of which Lord Northcliffe was the principal proprietor, proclaimed that the needs of the army could not be properly supplied without universal compulsion. On March 28 the Unionist War Committee resolved that there ought to be equal sacrifices from all men of military age; and Sir Edward Carson, a leading spirit in that Committee, urged the Government to extend compulsion universally, criticizing their hesitations. Lord Derby was also very critical in the House of Lords, and Lord Milner in that House implored the Government to put recruiting on the only satisfactory basis. The soldiers also pressed ministers hard. But a Cabinet Committee, consisting of Mr. Asquith, Mr. McKenna, Lord Lansdowne, and Mr. Austen Chamberlain came unanimously on April 14 to an adverse decision. The Cabinet did not accept their Committee's alternative scheme, but could not reach a decision. Not for the first time the Prime Minister had to ask the House of Commons for leave to postpone his official statement on the subject, telling the House that there were still points unsettled, and that the break-up of the Cabinet would be a national disaster of the most formidable kind. At length it was announced that a satisfactory decision had been reached; and on April 25, after the Easter holidays, in secret session in both Houses (the first of seven such sessions held during the war), ministers explained their proposals, which, it was found, only involved universal compulsion in case a number of other expedients which it is unnecessary to enumerate should fail to provide sufficient men. When the bill embodying the proposals was introduced by Mr. Long two days later, neither conscriptionists nor anti-conscriptionists found anything to say in its favour. It was withdrawn at once, and five days later Mr. Asquith announced that the Government had accepted universal compulsory service. The bill, which was introduced on May 3, brought within its operation every male between the ages of 18 and 41; and recalled time-expired men under 41 to the army. The exemptions remained as before, and Ireland was not included. In spite of Sir J. Simon's opposition, the bill passed easily through both Houses, though the method of dealing with conscientious objectors was felt to be a serious difficulty. The final step had been taken at last; but the Government had lost much of its prestige owing to the "wait and see" attitude which it had adopted.

Demand for Wider Measures.

Ministerial Indecision.

Universal Military Service Bill.

Military Service Bill.

There were other matters relating to the conduct of the war on which the press and the public and the two Parliamentary War Committees were dissatisfied with what seemed to them the slackness and hesitation of ministers. Dissatisfaction was particularly acute in regard to two questions, which had long given anxiety, the blockade of Germany, and the development of the British air force. It was pointed out that excessive quantities of food-stuffs and other sources of military supply were going to neutral ports adjacent to Germany, and it was suggested that the navy was hampered in the strict enforcement of the blockade by the interference of the Foreign Office. This latter charge Sir E. Grey denied on Jan. 26, but he appealed to neutral countries to make it easy for Great Britain to distinguish and discriminate. Business men were not reassured, and an excited meeting was held in the City of London on Feb. 14, with Lord Devonport in the chair, to demand a fuller and more effectual use of British sea-power. Thereupon a Ministry of Blockade was set up, with Lord Robert Cecil as its Parliamentary chief, and he shortly afterwards issued a very comprehensive list of contraband articles, and increased the stringency of the blockade. In June, after consultation with the Allies, he took the further important step of abandoning the Declaration of London, which hitherto, contrary to its interests, the British Government had observed.

Evidences of discontent with the position and development of the air forces were constantly recurring. The Germans were known to be very active in building and developing Zeppelins, and a great raid over the centre of England on Jan. 31 1916 called attention to their capacity for destruction. The system which made the British air

*Develop-
ment of
Air Forces.*

forces ancillary to the army and navy, and divided the responsibility between Admiralty and War Office, was vehemently called in question. A demand was made for an Air Ministry; but the only changes which the Government announced in February were the transference of the British defences against aircraft from the Admiralty to the War Office, and the appointment of a joint naval and military committee to stimulate production, under the chairmanship of Lord Derby. Public dissatisfaction was strikingly shown by the return on March 10 to Parliament of a flying man, Mr. Pemberton Billing—who had no local connexion but who advocated a strong air policy—for the conservative constituency of East Herts by a large majority over a Coalition candidate. The new member took an active, if somewhat indiscriminate, part in stimulating the Government, who shortly added Lord Montagu of Beaulieu, a keen promoter of aviation, to Lord Derby's committee. But this arrangement did not last long, and in the second week in April Lord Derby and Lord Montagu both resigned, as they found the committee had no real power. Accordingly in May the Government went further, and established a Joint Air Board

representing both army and navy, with Lord Curzon as president and Maj. Baird as parliamentary secretary. This departure was welcomed, though it was doubted whether even this Board would have sufficient independent power; and not only the critics, such as Mr. Winston Churchill, but Lord Curzon himself, proclaimed that an Air Ministry was destined to come—a prediction fulfilled in the following December, when Mr. Lloyd George formed his Government. The reforms already effected bore fruit in the autumn, when a Zeppelin was brought down at Cuffley by an intrepid British airman, the first of a long series of successes which constrained the enemy to rely upon aeroplanes rather than airships.

It began to be realized in the winter of 1915-6 that it was not only in arms that it was necessary to conquer Germany, but also in the field of economics. Success in arms might be compatible with defeat in the economic sphere. In January a resolution, proposed by Mr. Hewins, who had been secretary of Mr. Joseph Chamberlain's Tariff Reform Commission, and supported by Mr. Prothero, a great agricultural authority, demanding measures to bring the whole economic strength of the empire to bear in the struggle against Germany, was accepted by Mr. Runciman,

President of the Board of Trade, and carried without a division. This conflicted with the free-trade tradition, but even in Manchester, the home of free trade, the Chamber of Commerce came into line. The Chancellor of the Exchequer, Mr. McKenna, addressing the Association of Chambers of Commerce in February, said that the Government were prepared to assist in the development of foreign trade so as to ensure that England's bitterest foes and rivals should not have their former control; and Mr. Bonar Law next day announced that an economic conference would be held in Paris in the summer on this vital question. Lord Selborne, President of the Board of Agriculture, said in March that the whole attitude of Parliament towards agriculture would have to be changed; the agricultural laws must be so framed as to obtain the greatest possible national security. A great reinforcement of this propaganda was found in Mr. Hughes, the Prime Minister of Australia, who had come on a visit to England, and who made several speeches on the text that not merely must Germany's military power be destroyed, but that German control and influence in British trade and industry must be extirpated. Mr. Hughes's public appearances were received with acclamation; and he was appointed one of the British representatives at the Paris Conference, which met in the middle of June. In its final conclusions the Conference recommended (1) during the war period, coördination of regulations of allied countries prohibiting trading with the enemy, absolute embargo on importation of enemy goods, sequestration of enemy businesses, and stringent measures for restriction of enemy supplies; (2) in the reconstruction period after the war, restoration and reëquipment for despoiled countries, denial of most favoured treatment to enemy powers, and measures for conservation of allied resources and against enemy dumping; and (3) for the peace period, measures to render allied countries independent of enemy countries in raw materials and key industries, to facilitate interchange of allied products, and to assimilate allied legislation as to patents, trademarks and copyrights. These recommendations were received enthusiastically in England; but a minority objected to the idea of "war after the war."

The stringency of war conditions began to grip England and particularly London this spring. Public museums and galleries were to a great extent closed; and, in order to economize tonnage, the importation of many bulky cargoes, especially paper pulp and grass for paper-making, was prohibited. To ensure rapidity of production the Whitsuntide bank holiday was postponed. Economy in all directions was preached and practised; to economize coal and gas and electricity a "Summer time" Act was passed giving people an extra hour of daylight in the summer evenings; the King, whose example throughout the war was most inspiring, made a free gift of £100,000 to the national exchequer; an elaborate system of war savings was set up, under which 15s. 6d. lent to the Government was to mature into £1 in five years. None of these restrictions or economies affected the spirit of the country; a debate raised in Parliament in February, by the small body of pacifists who ingeminated peace, only drew from the Prime Minister a repetition, amid enthusiastic cheers, of his declaration at the Guildhall on Nov. 9 1914, that Britain would never sheathe the sword until the military domination of Prussia was wholly and finally destroyed. The only criticism of the navy estimates was Mr. Churchill's complaint that the Board of Admiralty which had succeeded him was deficient in energy and push.

*Stringency
of War
Condi-
tions.*

Once again, perhaps the most satisfactory feature of the ministerial policy was the resolute way in which the financial problem was faced. On Feb. 21 the Prime Minister introduced and carried two votes of credit—one a supplementary vote of £120,000,000 to cover the remainder of the current financial year, and the other of £300,000,000 to start the new year on April 1. This brought the total votes of credit since the outbreak of war to £1,782,000,000. The Chancellor of the Exchequer, in his

*Mr. Mc-
Kenna's
Second
Budget.*

budget introduced on April 4, estimated the net revenue at £502,000,000 and the expenditure at £1,825,000,000; so that there was a deficit of £1,323,000,000, to be met by borrowing, which would mean a new charge, for interest at 5% and sinking fund at 1%, of £70,000,000. He tackled this unflinchingly; raised income tax to a maximum of 5s. in the pound, thus gaining £43,500,000; increased the excess profits tax from 50 to 60%; imposed an amusement tax on tickets for all public shows and a railway ticket tax on all journeys costing more than 9d.; he also took toll of matches, table-waters, cider and perry. Then he increased very seriously the duties on motor-cars, motorcycles, sugar, cocoa, coffee and chicory. Colossal as the budget was, involving £300,000,000 of new taxation since the war began, it passed through Parliament substantially unchanged.

Mr. Asquith took advantage of Mr. Hughes's presence this spring to repeat an experiment which he had successfully made in the previous year when Sir Robert Borden, the Canadian Prime Minister, was in England; namely to invite the visiting Dominion minister to sit in Cabinet, and share in the imperial decisions on the war. He also continued his efforts to draw the Allies into closer coöperation by attending a war conference in Paris on March 27, and then proceeding to Italy to consolidate relations with the new Ally.

Shortly after his return, he had to deal with a sudden outbreak of rebellion at Easter in Ireland, principally in Dublin.

The rebellion was put down by military force under Sir John Maxwell; the ringleaders were tried by court-martial and shot; Casement, who had landed from Germany, was put on his trial for treason and hanged; the Chief Secretary, Mr. Birrell, and the Lord Lieutenant resigned; a commission was appointed to inquire into the causes of the insurrection (and, it may be added, reported that it was mainly attributable to weakness in administration); and in the middle of May Mr. Asquith went himself to Dublin with a view to arriving at some new arrangement for the future government of Ireland. On his return he told the House of Commons that he had been deeply impressed by the breakdown of the existing machinery, and by the universality of the Irish feeling that there was now a unique opportunity for a new departure. Accordingly he announced that ministers had unanimously commissioned their colleague, Mr. Lloyd George, to endeavour to effect a settlement. The announcement was favourably received, as

Mr. Lloyd George's good-will to Ireland was well known, and his reputation for getting work done had enormously increased since the outbreak of war. It was believed, moreover, that a Coalition would have a better chance than a party Government to arrange agreed terms. At first the negotiations appeared to

promise well. Mr. Redmond told a meeting of the Irish Parliamentary party in Dublin on June 10 that Mr. Lloyd George's proposals were:—(1) to bring the Home Rule Act into immediate operation; (2) to introduce at once an Amending bill, to cover only the period of the war and a short interval after it, providing during this period for the retention of the Irish members at Westminster in full number, and of the six Ulster counties under the imperial Government. Sir Edward Carson persuaded the Unionist Ulstermen to accept these terms, and Mr. Devlin obtained a vote in their support from the Nationalists of the six counties. But the growing body of Sinn Feiners regarded the negotiations with great disfavour; and, on the other hand, the Southern Unionists protested, and many Unionists in Parliament and the Cabinet objected, Lord Selborne resigning his office in consequence. Lord Lansdowne explained that the Government were not bound by Mr. Lloyd George's consultations, and certain modifications were introduced in order to meet Unionist objections. The main alteration was that the Government could not agree to retain the Irish members at Westminster in undiminished numbers after the next election. The Government also proposed during the transition to appoint an Irish minister responsible to Parliament, having a military officer associated with him with forces sufficient to maintain

order. These modifications were the reason, or the excuse, for Mr. Redmond to raise the cries of "coercion" and "breach of faith," and to withdraw from the negotiation; though Mr. Lloyd George, the Government negotiator, protested that in his opinion the terms were such as the Irish members might well accept. The negotiations having broken down, Mr. Duke, a Unionist, was appointed Chief Secretary, and a month later, Lord Wimborne, a Liberal, was reappointed Lord Lieutenant.

The summer of 1916 was marked by the sudden death of the great soldier upon whose experience and power of organization the majority of Britons at the outset of war placed their special reliance. Lord Kitchener, on a mission to Russia, left the north of Scotland on June 5 in H.M.S. "Hampshire," which that evening struck a mine to the east of the Orkneys and sank. There were only 12 survivors, and he was not among them. His services, in the early days of war, were of incalculable value. If, subsequently, he had failed in some degree to adapt himself to his environment, nevertheless his disappearance was felt all over the world as a heavy blow to the Allied cause. Its effect was minimized, so far as might be, by the appointment to the Secretaryship of State in his place of the civilian minister who had shown the greatest energy and resource in the war, Mr. Lloyd George. Lord Derby, who had rendered exemplary services to recruiting, became Under-Secretary for War. At the same time, Sir Edward Grey, the trusted Foreign Secretary, whose eyesight had been failing, went to the House of Lords as Visct. Grey of Fallodon. He retained the Foreign Secretaryship, and had an efficient representative in the House of Commons in Lord Robert Cecil, at once his Under-Secretary and Minister of Blockade.

Public opinion in England was disturbed this summer over many subsidiary matters relating to the war—the ill-treatment of British civilian prisoners at Ruhleben, and of British military prisoners in German camps, and the slight attention which the German Government paid to the reports of American diplomatic visitors and to British diplomatic representations; the increasing shortness of food, the difficulties of agriculturists whose labourers had been taken under the Military Service Acts and who had not been able as yet to obtain an adequate supply of capable women in their place, and the nearing prospect of rations; the judicial murder by the Germans of Capt. Fryatt, of the S.S. "Brussels," for endeavouring to ram a German submarine; and—what loomed largest in Parliamentary debate—the failure of British arms in two exclusively British theatres of action, the Dardanelles and Mesopotamia. The remaining troops had all been brought safely away from the Gallipoli peninsula in the winter of 1915-6, but the causes of the failure of a promising venture were still hotly disputed; in Mesopotamia, Gen. Townshend had been forced to retire before reaching Bagdad, had been besieged in Kut, and had finally, on April 29, been driven to surrender with all his force to the Turks. The Government resisted inquiry until public opinion proved too strong for them; but at the end of July two Royal Commissions were appointed; that for Mesopotamia under the chairmanship of Lord George Hamilton, a former Secretary of State for India; that for the Dardanelles under the chairmanship of Lord Cromer, the most venerated of British empire-builders.

Stirring events happened this spring and summer in the war nearer home. The German fleet ventured out into the North Sea, and, after being held and fought for several hours by Sir David Beatty and his battle-cruiser squadron, was brought to action by Sir John Jellicoe and the main fleet off the coast of Jutland, was severely handled, and only got back to harbour under cover of night. But British losses were serious, and many doubted whether the most had been made of a unique opportunity. Then the determined German attempt to take Verdun was resisted most heroically by the French in a fight lasting many weeks; and on July 1 the British army, partly with the view of relieving the pressure on its Allies, began a furious assault on the Somme, which, though successful

Rebellion in Ireland.

Mr. Lloyd George's Irish Negotiations.

Dardanelles and Mesopotamia Commissions.

Battle of Jutland.

and productive of glorious deeds, was terribly costly, and lasted till late autumn without breaking through the German lines.

In the midst of this long-drawn-out battle, Britain entered the third year of war, with ample indications from King, ministers, Empire and people that the struggle would be pursued without flinching. Votes of credit multiplied.

A Fight to a Finish.

In May Mr. Asquith obtained one for £300,000,000; at the end of July another for £450,000,000; and in October yet another for £300,000,000. Mr. Lloyd George, who was felt more and more to incarnate the spirit which possessed the British people, told an American interviewer in September that the war could not be ended except by a complete victory. "The fight must be to a finish," he said; "to a knock-out." Lord Grey of Falloon endorsed this opinion in October. There must be no peace, he said, except a peace which would ensure that Europe should henceforth live free from the shadow of Prussian militarism. And in November, in a telegram to Mr. Taft, on the occasion of a banquet in New York of a league to enforce peace, he expressed a sincere desire to see a League of Nations formed and made effective, to secure the future peace of the world—after the end of the present war.

Labour was restive this autumn. The railwaymen agitated for increased war bonuses, the South Wales section being particularly insistent, and made arrangements for a strike

Restiveness of Labour.

which was avoided by a doubling of the previous war bonus of 5s. in some cases and 2s. 6d. in others. The Labour Congress in September was not particularly fruitful in suggestions, save that there was a call for a Labour Ministry. The coal-mining industry occupied much public attention. Mr. Asquith pointed out, at a conference of owners and men on Oct. 25, that the output had seriously fallen off, thus imperilling the supply of munitions. Avoidable absenteeism, the main cause, must be reduced, if not eliminated. Both masters and men promised coöperation. But serious trouble broke out in November in the South Wales coal-field, owing to demands for higher wages. The Government made a new regulation under the Defence of the Realm Act by which the Board of Trade were to have power to take over and work coal-mines. Under this they took over the South Wales coal-field, but found it necessary to grant an advance of 15% in wages.

The restiveness of Labour was largely due to difficulties about food. A Board of Trade Committee on food prices was

Food Difficulties.

appointed in June with Mr. J. M. Robertson as chairman; and, with its report before him, Mr. Runciman announced that the Government had determined to control the importation of wheat, by the agency of a Royal Commission, with Lord Crawford as chairman. They had already made a large purchase of Australian wheat. A week later he mentioned that the Government had spent altogether over £60,000,000 in the purchase of meat; and he explained that the bulk of the mercantile marine was running under Government control. But he declined the suggestions made by Mr. Barnes from the Labour side for appointing a Food Controller, or instituting bread tickets or coupons, or any system of rationing. A month later he announced that the Government had decided to appoint a Food Controller, that war bread would be instituted, that the Government would take drastic steps to deal with wheat and potatoes, that maximum prices would be fixed and that the amount of sugar issued would be seriously reduced. Another matter in which the Government were driven against their will to accept the view of the House, and especially of the Labour members, was the creation of a unified and comprehensive Ministry of Pensions, instead of adopting the middle course of a Pensions Board of inadequate scope.

But the principal preoccupation of a confused autumn was the constantly recurrent problem of man-power. The army

Problem of Man-Power.

authorities believed that many young men had managed illegitimately to escape the obligations of the Military Service Acts; and they tried for a time, with little success, the system of "rounding up" men of military age at theatres, railway stations, football fields, parks, and other places of public resort. A more legitimate demand was for the

"combing out" of suitable men from Government offices and in reserved trades; and a Man-Power Distribution Board was appointed, with Mr. Neville Chamberlain as chairman, which set about this necessary job. The question of raising the military age was considered by the War Office, but put aside for the moment. Arrangements were however made, by which a considerable number of suitable young men were released from civil occupations and drafted for military service. At the same time recognition was given to the new volunteers, elderly men who had come forward to perform such military duties in the Home defence of the country as their age and their disabilities permitted. The public in England and Scotland naturally resented the exclusion of Ireland from the Military Service Acts, and there was pressure for her inclusion, in which Irish Unionists joined; but Mr. Redmond declared that any project of the kind was insane. At the same time he attacked with some bitterness the system of Government in his country as entirely inconsistent with the principles for which the Allies were fighting in Europe. While ministers praised Mr. Redmond's labours for recruiting, they could not but acknowledge the poor contribution of Ireland in men to the war compared with the rest of the Empire.

As autumn passed into winter, and the prolonged Somme battle died down without the hopes with which it had begun having been realized, and news came that the Germans had overrun the new Ally of the Western Powers, Rumania, and occupied Bucharest, the irritation of ardent spirits against the delays and

Discontent with the Ministry.

apparent want of efficiency of the Government gathered head. Criticism was largely focussed upon what was considered to be the "wait and see" temperament of the Prime Minister. New blood was also demanded for the Admiralty, the public having been disturbed by the comparative success and immunity of a recent German destroyer raid in the Straits of Dover; and at the end of November it was announced that Adml. Jellicoe would come there as First Sea Lord, Adml. Beatty succeeding him in command of the Grand Fleet. This change was welcomed, but more was desired, and was loudly

Mr. Lloyd George's Demand.

called for by a considerable section of the press, led by *The Times*. Mr. Lloyd George, who, within the Ministry, shared to the full the public desire for greater energy and coördination in the conduct of the war, recognized that this was the moment to enforce his ideas. He concentrated upon the point which had been treated as vital more than a year before by *The Times* and by competent critics in Parliament, the ultimate responsibility for the civilian day by day conduct of the war. The War Committee, at the moment, consisted of Mr. Asquith, Mr. Bonar Law, Mr. Lloyd George, Mr. Balfour, Mr. McKenna, Lord Curzon and Mr. Montagu. But it was merely a Committee of a Cabinet of 23 members, and was subject to the constant check and control of this miscellaneous and unwieldy body. On Dec. 1 Mr. Lloyd George, in a letter to the Prime Minister, demanded—and enforced his demand with a threat of resignation—a radical change of organization; namely that the conduct of the war should be placed in the absolute control of a small War Committee sitting daily and consisting of not more than four members, himself, Sir Edward Carson (a convinced supporter of an energetic policy), Mr. Bonar Law, and a Labour member. Mr. Asquith was pointedly omitted from the proposed body. He refused to agree, but determined, with the King's assent, to reconstruct his Government. Mr. Lloyd George endeavoured to build a golden bridge by consenting to admit the Prime Minister as a consultative and advisory member of the Committee, with the power of ultimate reference to the Cabinet. Mr. Asquith at first assented, but on second thought refused. After all, the essence of the scheme was that Mr. Lloyd George, with a very limited council of advisers, should direct the war, rather than Mr. Asquith. On Mr. Asquith's refusal, Mr. Lloyd George resigned, on Dec. 5. The defection of the most powerful man in the Ministry made it impossible for Mr. Asquith to continue, and he too resigned. The King sent for Mr. Bonar Law, the Unionist leader, but Mr. Law could not secure Mr. Asquith's

Political Crisis, 1916.

coöperation, and also considered that Mr. Lloyd George had shown the qualities which the nation wanted at this critical period. So the commission passed to Mr. Lloyd George, the statesman whose reputation had steadily grown throughout the world conflict, who had already played such a decisive part, as Chancellor of the Exchequer, Minister of Munitions, and Secretary of State for War, and who more than any of his colleagues embodied the will to victory of his countrymen.

Mr. Lloyd George was assured of the close coöperation of Mr. Bonar Law, and of the united support of the Unionist party. He set great store upon the help of the Labour party, one of whose members, in his view, ought to sit on the small Committee or Council directing the conduct of the war. Meetings of the Parliamentary Labour party and the National Executive were held, at which, on the advice of all the labour members who had been ministers in the First Coalition and of the chairman of the party, it was decided by a majority to take part in the new Government—a decision which was ratified by the annual Labour Party Conference in the following month. The action of the Liberal party was thought at first to be doubtful, because Mr. Asquith, and all his principal Liberal Cabinet colleagues, such as Lord Grey of Fallodon, Lord Crewe and Mr. McKenna, refused to serve under Mr. Lloyd George. But the Liberal War Committee pledged itself at once to active support; the Welsh Liberal members rallied in a body to the side of the Welsh Prime Minister; and a party meeting at the Reform Club, following the advice of Mr. Asquith, recorded its determination to give support to the King's Government engaged in the effective prosecution of the war. Mr. Lloyd George and Mr. Bonar Law, therefore, had a wide field of selection, only Mr. Asquith and his immediate friends, and Lord Lansdowne, who took the occasion to retire, being ruled out.

Having a free hand Mr. Lloyd George carried through an even more revolutionary change than that which he had submitted to Mr. Asquith. He constituted a small Cabinet of four members, who were relieved entirely of serious departmental duties, who were to sit daily, and to concentrate themselves upon the war, of the conduct of which they were to have absolute control. He himself, as Prime Minister, was the chairman of this War Cabinet; and, in order to perform this his main duty satisfactorily, he devolved the leadership of the House of Commons upon Mr. Bonar Law, who was indeed already the leader of the largest numerical section of its members. Mr. Law also became Chancellor of the Exchequer, and was an additional member of the War Cabinet, but was not expected to attend regularly. The Prime Minister's three regular Cabinet colleagues were Lord Curzon, who became Lord President of the Council and leader of the House of Lords, and two ministers without portfolio, Mr. Henderson, the Labour leader who had held high office in the first Coalition, and Lord Milner, the only statesman of marked administrative ability and experience who had not joined that Coalition. It was right to turn, at this critical moment, to the man who had borne the civil responsibility in the last British war, that with the Boers; and from this time onward Lord Milner's share in the conduct of the war from the British side was second only to Mr. Lloyd George's. The War Cabinet sat daily in Whitehall Gardens, having Sir Maurice Hankey, the secretary of the Committee of Imperial Defence, as its secretary, with a competent staff under him. Other ministers were summoned to its deliberations, whenever these concerned the departments for which they were responsible.

The one serious loss which Great Britain suffered through Mr. Asquith's resignation was that of the Foreign Secretary, Lord Grey of Fallodon, who had conducted the external affairs of the country, with increasing reputation and success, for 22 years. It was vitally important for Mr. Lloyd George to secure, as Lord Grey's successor, a statesman in whose character and record the Allies could have full confidence. He was fortunate in obtaining Mr. Balfour's consent to accept an office with whose work he had become familiar when acting Secretary of State in Lord

Salisbury's absence. For the other important posts in his Ministry Mr. Lloyd George relied very largely upon the services of business men and experts, hitherto in many cases outside politics and the Houses of Parliament, of whose aid he had made such excellent use in developing munitions. The country saw with satisfaction the Board of Trade entrusted to Sir Albert Stanley, who had previously directed the Underground railway and the motor-omnibus system; the Board of Education to Mr. H. A. L. Fisher, the Oxford scholar and historian, vice-chancellor of the university of Sheffield; the Local Government Board to Lord Rhondda, the South Wales colliery magnate; and the Board of Agriculture to Mr. R. E. Prothero (afterwards Lord Ernle), M.P. for Oxford University, who had managed for many years the vast agricultural estates of the Duke of Bedford. For the more efficient conduct of the war, five new ministries were created—Air, Labour, Pensions, Food Control, and Shipping Control—for two of which, Pensions and Food Control, some inchoate provision had been made in the last weeks of the first Coalition Ministry. Lord Devonport, who had large experience in the grocery business, became Food Controller; Sir Joseph Maclay, a Glasgow ship-owner, was appointed Shipping Controller; the new Air Board was constituted with Lord Cowdray, the head of a great firm of contractors, as president; while Labour and Pensions were fittingly assigned to two outstanding Labour members, Mr. Hodge and Mr. George Barnes. Seats were found in the House of Commons for Sir Albert Stanley and Mr. Fisher; but Sir Joseph Maclay preferred to work outside Parliament, and his office was represented in the House by Sir Leo Chiozza Money, the parliamentary secretary. Where Mr. Lloyd George appointed experienced parliamentarians to office, he chose those who had shown special keenness in the prosecution of the war. Then Sir Edward Carson went to the Admiralty; Lord Derby to the War Office; Mr. Walter Long to the Colonial Office; Dr. Addison to the Ministry of Munitions; and Sir Frederick Cawley, chairman of the Liberal War Committee, to the Duchy of Lancaster. Mr. Chamberlain remained Indian Secretary, Lord Robert Cecil Minister of Blockade, Mr. Duke Irish Secretary and Sir F. E. Smith Attorney-General, Sir Gordon Hewart becoming Solicitor-General in the place of Sir George Cave, who went to the Home Office. Sir Robert Finlay, who had been Attorney-General in 1900-6, was made Lord Chancellor as Lord Finlay. There were joint parliamentary secretaries to the Treasury, Lord Edmund Talbot (afterwards Lord Fitzalan), and Hon. Neil Primrose, Lord Rosebery's son.

In addition to these appointments, Mr. Lloyd George announced, in his statement on Dec. 19 of the policy of the new Government, that the time had come for complete mobilization of the labour reserves, and therefore the Cabinet had adopted the principle of universal national service, and had appointed Mr. Neville Chamberlain, Lord Mayor of Birmingham, Director-General of National Service. He would schedule all industries, and set labour free from non-essential industries, so as to be available for war and for essential industries. The new Prime Minister also announced that the Government would take complete control of all ships and of the whole mining industry. There must also, he said, be real sacrifices made in the matter of food. Every available square yard must be made to produce; and as to luxuries and indulgences there must be a national Lent. These exhortations were supplemented by Mr. Prothero, the Minister for Agriculture, who said that the War Office and the country must realize that Britain was as a beleaguered city, and that victory might well be lost or won on her corn fields and potato lands; and by Lord Devonport, the Food Controller, who pushed further the restrictions which Mr. Runciman had already enforced, limited dinners to three courses and luncheons to two courses in all public eating places, and hinted at rationing as the only way of ensuring that unpatriotic people did not get supplies in excess of their wants. In another direction the Government developed boldly a policy tentatively adopted by their predecessors. The Colonial Secretary summoned immediately by cable the Prime Ministers of the self-governing dominions to a special war conference of the

State-
ments of
Policy.

Empire, explaining that they would for the purpose of these meetings be members of the War Cabinet, and so directly responsible for the conduct of hostilities. The enormous share which the colonial forces had taken in military action by land and sea fully justified this development.

The public were gratified by the evidences of energy and resolution shown by the new Government. Mr. Asquith, though he took his seat on the front Opposition bench, protested that he did not appear as leader of an Opposition, or even of the Liberal party, but would give his successors the benefit of his experience. The Government had to deal immediately with a peace offer from Germany, based on the assumption that the Central Powers had won considerable successes and could not be defeated. If the Allies would negotiate on these assumptions, Germany would bring forward peace propositions; if not, the Central Powers were resolved to carry on the war to an end, "while solemnly disclaiming any responsibility for this before humanity and history." Mr. Lloyd George at once in Parliament said that it was necessary to know whether Germany was prepared to accept the only possible terms which the Allies could offer—namely restitution, reparation and guarantee against repetition. The formal reply to the Central Powers was based on this idea, and treated the German offer as empty and insincere.

Before this reply had been drafted, Mr. Woodrow Wilson, who had been re-elected President of the United States in the previous month as the man who had kept his country out of the war, addressed a Note to the belligerent Powers suggesting that they should issue a statement of their war aims—which, he somewhat strangely asserted, seemed to be much alike on both sides. Though this intervention was not welcomed in England any more than on the continent of Europe, the Allies sent in Jan. 1917 a courteous answer, explaining in some detail their objects of restoration and liberation, while the Central Powers merely expressed their readiness to enter a peace conference.

It soon became evident that the peace manoeuvres of the German Government were put forward in order to obtain an excuse for entering upon that indiscriminate submarine warfare on which their most active naval and military leaders were coming to base their main hope of success. The new system was put in force at the beginning of February. The German Government notified that they would regard all the waters surrounding the British Isles and the whole of the northern and western coasts of France, as well as the eastern Mediterranean, as barred zones within which German submarines would sink all ships at sight; save only that one passenger steamer would be allowed each way weekly between America and Falmouth, and one paddle-steamer daily between Flushing and Southwold. While this policy of desperation brought the United States within a couple of months into the war, it undoubtedly created a very serious situation for the Allies—especially for Great Britain, though it never deterred British ships or British sailors from sailing. The Prime Minister spoke early in February at Carnarvon of the "great and growing menace of German piratical devices"; at the opening of Parliament on Feb. 7, Mr. Asquith denounced the new warfare as "a declaration of war against humanity," and Mr. Bonar Law warned the House of Commons that the country had reached the very crisis of its fate.

The note of sacrifice, which Mr. Lloyd George said had hitherto been confined too much to the trenches, was sounded loudly in Great Britain from the very beginning of the year. From Jan. 1 train services became much slower and less frequent than before, while the fares were raised 50%; and from the same date it became compulsory to bake standard bread in which the proportion of wheat-flour was comparatively small. Prices were fixed at once for wheat, oats and potatoes, and a little later for tea, coffee, bacon, butter, cheese and lard; the amount of beer to be brewed was considerably reduced, so as to economize barley, sugar, tonnage, transport, labour and fuel. Lord Devonport, in view

of the urgent necessity for some curtailment of the nation's food consumption, issued on Feb. 2 a scheme for voluntary rationing; he called upon heads of families to limit their weekly purchases to the following quantities for each person comprising the household: bread 4 lb., meat 2½ lb., sugar ¾ lb. The King at once put himself and the Royal family and household on rations; and his example was widely, but far from universally, followed in the country. The attempt to limit consumption by prescribing the number of courses at meals in public eating-places proved a failure, and a new order was issued in April, providing for a weekly meatless day; for five days without potatoes, for rationing bread and meat by bulk on a scale which allowed 2 oz. of bread for each meal, 1 oz. of meat at breakfast, and 5 oz. at lunch or dinner; but the order did not apply to any public eating-place where the charge for a meal, exclusive of drinks, did not exceed 1s. 3d. Orders were issued restraining food hoarding, the making of rich pastry, and the undue consumption of food at afternoon tea. Apart from the submarine depredations, the harvest of two essential crops, wheat and potatoes, had failed in a greater or less degree this year throughout the world. With regard to potatoes, Lord Devonport asked people who could afford substitutes, such as rice or swedes, to use them, so as to prolong the supply of potatoes for the poor; and Mr. Prothero urged that every village and small town should make itself self-supporting with regard to potatoes. With regard to wheat and flour, it was ordered that bread should be sold only by weight and must be at least 12 hours old; maximum prices were fixed for home-grown wheat, barley and oats; the use of wheat, rye and rice for any other purpose except for human food was prohibited; importation of feeding-stuffs for cattle was limited; and power was given to the Food Controller to take over the flour-mills and issue regulations for their management. Mr. Prothero, in order to stimulate food production at home, made arrangements for turning German prisoners and a large supply of women on to the land.

But the main contribution of the Minister of Agriculture to native food supply was a Corn Production bill, which was calculated to turn pasture into arable land on a large scale. It provided for the payment of a bounty to the occupier of any land on which wheat or oats were produced, if the average price of wheat or oats should fall below a certain minimum. A minimum wage of 25s. was also to be secured for agricultural labourers, landlords were restrained from raising rents in consequence of the measure, and powers were given to the Board of Agriculture to enforce proper cultivation and to take possession of untenanted land. In introducing the bill Mr. Prothero said that, with three-fifths of the total cultivated area under the plough, the nation would be free of the nightmare of the submarine menace. Under the bill the State would go into partnership with the agricultural interest, and stand security against loss. So complete a breach with the Victorian attitude of *laissez faire* towards agriculture could not, of course, pass without challenge from rigid free traders like Mr. Runciman. But the second reading was carried by 288 to 27; and in committee an attempt by the Labour party to raise the minimum agricultural wage from 25s. to 30s. was rejected by 301 to 102. When the bill reached the House of Lords, it met with the approval of Lord Lincolnshire, both an eminent free trader and an expert agriculturist, and duly became law. At the beginning of the session of 1918 Mr. Prothero testified to the patriotic way in which landowners and farmers were ploughing up grass-lands and taking advantage of the Act. Besides these measures of Lord Devonport and Mr. Prothero, steps were taken to save tonnage by prohibiting or restricting the import of non-essential articles, notably alcoholic liquors, timber and paper.

Such were the precautions taken to economise food and tonnage, and to stimulate production. The measures employed by the Admiralty to meet the menace included the establishment of a large new minefield in the North Sea, the arming of merchantmen as rapidly as possible, and the appropriation of the shipbuilding programme mainly to making good the losses in the mercantile marine. An anti-

submarine department was also set up, composed of the most experienced men serving at sea, who invited suggestions from any sailor in the fleet. Then there was the Board of Inventions, presided over by Lord Fisher, and containing some of the greatest men of science in the country. But Sir Edward Carson, the First Lord, did not claim that any certain remedy had been found. The figures proved this only too clearly. In the first three months of unrestricted submarine warfare, Great Britain lost nearly 1,500,000 tons of shipping (out of a total of some 20,000,000 tons of which 8,000,000 tons were being used for war purposes), and April, the last of these months, was the worst of them all. In one week alone of April 41 British vessels of over 1,600 tons and 16 under that tonnage were sunk.

These alarming figures naturally suggested the advisability of compulsory rationing, and both in the press and in Parliament there were loud calls in May for its immediate institution. Lord Milner told the House of Lords that the Government would only resort to it if convinced of its absolute necessity, but that meanwhile they were studying the various methods of rationing. The returns of shipping losses during May and subsequent months, though grave enough, showed a marked improvement on the April record, and the Food Ministry stated that the prospect of compulsory rationing was steadily receding. But people were worried by the shortness of food, especially bread, sugar and milk, which led to queues at shops, by the high prices especially of meat and by the uncertain policy of the Food Controller. He instituted a campaign to explain to people why they should eat less bread and meat. He asked people to give up the use of starch. But he was slow to fix retail prices, and a cry arose that he allowed the public systematically to be robbed by profiteers owing to his inaction. Steps were eventually taken in June to curb speculation in food, by prescribing that meat salesmen should sell only to retail butchers or consumers, and that the prices charged on reselling should not exceed a certain maximum. More confidence was felt in the Food Ministry when in the middle of June Lord Devonport resigned the controllership owing to unsatisfactory health, and Lord Rhondda, whose reputation for getting things done had been increased at the Local Government Board, was prevailed upon to accept the post.

Mr. Neville Chamberlain's proposals for national service were formulated in February. The object was to secure substitutes to replace the men taken for active service, and to draft labour from unessential to essential trades. He called for volunteers from men between 18 and 60, asking willing workers to enter their names on a register; and the Government introduced a bill establishing a Ministry of National Service. The bill was not, however, well received; the Labour party were afraid lest industrial conscription should be introduced by a sidewind; and the whole scheme proved somewhat abortive. But the need of the army for more men was urgent, and the Government introduced towards the end of March a new Military Service bill, providing for a fresh examination of discharged and rejected men; the authorities hoped by this means to secure 100,000 fresh recruits in three months. Drastic as this measure was, Lord Derby in the House of Lords said that larger measures would be necessary.

The new Chancellor of the Exchequer, Mr. Bonar Law, lost no time in making a further effort to raise money on a large scale for the war. At a great meeting at the Mansion House on Jan. 5, with the Prime Minister by his side, he announced the conditions of a new loan. It was to be a 5% Government stock issued at 95, and arrangements were made for converting previous war issues into the new stock. The lowest individual sum accepted would be £50, or £5 through the Post Office, and bankers would give facilities to their customers to subscribe. There was also a tax-compounded 4% loan to be issued at par. The new loan was a great success, yielding over a thousand millions sterling subscribed for by five and a quarter million people. The money was badly needed, as the expenses of the war were mounting rapidly. Mr. Law obtained a vote of credit in December 1916 for £400,000,000,

and on Feb. 12 1917 two votes of credit amounting together to £550,000,000, the largest sum ever asked hitherto at a single sitting in the financial history of the country. He told the House that the average daily cost of the war had risen to £5,700,000. It is not surprising that in these circumstances, and with the enormous development of Government offices and staffs, there should have been an outcry in Parliament against what Lord Middleton called an uncontrolled orgy of expenditure. But, in spite of protest, the expenses continued to mount. Before the introduction of the budget, Mr. Law had to obtain in March a further vote of credit for £60,000,000 to meet unforeseen items of expenditure. In the budget he proposed no new taxation, but increased the entertainments tax and the tobacco duty, and raised the excess-profits duty from 60 to 80 per cent. He explained that 26% of the war expenditure had been provided out of revenue. Immediately after the budget, on May 9, he came once more to the House of Commons, this time for a vote of credit of £500,000,000; and on July 24 the largest vote of all, £650,000,000, had to be obtained, and it was recognized in debate that the country was rapidly reaching the limit of its possible expenditure. Two more votes, for £400,000,000 in September, and for £550,000,000 in December, were needed before the end of the year. In this autumn, Mr. Law put "on tap" an entirely new form of "continuous" loan, unlimited in amount, in the form of national war bonds, bearing interest at 5% and 4% free of income tax. By Jan. 11 1919 £1,446,625,613 of these bonds had been sold, and nearly £50,000,000 of small post-office bonds had been subscribed for. It may be mentioned that the pressure of the war was shown this year to have broken down many cherished financial prepossessions. The passage of the Corn Production bill has been already mentioned. A committee on commercial and industrial policy, of which Lord Balfour of Burleigh, a life-long free trader, was chairman, recommended in February: (1) the taking of special steps to stimulate, where economically desirable, the production of food-stuffs, raw materials and manufactured articles throughout the Empire; (2) the adoption of Colonial Preference; and (3) the establishment of a wider range of customs duties. Moreover the Government of India, in spite of determined opposition from Lancashire, increased, and was supported by the Government at home and by the House of Commons in increasing, for revenue purposes, the import duties on cotton, without imposing any countervailing excise.

These tendencies were accentuated by the proceedings of the Imperial War Cabinet and Imperial Conference. The Imperial War Cabinet began its sittings in March, the Prime Ministers of Canada, S. Africa, New Zealand and Newfoundland and the Secretary of State for India (advised by Indian and Anglo-Indian councillors) sitting, along with the British Prime Minister and the members of his War Cabinet, to determine matters essential to the conduct of the war, as well as to consider imperial policy in regard to terms of peace. Mr. Hughes, Prime Minister of Australia, was unfortunately detained at home by political complications. Sir Robert Borden explained, in a speech on April 2, that the various Prime Ministers met in the Imperial War Cabinet as equals, though the British Prime Minister presided, *primus inter pares*. Each nation of the Empire thus had its voice upon questions of common concern, while preserving perfect autonomy. "For many years the thought of statesmen and students in every part of the Empire has centred round the question of future constitutional relations. It may be that now, as in the past, the necessity imposed by great events has given the answer." At the end of April Mr. Bonar Law announced in the House of Commons that the Imperial War Cabinet had accepted the principle of Imperial Preference; but there was no intention of making any change during the war, nor did it involve the taxation of food. Mr. Lloyd George, when receiving the freedom of the City of London, said at the Guildhall that one of

the first duties of statesmanship would be to develop the Empire. The sittings of the Imperial War Cabinet lasted till May 17, and Mr. Lloyd George told Parliament that the experiment had been a complete success. At the last session, on his proposal, it was agreed that meetings of an Imperial Cabinet

Imperial War Cabinet, 1918.

should be held annually, or at any intermediate time when matters of urgent imperial concern had to be settled. Accordingly another session of the Imperial War Cabinet was held in the summer of 1918, lasting from June to August, when there was a full attendance. It was decided that for the future the Prime Ministers, as members of this Cabinet, should have the right of direct communication with the Prime Minister of the United Kingdom; and that each Dominion should have the right to nominate a visiting or resident minister in London to be a member of this Cabinet at meetings, to be held at regular intervals, other than those attended by Prime Ministers.

Each of the two years, simultaneously with the Imperial War Cabinet, an Imperial Conference, of which the membership embraced other representatives of the various Empire nations besides the Prime Ministers, sat under the presidency of the Colonial Secretary. In 1917 the Conference recommended that a special Imperial

Imperial Conference, 1917-8.

Conference should be called to deal with the future constitutional relations of the Empire as soon as possible after the cessation of hostilities, couching its recommendations, however, in such terms as to preclude the setting up of an Imperial Legislature or an Imperial Executive. In 1918 the principal recommendations all related to economic questions. The Conference endorsed the principle of a Non-Ferrous Metal Industry Act which the British Government, in spite of determined Free Trade opposition, had passed in the winter, in order to eliminate enemy influence in Great Britain from the control of such metals and ores as zinc, copper, tin, lead, nickel and aluminium, and made dealing in such metals without a Board of Trade licence unlawful until five years after the war. The other Governments of the Empire were advised to free themselves in similar fashion from dependence on German controlled organizations in respect of these metals. The Conference also recommended that the Governments should secure the command of essential raw materials produced within the Empire so as to repair the effects of war and safeguard industrial requirements, and should make arrangements with Allied Governments in order to utilize the raw materials produced in Allied countries. A further resolution recommended the appointment of a committee to consider the possible methods of obtaining such command of raw materials, and consultation with producers and merchants concerned in each commodity. Mr. Lloyd George and Mr. Bonar Law endorsed these resolutions in speeches to a deputation of manufacturers on July 31 1918. The former said that under no conditions must industries essential from the point of view of national defence and security be let down in the future; the latter, that an immense move forward had been made in the whole conception of British trade policy, the principles of a common Empire and of preference within the Empire being established.

Outside the submarine menace there were some cheering symptoms in the military situation in the spring and summer of

Entry of America into the War.

1917. The retreat in February of the German troops in France from the lines they had held since the autumn of 1914 to the Hindenburg line, the considerable captures of prisoners and guns by British troops in the battles of Arras in April, of Messines in June, and of Third Ypres in July, and Sir Stanley Maude's victorious advance to Bagdad in March, confirmed the confidence of the British people in the efficiency of their new armies. Above all, the entry of America into the war was hailed with welcome and relief in Great Britain. As the Prime Minister said, the advent of the United States made it clear to the world that "this is no struggle for aggrandizement and for conquest, but a great fight for human liberty." Mr. Balfour went across the Atlantic on a mission to arrange for common working; and the services of the British navy were placed at the disposal of the United States

for the convoy of troops. It was felt that, if the Allies could hold out sufficiently long, which there was no reason to doubt, the numbers and wealth of the United States must finally turn the scale against the Central Powers. One immediate advantage of American belligerency was the removal of the last obstacle to a stringent blockade of Germany, and Lord Robert Cecil could claim this spring that there was now a complete cessation of oversea importation into enemy countries.

The Russian Revolution, which began in March, was also hailed at the time in England as a favourable portent for the Allies. It was, said Mr. Lloyd George, the sure promise that the Prussian military autocracy would, before long, be overthrown. But, as a matter of fact, from the first days of the revolution, there was an informal armistice and overtures for fraternization on the eastern front, and an attempt by Gen. Brusilov to renew fighting in July and August came to an end before long through the spread of insubordination. Thenceforward it was realized that the Germans would be able to transfer almost the whole of their forces hitherto in the east to the west, and that in consequence the task before the British army had become appreciably heavier. The revolution had also an unsettling influence on British workmen, already showing symptoms of restlessness under the strain of war. There was in March a serious strike of engineers at Barrow, disapproved by their union, but organized by shop stewards, which collapsed after a fortnight only on the threat of the Government to use their powers under the Defence of the Realm Act. Another unauthorized strike of engineers took place in S. Lancashire in May, largely as a protest against dilution; and there was trouble in other trades and in other parts of the country. In August a railway strike was threatened, owing to long hours and overwork, but was abandoned on a promise by the Government to continue the control of railways for a time after the cessation of hostilities, and meanwhile to do their best to secure a shorter working-day. A further railway crisis occurred in November, about wages, resulting in an advance estimated to cost the companies £9,500,000 a year. To set against these unsatisfactory features, there was published in June the Whitley Report, so called because the chairman of the Reconstruction Committee which compiled it was the then Chairman of Committees of the House of Commons, afterwards Speaker. This recommended the setting up of Joint Industrial Councils of masters and men in each industry, to settle all points of difference and wages and management. Such councils were set up in many trades, with beneficial results.

Strikes in 1917.

Whitley Report.

Russia and War Aims.

The features in the Russian Revolution which attracted a section of British working-class opinion were the war aims put forward by the Socialists, "No annexations and no indemnities," and the power obtained by the Soviets, or workmen's committees, culminating in a Soviet Government in October. In answer to pacifists in the House of Commons Lord Robert Cecil explained that imperialistic aims based on force and conquest were absent from the British programme, but that, in view of Armenia, the German African Colonies, Poland, Alsace-Lorraine, and Italia Irredenta, it was impossible to accept the programme of "no annexations," and in view of the wanton damage in Belgium, Serbia, and northern France, and of the destruction of merchant vessels, that of "no indemnities" was equally out of the question. The Independent Labour party in a conference at Leeds took up an attitude of sympathy with the Russian position, and advised the formation of Soviets in England. A large section of Labour opinion, comprising both moderates and extremists, desired that, in accordance with the wish of the Russian Socialist Government, English Labour should be represented at a conference, at which German representatives would be present, to be held at Stockholm at the instance of the International Socialist Bureau. But the Seamen's and Firemen's Union, which had suffered heavily through Germany's outrageous policy at sea, refused to carry the delegates; and neither American, Belgian nor French representatives would appear. The

Stockholm Conference.

only result of the movement was that Mr. Henderson, who had been active in its promotion, had to resign his seat in the War Cabinet. Even the Trades Union Congress at its annual meeting in September declared by an overwhelming majority against an International Conference at Stockholm "at the present moment." But before the end of the year the Labour party, suspicious of militarist or imperialistic designs among the Allies, drafted on its own account a statement of war aims of a somewhat idealistic character, demanding in particular the establishment of a league of nations,—a demand which Lord Robert Cecil welcomed on behalf of the Government.

During this autumn the Labour party also busied itself with a reorganization of its constitution, which was to transform it from a federation of Labour and Socialist societies into a national democratic political organization open to every worker who laboured "by hand or brain." The work was completed during the winter, and the new constitution was adopted in March 1918. The aim was, by forming local associations, and by appealing to middle-class workers and to the newly enfranchised women, to secure sufficient support from the electorate to warrant the hope of a Labour Government in power before many years. The new Labour party, thus constituted, held its first annual meeting in London in June 1918, promulgated a comprehensive socialistic programme, and in spite of the protests of Labour ministers, determined no longer to recognize the political truce, though it did not insist that these ministers should withdraw from office so long as the country was at war.

The increasing detestation of the Germans which was inspired by their merciless submarine campaign and by their recurrent air-raids insured a warm welcome for certain measures which the King took in the summer of 1917 for dissociating the royal family from German connexions. In June he decreed that those princes of his family who were his subjects and bore German names and titles should relinquish those titles and adopt British surnames. Accordingly the family of Teck became that of Cambridge and that of Battenberg Mountbatten; and the following peerages were conferred: the Duke of Teck, Marquess of Cambridge; Prince Alexander of Teck, Earl of Athlone; Adml. Prince Louis of Battenberg, Marquess of Milford Haven; Prince Alexander of Battenberg, Marquess of Carisbrooke. In July the King abandoned all German titles for himself and family, and issued a proclamation that his house and family should henceforth be known as the house and family of Windsor. The King also heartened the munition workers of Lancashire and Cheshire and the shipping and engineering workers of the Clyde district by making tours among them, and he paid a visit in the summer, not for the first time, to the Grand Fleet. He instituted, moreover, two new orders—the Order of the British Empire, and the Order of Companions of Honour.

The reports of the Dardanelles and Mesopotamia Commissions were published, the one in the spring, and the other in the summer, of the year 1917; and the revelations they contained of mismanagement and muddle in high quarters confirmed the public in its satisfaction that the two War Administrations presided over by Mr. Asquith had given way to Mr. Lloyd George's War Cabinet. The report of the Mesopotamia Commission, with its reflections on the Government of India, brought about Mr. Austen Chamberlain's resignation of the Secretaryship of State for India. Other ministerial changes took place about the same time:—Lord Rhondda succeeded Lord Devonport as Food Controller, Sir Auckland Geddes succeeded Mr. Neville Chamberlain as Director of National Service; Mr. Barnes succeeded Mr. Henderson as Labour representative in the War Cabinet; Sir Edward Carson left the Admiralty to become a member of the War Cabinet without portfolio—a position from which he resigned in Jan. 1918; Sir Eric Geddes became First Lord of the Admiralty, Dr. Addison Minister of Reconstruction without portfolio, Mr. Hayes Fisher (afterwards Lord Downham) President of the Local Government Board, Mr. Hodge Minister of Pensions,

and Mr. G. H. Roberts Minister of Labour. Mr. Lloyd George took the opportunity to bring back into high office his friend Mr. Churchill, and to attract to his banner Mr. Edwin Montagu, one of the ablest of the younger Liberals. Mr. Churchill became Minister of Munitions, and Mr. Montagu Secretary of State for India. Mr. Lloyd George also persuaded Gen. Smuts to remain in England as a regular member of the War Cabinet.

Several of these appointments had a special interest. The public looked askance at the return to office of Mr. Churchill, after his responsibility for the Dardanelles fiasco; but Mr. Lloyd George had a high opinion of his friend's energy and capacity in office, and realized the inadvisability of leaving him to become the nucleus of a critical and aggressive opposition. Mr. Montagu took office with a mission to satisfy, so far as might be possible, the aspirations of a large body of Indian opinion after a wide measure of self-government. He visited India in the winter of 1917-8, and drew up, in conjunction with Lord Chelmsford, the Viceroy, a report on Indian Constitutional Reform—published in the summer of 1918—which was well received in the House of Commons, but which was met with considerable criticism in the Lords, where the appointment of a joint committee to consider it was rejected by a majority of only four. Dr. Addison's appointment as Minister of Reconstruction showed a laudable desire on the part of the Government to be prepared for the end of hostilities, which might come with little warning. So zealously did he work that he was ready to announce, the day after the Armistice in Nov. 1918, the plans of the Government for demobilization, for the resettlement of officers and men in civil life, and for the reestablishment of industry on a peace basis. His main expedient for tiding over a difficult time was the establishment of an out-of-work donation—to be in operation for six months for civil workers and for twelve months after demobilization for soldiers. The advent of the brothers Geddes to Cabinet rank was due to admirable administrative work done by Sir Auckland under the War Office, and by Sir Eric both under the War Office and in the Admiralty. Sir Auckland changed Mr. Neville Chamberlain's original scheme of national service, which had involved somewhat elaborate office expenses and had produced only moderate results. He saved some £100,000 a month by reducing the expenses of a central office, and worked instead through employment exchanges, trade unions and societies of employers' federations. He effected a drastic comb-out of civilians, card-indexed the whole of the army at home, transferred workers from luxury trades and occupations to essential industries, and recruited a further large supply of female labour.

Sir Eric Geddes went to the Admiralty to complete and work a reorganization which his predecessor (Sir Edward Carson) had initiated, when, in May, a new naval war staff was constituted. The First Sea Lord, as chief of the staff, was freed of all administrative detail in order that he might give his undivided attention to questions of policy and strategy; and he had the assistance of a director of operations, a director of intelligence, and others. There was also revived the office of Admiralty Controller, who was to organize the whole of the supply of the navy including transport, victualling, manufacture of ordnance, and shipbuilding. Sir Eric had then been brought in from the outside to fill this important post, as a great civil administrator who had just successfully organized the military railway system behind the lines in France, and in July, when Sir Edward Carson's vigorous counsel was needed in the War Cabinet, he became himself First Lord. The two main tasks of the Admiralty under him were to defeat the submarine menace, and to stimulate shipbuilding. They were more successful in the first than in the second. By provision of various ingenious methods of attacking and destroying underwater vessels they steadily reduced the losses of British ships, and they were able to announce the details of some 150 German submarines destroyed. But in spite of obtaining the assistance of Lord Pirrie, the great Belfast shipbuilder, as Controller-General of Merchant Shipbuild-

Ireland, but exempting north-east Ulster for five years, and providing for delegations representing both areas, with power to unify Irish legislation. If this plan was not satisfactory, he suggested that a convention of Irishmen of all parties should be assembled in Ireland in order to produce a scheme of their own to submit to the British Parliament. Neither the Nationalists nor the southern Unionists would accept Mr. Lloyd George's specific plan; but all parties except Sinn Fein accepted the idea of an Irish convention. Representative men, many of them non-political, were chosen to take part in the assembly; and, in order to produce an atmosphere of harmony, the Government released without reservations all the political prisoners in confinement for connexion with the Dublin rebellion. One of these was Mr. De Valera, who refused to have anything to do with the convention, and who was almost immediately elected M.P. for East Clare by an enormous majority. In spite of this ominous event, which showed that popular favour in southern Ireland was deserting the Nationalists for Sinn Fein, the Convention duly met on July 25, at Regent House, Trinity College, Dublin, and unanimously appointed Sir Horace Plunkett as their chairman. The Convention sat for many months, but, though there was an unexpected amount of agreement in some respects, it failed to arrive at anything approaching a unanimous report. The spread of the Sinn Fein movement in Ireland, the death from hunger strike of a Sinn Fein prisoner, and the illness and death of John Redmond, the Nationalist leader and a leading member of the conference, contributed to this untoward result. It was in April 1918 that the report was issued; and Sir Horace Plunkett claimed, in a letter to the Prime Minister, that "the Convention has laid the foundation of Irish agreement unprecedented in history." The Government, with no definite guidance from the Convention, proceeded to draft their own proposals; but these were not submitted to Parliament, as Lord French and Mr. Shortt, newly appointed Lord Lieutenant and Chief Secretary, discovered in May a further treasonable conspiracy between the Sinn Fein leaders and Germany, by which the Germans were to supply munitions for a rebellion to follow a successful German offensive in France. The Sinn Fein headquarters were raided by the police and 150 Sinn Fein leaders were arrested under the Defence of the Realm Act. In view of the disturbed state of Ireland, ministers, though they were harassed by the Nationalists in Parliament for their inaction, determined to postpone legislation.

Sinn Fein Conspiracy. Lord Rhondda, at the outset of his Ministry, obtained a much larger control and wider scope than had been possessed by his predecessor as Food Controller. He took over the Oils and Fats Department from the Ministry of Munitions and was given by Order in Council the same powers as the Admiralty, Army Council, and Ministry of Munitions already possessed, for requisitioning and controlling prices. The new crop of potatoes enabled him to abolish potatoless days; but it was to prices, which had risen enormously owing not merely to speculation and profiteering, but to deficient harvests, shortage through submarine depredations, and the depreciation of currency caused by the vast issues of paper money all over the world, that he mainly directed his attention. He explained his policy, in the House of Lords on July 26 1917, as being one of determining prices at every stage from the producer to the retailer, on the principle of allowing a reasonable pre-war profit. Existing agencies were to be used for the purposes of distribution under licence and control and under the supervision of local food controllers to be appointed by the local authority. He took over all the flour mills, and at heavy cost to the Exchequer reduced the price of flour so as to enable bread to be sold at 9d. per quarter loaf instead of the existing price of 1s. He fixed a sliding scale for prices of live cattle, but left the fixing of retail prices for joints to the local food committees. The appointment of local committees and fixing of prices went on regularly during the autumn of 1917 till hardly any kind of food was left at market price; and a vigorous economy campaign was organized under the direction of Sir

Lord Rhondda as Food Controller.

Arthur Yapp, of the Y.M.C.A., as Director-General of Food Economy. Sugar cards were issued in October. The sale or use of cream, save for children and invalids, was prohibited during the winter months. A new scale of **New Scale of Voluntary Rationing.** voluntary rations, not applying to children, was issued in November. The bread ration varied from 8 lb. per week for men on the heaviest manual labour to 3 lb. 8 oz. for women on sedentary work. For other foods the weekly ration was to be: cereals other than bread, 12 oz.; meat, 2 lb.; butter, margarine, oils and fats, 10 oz.; sugar, 8 oz. In December there were sporadic shortages of food of all kinds, and food queues at butchers', grocers' and bakers' shops became longer and more frequent, creating great dissatisfaction among all classes, especially the working-classes. To meet the difficulty in part Lord Rhondda gave powers to local committees to transfer stocks of margarine from retailers who were well supplied to those who were deficient; he also set up a Consumers' Council to advise the Ministry of Food; and he gave permission to the Birmingham Food Control Committee to try an experiment with a scheme whereby each household should be supplied with a card entitling them to prescribed rations of tea, butter and margarine to be procured from a particular registered retailer. As the year drew to a close, it was obvious, and Lord Rhondda admitted it himself, that compulsory rationing would have to come.

It should be noted that Government control was extended during 1917 over other staple industries besides those dealing with food. In July the cotton trade was brought under a board of control consisting of spinners, manufacturers, importers, distributors and workmen, together with representatives of the Board of Trade. In September a similar board was set up by the Army Council to regulate the woollen and worsted trade. Railways, the liquor trade, shipping, and mines had already passed successively under ministerial direction; as the strain of war grew more severe, the tendency inevitably was for each trade to set up a representative body to direct its functions and activities, through consultation with the Government. It may be added that, though it was no part of ministerial intention to discourage amusement and recreation, it was found necessary to suspend racing in May 1917.

Mr. Lloyd George followed Mr. Asquith closely in his statements during the year of the war aims pursued by the Allies, and in his repudiation of an inconclusive peace. At Glasgow in July he said that "we should continue to fight for the great goal of international right and international justice, so that never again can brute force sit on the throne of justice, nor barbaric strength wield the sceptre of right." Mr. Asquith at Liverpool in October said that the worst that could happen to the world would be a patched-up peace; Gen. Smuts, who made several speeches while he remained in England as a member of the War Cabinet, said at Cardiff in the same month that the present struggle was deciding upon what basis the future would be built, whether on freedom, or on the will to power and the will to force. An entirely different note was struck by Lord Lansdowne, advocating in November, in a letter to the *Daily Telegraph* (which *The Times* had previously declined to publish), a negotiated peace. He received no support, save from professed pacifists; and Mr. Lloyd George took occasion to warn people against the man who thought there was a half-way house between defeat and victory. He admitted that it was a bad moment for the Allies in the war, because Russia had stopped and America was only preparing to come in. Certainly the course of the war in the autumn was unsatisfactory. Italy had been invaded in October and her armies driven back to the Piave, the fruits of Sir Julian Byng's brilliant victory, by the first use of tanks at Cambrai in November, had been largely neutralized by a German counterstroke, and in December a regular armistice was concluded between Germany and Russia. To be finally turned in the beginning of March 1918 into the humiliating treaty of Brest-Litovsk. Russia went out of the war; but Great Britain had a gleam of success in the end of the year through the capture of Jerusalem by Sir Edmund Allenby.

General Control of Trade.

Leading Men and War Aims.

A Bad Moment in the War.

The prospect was sufficiently anxious fully to warrant the renewed call of the Prime Minister in the new year for sacrifice — sacrifice worthy of the sacrifices made by those at the front. "To every civilian," he wrote in a message to the nation, "I would say: 'Your firing-line is the works or the office in which you do your bit; the shop or the kitchen in which you spend or save; the bank or the post-office in which you buy your bonds.'" Sir Auckland Geddes immediately illustrated the necessity of sacrifice by introducing a bill, the chief effect of which was to call up from civil employment a number of young men who had hitherto been exempt from military service; and he announced that it was necessary to raise immediately 420,000 to 450,000 from this class. After some demur the trade unions agreed to coöperate in making the measure effective, and it became law on Feb. 6.

The finance of the war called this year for greater sacrifices from the taxpayer than ever before. The money voted for military purposes exceeded that of any previous year. Mr. Law obtained votes of credit for £600,000,000 in March; £500,000,000 in June; £700,000,000 (the largest amount ever voted in one sum) in August; and again for £700,000,000 in November. This made a total of £8,742,000,000 for the whole war (of which £1,465,000,000 had been lent to the Allies down to the Armistice). The average daily expenditure, which was £6,986,000 in 1917-8, fell in the seven war months of 1918-9 to £6,688,000. In his budget, introduced in April, Mr. Law made unprecedented demands on the taxpayer, in order to raise sufficient revenue to cover the peace expenditure and the increased debt charge. He imposed additional taxation estimated to bring in £114,000,000. Income tax was raised from 5s. to 6s. in the £; the farmers' tax was doubled; rates of supertax increased up to a maximum of 4s. 6d. in the £, and the limit of exemption lowered from £3,000 to £2,500; a 2d. stamp tax was placed on cheques; beer and spirit duties were doubled, and sugar, tobacco, and match duties raised; letter rate was raised to 1½d. and post card rate to 1d.; and there was to be a luxury tax of 2d. in the shilling. This last tax was eventually dropped, after a select committee of the House of Commons had spent many weeks in examining and reporting on its possibilities. There was little opposition to the rest of the proposals, save to the doubling of the stamp on cheques, against which there was considerable protest in the City, which the Chancellor of the Exchequer disregarded. Protests, however, were raised against extravagance and waste, without which the estimates of expenditure and revenue would hardly have reached the gigantic totals of £2,072,197,000 and £842,050,000, leaving a deficit of £2,130,147,000 to be met by loan. It was estimated in January by Mr. Herbert Samuel, chairman of a select committee of the House of Commons on national expenditure, that the following increases had taken place since the preceding August: the 9d. loaf, £45,000,000; bonus to potato-growers, £5,000,000; to miners, £20,000,000; to munition workers, £40,000,000; to railwaymen, £10,000,000; and to civil servants, £3,000,000; increases in pay to officers, over £7,000,000; to soldiers, £65,000,000. The increases of pay voted to navy and army by Parliament in 1917 were, it may be explained, overdue, and were only a fitting acknowledgment of their heroic service. It should be added that in the autumn of 1918 the Government made provision for the intellectual welfare of soldiers by establishing a new department, under the charge of Col. Lord Gorell, to direct and coördinate education in the army.

It was in the matter of food that the sacrifices demanded were most felt by the bulk of the population. In January the quantity of staple foods which might be consumed by visitors in hotels and by people taking casual meals was limited by order; and in February compulsory rationing of meat was enforced in London and the Home Counties. Meat cards were issued, with coupons attached, under conditions that restricted the weekly adult ration to 1s. 3d. worth of butcher's meat, together with other meat equivalent to 5 oz. of butcher's meat. At the same time butter and margarine were rationed, 4 oz. being allowed per head per week. At first there was a good deal of outcry against Lord Rhondda, as there had been against Lord Devonport, and attacks were made upon him in both Houses of Parliament, on account of his interferences with the course of trade, his "meddling and muddling." But in the Lords he was defended with spirit by Lord Milner, who said "that we were in a better position as regards food than any of the other countries engaged in the war; that, however the German submarine campaign might have embarrassed us, it had certainly not starved us and had not diminished the necessary supplies of our armies in the field." Mr. Clynes, the parliamentary Under-Secretary of the Department, claimed with justice that, under its arrangements, the poorest people were going to have an equal chance with their richer brethren, and that men, women and children, and not money, would be the consideration that would determine the appropriation of food. The Government, he said, had taken the place of the merchant and importer. The shortage of coal demanded further sacrifices by the general consumer. It was found necessary to supplement the "summer time" arrangement, now become permanent, by a curfew order, limiting the hours for lights and fires, and compelling theatres to close at 10:30; and gas and electric light were rationed. Later on in the year railway facilities were greatly diminished, and fares increased.

The Government was criticised at the opening of the parliamentary session of 1918 for failing to reach the high standard they had set themselves in the departments of man-power, food production and shipbuilding. But Mr. Law pointed out that in 1917 they had put into the army 820,600 additional men; had brought a million more acres under the plough, producing an additional 850,000 tons of cereals and 3,000,000 tons of potatoes; and had built 1,163,474 tons of shipping, compared with a tonnage of 530,000 built in 1916. Another subject of criticism was the arrangement made with the Allies for the joint conduct of the war. Here the Government had been very active. The unity and continuity of direction which Mr. Lloyd George had ensured in the prosecution of the war, so far as the British forces were concerned, by the institution of his small War Cabinet in permanent session, he and his Cabinet earnestly desired to see more completely realized in the joint councils of the Allies. At a meeting of leading ministers of the principal Allies, held at Rapallo in the autumn of 1917, a plan of coördination was approved. A war council, composed of the Prime Minister and another member of each of the three Governments of France, Italy and Great Britain, was constituted to meet at Versailles normally not less than once a month, and it was hoped that other Great Powers, especially the United States, would join the council. Mr. Lloyd George was in Paris in November 1917 for the first meeting; but he was disappointed with the results, and, at a luncheon there, he made an appeal to public opinion in the various Allied countries, by delivering a very pessimistic and, as it seemed to many, a very injudicious speech, in which he declared that unless some change were effected he could no longer remain responsible for a war direction doomed to disaster from lack of unity. He succeeded in drawing public attention; but the critics were disposed to suggest that this was a new device to enable politicians to interfere with work properly belonging to soldiers. One of Mr. Lloyd George's difficulties in securing coördination had been the instability of French ministers during 1917. M. Briand's Ministry, after a tenure of office of 18 months, fell in March; M. Ribot, who succeeded him, was overturned in September; M. Painlevé, the next prime minister, only lasted two months; but, fortunately, in his successor, M. Clemenceau, France obtained a chief whose whole thoughts, like Mr. Lloyd George's, were devoted to winning the war. With his coöperation the Versailles Council was strengthened, and arrangements were made to coördinate it with the general staffs of the various Allies by each appointing a staff officer as permanent military adviser at Versailles. This arrangement cost the Government the services of Sir William Robertson, the chief of the staff, who refused either to take the military advisership,

which fell to Sir Henry Wilson, or to continue in office unless the military adviser at Versailles were merely his deputy.

In fact, Mr. Lloyd George and his Cabinet had by no means reached their aim of satisfactory coördination when the great German advance began on March 21. The British and French armies were both driven back in a series of bloody battles, and they were seriously menaced with a rupture of their contact with each other by a fierce attack which the Germans directed against Amiens. Then it was realized that what the Allied forces in France needed for success was not an Allied council but a single military head. Sir Douglas Haig agreed in this with Lord Milner, who was then representing the War Cabinet in France, and with M. Clemenceau; and Gen. Foch, the most scientific of French soldiers, who had already distinguished himself highly in the war, was appointed Generalissimo, to the general satisfaction.

The next few months in Britain were perhaps the most anxious time of the whole war. A fresh Military Service bill was at once introduced, raising the military age to 50 and in certain cases to 55, and Ireland was for the first time to be included in a compulsory measure, ministers announcing at the same time that they were about to introduce a fresh Home Rule bill based on a consideration of the reports of the Irish Convention. The bill was hotly opposed, not only by the Nationalists, but by many experienced members who doubted whether it would really give ministers the men they needed. But Mr. Law insisted on carrying it as it stood, and told the Nationalists that they did not realize the growing bitterness in England at the exemption hitherto of Ireland from the sacrifices demanded of Great Britain. The bill was carried by majorities of 200; but it was never in fact put in force in Ireland. The Roman Church joined the Nationalists and Sinn Feiners in denouncing conscription, and the Government, having to abandon this project, abandoned also the attempt to pass this year a Home Rule bill.

Besides this new Military Service Act, the Government strengthened the forces in France by sending at once to Sir Douglas Haig a large proportion of the men hitherto retained in the island as a home defence army, and they instituted a vigorous comb-out once more of munition workers, miners, and the Civil Service. They strengthened the War Office, by making Lord Milner, the most vigorous member of the War Cabinet after the Prime Minister, Secretary of State for War; Lord Derby going as British ambassador to Paris, where he admirably reinforced the good understanding of the two Powers. The vacancy in the War Cabinet was filled by Mr. Austen Chamberlain. About the same time Sir William (since Lord) Weir succeeded Lord Rothermere as Air Minister.

The strain engendered by the serious situation of the British forces in France produced some regrettable recriminations in Parliament *à propos* of the substitution of Gen. Sykes for Gen. Trenchard as chief of the air staff, and of a letter which a distinguished general, Sir Frederick Maurice, late director of military operations, thought fit to write to *The Times*, accusing ministers of making statements to Parliament, giving "a totally misleading impression" of the military situation. Ministers in this latter case offered to refer the charges to two judges, but the leading Liberals refused this tribunal, and Mr. Asquith, for the first time definitely acting as leader of opposition, moved to refer the allegations to a select committee of the House of Commons. Mr. Lloyd George, in debate, categorically and in detail maintained the truth of the Ministerial statements, and the motion was rejected by 293 votes to 106 votes. Gen. Maurice, for his breach of discipline, was placed by the Army Council on retired pay, and became a military correspondent for the press. The anxieties of the times also revived the strong feeling about the alien danger; and, in deference to public opinion, certificates of internment and naturalization were revised, no aliens were allowed to be employed in Government offices during the war, new measures were taken to establish the identity of aliens, and drastic restrictions were imposed on changes of name. Enemy

banks, too, were finally wound up, and it was provided that no such banks should be established for a period after the war.

The food condition was better this summer, owing to Lord Rhondda's admirable arrangements for securing supplies from all quarters of the world, and to the diminution of the menace from submarines owing to the provision of submarine chasers and other methods. Compulsory rations of meat, however, continued, though a larger quantity was allowed. Tea, too, was rationed, and though milk was not rationed its price was fixed according to the season. Arrangements were made to get in the harvest, in the absence of men at the front, by a great volunteer contingent of public-school boys in their holidays, and of women. The Food Controller established with great success national kitchens, and afterwards, in a few great towns, national restaurants. On July 3 Lord Rhondda died, just when he had arranged to introduce, in place of the loose cards hitherto used, a system of ration books. These were brought into use by his successor, Mr. Clynes, on July 14, and contained coupons for sugar, butter or margarine, lard, butcher's meat and bacon. Thus a satisfactory national system was at last evolved, which worked well and favoured no one.

While it was generally admitted that the War Cabinet was a much better organ for the conduct of the war than any of the previous arrangements, there was frequent complaint that the result of concentrating all real directing power in the hands of four to six men, all deeply engrossed in the war, was that domestic affairs were insufficiently attended to. Accordingly in June 1918 a Committee on Home Affairs was appointed, which was to meet, at least once a week, under the chairmanship of the Home Secretary. All domestic questions requiring the coöperation of two or more Departments and calling for Cabinet decision were to be referred to it. The Committee were to have the power of decision, on behalf of the Cabinet, but larger questions of policy were to be referred to the War Cabinet.

The fourth anniversary of the war, being a Sunday, was observed as a day of national intercession, to invoke the Divine Blessing on the country's cause. Marshal Foch's offensive had been in progress for more than a fortnight; but it was still far from clear whether it could proceed without a check. Mr. Lloyd George sent a stirring message on the day to the Empire, bidding Britons to "hold fast." The battle, he told them, was not yet won. "We cannot seek to escape the horrors of war for ourselves by laying them up for our children. Having set our hands to the task we must see it through till a just and lasting settlement is achieved." The appeal was timely, but many of the workers paid little heed to it.

Throughout August and September, while the Allied troops in France, and especially the British armies, were winning victory after victory and steadily driving the Germans out, and while Bulgaria and Turkey were being forced to surrender, a series of strikes broke out all over the country, in many cases promoted not by the unions but by the shop stewards. Women workers in London on omnibuses and tubes struck to obtain the same war bonus as that accorded to the men. The strike spread to Bath, Bristol, Brighton, Folkestone, Hastings, and Weston-super-Mare, but the women returned to work in a couple of days on a promise of full consideration of their demand, which was eventually conceded. A much more serious matter was the London police strike which, without notice, deprived London for two days, Friday and Saturday, Aug. 30 and 31, of police protection. Undoubtedly the Metropolitan Police had grievances in regard to wages and allowances, which had been under consideration of the authorities for an unconscionable time without result, but it was a shock to public conscience that the defenders of law and order should have thought themselves at liberty to leave the public defenceless in order to call attention to their claims. Sir Edward Henry, the Commissioner of Police, resigned, and was succeeded by Gen. Macready; but it was believed that it was the Home Office that was mainly to blame. Mr. Lloyd George settled the strike by granting the men liberal terms; but he

Strikes in 1918.

declined to recognize any union of the police. There was a strike of Lancashire operative cotton-spinners in September against the advice of their union, but the men returned to work on an appeal by Mr. Lloyd George, who promised to appoint at once a tribunal of inquiry. The tribunal allowed an increase of wages, but rejected the men's claim to decide the nature of their unemployment benefit. The most serious strike was that of railway men, especially in the South Wales district, in the same month. There was a dispute as to the extent of the advance to be granted in wages, and the National Union of Railwaymen and the War Cabinet agreed upon a certain scale. But the men threw over their leaders, and were only brought to reason when the Courts prohibited the unions from paying strike pay to their members. Mr. J. H. Thomas resigned the secretaryship of the National Union, and was only induced to return after a while on a promise of better observance of discipline. These and other less important strikes caused the Trade Union Congress at Derby to impress upon trade unions the desirability of a frank acceptance of the Whitley Report and joint industrial councils.

Other causes of anxiety of the autumn were a severe attack of influenza, which spread rapidly from July onwards, caused the weekly death roll by the end of October to rise in London to 761, and in 66 great towns to 1,895, and only began to wane in November; a great deficiency in coal which led to household rationing, and to great economies in lighting and heating arrangements by municipalities and other public bodies; a reduction in the meat ration; and the sufferings of the British prisoners in Germany, and her delay in ratifying the Hague agreement for reciprocal return of prisoners which had been negotiated by Sir George Cave and Lord Newton.

But from the end of September onwards the persistent and accumulating good news from every seat of war gradually changed the attitude of the country from one of anxiety to one of increasingly hopeful expectation. In opening a war bond campaign at the Guildhall on Sept. 30, Mr. Bonar Law concluded his speech with a new accent: "I do not say that this is the end, but I do say that this is the beginning of the end." For the purpose of the appeal Trafalgar Square was turned into a realistic representation of a shell-shattered French village. The "Feed the Guns" week, which was started by the opening of this show on Oct. 7, was all the more successful, as President Wilson was already in correspondence with the Central Powers as to the general principles on which peace could be based. By the time that Nov. 9, Lord Mayor's Day, came round, terms of armistice, amounting in effect to surrender, had been handed by Marshal Foch and Adm. Wemyss to a German delegation, and the news of their acceptance was hourly expected. The Lord Mayor's Show, with tanks and captured guns, and detachments of British, Imperial and Allied troops and of Women's Auxiliary Corps, typified the magnificent effort of the Empire now being crowned with victory; but on that Saturday evening the Prime Minister could only say at the Guildhall banquet, "I have no news for you."

It was on Monday morning, Nov. 11, at 11 o'clock, that the bursting of maroons announced to London that the Armistice had been signed, that hostilities had ceased, and that the war, in all human probability, was over. Almost instantly crowds poured into the streets, flags and decorative rugs and tapestries were hung out of windows throughout the centre of the town, from public offices and private houses, and a great throng assembled at Buckingham Palace to cheer the King, who appeared with the Queen on the balcony, and showed how fully he shared the rejoicings of his subjects. The scenes of enthusiasm and public jubilation in the streets throughout the day were indescribable. When the House of Commons met, the Prime Minister read out the terms of the Armistice, and added, "This is no time for words. Our hearts are too full of gratitude, to which no tongue can give adequate expression." Immediately the two Houses of Parliament, led by the Lord Chancellor and the Speaker, proceeded to St. Margaret's church to give thanks to God. Next day the King and Queen attended a special service of thanksgiving at St. Paul's. The general rejoicings lasted

throughout the week. Before Parliament was prorogued both Houses voted addresses of congratulation to the King, which were presented to him in the Royal Gallery of the Palace of Westminster; and His Majesty, recalling the splendid services of the sailors and soldiers from all parts of his Dominions, pledged himself anew to uphold the honour of the Empire and to promote the well-being of the people. Before the month was out, in accordance with the terms of the Armistice, the German submarines came and surrendered off Harwich, and the main German fleet, battleships, battle cruisers, light cruisers and destroyers, steamed into the Firth of Forth and there surrendered to Adm. Beatty. It was a fitting tribute to the sea-power which had been the main factor in deciding the issue.

IV. AFTER THE WAR, 1918-21

The conclusion of hostilities was immediately followed by the prorogation and dissolution of Parliament and a general election. Though protests were raised in some quarters, especially by the Independent Liberals, this was quite the natural procedure. Under the Parliament Act, the now expiring Parliament should have been dissolved three years previously, in Dec. 1915, and its life had only been prolonged from time to time by special Acts in order to avoid an election during the war. A Reform bill which enormously enlarged the electorate, adding two million male and six million female voters, had been passed in Feb., and it was right, and in accordance with precedent, that the new constituency should be consulted at the earliest moment compatible with national safety. It was evident that the Government to whom the new Parliament should give its confidence would go to the Peace Conference with its hands strengthened.

Was the Coalition to continue? The two heads of the Government, the Prime Minister, Mr. Lloyd George, and Mr. Bonar Law, the leader of the Unionists, decided, to the public satisfaction, that it should, on the ground that it would be disastrous to deal on party lines with the peace negotiations and the problems of reconstruction. They issued a joint appeal for support to the Coalition Government "in the execution of a policy devised in the interest of no particular class or section, but, so far as our light serves us, for the furtherance of the general good." They asked the nation to preserve the same unity in peace that it had manifested in war. They promised, among other things, to promote disarmament and a league of nations; to take special care of the soldiers and sailors who had served in the war; to increase production, especially in agriculture; to forward housing, afforestation, and transport; to give a preference to the colonies, and to preserve key industries at home; to reform the House of Lords; to develop responsible government in India; and to explore all paths towards a settlement in Ireland, with the proviso that there must be no separation and no coercion of Ulster. One element of the Coalition, the Labour party, had determined to secede; and accordingly Mr. Clynes, Mr. Hodge and Mr. Brace resigned, though Mr. Barnes preferred to leave his party and remain in the Government; and Mr. George Roberts accepted Mr. Clynes's post of Food Controller. The Labour party made great preparations to capture a large number of constituencies, but they committed the mistake of adopting among their candidates those Labour leaders who had opposed the national policy and had been notorious pacifists, as well as those who represented the patriotic majority. This attitude helped to increase the electoral support of the National Democratic party, who favoured the claims of Labour but approved of the Coalition. The Liberal party were divided. Those who had hitherto regularly supported Mr. Lloyd George were prepared to continue their support; but Mr. Asquith and those of his colleagues who had resigned with him, and a large section of the party, declined to commit themselves to any further support, and stood as Independent Liberals. In these circumstances, the Government asked for a pledge of support from candidates, and refused to assist those who declined to give it. The certificate that the pledge had been given was commonly called a "coupon," and was the subject of indignant protest by

General Election of Dec. 1918.

The Beginning of the End.

The Armistice.

Independent Liberals and some others. In response to a popular agitation for the trial of the Kaiser, for punishment of war criminals and for full reparation from Germany, Mr. Lloyd George on the eve of the election announced that these points were included in the Coalition programme, and further that he was against conscript armies in all lands.

The election was held on Dec. 14 1918, but owing to the arrangements which had been made for taking the votes of sailors and soldiers, the votes were not counted and announced till the end of the year. The result was an overwhelming victory for the Coalition, 478 of whose official candidates were returned, constituting a majority of 249 over all non-Coalition parties. The Labour party obtained 63 seats, a number which was sufficient to constitute them the official Opposition, as the Independent Liberal party came back only 28 strong, Mr. Asquith and all his former colleagues of Cabinet rank being defeated. The same fate befell the whole of the pacifists, whether among the Labour or among the Liberal party. The defeat of Labour and Independent Liberalism would not have been so overwhelming had there not been an extraordinary number of three-cornered contests. But the resolve of the electorate that the Government which waged the war to a successful issue should make the peace and begin the reconstruction of the country was clearly manifest. In Ireland the returns indicated the collapse of the Nationalists and the triumph of Sinn Fein in the south and west. Only seven Nationalists survived, compared with 73 Sinn Feiners and 25 Unionists. The only woman returned was Countess Markiewicz, a Sinn Feiner. None of the Sinn Feiners took their seats at Westminster.

Mr. Lloyd George immediately undertook a reconstruction of his Ministry. The changes were not so numerous as had been expected. Mr. Austen Chamberlain relieved Mr. Bonar Law of the extra burden of the Chancellorship of the Exchequer; Sir Frederick Smith, the Attorney-General, became Lord Chancellor, with the title of Lord Birkenhead; Lord Milner became Colonial Secretary; Mr. Walter Long was appointed First Lord of the Admiralty; Mr. Churchill was entrusted with two secretaryships of State, that of War and that of Air—a combination much and reasonably criticised; Sir Robert Horne became Minister of Labour, in succession to Mr. Hodge; Mr. Andrew Weir, created Lord Inverforth, was made Minister of Munitions (rechristened "Supply"); a new Ministry, that of Ways and Communications (afterwards better named "Transport"), was created for Sir Eric Geddes; and an Indian, Sir S. P. Sinha, who had been the first native to sit on the Viceroy's Council, was made Under-Secretary for India, and created a peer. In view of the approaching Peace Conference, the system by which the Prime Minister was relieved of the labours of leadership in the Commons, by entrusting them to Mr. Bonar Law, was continued.

The last days of 1918 witnessed the reception in London of the first detachments of the returning British troops, of their victorious commander, Field-Marshal Haig, of Marshal Foch and M. Clemenceau; and, especially, of President Wilson, passing through England on his way to the Paris Conference. This great assembly was opened formally by President Poincaré on Jan. 18 1919, and thenceforward for several months Mr. Lloyd George and many of his principal colleagues were absent for long periods in Paris. These tokens of victory and peace were at variance with the symptoms of domestic life in Great Britain. Within a few days of the Armistice deputations from workers, especially munition workers, were demanding of the Prime Minister a living wage. The railway men decided to withdraw the truce in their industry and demanded an 8-hour day, which the Government promptly conceded. Other industrial troubles followed. Demobilized soldiers, miners, police, boilermakers, dock workers, engineers, all made urgent demands, with strikes declared or threatened. At first the trouble was worst on the Clyde, but the outlook was soon gloomier in London. The "tube" men came out on Feb. 3, and remained out for a week till they obtained an 8-hour day. Then the London electricians threatened to cut off all the elec-

tricity, stopping tramways and lighting, if the Government did not settle with the Clyde workers. The Government met the threat by a regulation under the Defence of the Realm Act making electrical strikers liable to six months' imprisonment.

It was in these unpropitious circumstances that Parliament met. Mr. Adamson, a miners' representative, as chairman of the Labour party, appeared as Opposition leader; and Sir Donald Maclean, who had been deputy chairman of Ways and Means in the last Parliament, led the Independent Liberals, pending Mr. Asquith's return. Ministers did not satisfy the Labour men, who moved an amendment to the Address, but were beaten by 311 to 50. The note of labour unrest thus struck resounded throughout the session and the year. Increased wages and shorter hours were demanded in trade after trade, though in most cases there had been repeated advances of wages during the war. The increase of prices, indeed, seemed to warrant, or at least excuse, a further advance. On the other hand, there was an unfortunate but natural tendency, after the strenuous labours of the past four years, to take work easily, and not merely to work shorter hours but to produce less in the hour. Further, the revolution in Russia, the deplorable effects of which on the condition of the Russian working-classes were only gradually revealed to British working men, increased the revolutionary ardour of the more advanced leaders, and disposed them to foment disputes and reject conciliation. The miners were the first in the field, demanding not merely a 30% increase in wages, and a 6-hour day, but nationalization of the mines and minerals. The Government wished, reasonably enough, before coming to a decision, to consider the effect on the general welfare of such stringent changes in the fundamental industry of the country. The Miners' Executive however would not wait, but took a ballot which declared by a large majority in favour of a strike. A truce, however, was arranged, while the Government set up in haste a Royal Commission, presided over by Mr. Justice Sankey, the proceedings of which were hurried forward. Meanwhile ministers endeavoured to meet the industrial unrest by a new scheme of conciliation. Sir Robert Horne, Minister of Labour, convened on Feb. 27 a representative meeting of employers and workmen at Westminster, which Mr. Lloyd George subsequently addressed. This Joint Industrial Conference appointed a committee which recommended, *inter alia*, a maximum normal week of 48 hours, establishment by law of minimum time rates of universal application, and the creation of a permanent National Industrial Council of 400 members, elected in equal numbers by organized employers and workpeople, to advise the Government on industrial questions. The report was accepted by the conference and received sympathetically by the Government. In pursuance of this policy the Government in November introduced and passed an Industrial Courts bill, giving the Minister of Labour power to appoint courts of inquiry into trade disputes, consisting of employers, workmen and independent persons. In March the two other members, besides the miners, of the "Triple Alliance" as it was called, the railway men and the transport workers, insistently demanded improved conditions, in particular a 48-hour week. Both gained the greater part of their claims, but the railway men only after a strike resolution. The Sankey Commission produced a litter of interim reports, the chairman's, which the Government adopted, recommending an increase in wages of 2s. a day, a 7-hour day till 1921, then a 6-hour day; a penny a ton, equivalent to £1,000,000 a year, to be set aside for the improvement of housing; reorganization of the industry, and an effective voice for the miners in its direction. On nationalization no opinion was expressed in the chairman's report. The miners were still dissatisfied, but, on their leaders' advice, gave a majority on a ballot for acceptance. Subsequently, in June, the Sankey Commission issued further reports, all recommending nationalization in some form, and most of them calling attention to the alarming decrease of output. The miners' leaders insisted that the Government, having accepted the interim report, were bound also to accept the nationalization

Nationalization.

advocated in the final reports. But, in Oct., Mr. Lloyd George emphatically repudiated this, and said that the nation, and not a fraction, must decide a political and economic question of this magnitude. As time went on it became increasingly evident that the nation's experience of Government control during war did not incline it to extend the system during peace. People were thoroughly sick of "bureaucracy."

The Government showed their good faith towards the Labour party by introducing and carrying through a bill restoring pre-war "trade practices," in spite of the growing evidence that many of these practices were hindrances to that increase of output which the situation needed. There was a comparative lull in trade disputes during the summer, though discontent was rife among the police both in London and in Liverpool, and there was a cotton strike which was settled by an advance of 30% in wages and the concession of a 48-hour week. There were also sporadic strikes of miners in South Wales and in Yorkshire. The threatened London police strike took place on Aug. 1, the object being to compel the Government to recognize the men's union. But it was a fiasco; those who came out were less than 900 out of a total of 20,000; and they were all dismissed. The labour situation became acute in September. The Trade Union Congress which met at Glasgow on Sept. 8 was mainly concerned with "Direct Action,"—that is, the application of the industrial strike

to secure political change. In spite of a spirited protest by Mr. Clynes, who adjured the Labour men to adhere to constitutional methods, the Congress passed a resolution calling for the repeal of the Conscription Acts, and the immediate withdrawal of troops from Russia, and, failing compliance by the Government, for a special Congress "to decide what action shall be taken." This was almost immediately followed by a sudden and formidable railway strike. There had been negotiations for a standardization of wages for six months. Dissatisfied with Government concessions already amounting to £65,000,000 a year in the railway wage bill, and necessitating an advance of 50% in passenger rates and more in goods rates, a national strike was declared without warning on Sept. 26. Prompt and decisive measures to meet the threat to the nation were taken by Government. Volunteers were called for and responded in great numbers. Drastic restrictions were placed on light and fuel. Hyde Park was used as a milk depot for London. The motor lorries, which were the product of the war, proved an enormous resource. After the first few days, the railway companies began to run trains in increasing numbers. An attempt was made to involve other unions, but their officials, as a rule, promoted conciliation, and on Oct. 5 an agreement was reached, by which the Government promised stabilization of wages at their existing level till Sept. 30 1920, instead of Dec. 31 1919—a concession more of form than of substance. The strike ended on Oct. 6, having only lasted 10 days. Another dispute, not so spectacular, but gravely affecting the whole engineering trade, an iron moulders' strike, was in progress throughout all the last quarter of the year, and was finally settled at the end of the following Jan. by the concession of a 5s. increase in wages instead of the 15s. demanded.

Fortunately this dismal record of industrial conflict does not exhaust the story of 1919. First of all, after many vicissitudes and uncertainties, peace was made and signed at Versailles on June 28. There were royal proclamations and public rejoicings. Parliament accepted the treaty at Mr. Lloyd George's hands with only a few expressions of dissatisfaction, and on July 19 there was a great victory march through London, ending up with a defile before the King, in front of Buckingham Palace, of the armed forces of the Empire and of those of the Allies. Sir David Beatty and Sir Douglas Haig led their men; Gen. Pershing commanded the Americans; and the Allied commander-in-chief, Marshal Foch, was himself present with his staff. The friends of the most novel portion of the Treaty of Versailles, the Covenant of the League of Nations, organized in the autumn a campaign in the country in its support,—beginning with a meeting on Oct. 13 at the Mansion House,

presided over by the Lord Mayor, and addressed by Mr. Asquith, Lord Robert Cecil, and Mr. Clynes. One result of the peace was the termination in Oct. of the exceptional methods of government improvised by Mr. Lloyd George in order to win the war, and the reversion to a Cabinet in the pre-war sense. It consisted of 20 members, being for the most part the holders of those offices which usually conferred Cabinet rank in pre-war days; but Mr. Barnes was a member, though without a portfolio; the Viceroy and Chief Secretary for Ireland were to alternate, whichever happened to be in London at the moment being summoned; and the new Minister of Transport, Sir Eric Geddes, was also included. The Cabinet Secretary and his staff were retained.

Besides the measures necessary for demobilization and for restoring the navy and army to a peace basis, ministers passed in this year several bills of great importance. Two new ministries were established, one of Health, into which the old Local Government Board was converted and to which were allotted various departments, relating to national health, from other offices; and one of Transport, which was to have control of railways, light railways, tramways, canals and inland navigation, roads, bridges, and traffic generally. Even electricity was included within its general scope; but a special Electricity Supply bill was passed, constituting commissioners who were to control the supply of electricity for domestic and industrial purposes. It was said in debate that the task of the Transport Ministry would be one for a "superman"; and eventually docks and harbours were exempted from his direct control. Then a Housing bill was passed, compelling local authorities to provide housing plans; and a scheme was adopted empowering such authorities to issue 5½% local bonds, free of income tax for holders of less than £500. A subsidy of not exceeding £15,000,000 was also provided by Government. There were bills also facilitating the acquisition of land for public purposes, and for the settlement of soldiers and sailors on the land. The emancipation of women; moreover, was practically completed by the passing of a bill providing that no person should be disqualified by sex from the exercise of any public function, or from being appointed to any civil or judicial office or post, or from entering or resuming any profession or vocation. Women were also made eligible as jurors, but the House of Lords still refused to admit women holders of peerages in their own right to sit or vote. At a by-election for Plymouth in Nov. Lady Astor was returned as member in place of her husband, who had succeeded to the peerage, and she was the first woman to sit and vote in the House of Commons. The last Government bill which deserves notice was a Profiteering bill, to endeavour to cope with the great inflation of prices. A central tribunal, presided over by Mr. McCurdy, was set up; and there were also local tribunals, with powers of fining and imprisoning those found guilty before them of undue profit-making.

The object and general tendency of this legislation were greatly to improve the health and social and industrial conditions of the masses of the people; to make, in Mr. Lloyd George's full-blooded phrase, "a land fit for heroes to live in," but at the price of setting up costly new ministries, and a considerable expenditure in rates and taxes. Mr. Chamberlain's budget was conceived on the same large lines. He estimated the expenditure at the gigantic sum of £1,434,7910,000, and the revenue on the existing basis of taxation at £1,159,650,000. Therefore, though the war was over, he proposed to increase rather than diminish taxation, except that he reduced the excess profits duty—a war tax *par excellence*—from 80 to 40%. But he greatly increased the taxes on spirits and on beer, and raised the death duties on large estates. The main feature of the budget was the establishment at last of imperial preference, by giving an abatement of a sixth on the duties levied on such imports as tea, coffee, cocoa, sugar, tobacco and motor spirit, and of a third on those levied on cinema films, clocks and watches, motor-cars and cycles. He calculated that, by the changes proposed in taxation, he would bring the revenue up to £1,201,100,000. For the balance he looked to a Victory Loan, which was

sold after Whitsuntide in two forms: (1) 4% Victory Bonds issued at 85 redeemable by annual drawings at par; (2) a 4% funding loan issued at 80 and redeemable within 70 years in the ordinary way. The Labour party, with a portion of the Liberal party, strongly advocated a levy on capital in order to reduce the debt, now £8,000,000,000, to more manageable proportions; but Mr. Chamberlain set his face against it as the greatest possible discouragement of industry and enterprise.

Mr. Asquith and the Independent Liberal party, with some assistance from the Labour men, started a not very formidable agitation in the name of Free Trade against the preferential proposals of the budget. A more effective movement, which gathered force as the year advanced, was that against the extravagant manner in which the Government was carried on. There was a special scandal about a motor-vehicle reception depot which had been established towards the close of the war on 600 ac. of good wheat land at Chippenham, near Slough, and which was apparently, now that the war was over, being rather extended than curtailed. A select committee of both Houses reported in July that the decision to continue the works after the Armistice had not been justified. Complaint was made of the continuance in peace of war-time naval and military estimates, of war-time ministries, such as Food, Supply and Shipping, and of enormously swollen staffs. It was maintained that it was impossible that the country could go on paying the gigantic taxes and rates which Parliament and the local authorities were exacting, without speedy bankruptcy. Lord Rothermere, who had himself been in charge of a new department during the war, was the protagonist of this movement; and his son, Mr. Esmond Harmsworth, was returned in Nov. to Parliament as primarily an "Anti-waste" member. An increasing section of the press harped on the same theme.

The principle of self-determination, as proclaimed by President Wilson in Paris, produced fermentation in many parts of the British Empire, notably India, South Africa, Egypt and Ireland. In India there was serious trouble in the Punjab, and a regrettable affair at Amritsar, but hope was placed in the Montagu-Chelmsford scheme of reform. In South Africa, fresh life was given to the Hertzog nationalist movement, and the South African party and the Unionists were driven to draw closer together. In Egypt there was violent upheaval, and Lord Milner went out with a special mission to inquire and report. In Ireland

things proceeded from bad to worse throughout the year. Sinn Féin, who had triumphed in the elections, met at Dublin in Jan., appointed an executive, and pledged themselves to the independence of Ireland.

An informal war against all representatives of British authority in the country was begun; and outrages and murders steadily increased, an attack on the life of the Viceroy, Lord French, coming near the end of the year. Meanwhile the Cabinet appointed a committee, of which Mr. (afterwards Lord) Long was chairman, to make representations as to Irish government.

It is pleasant to turn to record the visit in the autumn of the Prince of Wales, first to Newfoundland, then to Canada, and finally to the United States,—each visit, owing to his charm and power of sympathy, proving a bond of union, first of the Empire, and then of the English-speaking peoples. He made another imperial trip in 1920, this time to Australia and New Zealand, with

equally happy results; but it was wisely decided that his contemplated visit to India should wait, in view of the strain of the last few years on his strength, till another winter. Another considerable accomplishment of the year 1919 was the passage of a Church Enabling bill, promoted both by the ecclesiastical authorities and by the main body of Church laymen, setting up a National Assembly of the Church of England, which should have some of the powers of independent action always asserted by the Church of Scotland, but subject to the supreme authority of Parliament. The National Assembly in its first meetings in the coming year seemed to justify the hopes formed of it. Though earnest, it was businesslike and not extreme.

The year 1920 opened with the final severance of all direct connexion between the Government and organized labour by the resignation of Mr. Barnes, Minister without portfolio, and of Mr. George Roberts, the Food Controller. These resignations were, however, of small importance by the aide of the reappearance of Mr. Asquith in Parliament as member for Paisley. Mr. Asquith's platform was that of a strong opponent to the Coalition, which he said ought now to be dissolved; he advocated Free Trade, retrenchment, and for Ireland Dominion Home Rule. At first it seemed as if he might provide the Government with what they sorely needed, a competent and determined Opposition. But his followers in the House were so few that, after a while, he was discouraged and transferred his main activities to the constituencies, where he succeeded in rallying most of the local Liberal associations to his banner.

The principal matters which occupied the attention of the country in the year were the labour unrest, Ireland, and Government extravagance. Mr. Chamberlain's budget dealt with figures of the same magnitude as in the previous year. In spite of the fact that the estimates for the navy and army showed a diminution of about £340,000,000 compared with those of the previous year, he nevertheless contemplated a total expenditure of £1,418,300,000; and in order that he might make a serious attempt at reducing the weight of the debt he increased the charges for letters, newspapers and telegrams, and also for receipt and stamp duties; he increased, moreover, still further the duty on beer; doubled that on wine with a special 50% duty on imported sparkling wines; and increased that on cigars. He lowered the limit of exemption from supertax to £2,000; but made various readjustments of income tax which would ease the burden to the taxpayer of small means, while taxing the rich man still more severely. Finally he imposed a new tax of 1s. in the £ on company profits, and raised the excess profits duty (which it had been hoped might be repealed) to 60%. To this last provision most serious exception was taken in the City of London and by the industries of the country; and an agitation was started which did not rest till it had finally secured a promise from the Chancellor to repeal the excess profits tax altogether in the coming year. The general result of the budget was to stimulate the "Anti-waste" party, who began to count seriously in by-elections.

The labour unrest during the year mainly affected the great coal-mining industry, which never settled down during the two and a half years that succeeded the war. It was but a patched-up truce that was arranged after the Sankey Commission, and the men still hankered after higher wages (to correspond with the still rising prices) and for nationalization in some form. The Government absolutely refused nationalization, but promoted a Coal Mines (Emergency) bill which should continue the war pooling arrangements and the Sankey wage till the termination of State control. This did not at all content the men, who demanded in March an immediate advance of 3s. per shift for miners over 16, and of 1s. 6d. below that age. After many negotiations the Government made a proposal of a guaranteed minimum advance of 2s. for adults, 1s. for youths between 16 and 18, and 0d. for boys under 16. This was accepted on ballot in April. It was estimated that this concession implied an extra charge of more than £30,000,000 a year on the industry, the surplus available to meet it being only about £8,000,000. The Government passed this session a Mining Industry bill, constituting a Department of Mines under the Board of Trade, dropping their original and wasteful idea of constituting a brand new ministry. This was unpopular among the miners, and perhaps contributed to the new demand sprung in Aug. on the Government. In 1919 ministers had had unfortunate dealings with the price of coal. In July of that year they had increased the price by 6s. a ton on the reasonable ground that this was the necessary result of the increased wages granted in accordance with the Sankey report. Then suddenly in Nov. they decreased the price of domestic coal by 10s., on the ground that it was fair that the consumer should share in the large profits which, owing

Mr. Asquith's Return to Parliament.

The Budget of 1920.

Miners' Unrest.

to the high prices ruling in America, were made on exported coal. But this could not be maintained, and in May 1920 the price of domestic coal was raised by 14s. 2d. a ton, and that of industrial coal by 4s. 2d. In view of these facts the miners at the end of July 1920 coupled with a demand for a further advance of 2s., 1s. and 9d. a shift for the three grades, a demand for a reduction of price to the consumer of 14s. 2d. a ton. It was thought that this bribe would make the public sympathetic to their claims. The calculation was that the increase of wages

Coal Strike of 1920.

would cost the industry £27,000,000, and the reduction of price would add another £36,000,000,—thus more than accounting for the £60,000,000 made by the Government as profits on exported coal, and badly needed by them for their general revenue. These demands the Government absolutely declined to entertain; and on a ballot near the end of August the miners determined to strike in order to obtain them. But the opening of the strike was postponed for more than a month and a half, pending a series of negotiations between the Government, the representatives of the owners and the Miners' Federation, and also the spokesmen of the railway men and of the transport workers, who intervened as members of the Triple Alliance to support the miners' claims. Nationalization, though Mr. Smillie, one of the leaders, said the miners would never rest till they got it, was not actually claimed on this occasion; the altruistic demand for a large reduction of the price of coal to the consumer was soon dropped, and the struggle became one merely for increased wages—a claim based by the miners on the still rising prices. The Government and the owners pointed out that, since the increases in wages under the Sankey award, output had decreased,—and maintained that increase in wages would only be justified by increase of output. The miners insisted on an advance of 2s. as a preliminary, and the strike began in the middle of October and lasted a fortnight. The National Union of Railway Men threatened to strike in support of the miners, but it is doubtful whether the railway men themselves would have come out in any number. The question was never put to the test, as a provisional arrangement was come to, and confirmed on ballot, by which the miners got their 2s. a day (and could get more by increased output) till Jan. 3, after which wages were to be governed by a sliding scale, ultimately to be superseded by an agreed scheme for their permanent regulation. Sir Robert Horne, who, with the Prime Minister, bore the brunt of these negotiations, greatly enhanced his reputation by his firmness, adroitness and geniality.

There were disputes in the cotton and engineering and other trades during the year, but nothing comparable to that in the coal industry. Organized labour, which had been very sensitive since the Russian Revolution of any attempts to interfere in arms with the Soviet Government, formed, in this summer of 1920, in view of the strained relations between Poland and Russia, a Council of Action to prevent any such interference, with the implied threat of a general strike at its back. This unconstitutional proceeding was justified in a half-hearted manner by the moderate leaders, Mr. J. H. Thomas and Mr. Clynes. But the French Government refused to allow delegates of the Council of Action to remain in France; and, as an independent Poland and peace with Russia were soon seen to be secured, Mr. Thomas discreetly buried the Council with an appropriate eulogium at the Trade Union Congress. The financial offers made by the Bolsheviks to the *Daily Herald*, the labour organ, which were revealed in the autumn, added to the growing discredit of Bolshevik rule in Labour eyes.

The "war" of murder and outrage waged by civilian Republicans in Ireland against the civil and military forces of the Crown, and against prominent loyalists in all parts

Slain Fein "War" in Ireland.

of the south and west, was intensified from the beginning of the year onwards. To meet the crisis the Royal Irish Constabulary were increased, an auxiliary force of cadets, mainly young English officers who had served in the war, was created, and the troops reinforced. In August Sir Hamar Greenwood, who had succeeded Mr. Macpherson in April as Chief Secretary, hurried through Parliament a Restora-

tion of Order in Ireland bill which provided for the suspension of trial by jury in disturbed areas and the substitution of trial by court martial. The strain of outrage and assassination to which military and police were subjected proved too much for the nerves of some members of the forces of order, especially among the insufficiently disciplined auxiliaries; and in a considerable number of cases unauthorized reprisals were carried out, in which individuals, not always guilty, were shot, and dwelling-houses and shops and warehouses and creameries were sacked and burnt. The British public, as a whole, was so conscious of the widespread conspiracy and the appalling crimes that had to be faced and got under by inadequate but courageous forces, that it was disposed to condone occasional acts of reprisal, provided that due efforts were made by the authorities to restore and enforce discipline. That was eventually done and certain definite reprisals authorized in definite cases, but not until after a delay of several months, during which Mr. Asquith and Sir John Simon and the Independent Liberals in general, with the aid of some bishops and other ministers of religion, conducted a violent agitation against the misdeeds of a small portion of the forces of the Crown—in which the crimes and the "war" against which these forces were struggling seemed to be unduly disregarded. The police and troops were successful in so far that they prevented Sinn Féin officers and tribunals from functioning openly, as heretofore, in many parts of the south and west. But, in spite of occasional boasts by ministers, like Mr. Lloyd George's assertion at Guildhall on Lord Mayor's day "We have murder by the throat," crime was not stopped, and there was little improvement in the state of the southern and western provinces by the summer of 1921. Indeed the "war" was carried in the spring of 1921 into England; and in Liverpool and the neighbouring country, and in London and the Home Counties, outrages were committed.

It was not merely by force that the Government proposed to meet the crisis in Ireland. The conjunction of Unionists and Liberals in one coalition seemed to give an opportunity for an agreed settlement of the Home Rule dispute. As a result of the labours of the Cabinet Committee presided over by Mr. Long, the Government introduced in Feb. a Home Rule bill of a novel character. It provided for the establishment of two Irish Parliaments, one in Belfast, for the six north-eastern counties, and one in Dublin for the remaining counties, and of a Council of Ireland "with a view to bringing about harmonious action between the Parliaments and Governments of Southern Ireland and Northern Ireland." The Council was to consist, in the first instance, of a President appointed by the King, and of delegations of 20 members of each of the two Irish Parliaments; but the two Parliaments might vary its constitution, and provide for it being elected by Parliamentary electors. Further, the two Irish Parliaments had power given them to establish, in place of the Council of Ireland, a Parliament for the whole of Ireland, consisting of one or two Houses. Thus the bill, which recognized the necessity of partition for the present, made provision for unity in the future. As originally drafted, the bill provided only for one House, a House of Commons, in each area; but the Lords added a Senate in each case, which the Government accepted. The executive power in the two areas was to continue vested in the King, who might delegate his authority to the lord lieutenant. The number of Irish members of Parliament at Westminster was to be 42. Of the Irish contribution of £18,000,000 a year to Imperial expenditure, 56% was apportioned to Southern, and 44% to Northern Ireland. There was to be a separate judiciary in each area, with a High Court of Appeal for the whole of Ireland. The powers reserved for the Imperial Parliament were roughly those reserved under the Act of 1914 which Mr. Redmond had accepted, save that further taxes were placed at the disposal of the two Parliaments; and in case of an Irish Parliament being constituted full powers over customs and excise were to be extended to it. If the southern Parliament refused to function, that part of Ireland was to be governed as a Crown colony. The reception of the bill was very unfavourable in southern and western Ireland, by Nation-

Reprisals.

New Home Rule Bill.

alists and Sinn Feiners. It was a scheme, said the *Freeman's Journal*, for the "plunder and partition" of Ireland. Protestant Ulster, after a little hesitation, took the line that she was quite satisfied with her present position in the United Kingdom, but that, if Parliament thought such a measure right, she would accept it and do her best to make it a success. The bill was opposed, on the ground that it involved partition, both by the Labour party, who were prepared to concede the absolute right of self-determination, and by Mr. Asquith, who proclaimed his adherence to a Dominion Constitution. That also was the view of Sir Horace Plunkett; and several southern Unionists, such as Lord Dunraven and Lord Middleton, demanded complete fiscal autonomy for Ireland. The bill eventually passed into law in Dec. 1920, and was put into force in 1921. Lord Edmund Talbot, who

**Bill Passed
and Elec-
tions Held.**

became Viscount Fitzalan, an English Roman Catholic, was appointed Lord Lieutenant, and elections were duly held for the two Parliaments in the spring. As the campaign of Sinn Fein terrorism was still in full swing in southern Ireland, Sinn Feiners were everywhere returned in that area unopposed, save in Trinity College. In northern Ireland the Unionists had a great electoral success, returning 40 out of the 52 members of the new House of Commons. As Sir Edward Carson had retired and taken a Lordship of Appeal, Sir James Craig was the Unionist leader, and formed a Government as Prime Minister. The King and Queen opened the

**The King
and
Ulster.**

Ulster Parliament in state on June 22, the King, in moving language, expressing the hope in his Speech from the Throne that Irishmen would forgive and forget. Thereupon Mr. Lloyd George, while making every arrangement for strengthening the authority of the Crown in southern Ireland against the forces of disorder, issued a public invitation to Mr. De Valera, the Sinn Fein leader, and to Sir James Craig, to come and confer with him at once in London without conditions. Sir J. Craig accepted immediately; and Mr. De Valera, after consulting with other Sinn Fein leaders and with some of the southern Unionists, also came to London; while a truce was called in the "war" (see further the article IRELAND).

Several important changes took place in the Ministry in the early months of 1921. Mr. Long retired from the Admiralty for ill health and was subsequently created a viscount. Lord Milner, after remarkable service to the State, resigned the Colonial Office, and retired into private life, being succeeded by Mr. Churchill. Mr. Bonar Law had a sudden breakdown, which entailed immediate abandonment of political work, and which, as he was one of the main pillars of the Coalition, might well result in serious political complications. But Mr. Austen Chamberlain was immediately elected by the Unionist party to be leader in the House of Commons in his place; and he stepped into the same confidential relation that Mr. Law had held in regard to the Prime Minister. He became Lord Privy Seal. Sir Robert Horne

**Minis-
terial
Changes
in 1921.**

succeeded him as Chancellor of the Exchequer, and was succeeded at the Board of Trade by Mr. Stanley Baldwin. The Government bills which attracted most attention in this session were one by Sir Eric Geddes for grouping the railways of the country in the interests of efficiency and economy; and another promoted by the Board of Trade for the safeguarding of special industries. The Independent Liberals, in their opposition to the Protection which they discovered in this latter bill, made use of the well-known arts of obstruction, and all-night sittings were resumed. The budget dropped the excess profits duty, and the higher rates of duty imposed in the previous year on sparkling wine and cigars. Postal rates were however further increased. Otherwise taxation remained at the same height.

This heavy burden was more felt this year, because the period of inflated trade which had succeeded the war had come to a sudden end in the previous autumn; prices tumbled down; it was impossible to find markets for goods; wages had to be reduced and men dismissed in one great industry after another; and unemployment steadily increased. It was borne forcibly in upon every individual that economy in public and private expenditure was imperative.

**Depres-
sion in
Trade.**

By-elections, as might be expected with so huge a majority, had on the whole gone against the Government from the beginning. But their losses this spring and early summer had this exceptional character, that the victors in the three contests which attracted most attention, at Dover, St. George's (Westminster) and East Herts., ran simply and purely as "Anti-waste" candidates. The tendency of the Government, already manifested, to restrict its ambitions and curtail its schemes, was intensified.

Already practically all the new war ministries, except the Pensions Ministry, had been disbanded; the putting into complete effect of Mr. H. A. L. Fisher's comprehensive but somewhat extravagant Education Act had been postponed; and urgent admonitions in favour of economy had been circulated to the departments. Now it was announced by Mr. Churchill that he had formulated a scheme by which the enormous outlay in Mesopotamia and Palestine, against which there had been a great public outcry, might be materially reduced. Dr. Addison, who was thought to have studied thoroughness rather than economy in regard to his housing schemes and his medical staff at the Ministry of Health, resigned that Ministry; and so strong a protest was roused by his retention in the Cabinet without a portfolio but with a salary, that the Prime Minister felt it necessary in June to declare that the arrangement was only for the remainder of the session, and that the salary would be halved. Dr. Addison's successor in the Ministry of Health, Sir Alfred Mond, announced an administration on much less ambitious lines. Ministers also abandoned their guarantee of agricultural prices and wages; and further determined to terminate their control of the coal industry on April 1, four months earlier than the date originally announced. This resulted in yet another coal strike, or stoppage, the most serious of all the strikes in the industry in these years. The men could not reconcile themselves to the great reductions in wages necessary to make the industry self-supporting. And they also demanded a national pool—a half-hearted form of their old demand for nationalization. They alienated public sympathy at first by withdrawing the pump men from the mines—a position from which they had to recede. The Government offered a temporary subsidy of 10,000,000 to tide over the difficult early weeks; but terms could not be arranged, and the strike lasted for three months—April, May and June,—and was settled in the end on terms which the men might have had early in the dispute, if they had not clung to the national pool, which of course had to be abandoned. The loss to the country was enormous, as the great industries dependent upon coal had one after another to close down their works. But the employers in these industries could afford the stoppage better than the men, as, owing to the depression of trade, they would have been manufacturing during these months at a loss. The funds of the great unions were depleted and many of them got deeply into debt; and there was some want and hardship amongst women and children. Happily, it was a season of warmth and brilliant sunshine, so that the domestic fire was needed only for cooking.

**Coal
Stoppage
in 1921.**

A momentous conference was held in London in the summer of 1921 between the Prime Ministers of the United Kingdom, the Dominion of Canada, the Commonwealth of Australia, the Dominion of New Zealand and the Union of South Africa, together with representatives of India. The main object of the conference was to formulate a common foreign policy for the sister nations composing the British Empire, and to come to a decision as to the renewal of the Anglo-Japanese alliance (see BRITISH EMPIRE).

There were symptoms of uneasiness in the latter part of 1920 and in 1921 in the extreme wings of both parties to the Coalition. On the one hand there was some fraternizing between Independent and Coalition Liberals; and on the other Lord Salisbury was the spokesman of those "Dries" who urged Unionists to come out of the Coalition and resume their independence, a course which had already been taken by a few individuals, conspicuous among whom were his brothers, Lord Robert and Lord Hugh Cecil. But neither move-

ment appeared to be strongly supported, though much greater independence had been shown of late by the Ministerial majority in the House of Commons. The Labour party, though alternately upbraided and cajoled by the Independent Liberals, showed no disposition to enter into a political compact with them; and without such an arrangement it did not look as if Mr. Asquith and his friends could command anything approaching adequate support in the country to regain office. Many Liberals indeed had gone over to Labour; but the Labour party, whose programme demanded a continuance of heavy expenditure and therefore high taxation, were for the time out of accord with public sentiment.

Mr. Lloyd George, in spite of virulent abuse, partly political, partly personal, still remained throughout 1921 by far the greatest individual force in the country. He strengthened his position, indeed, from every point of view but one, by the course of events during the closing months of the year. The fact that, after general expectations of a break-down in the Irish negotiations, the conference which began in London in October between delegated representatives of Sinn Féin and the Government ended on Dec. 6 in a unanimously signed agreement for the setting up of an Irish Free State, was a great personal triumph for his patient diplomacy. Though he was too much engaged in this matter to be able, as he had intended to do, to attend the Conference for the Limitation of Armament held in Washington, at which Mr. Balfour took his place, the Prime Minister could claim for his Government a very satisfactory issue from the Conference to the initiation of which by President Harding and his Secretary of State, Mr. Hughes, Mr. Lloyd George himself had given the strongest encouragement earlier in the year. Incidentally the question of a prolongation of the Anglo-Japanese alliance—which had been a difficult point at the Imperial Conference in the summer—was successfully removed by the substitution of the Four-Power Agreement adopted in Washington; and thus Mr. Lloyd George had the satisfaction of clearing away two important obstacles to the consolidation of the Anglo-

American *entente* for which he was always striving in international affairs.

The only point of view from which Mr. Lloyd George's indispensability at this moment as Prime Minister could be said, therefore, to have been weakened was that of his success. Paradoxically enough, the mere fact that his long struggle to reconcile Irish national aspirations with inclusion within the British Empire had at last been rewarded might appear to leave him no longer *l'homme nécessaire* for that purpose. How far this possibility might react on the political situation, in the later regrouping of parties, had now to be shown. But individually Mr. Lloyd George, at the end of 1921, held the dominating place among political leaders. Mr. Asquith had lost his hold both over the country and over his old party. The Labour party, though practically certain of a large increase in Parliamentary representation whenever the country should be appealed to, had several prominent leaders but no really outstanding chief. The Conservatives, as such, were without any striking personality; Mr. Austen Chamberlain had shown no disposition to break away from the alliance with Mr. Lloyd George, and Mr. Bonar Law, though his health was restored, had ignored every suggestion so far that he should return to the political arena as an independent Conservative leader. Among the rest, the only men whose reputations had notably grown in 1921 were Lord Birkenhead and Mr. Churchill; and it was to them, either in rivalry or in combination, that current political talk usually pointed, should occasion arise for alternatives to a Lloyd George Ministry. As Lord Chancellor, Lord Birkenhead had won golden opinions on all sides, and he had never shown his capacity for statesmanship more prominently than during the past year, when he had put all his pre-war record as an aggressive sympathizer with Ulster aside in helping to secure an agreement with Sinn Féin. He and Mr. Churchill were still sufficiently young, as well as able and experienced, to make their political futures incalculable.
